**Note:** Attributes, such as system fields, discovery fields (**discovery_source**, **last_discovered**, **first_discovered**), and read-only fields (such as the asset field) do not appear in the list.

6. On the **Merge Relationships and Related Items** tab:

a. In the Merge Relationships section, select whether to merge all relationships from all duplicate CIs into the master CI. Click **View all relationships** to display all the relationships in which a duplicate CI is a parent or a child. You can click a **Parent** or a **Child** link to display more details. Orphan and duplicate relationships of duplicate CIs are deleted if you choose to merge relationships. For more information about the CMDB Health relationship KPI, see CMDB Health KPIs and metrics.

b. In the Merge Related Items section use the slushbucket to select related items to be merged into the master CI. Click **View all related items** to display all related tables (items) and the count of references in each table to one of the duplicate CIs. You can click the links in **Master CI Related Items** and **Duplicate CIs Related Items** to display details about the related items.

Related items in the slushbucket have the following format:

- **Related table label**
- **Related table name**
- **Reference field in related table**

Change Request [change_request] -> Configuration item (2)

Count of records in related table where the reference field points to one of the duplicate CIs
• By default, all items in the default related items list are selected to be merged.

• Related items (tables) that have no references to a duplicate CI are not listed, unless that table is included in the default related items list.

• Since asset related tables are part of the exclusion list, they are not available for merge.

See Manage default related items list for more information about configuring a default list of related items.

c. Click Next.

7. On the Determine Duplicate CI Actions tab, choose one of the following actions to perform after completing the reconciliation. Then click Next.

• Set attributes to custom values (recommended): Retain all duplicate CIs. Mark the duplicate CIs as invalid by setting a specific Attribute to a specific Value for all duplicate CIs. For example, set Operational Status to Retired to retire the duplicate CIs. The duplicate_of attribute of the duplicate CIs is automatically set to the appropriate master CI. Also, the duplicate CIs will not be added to any de-duplication task after this task is remediated. If the identification engine is not configured to skip duplication, ensure that identification inclusion rules are configured to exclude the duplicate CIs during identification. This configuration prevents new de-duplication tasks with the same duplicate CIs from being created after remediation.

   Note: Discovery fields, system fields, read only fields, and date fields are excluded from the attributes list.

• Delete: Delete all duplicate CIs (only the master CI remains).

   Note: Review Roll back and delete recovery for information about reverting the deletion of CIs and related records.

8. On the Review and Confirm tab:

   a. Review the summary of the expected updates for this duplicate CIs reconciliation. Updates are based on your selections and therefore the summary includes only the details that are applicable. This summary can include details of the relationships and related items that will be merged to the master CI, the attribute values that the master CI will be set with, and the number of CIs that will be deleted. Click Attributes, Relationships, Related Items, or Duplicate CI Actions if applicable, to display further details such as changes to attribute values.
b. Click **Remediate** to complete the reconciliation according to your reconciliation settings. Once complete, the task **State** is set to **Closed Complete**.

**Results**

The following relationships are deleted without being merged to the master CI:
- Relationships in which the type, child, or parent field is empty.
- Relationships for which merging to the master CI will result in cyclic relationships.
- Relationship for which merging to the master CI will result in duplicate relationships.

**What to do next**

The reconciliation process runs in the background and may take a while to complete. Upon completion, the system sends a confirmation notice to the remediator of the task. Meanwhile, you can:

- **Review Identification Rules**: Review identification and inclusion rules and make any necessary updates to reduce CI duplication.
- **Check Progress**: View the task activities that are logged as the remediation progresses.
- **View Master CI**: View the master CI for this reconciliation process.

**Special remediation scenarios**

There are a few special remediation scenarios in which the Duplicate CI Remediator behaves differently.

**Large number of duplicate CIs**

Support for reconciliation of duplicate CIs in the Duplicate CI Remediator is limited when the number of duplicate CIs exceeds a certain threshold. This threshold is based on the value of the `glide.duplicate_ci_remediator.max.cis` property, which is 1,000 by default. You can update this property to increase the threshold. However, this threshold never exceeds 5,000, even if you set the property to a value greater than 5,000.

When the number of duplicate CIs for a de-duplication task exceeds the threshold, the options available in the wizard are limited:
• On the Select Master CI tab, only the **Recommended** list of master CIs appears, and only the **Use Master CI** option is available.

• Recommendations are based only on the oldest created, newest updated, and most recently discovered CIs.

• Reconciliation of attribute conflicts and CI relationships is not supported, and only default related items are reconciled.

**Duplicate serial numbers:**
The Duplicate CI Remediator is usually applied to duplicate CMDB CIs. However, in some situations de-duplication tasks might be created for duplicate serial numbers. When the Duplicate CI Remediator processes duplicate serial numbers, the merge of relationships from duplicate records, is not referenced and is not applied.

**Manage default related items list**
You can add or remove items from the default list of related items which is used globally in the Duplicate CI Remediator for all de-duplication tasks.

**Before you begin**
Role required: itil_admin

**About this task**
The default related items list appears on the **Merge Relationships and Related Items** tab in the Duplicate CI Remediator. Globally modifying the list affects all de-duplication tasks being remediated by the Duplicate CI Remediator.

Alternatively, you can modify the list for only a specific task in the Duplicate CI Remediator without affecting the default global list.

**Note:** Only related items in which the reference field points to Configuration Item [cmdb_ci] in **sys_dictionary** can be selected for the default related items list. Related items with references to any child of the Configuration Item class cannot be selected for the default related items list, but are still available for merging in the Duplicate CI Remediator for a specific task.
Procedure

1. Navigate to **Configuration > Identification/Reconciliation > Duplicate CI Remediator Default Related Items**.

2. On the Default Related Items List for Duplicate CI Remediator page, use the slushbucket to add or remove items from the **Selected** list.

3. Click **Save**.

Properties for duplicate CIs

Use the properties for duplicate CIs to configure how duplicate CIs are processed.

These properties are available for duplicate CIs. To view and edit these properties, the admin role is required.

### Properties for duplicate CIs

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Attributes in which `max_length` exceeds this property value (4000 by default) are excluded from the **Select Master CI, Merge Attribute Values, and Determine Duplicate CI Actions** tabs in the Duplicate CI Remediator wizard. glide.duplicate_ci_remediator.max.field_length | If the `max_length` for an attribute is equal to the property value and the size of the data exceeds the property value, then the data is truncated to the property value and the attribute appears in attribute lists.  
• Type: integer  
• Default value: 4000  
• Location: **Configuration > CMDB Properties > Duplicate CI Remediator Properties**  
  
  Note: This property impacts the performance of de-duplication tasks, therefore be cautious about setting this value. |
| Comma separated list of related tables in the format `<table>.<reference column>`, that are excluded from merging during duplicate CI remediation. glide.duplicate_ci_remediator.related_items_blacklist |  
• Type: string  
• Default value: `cert_task.cmdb_ci,cert_audit_result.configuration_item,discovery_log.cmdb_ci,alm_hardware.ci,alm_asset.ci,fm_expense_line.cmdb_ci`  
• Location: **Configuration > CMDB Properties > Duplicate CI Remediator Properties**  
| Threshold for the number of duplicate CIs, which if exceeded, support for reconciliation in the Duplicate CI Remediator is limited (1,000 by default). glide.duplicate_ci_remediator.max.cis |  
• Type: integer  
• Default value: 1000  
• Location: **Configuration > CMDB Properties > Duplicate CI Remediator Properties**  
  
  Learn more: See 'Large number of duplicate CIs' in Remediate a de-duplication task.  
This threshold never exceeds 5,000, even if you set the property to a value greater than 5,000. |

**Service Mapping**

- Entry point types for Service Mapping
- CI types for Service Mapping and Discovery

**Agent Workspace for Configuration Management Database (CMDB)**

Agent Workspace for CMDB provides an easy-to-navigate interface that helps service agents access essential CMDB configuration items and drill down to related items such as changes, incidents, and timeline.

Agent Workspace for CMDB provides:

- Key health scores for CIs
- Level 1 CI relationships
- Condensed timeline view of incidents, changes, and change requests for a CI, for the past 7, 14 (default), or 30 days
- Critical incidents and change requests for CIs
- Key attributes related to CIs.
- Ability to create incidents and change requests for CIs, and to delete a CI
Plugins
The CMDB Agent Workspace plugin (com.cmdb-workspace) is activated by default in a base system. The CMDB Workspace plugin adds the following to Agent Workspace:

- CMDB list category and associated filtered lists
- Configured CMDB Workspace forms for many common CMDB classes
- CMDB-specific widgets: CMDB Health, CMDB Relationships, and CMDB Timeline

Roles
To access Agent Workspace for CMDB, the workspace_agent and itil roles are required.

CMDB Workspace form view in Agent Workspace
Service agents see forms in the CMDB Workspace form view for the CMDB classes that this view is configured for:

The CMDB Workspace form view for CMDB classes contains the following components:

- **Widgets**
• **CI Health:**
  Shows Critical Incidents, Change Requests, and the following CMDB Health scores: incomplete attributes, non-compliant relationships, stale relationships. Lets you open the CI Dashboard.

• **Level 1 Relationships:**
  Shows level 1 relationships. Lets you open the Dependency Views map.

• **CI Timeline:**
  Shows record changes, change requests, and incidents on a timeline. The timeline is for the past 14 days, condensing details that might be relevant to a current issue.

**Actions**

The **more** icon in the upper right corner lets you create a change, create an incident, or delete the CI.

**Related lists**

The CMDB Workspace form includes CIs’ related lists such as Change Requests, Incidents, Tasks, or other related lists that apply to the class.

**Derivation of the CMDB Workspace form**

The CMDB Workspace form is derived throughout the hierarchy as follows:

- CMDB Workspace form definitions are not derived by child classes in the CMDB hierarchy.
- In a base instance, the ribbon of the CMDB Workspace form is defined for the top level Configuration Item class and is derived throughout the hierarchy.
- The form header of the CMDB Workspace form view is derived by child classes. However, in a base instance, the CMDB Workspace form header is specified per class for the classes that a CMDB Workspace is configured for.

**Default CMDB filtered lists**

Agent Workspace for CMDB includes by default several filtered lists such as Applications, Databases, Infrastructure Gear, Servers, and PC. Those filtered lists are not always aligned with the CMDB hierarchy. Instead, they represent user-friendly groupings of several categories of CMDB classes. The columns that appear for each class, are the default columns for the class as specified in the platform.

To see the list of classes that are included in a CMDB list category:
1. Navigate to **Workspace Experience > Workspace > Agent Workspace Home**.

2. In Agent Workspace, click the **User Menu** icon in the upper right corner and select **Configure Workspace**.

3. Select the **Workspace List Categories** tab under **Related Links**, and then select the **CMDB** list category.

4. Select a filtered list such as **Applications**, to open the Workspace List form for the selected filtered list.

For information about configuring filtered lists in Agent Workspace, see [Set up filtered lists in Workspace](#).

**Default form view**

CMDB classes that do not have a CMDB Workspace form view configured for, appear with the default Agent Workspace form view which you can use for updating CIs. You can configure CMDB Workspace form views for any additional CMDB table that is commonly used in your organization, for which a CMDB Workspace form is not configured by default.

**Related information**

- Agent Workspace
- CMDB Health
- CI relationships in the CMDB
- CI Timeline
- Related lists

**Configure a CMDB Workspace view**

Configure a CMDB Workspace view for a CMDB table that is commonly used in your organization, for which a CMDB Workspace form is not configured by default.

**Before you begin**

Roles required vary by the element being configured in each step:

- Form headers: `workspace_admin`
- Form sections: `personalize_form`
- Related lists: `personalize_form`
- System property: `admin`
- Workspace view rules: `workspace_admin`
Procedure

1. Configure form header:

   See Set up form headers in Workspace for the steps to configure a form header. When configuring a form header, set the Table field on the configuration forms to the CMDB class that you are creating a CMDB Workspace form for.

   If not configured for the class, form headers are derived from parent classes.

2. Configure form sections:

   a. Open a CI form for the class that you are creating a CMDB Workspace form for.

   b. Right-click the CI form banner and select Configure > Form Layout in the menu.

   c. On the layout configuration form, create a new view named CMDB Workspace:

      i. Ensure that the default section, which is named as the class name, contains the class key attributes. Note the name of that section and then rename it to Key attributes.

         Navigate to System UI > Form Sections. In the Section Elements list view, locate that form section (which is associated with the CMDB Workspace view) and set its Caption value to Key attributes.

      ii. Add a new section named More attributes. Add the rest of the attributes to this section, and as the last item add Activities (filtered) to see activity stream on the form.

         For more information about configuring form layout, see Configure form layout.

3. Select the class attributes to appear in the activity stream on the form:

   a. Create a system property, using the ‘glide.ui.cmdb_ci_<class name>_activity.fields’ format for the property name.

   b. Set the property Type to string.

   c. Set the Value to the field names that you want to include in the activity stream on the form.

4. Add related lists to the form:
a. Right-click the CI form banner and select **Configure > Related Lists**.

b. On the Configuring related lists form, create a new view named **CMDB Workspace**.

c. Add the related lists you want to see on the form, such as **Change Request → Configuration Item**.
For more details, see *Add a related list to a form*.

5. **Configure a Workspace View Rule** to tie the respective class table to the CMDB Workspace view.

**View CI in Agent Workspace**

View various details for a CI using CMDB Workspace form view, in Agent Workspace. The CMDB Workspace form view provides details such as key health scores, a timeline view of incidents, changes, and change requests, and critical incidents, change requests, and attributes related to CIs.

**Before you begin**

CIs appear in a CMDB Workspace form view only if a CMDB Workspace form view is configured for the respective CMDB class. Otherwise, CIs appear in the default CMDB Workspace form view, which you can use for updating CIs.

Role required: agent_workspace_user and itil

**Procedure**

1. Navigate to **Workspace Experience > Workspaces > Agent Workspace Home**.
2. Click **Lists**, navigate to **CMDB** and then click a class such as **Servers**.
3. In the class list view, select a CI.

**What to do next**

- Click the **more** icon in the upper right area and select **Create Change**, **Create Incident**, or **Delete** to delete the CI.
- In the CI Health widget, click **CI Dashboard** to open the CI Dashboard.
- In the Level 1 Relationship widget, click **Dependency Map** to open the Dependency Views map for the CI.
- In the CI Timeline widget, click **Show Legend** and set what type of events appear on the timeline.

**View CMDB benchmarks**

CMDB calculates several CMDB Health benchmarks which then display in the Benchmarks dashboard. These benchmarks are based on various CMDB Health
metrics, displaying monthly averages, trends, comparisons to industry averages of your ServiceNow peers, and global benchmarks.

**Before you begin**
The CMDB Health Dashboard jobs must be enabled and health data must be collected. Also, navigate to **Benchmarks > Setup** and ensure that the CMDB KPIs are enabled under **IT Operations Management**.

**About this task**
CMDB provides the following benchmarks:

- % of non-compliant CIs
- % of duplicate CIs
- % of stale CIs

For an instance, each of these benchmarks is the calculated monthly average for the corresponding CMDB Health metric. Calculating a monthly average requires that there is a metric result value for each day of the month. Therefore, each day on which the respective Health Dashboard job did not run, is assumed with the aggregated result from the run that is most recent to that day. The monthly average is then calculated based on the sum of all the daily aggregated results for the metric in that month, divided by the number of days of the month. For a CMDB Health Dashboard job that ran multiple times in a single day, only the results of the last run in that day are used for the monthly average calculation.

 electrónico: The frequency of CMDB Health Dashboard job executions depend on whether the job is enabled, its schedule and on manual runs.

Global averages are based on the sum of monthly averages of all peer instances, divided by the number of instances (aside from instances for which the monthly average is 0).

**Procedure**
1. Navigate to **Benchmarks > Dashboard**.
2. Click the ✔ icon and select **IT Operations Management**.
3. Click **ALL** or **CMDB**.
4. Click on a CMDB benchmark to drill down to trend data, and other benchmark details.

CMDB APIs (CMDB SDK)
Use CMDB APIs to create, update, and read operations on the CMDB. Domain separation is supported in CMDB APIs.

CMDB APIs (CMDB SDK)
Use the following CMDB APIs to create, update, and read operations on the CMDB:

• CMDBGroupAPI - Scoped
• CMDBTransformUtil - Global
• CMDBUtil - Global
• IdentificationEngineScriptableApi
• IdentificationEngine - Scoped

Domain separation in CMDB APIs
Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

CMDB APIs are used for accessing the CMDB from a script. CMDB stores the CI and relation information; CMDB is domain separated.

CMDB APIs support the following operations:

• Create a new CI
  ◦ This operation goes through the Identification and Reconciliation Engine which supports domain separation when creating a CI. The domain of the caller is used for this operation.

• Update an existing CI
  ◦ This operation goes through the Identification and Reconciliation Engine which supports domain separation when creating a CI. The domain of the caller is used for this operation.
• Create/Delete relations
  ◦ The cmdb_rel_ci table is not domain separated.

• Query CMDB CI/Query CMDB table
  ◦ Results are filtered by the domain(s) visible to the caller.

• Query CMDB metadata table
  ◦ Metadata information is not domain separated.

Setting up domain separation for CMDB APIs
If domain separation is enabled for CMDB, then it is also available for CMDB APIs.

Data separation
Data is stored and domain separated in CMDB. There is no additional work needed from the CMDB API perspective.

Configuring a domain-separated environment
The configuration is done at the CMDB level.

If a domain column is present for base system application tables
See the Domain separation in CMDB Health topic.

Tenant domains and application data
There is no application-specific data to manage with CMDB.

Related information

Quick start tests

Useful related lists in CI forms

By default, the forms that display manageable configuration items (CI) - computers, printers, network gear, uninterruptible power supplies (UPS), and power distribution units (PDU) - provide a number of related lists for the form.

The following related lists are common to all forms for manageable CIs:

- Network Adapters - Displays all the NICs installed on a CI.
- CI IPs - Displays all the IP addresses on this CI:
  - Computers (workstations, laptops using various Mac and Windows operating systems)
  - Windows servers
  - Linux servers
  - AIX servers
  - Solaris servers
  - Devices discovered through SNMP.
- DNS Names for CIs - Displays all the DNS names on a CI.
The IP version information appears in all IP address related lists and forms.

**Note:** Since all paths here click into the IP Address to DNS Names list that associates an IP address with a DNS name, this part of the common flow was not added to the tree structure.

**Discovery source**

A table called Source [sys_object_source] stores information identifying the source of a discovery (by ServiceNow Discovery or another product), the ID of that source, and the date/time of the last scan. To view this information, configure a CI form and add the Sources related list. This table is populated automatically when the Discovery plugin is enabled.

**Activate the Extended CMDB plugins**

The Configuration Management (CMDB) application provides core functionality for the configuration management database, including modules for hardware and configuration items. The separate Extended CMDB plugin includes a collection of modules for specialized configuration items, such as radio hardware, test equipment, and voice system hardware.

**Before you begin**

Role required: admin

**About this task**

The Configuration Management (CMDB) plugin is automatically active for all instances. You must activate related plugins to access the modules for specialized configuration items.

- CMDB Mainframe (com.snc.cmdb.mainframe)
- CMDB Radio Category (com.snc.cmdb.radio.category)
- CMDB Telecom Category (com.snc.cmdb.telecom.category)
- CMDB Test Equipment (com.snc.cmdb.test.equipment)

**Procedure**

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade. If the plugin depends on other plugins, these plugins and their activation status are listed.
3. **Optional:** Select the Load demo data check box.
Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Click **Activate**.

**Enterprise CMDB**

The Enterprise Configuration Management Database (ECMDB) is targeted toward businesses that want to monitor, manage, measure, track, alert on change, and generally understand business systems that consist of a large number of components, business, and support personnel.

For example, a bond trading service may have multiple application, and web servers, several databases, Linux, UNIX, and Windows servers. There will be security products, network storage, disaster recovery procedures and hardware, etc. that are necessary for the service to operate properly.

The ECMDB makes it easy to either manually enter the relationships or have them populated automatically by discovery tools. In addition to the hardware, software, network, database, and storage areas, it is beneficial to know which individuals or groups are responsible for the service from both a business perspective as well as an IT perspective. Who are the line of business users and managers? Who starts and stops the application or its components? Who monitors the log files? Who is in charge of backup and restore, business continuity, and disaster recovery?

Enterprise CMDB is available with the Configuration Management (CMDB Enterprise Edition) (com.snc.cmdb.enterprise) plugin, which is active in the base system.

**CMDB Relationships**

The ECMDB lets you easily track all relationships by relationship type.

The Enterprise CMDB extends the capabilities of the ServiceNow platform CMDB in the following areas.

**Extended configuration item types**

- Clusters
- Database Instances (Oracle, MySQL, MSFT SQL Server)
- File Systems (Direct and network attached)
- Linux Servers
Extended relationships

Accurate description of relationships between items, and between items and people or groups, is important to understand the fabric of a business service. ECMDB provides many relationship types out of the box, but it is easy to extend the number of relationship types. Example relationship types include the following.

- Connects to
- Depends on / Provides Service to
- Powered by / Powers
- Protected by / Protects
- Disaster Recovery Provided by / Provides Disaster Recovery for

Visualization

The system can show relationships as a hierarchy using a standard treeview, flattened, or graphically, all in a simple web interface.

Auditing

Auditing of changes to configuration items is turned on by default.

Federation

Federation of third party discovery and configuration data is supported through standard synchronization offerings (SMS, LAN Desk, others) and through the CMDB Discovery [cmdb_discovery] table.

Configuration item modeling (product models)

Model driven configuration management allows the definition of CI models up front that can be associated to product maintenance lifecycles, cost centers, and support organizations, as well as provides a means for capacity and inventory planning. By defining models for CIs (which have a many to one relationship to the model), you can dynamically group actual discovered or imported CIs into logical, operational, and financial models. This facilitates an organized approach to managing your assets (CIs) in their respective domains.
Enterprise Configuration Management Database (ECMDB) action icons

Any of the following icons may appear in the ECMDB lists of related items.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>✗</td>
<td>For currently active incidents against this configuration item</td>
</tr>
<tr>
<td>🚨</td>
<td>For currently active problems against the configuration item</td>
</tr>
<tr>
<td>🔴</td>
<td>For currently active changes against the configuration item that are not covered in the past, current, pending changes. For example, a request to update the operating system on a server that is currently in progress may display this icon.</td>
</tr>
<tr>
<td>🔵</td>
<td>For changes that were recently completed against the configuration item. Changes with an &quot;Actual_end_date&quot; in the past.</td>
</tr>
<tr>
<td>🔴🔺</td>
<td>For changes that are planned soon against the configuration item. Changes with an &quot;Actual start date&quot; in the future.</td>
</tr>
<tr>
<td>🔴🔻</td>
<td>For currently active changes against the configuration item that have an &quot;Actual start date&quot;</td>
</tr>
<tr>
<td>🔵</td>
<td>For outages that were recently completed against the configuration item. Outages with an &quot;end&quot; date in the past.</td>
</tr>
<tr>
<td>🔵🔺</td>
<td>For outages that are planned soon against the configuration item. Outages with a &quot;begin&quot; date in the future.</td>
</tr>
<tr>
<td>🔵🔻</td>
<td>For currently active outages against the configuration item that have a &quot;begin&quot; date in the past and no &quot;end&quot; date</td>
</tr>
<tr>
<td>■</td>
<td>This will only show up in the Tree view and indicates that a configuration item that is downstream has at least one of the above issues against it.</td>
</tr>
</tbody>
</table>

The system looks 5 calendar days in the past and 7 calendar days in the future when looking at recent outages and changes.
Business service tables

In the CMDB, child tables of the Service table [cmdb_ci_service] store information about services, including application services.

An application service is work or goods that are supported by an IT infrastructure. For example, delivering email service to an employee can require services such as email servers, web servers, and the work to configure the user's account. An application service management map graphically displays the configuration items (CI) that support an application service and the relationships between the CIs.

The Service table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business criticality</td>
<td>The importance of this service to the business. This field can be used to determine disaster recovery strategies for this service. Default options are:</td>
</tr>
<tr>
<td></td>
<td>• 1 - most critical</td>
</tr>
<tr>
<td></td>
<td>• 2 - somewhat critical</td>
</tr>
<tr>
<td></td>
<td>• 3 - less critical</td>
</tr>
<tr>
<td></td>
<td>• 4 - not critical</td>
</tr>
<tr>
<td>Service classification</td>
<td>Designates the type of the service. For more information, see Application services</td>
</tr>
<tr>
<td></td>
<td>• Technical Service (For more information, see )</td>
</tr>
<tr>
<td></td>
<td>• Service Offering (For more information, see Service offerings)</td>
</tr>
<tr>
<td></td>
<td>• Shared Service (For more information, see )</td>
</tr>
<tr>
<td></td>
<td>• Billable Service (To represents a service that is billed, or that is cost managed)</td>
</tr>
<tr>
<td>Used for</td>
<td>Designates how this service is used. Default options are:</td>
</tr>
<tr>
<td></td>
<td>• Production</td>
</tr>
<tr>
<td></td>
<td>• Staging</td>
</tr>
<tr>
<td></td>
<td>• QA</td>
</tr>
<tr>
<td></td>
<td>• Test</td>
</tr>
<tr>
<td></td>
<td>• Development</td>
</tr>
</tbody>
</table>
The Service table (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Demonstration</td>
<td></td>
</tr>
<tr>
<td>• Training</td>
<td></td>
</tr>
<tr>
<td>• Disaster Recovery</td>
<td></td>
</tr>
</tbody>
</table>

**Users supported**
The users that this service supports. A reference to the Group [sys_users_group] table.

**Version**
Use this field for your own versioning processes.

The Service Configuration Item Association table

The Service Configuration Item Association table [svc_ci_assoc] binds an application service and a CI to track which CIs are part of each application service.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item Id</td>
<td>A reference to the Configuration Item [cmdb_ci] table.</td>
</tr>
<tr>
<td>Service Id</td>
<td>A reference to the Service [cmdb_ci_service] table.</td>
</tr>
</tbody>
</table>

Table form views

When you view a table definition form, you can open the context menu, and select a form view in which to display the table. The default view for a table is the Default view. For any class that is an extension of the CMDB table, you can select the CI Definition view which provides additional access to related tables and information.

The CI Definition form view is a centralized location from which you can configure and view a table. In addition to the information that the default view displays, the CI Definition form view provides the following controls,

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Icon tab</td>
<td>View and create new NG-BSM icons for CI types</td>
</tr>
<tr>
<td>CI Identifier tab</td>
<td>View and create new CI identifiers</td>
</tr>
<tr>
<td>Reconciliation Definitions tab</td>
<td>View and create new data source definitions</td>
</tr>
</tbody>
</table>
To access these additional controls on the CI Definition form view, you need to first create a new table that is derived from the CMDB table, and then view it using the CI Definition form.

Create a CI class

**Analytics and Reporting Solution for Configuration Management (CMDB)**

Analytics and Reporting Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With Analytics and Reporting Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

**Important:** Set up and test Analytics and Reporting Solutions on a non-production instance before enabling them in production.

**Note:** Analytics and Reporting Solutions provide all the configuration records required to analyze default applications. Customize these records for use in your production environment. For more information, see Configure Analytics and Reporting Solutions.

To enable the solutions for Configuration Management (CMDB), an admin can navigate to **Performance Analytics > Guided Setup**. Click **Get Started** then scroll to the section for Configuration Management (CMDB). The guided setup takes you through the entire setup and configuration process.

Connect

ServiceNow® Connect is a real-time messaging platform that connects you to your coworkers, bypassing email and static documents.

Connect integrates with other features within the system, such as Visual Task Boards, Human Resources Management, and Customer Service Management. The Connect interface overlays the standard interface, which allows users to participate in conversations while they work.

Connect contains the following features:

• **Connect Chat**: Enables users to chat with individuals and groups, quickly share files, and collaborate on any record by connecting with the right people instantly.

• **Connect Support**: Enables support agents to provide real-time assistance to end users, using queues. Requires the Connect Support plugin.

UI16 or UI15 is required to use Connect.

⚠️ **Note:**

• Connect does not replace legacy chat but offers some of the same functionality. Do not use these features concurrently.

</tr>
</tbody>
</table>
Supported browsers for Connect
The system supports Connect Chat and Connect Support on most modern browsers.

• The latest public release of Firefox or Firefox ESR
• The latest public release of Chrome
• Safari version 9.1 and later
• Microsoft Edge version 90
• Internet Explorer version 11
  ◦ Edge mode is supported.
  ◦ Compatibility mode is not supported.
  ◦ Setting Security Mode to High (via the Internet Options > Security tab) is not supported.
  ◦ Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.

Activate Connect
Connect is active by default on new instances. For upgraded instances, you can activate the Connect plugin (com.glide.connect) if you have the admin role.

Before you begin
Role required: admin

About this task
If you used Collaboration in the Fuji release, the Connect plugin is activated automatically.

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears:

```
Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.
```

**Related information**

- List of plugins

**Properties installed with Connect**

Properties are added with activation of Connect.

**Note:** To open the System Property [sys_properties] table, enter `sys_properties.list` in the navigation filter.

</tbody>
</table>
Activate Connect Support

You can activate the Connect Support plugin (com.glide.connect.support) if you have the admin role. This plugin includes demo data.

Before you begin

⚠️ Important:
In Paris and future releases, Connect Support no longer receives enhancements or non-priority bug fixes. Consider migrating to ServiceNow® Advanced Work Assignment and Agent Chat in workspace to automatically assign chat requests and other work items to agents. For details, see Migrate from Connect Support to Advanced Work Assignment and Agent Chat.

If you are currently using the legacy chat feature to provide help desk support, close any open help desk chats before activating Connect Support. Legacy chat and Connect Support should not be used concurrently. When you activate Connect Support, the system automatically sets the stWorkplace from Facebookate of all Chat Queue Entry [chat_queue_entry] records to Closed Complete. This ends any open help desk chats. For more information, see Migrate from legacy chat to Connect Support.

Role required: admin
Procedure

1. Navigate to **System Applications > All Available Applications > All.**
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see **Request a plugin.**
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

   **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: *Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.*

Properties installed with Connect Support

Properties are added with activation of Connect Support.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</table>

**Additional plugins for Connect Support**

Additional plugins are available for Connect Support. These plugins integrate Connect Support with other features and provide capabilities to track performance metrics.
You must have the admin role to activate these additional plugins. For details, see [Activate a plugin](#).

### Additional plugins for Connect Support

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
</table>
| Connect Support Manager's Dashboard [com.glide.connect.managers_dashboard] | Provides a homepage for Connect Support and all required configuration records. Though the plugin name contains the term dashboard, the plugin does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.  

> **Note:** The Connect Support Manager's Dashboard plugin does not activate Connect Support automatically. You must activate Connect Support to collect data for the homepage.  

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
</table>
| Human Resources Application: HR Connect [com.snc.hr.hr_connect]        | Sets up a human resources (HR) chat queue and makes it available on the HR Service Portal.                                                                                                                     

> **Note:** This plugin does not appear in the System Definition>Plugins list. Contact ServiceNow personnel to activate it.  

If not already active, the Human Resources Application: HR Connect plugin activates these related plugins:  

- **Human Resources Application: Core [com.snc.hr.core]:** Provides basic HR features.

</tbody>
</table>

### Connect interface

Users can work in a compact view of Connect, which overlays the standard user interface, or in a full-screen workspace.

Connect Chat and Connect Support share the same interface, so support agents can keep track of all their conversations in one place.

### Connect overlay

The Connect overlay appears over the standard user interface. It consists of the Connect sidebar, which is the primary interface for Connect Chat and Connect Support, and any Connect mini windows that are open. Each mini window contains a header, a conversation area, and a message field.
**Connect overlay**

[Image of a ServiceNow interface with Connect overlay]

**Note:** An administrator can disable the Connect overlay so users can only use the Connect workspace, a full-screen interface with additional Connect tools.

**Connect sidebar**

The Connect sidebar is the primary interface for Connect Chat and Connect Support. It lists your conversations and provides access to create conversations.

The sidebar is collapsed by default. Click the toggle Connect sidebar icon in the banner frame to expand or collapse the sidebar, which appears on the right edge of the interface.

**Connect Chat**

The chat view of the sidebar is available to all users. If Connect Support is enabled, users must click the chat tab of the sidebar, which is represented by a speech bubble icon. If Connect Support is not enabled, there are no tabs in the sidebar and the chat view displays by default.

The chat view of the sidebar lists all your current Connect Chat conversations. It also contains a filter tool and a button to create conversations.
If you have unread messages in a conversation, a number appears by the conversation in the sidebar. Point to a conversation and click the x icon to remove the conversation from the sidebar.

**Connect Support**

The support view of the sidebar is available when Connect Support is activated. The support view is visible only to users who are agents for at least one support queue. Users must click the support tab of the sidebar, which is represented by a headset icon.

The support view displays **Queues** to which you belong. It also displays your open support conversations under **Cases**.
If you have unread messages in a conversation, a number appears by the conversation in the sidebar.

**Connect mini windows**

When you open a Connect Chat or Connect Support conversation in the Connect overlay, it opens in a Connect mini window. Each mini window contains a header, a conversation area, and a message field.

Several icons appear in the mini window header and by the message field.

**Note:** The icons you see for each conversation depend on the conversation type and other conditions.

**Chat mini window icons**

<table>
<thead>
<tr>
<th>Icon</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>🌟</td>
<td>Add user</td>
<td>Add a user to the conversation. This icon is visible for group and record conversations only. Administrators can enable this icon for Connect Support conversations.</td>
</tr>
<tr>
<td>📄</td>
<td>View document</td>
<td>View the record associated with the conversation. This icon is visible for record and support conversations only.</td>
</tr>
</tbody>
</table>
Chat mini window icons (continued)

<table>
<thead>
<tr>
<th>Icon</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>🔄</td>
<td>New window</td>
<td>Open the conversation in the Connect workspace, a full-screen window with additional Connect tools.</td>
</tr>
<tr>
<td>❌</td>
<td>Collapse/Expand conversation</td>
<td>Hide or show the conversation. Alternatively, click anywhere in the mini window header to the left of the icons.</td>
</tr>
<tr>
<td>✗</td>
<td>Close window</td>
<td>Close the mini window. The conversation remains in the Connect sidebar and the history is preserved when you reopen the conversation. You can also close a mini window by pressing the Escape key.</td>
</tr>
<tr>
<td>⌋</td>
<td>Connect actions</td>
<td>Open the Connect actions menu, which contains options like Transfer and Create Incident. This icon is visible only when Connect actions are available for the conversation. By default, this icon is visible for support conversations only. Administrators can add options to this menu by creating Connect actions.</td>
</tr>
<tr>
<td>⌨️</td>
<td>Message type</td>
<td>Choose whether messages are added to the associated record as comments or work notes. This icon is visible only for record and support conversations.</td>
</tr>
<tr>
<td>📂</td>
<td>Attach file</td>
<td>Attach and send a file. Select one or more files and click Open. You can also add an attachment by dragging and dropping it directly in the conversation.</td>
</tr>
</tbody>
</table>

Connect workspace

The Connect workspace is a full-screen view of all your Connect Chat and Connect Support conversations in one place. It contains the conversation pane, which displays the conversation header and an expanded version of the mini window, and the conversation tools area.

To open the Connect workspace, navigate to Collaborate > Connect Chat or click the new window icon (往来) in a Connect mini window. If you do not have any recent conversations, a screen appears with helpful information about Connect.

The Connect workspace is composed of the following elements.
## Connect workspace elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sidebar</td>
<td>Provides access to conversations. The Connect sidebar behaves the same way in the workspace as it does in the Connect overlay. The only difference is that the sidebar appears on the left edge of the Connect workspace. For more information about using the sidebar, see <a href="#">Connect sidebar</a>.</td>
</tr>
<tr>
<td>Conversation pane</td>
<td>Displays the currently selected conversation.</td>
</tr>
<tr>
<td>Conversation tools</td>
<td>Provides quick access to key information, conversation members, attachments, and notification preferences for the currently selected conversation. Some of the conversation tools vary depending on the type of conversation.</td>
</tr>
</tbody>
</table>

### Connect workspace

The conversation pane of the Connect workspace displays the conversation header and an expanded version of the mini window.
The header displays basic conversation details like the avatar and name. You can edit these details for group or record conversations.

Below the header, messages appear in chronological order. You can enter messages in the text entry field at the bottom of the window.

**Connect conversation tools**

The conversation tools area in the Connect workspace contains several tabs, each represented by an icon.

Click an icon to open the tab. Click the same icon again to hide the tab. The tabs you see for each conversation depend on the conversation type and other conditions.

### Conversation tool tabs

<table>
<thead>
<tr>
<th>Tab icon</th>
<th>Tab name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>📃</td>
<td>Info</td>
<td>Contains the following sections, each of which appears only if it contains information.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>Record</strong>: Lists details about the record the current conversation follows, such as record number, state, assignee, and short description. The fields displayed in this section vary by the type of record. This section is available only for record conversations.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>Related Records</strong>: Lists Visual Task Boards and task records that have been referenced in the conversation, such as incidents, problems, or changes. When you send a record number as a message or drag a record in a conversation, it appears as a link. The list displays the short description for each task. Click a task to open the record in a new browser tab. Only conversation members who have rights to view the tasks can access them.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>Links</strong>: Lists URLs that have been referenced in the conversation. Click a link to open the destination page in a new browser tab.</td>
</tr>
<tr>
<td>📝</td>
<td>Record</td>
<td>Displays a compact form view of a record created from the current conversation, such as an incident.</td>
</tr>
</tbody>

</tbody>
</table>

### Enable or disable Connect notifications globally

You can edit your Connect notification settings globally to enable or disable mobile, desktop, email, or audio notifications for all your Connect Chat and Connect Support conversations.

**Before you begin**
Role required: none

**About this task**
By default, Connect mobile, email, and audio notifications are enabled globally. You must enable desktop notifications.

An administrator can customize the sound used for audio notifications.

⚠️ **Note:** You receive mobile notifications only if you have installed the ServiceNow mobile app.
Procedure

1. In the banner frame, click the gear icon (⚙️) to open the system settings.
2. In the system settings window, click the Notifications tab.
3. In Notifications by Category, navigate to Connect.
4. Enable or disable Connect mobile, desktop, email, or audio notifications.
5. Optional: Configure the following system notifications. For more information on how to configure system notifications, see Apply notification conditions.

<table>
<thead>
<tr>
<th>Notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity Stream @Mention Email</td>
<td>Sends an email alert to a user anytime they get @mentioned in an activity stream</td>
</tr>
<tr>
<td>Collaboration Offline Group Message(s)</td>
<td>Sends email to offline users who are members of a group conversation after a certain number of minutes determined by the collaboration.email_interval property to limit spam.</td>
</tr>
<tr>
<td>Note: It takes 90 seconds after a user logs out for the system to register that the user is offline. If a message is sent to the user within 90 seconds of them logging out, then the user does not receive the notification.</td>
<td></td>
</tr>
<tr>
<td>Collaboration Offline Message Bundle</td>
<td>Sends email to offline users after a certain number of minutes determined by the collaboration.email_interval property to limit spam.</td>
</tr>
<tr>
<td>Note: It takes 90 seconds after a user logs out for the system to register that the user is offline. If a message is sent to the user within 90 seconds of them logging out, then the user does not receive the notification.</td>
<td></td>
</tr>
</tbody>
</table>
### Notification Description

<table>
<thead>
<tr>
<th>Notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectMessagePushNotification</td>
<td>Uses a push notification to inform users when there are new messages in a conversation</td>
</tr>
<tr>
<td>ConnectNotificationPushNotification</td>
<td>Uses a push notification to inform a user when they have been @Mentioned in a record</td>
</tr>
</tbody>
</table>

### What to do next
Edit which notifications you receive for a specific conversation.

### Connect notification browser support
The following browsers support Connect chat notifications.

#### Connect chat browser support

<table>
<thead>
<tr>
<th>Browser</th>
<th>Enable notification steps</th>
</tr>
</thead>
</table>
| Chrome                                           | 1. From a Chrome window, click the Chrome menu in the upper right corner.  
2. Go to Settings > Show advanced settings... > Privacy > Content settings.  
3. In the Content settings window, from the notifications section, select your notification settings. |
| Mozilla Firefox (starting with version 44)        | Manage browser notification settings using the information icon next to the URL.                                                                              |
| Safari (starting with OS X Mavericks)             | 1. From a Safari window, open Preferences.  
2. Select the notifications tab.  
3. Select Allow or Deny to control which websites have access to notifications. |
Connect chat browser support (continued)

</tr>
</tbody>
</table>

⚠️ Note: Internet Explorer does not support Connect notifications out of box.

**Edit which notifications you receive for a conversation**

You can control which types of Connect notifications you receive for each conversation and when you receive them.

**Before you begin**

Role required: none

**About this task**

Connect can send mobile, desktop, email, and audio notifications to inform you of messages and other activity, when you are not actively viewing Connect. You can edit your notification preferences in each conversation to control which notifications you receive for the conversation and under what circumstances. For example, if you are a member of a large group conversation, you might want to receive mobile, desktop, and email notifications for all activity, and audio notifications only when someone mentions you. You might also want to disable a certain type of notification entirely for a conversation.

By default, you receive mobile, email, and audio notifications for all activity in every conversation you belong to. You must enable desktop notifications manually. Not all browsers allow desktop notifications. For more information, see Enable or disable Connect notifications globally.

An administrator can customize the sound used for audio notifications.

⚠️ Note: You receive mobile notifications only if you have installed the ServiceNow mobile app.
**Procedure**

1. Open a conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation, click the notification settings tab (⋯).
3. Edit the following settings according to your preferences.

   **Note:** If a notification type is disabled globally, a link to enable that type appears. You must click the link before you can edit conversation-specific notification settings.

<table>
<thead>
<tr>
<th>Notification type disabled globally</th>

Upload a profile picture

You can upload a profile picture in your Live Feed profile to use as an avatar in Connect Chat and Connect Support conversations.

Before you begin
Role required: none

About this task
Users who do not have profile pictures are represented by an avatar with their initials. Administrators can upload a profile picture in a user record which displays if there is no Live Feed photo.

Procedure
1. Navigate to Collaborate > Live Feed.
2. Click the tile with your picture or initials and title.
3. Use one of the following actions to add your photo.
• Locate the photo file you want to use and drag it over the existing photo.
• Point to the existing picture (or tap the photo in the smartphone or tablet interface) to display the **Upload a picture** link. Click the link, navigate to the location of the photo you want to use, and click **Open**.

![Upload a picture](image)

**Related information**

Update your Live Feed profile

**Drag a file into a Connect conversation**

Drag and drop functionality in Connect Chat and Connect Support provides an easy way to share external attachments and links or items from within your instance.

**Before you begin**

Role required: none

**About this task**

You can drag several things from within an instance, including items from the application navigator, records or breadcrumbs from lists, and Visual Task Boards from the My Task Boards page.

**Procedure**

Drag an item in a Connect mini window.

To drag a record from a list, drag the reference icon ( mädchen ), the record number, or a reference column value.

Connect accepts the same file extensions as the platform. For more information, see .
Share a Visual Task Board in a Connect conversation
You can share a Visual Task Board in a Connect Chat or Connect Support conversation.

Before you begin
Role required: none

Procedure
2. Drag a task board to a Connect mini window.
   A link to the task board appears in the conversation. The task board is also listed in the conversation tools, which are visible in the Connect workspace. Only conversation members who are members of the board can access it. If you share a task board in a record conversation, it appears as a URL in the record activity stream.

Related information
   Connect
   Visual Task Boards

Mention a user in a Connect conversation
You can get someone's attention in a group conversation by mentioning them.

Before you begin
Role required: none

About this task
Users can set their notification preferences so they receive notifications only when they are mentioned. Mentioning a user creates a shortcut to view their basic information and send them a direct message.
**Procedure**

1. Open a Connect group conversation.
2. In the message field, type the @ character. A suggestion menu appears with the names of the conversation members.
3. Select the person you want to mention and send the message.

**Connect administration**

Administrators can configure various performance settings and features that impact both Connect Chat and Connect Support.

⚠️ **Note:** There are also administrative options specifically for Connect Chat or Connect Support. For more information, see Connect Chat administration and Connect Support administration.

**Properties for Connect**

The Connect Properties page provides several configuration options for Connect.

Users with the admin role can access these properties by navigating to Connect > Administration > Properties.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Disable Presence glide.ui.presence.disabled | Turns off user presence globally when enabled. Enabling this property turns off user presence throughout the platform, not just in Connect.  
  - **Type:** true | false  
  - **Default value:** false  
  - **Location:** Connect > Administration > Properties  
  - **Learn more:** |
| Enable Connect in the frameset collaboration.frameset | Determines whether the Connect overlay is visible (enabled). This property also impacts Connect Support.  
  - **Type:** true | false  
  - **Default value:** true  
  - **Location:** Collaborate > Administration > Properties  
  - **Learn more:** Disable the Connect overlay |
| Enable Connect to retrieve external link metadata in order to render richer content in messages with links to YouTube, news articles, images, etc. connect.retrieve_external_link_content | Enables Connect to render URLs for external sites as links. When this property is disabled, URLs that point anywhere outside the instance appear as plain text. This property also impacts Connect Support.

Configure the polling interval

The polling interval determines how frequently the system polls for new Connect messages.

**Before you begin**

Role required: admin

**About this task**

The default interval is 10 seconds. You can change this value. The shorter the polling interval, the more frequently the system checks for new messages and the greater the impact on performance.

⚠️ **Note:** This setting impacts Connect Chat and Connect Support.

**Procedure**

1. Navigate to `sys_properties.list`.

2. Locate the `collaboration.polling_interval` property.

3. Set the **Value** to a different number of seconds.

   Setting the polling interval to a value smaller than 2 is likely to tax the system too heavily, while a value greater than 10 is likely to result in a poor user experience.

Disable the Connect overlay

The Connect overlay is enabled by default and is integrated with the standard user interface. You can disable the Connect overlay.

**Before you begin**

Role required: admin
About this task
To disable the Connect overlay and remove the toggle Connect sidebar icon from the banner frame, set the `collaboration.frameset` property to `false`.

Procedure
1. Navigate to Connect > Administration > Properties.
2. Locate the property called `Enable Connect in the frameset (collaboration.frameset)` and clear the check box.
3. Click Save.

Results
When the frameset is disabled, any Connect chats open in the Connect workspace. For more information on completely disabling Connect Chat, see Disable Connect Chat.

Customize the Connect audio notification sound
You can replace the default Connect audio notification sound with an audio file of your choice.

Before you begin
Upload the audio file you want to use as the notification sound.

Role required: admin

About this task
The audio notification sound is used for all Connect conversation types, including Connect Support conversations.

Procedure
1. Navigate to System UI > Audio Files.
2. Locate the audio file you want to use as the notification sound and copy the Name value.
3. Navigate to Connect > Administration > Properties.
4. Locate the property called `Audio file to play to notify users of new messages, support conversation transfers and @mentions in Connect (connect.notification.audio_alert)` and replace the default value with the name of the audio file.
5. Click Save.
Results
End users receive audio notifications when sending and receiving support chats. Support agents only receive audio notifications for inbound chats when the chat window is not in focus.

Administer Connect actions
You can create or modify Connect actions to provide custom functionality in Connect Chat or Connect Support conversations.

Before you begin
If you want to customize the icon for a Connect action, navigate to Collaborate > Administration > Action Icons to view the available icons and their class names. Note the class name of the icon you want to use.

Role required: admin

About this task
The Connect action menu appears by the message entry field when one or more Connect actions are available for a conversation, based on defined conditions. When a user selects a Connect action, the system runs the script defined for that action.

Procedure
1. Navigate to Connect > Administration > Actions.
2. Click New or open an existing record to edit a table.
3. On the form, fill in the fields.

Connect Action form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>JavaScript condition statement that must return true for the action to be available in a conversation. For example, to show the action in Connect Support conversations only, enter conversation.type === &quot;support&quot; Or conversation.table === 'chat_queue_entry'. For information about the conversation object, see the GlideConversation API reference documentation.</td>
</tr>
<tr>
<td>Hint</td>
<td>This field is not used.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>

<tr>
<td>Icon Class Name</td>
<td>Class name of the icon to use. To view all available icons and their class names, navigate to Collaborate &gt; Administration &gt; Action Icons.</td>
</tr>
<tr>
<td>Order</td>
<td>Order of the action relative to other items in the Connect action menu.</td>
</tr>
</tbody>
</table>
| Script      | Script to execute when the action is run. For example, to create a new incident that is based on the conversation, enter the following code: response.newRecord("incident",{  
  short_description: conversation.document.short_description || "",  
  caller_id: conversation.document.opened_by  
});   

For information about the response object, see the ConnectActionResponse API reference documentation.  

⚠ **Note:** You can only create a Connect action that is based on a task table.                                                                                                                                 |
| Shortcut    | Text that triggers the action when entered after the "/" character in a conversation.                                                                                                                          |
| Title       | Text that appears in the Connect action menu. The title for each Connect action should be unique.                                                                                                           |
Configure the fields on a record card in Connect

When a record is either linked to or created from a Connect Chat conversation, the details of the record display as a card in the chat window.

About this task
The card view only applies to the full Connect Chat page and the end-user view of Connect Support conversations.

Role required: admin
Procedure

1. Select the menu icon (≡) on any of the column names of the incident list view.

2. Right-click on the column name and select **Configure > List Layout**.
3. On the Configuring Incidents List screen, select **New** from the View name list.

![Configuring Incidents List screen](image)

4. In the Create New View dialog, enter **Connect** in the View name field.

![Create New View dialog](image)

For more information on creating a form view, see **Create and delete views**. You cannot remove the Author or the Updated fields from the card regardless of whether they are on the view or not. The card always shows the Short Description field in the top even if it is in a different order in the list.
5. Choose the fields that you want to display on the Connect card and select the fields.

6. Validate that the card displays the fields in a Connect Chat conversation.

**Disable specific URLs for Connect**

Prevent users from accessing certain websites by disabling linking to specific Top-Level Domains (TLDs).

**Before you begin**

Role required: admin

**Procedure**

1. In the navigation filter, type `sys_properties.list`.
2. Search for the `glide.ui.url.external.top_level_domains` system property.
3. In the value field, remove any TLDs that you do not want your users to have access to. For example, remove any TLDs that are commonly used for restricted websites, such as `xxx` or `adult`.

   The list of TLDs is based on the top 200 most common domains.

**Results**

Any TLD not included in the value field becomes unclickable in Connect.
Connect Chat

Connect Chat is a real-time messaging tool that enables users to chat with individuals and groups, quickly share files, and collaborate on any record by connecting with the right people instantly.

Connect Chat animates communication around records, Visual Task Boards, topics of interest, or groups of people.

Features include:

• Direct conversations between two users.
• Group conversations between three or more users.
• Conversations linked to records. Comments and work notes appear in conversations in real time and users can update the record directly from the conversation.
• Drag-and-drop sharing of links, files, and records.

UI16 or UI15 is required to use Connect Chat.

This video demonstrates how to use Connect Chat.

How to use Connect Chat

This video demonstrates how to use Connect Support.

How to use Connect Support

🤔 Note:

• Connect Chat does not replace legacy chat but offers some of the same functionality. The features should not be used concurrently.

Connect Chat use

All users have access to Connect Chat, a convenient way to stay updated on all the people and documents you work with in a familiar chat interface.

You can start using Connect Chat right away with virtually no setup. Connect Chat supports a few different types of conversations so you can use it as a social tool or a quick way to follow specific records.

Start a direct or group conversation

You can start a conversation with one or more users in Connect Chat.

Before you begin

Role required: none
About this task
A conversation between two users is called a direct conversation. A conversation between three or more users is called a group conversation.

Procedure
1. In the chat view of the Connect sidebar, click the plus icon (+) by the filter. A Connect mini window appears.
2. In the To field, enter the name of the user you want to chat with. Suggestions appear as you type.
3. Optional: Enter additional names to create a group conversation. You can add or remove group conversation members later. You cannot add members to a direct conversation after you create it.
4. Press the Enter key to shift focus to the message field.
5. Send a message to create the conversation. The conversation is added to the Connect sidebar for quick access.

Follow a record in Connect
You can follow a record in Connect Chat to track activity as it happens, in a familiar chat interface. When you follow a record, you become a member of a record conversation.

Before you begin
Role required: whichever role is required to access the record you want to follow in Connect

About this task
You must first activate the Connect (com.glide.connect) plugin to complete this task.

Any record conversation you create in Connect becomes a record feed in live feed, and vice versa. Unlike direct or group conversations, all messages in record conversations are comments or work notes.

Note: By default, record conversations are enabled for all tables that extend Task [task]. Administrators can enable record conversations for additional tables or disable them if desired.

Procedure
1. Navigate to a task record.
2. Do one of the following actions.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Follow the record</td>
<td>a. In the form header, click <strong>Follow</strong>. The system adds you as a member of the record conversation, but does not open the conversation. You can open the conversation from the Connect sidebar.</td>
</tr>
</tbody>
</table>
| Follow the record and open a chat mini window | a. In the form header, click the down arrow in the **Follow** button.  
  b. Select **Open Connect Mini**.  
  The system adds you as a member of the record conversation and opens it in a Connect mini window. |
| Follow the record and open the Connect workspace | a. In the form header, click the down arrow in the **Follow** button.  
  b. Select **Open Connect Full**.  
  The system adds you as a member of the record conversation and opens it in the Connect workspace, the full-screen view. |

The **Follow** button is relabeled **Following**.

3. Add comments or work notes to the record directly from Connect.  
Any comments or work notes added to the record appear in the record conversation. Likewise, comments and work notes you add to the conversation appear on the record.

a. In the record conversation, by the text entry field, click the message type icon (💬).  

b. Select **Comment** or **Work Note**.

c. Enter a message.  
By default, record conversation messages are added as work notes.

ℹ️ **Note:** If you add an attachment to a record conversation, it is attached to the underlying record as well.
What to do next
Edit your notification settings for the record conversation.

Related information
Live Feed

Edit basic conversation details
In Connect Chat, you can customize the avatar, name, and description for a group or record conversation.

Before you begin
Role required: none

About this task
These details are not editable for direct conversations.

Note: The name and description for a record conversation default to the record name and short description. However, editing the name or description for a record conversation does not change anything on the underlying record.

Procedure
1. Open the a group or record conversation in the Connect workspace.
2. Click anywhere in the conversation header to the left of the icons.
   A pop-up appears to edit conversation details.
3. Edit the conversation image, name, and description as needed.
4. Click Save.

Add or remove conversation members
In Connect Chat, any member of a group or record conversation can add or remove other conversation members. In a direct conversation with only two people, you cannot add members to the conversation after you create it.

Before you begin
Role required: none
Procedure

1. Open a group or record conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation pane, click the member list tab (👥).
3. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a member</td>
<td>a. Click Add Member to Group.</td>
</tr>
<tr>
<td></td>
<td>b. Use the search field to find and select a user.</td>
</tr>
<tr>
<td>Remove a member</td>
<td>a. Point to a member name.</td>
</tr>
<tr>
<td></td>

Create a Connect conversation from a Visual Task Board

Create a Connect Chat conversation from a Visual Task Board to collaborate with board members and keep track of activity as it happens.

Before you begin
Role required: none

About this task
When you create a conversation from a task board, all the board members become members of the conversation. The members are synchronized between the task board and the conversation. For example, if you remove a user from the conversation, the system automatically removes the user from the board as well.

Procedure

2. Open a task board.
3. In the board header, click the connect with board members icon (👥). The system automatically opens a record conversation for the board. Each board member becomes a member of the conversation.

Connect Chat
Visual Task Boards
Connect Chat administration

Administrators can configure various performance settings and features of Connect Chat.

? Note: There are also settings that apply to both Connect Chat and Connect Support. For more information, see Connect administration.

Configure the email notification interval

The email notification interval determines how long the system waits before sending a Connect Chat email notification to an inactive user.

Before you begin
Role required: admin

About this task
The default interval is 3 minutes. You can change this value.

Procedure
1. Navigate to Connect > Administration > Properties.
2. Locate the property called Number of minutes to wait before collecting unread messages and sending an email to offline users. (collaboration.email_interval) and set the value to a different number of minutes.
3. Click Save.

Results
When an offline user is sent a Connect message, the collaboration.new_offline_message event fires. The system waits the amount of time provided in the collaboration.email_interval property, then triggers the collaboration.notify_offline_user and collaboration.notify_offline_user.group events (depending on if the conversation was peer to peer or a group conversation). The sysevent_email_action record listens for collaboration.notify_offline_user(.group) then builds an email notification containing all the messages from the last collaboration.email_interval minutes that the user has received in that conversation.
Enable record conversations for a table

Record conversations are enabled for all tables that extend Task [task] by default. You can configure record conversations for additional tables that extend Task.

Before you begin
Role required: admin

About this task
To create record conversations, users must have access to the Follow button in the form header. To show the button and thus enable record conversations for a table, the following conditions must be true.

- The live_feed dictionary attribute must be set to true for the table.
  - By default, live_feed=true for all tables that extend Task [task].
- The glide.live_feed.task_header_button property must be set to both or collaboration.
  - By default, glide.live_feed.task_header_button is set to collaboration.

Procedure
1. Navigate to the list view of a table for which you want to enable record conversations.
2. Perform the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v3</td>
<td>a. Click the list title menu and select Configure.</td>
</tr>
<tr>
<td></td>
<td>b. In the Configure window, click Dictionary.</td>
</tr>
<tr>
<td>List v2</td>
<td>Right-click any column header and select Configure &gt; Dictionary.</td>
</tr>
</tbody>
</table>

The list of dictionary entries for the table appears.
3. Open the dictionary entry that has Type set to Collection. The Dictionary Entry form appears.
4. In the Attributes related list, click New. The Dictionary Attribute form appears.
5. In the Attribute field, enter Live feed.
6. In the Value field, enter true.
7. Click Submit.
8. Navigate to Collaborate > Administration > Properties.
9. Locate the property called Determine whether or not a button is shown in task forms to view the Collaboration document conversation or Live Feed Record Feed related to the task (glide.live_feed.task_header_button).
10. Ensure the property is set to both or collaboration. The glide.live_feed.task_header_button property also controls whether the show live feed icon (_DBG) appears. If the property is set to collaboration, the show live feed icon does not appear on form headers.

Prevent users from following records in Connect for all tables
Users can follow records in Connect for any table that extends Task [task] by default. You can disable this functionality for all tables.

Before you begin
Role required: admin

About this task
To disable record conversations for all tables, prevent the Follow button from appearing in all form headers by editing the glide.live_feed.task_header_button property.

Procedure
1. Navigate to sys_properties.list.
2. Locate the glide.live_feed.task_header_button property.
3. Set the Value to live_feed.

Prevent users from following records in Connect for a specific table
Users can follow records in Connect for any table that extends Task [task] by default. You can disable this functionality for a specific table.

Before you begin
Role required: admin
### About this task
To disable record conversations for a specific table, prevent the **Follow** button from appearing in form headers for the table. To do so, set the `live_feed` dictionary attribute to `false` for the table.

### Procedure
1. Navigate to the list view of a table for which you want to disable record conversations.
2. Perform the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v2</td>
<td>Right-click any column header and select <strong>Configure &gt; Dictionary</strong>.</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the list title menu and select <strong>Configure</strong>, and then select <strong>Dictionary</strong>.</td>
</tr>
</tbody>
</table>

The list of dictionary entries for the table appears.

3. Open the dictionary entry that has **Type** set to **Collection**. The Dictionary Entry form appears.
4. In the **Attributes** related list, locate the **Live feed** dictionary attribute.
5. Set the **Value** to **false**.
   Setting the dictionary attribute to **false** also removes the show live feed icon ( sqlSession ) for the table.

### Disable Connect Chat
You can disable Connect Chat to prevent users from being able to chat within the platform.

**Before you begin**
Role required: admin

**About this task**
Disabling Connect Chat hides the Connect Chat sidebar icon. Users who try to access Connect Chat from the navigation pane receive a message that says Connect has been disabled.
Procedure

1. In the navigation filter, type `sys_properties.list` and press Enter.
2. Search for the `glide.connect.chat.disabled` property.
3. Set the property value to `true`.

Connect Support

Connect Support is a real-time messaging tool that enables support agents to easily track their support cases, find solutions, and resolve problems quickly.

**Important:**

Starting with the Paris release, Connect Support no longer receives enhancements or non-priority bug fixes. Consider moving to ServiceNow® Advanced Work Assignment and Agent Chat in workspace to automatically assign chat requests and other work items to agents. For details, see Move from Connect Support to Advanced Work Assignment and Agent Chat.

Connect Support builds on the messaging platform provided with Connect. For general information about the Connect interface, setup, and administration, see Connect. When Connect Support is enabled, users designated as support agents can access the support tab of the Connect sidebar.

Using Connect Support:

- Administrators can create chat queues and enable users to access live support.
- Support agents can monitor the queues to provide instant support.
- Users can share links, files, and records using drag-and-drop.

UI16 or UI15 is required to use Connect Support.

**Note:**

- Connect Support does not replace legacy chat but offers some of the same functionality. Do not use the features concurrently.

Monitor incoming Connect Support conversations

In the support tab of the Connect sidebar, you can monitor the queues for which you are an agent and accept incoming conversations.
Before you begin
Role required: none

About this task

Note: The support tab is visible only if you are an agent for one or more queues.

Procedure

1. Navigate to Connect > Connect Support.
   The Connect workspace opens in a new tab.

2. Click the support tab of the Connect sidebar, indicated by a headset icon (㎝).
   The support tab displays Queues to which you belong. It also displays your open support conversations under Cases. When a user starts a support conversation or an agent transfers a conversation to a queue, any agent who belongs to the associated queue can accept the conversation. An agent can also request to transfer a conversation directly to you.

3. Accept a conversation in one of the following ways.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Accept a conversation from a queue</strong></td>
<td>Under <strong>Queues</strong>, click <strong>Accept</strong> by the queue. The conversation opens in the conversation pane and an entry appears in the <strong>Cases</strong> section of the sidebar.</td>
</tr>
<tr>
<td><strong>Accept a transfer request</strong></td>
<td>Under <strong>Cases</strong>, click <strong>Accept</strong> by a transfer request. The conversation opens in the conversation pane. The agent who transferred the conversation can stay in the conversation.</td>
</tr>
</tbody>
</table>

4. Respond to the user and help resolve the issue.
   By default, your messages are added to the conversation record as comments and are visible to the user.

5. **Optional**: Initiate a Zoom meeting to help resolve customer issues faster. For more information, see [Initiate Zoom meetings from chats](#).

**Related information**
- Configure a survey in the Connect chat support

**Share knowledge in a Connect Support conversation**

The support view of the Connect workspace has a built-in knowledge tool that makes it easy to search for knowledge articles and share them in a conversation.

**Before you begin**
Role required: none
About this task
Use the knowledge tool to research user questions and provide solutions quickly and easily.

Procedure
1. Open a support conversation in the Connect workspace.
   The knowledge tool is not available in Connect mini windows.
2. In the conversation tools area to the right of the conversation pane, click the knowledge base tab, which is represented by an open book icon.

   The knowledge homepage appears in the conversation tools pane.

3. Search for articles related to the user's issue.
   For more information about finding knowledge, see Search using Knowledge Management v3.
4. To share an article in the conversation, drag a knowledge article link to the conversation pane and drop it anywhere in the drop zone that appears.
Transfer a Connect Support conversation to a different agent or queue

You can transfer a Connect Support conversation to a different agent in the queue or to a different queue.

Before you begin
Role required: none

Procedure
1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (≡) to open the Connect actions menu.
3. In the Connect actions menu, select Transfer. A transfer dialog box opens.

4. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transfer the conversation to an agent</td>
<td>a. To start the transfer request, click Transfer by an agent's name. Be sure to choose an agent who is online. A green dot on their avatar indicates that a user is online. You can cancel the transfer any time before it is accepted.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| **b.** When the transfer is accepted, select one of the following options in the dialog box that appears. | • **Stay:** Remain in the conversation, which is also known as a warm transfer. This option is ideal if you want to provide the new agent with background information or introduce the user to the new agent.  
  • **Leave:** Exit the conversation, which is also known as a cold transfer. |
3. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a member</td>
<td>a. Click Add Member to Group.</td>
</tr>
<tr>
<td></td>
<td>b. Use the search field to find and select a user.</td>
</tr>
<tr>
<td>Remove a member</td>
<td>a. Point to a member name.</td>
</tr>
<tr>
<td></td>
<td>b. Click the minus icon (−).</td>
</tr>
<tr>
<td></td>
<td>The assigned support agent cannot be removed from a Connect Support conversation.</td>
</tr>
</tbody>
</table>

**Note:** Only the assigned support agent can create an incident from the Connect Support conversation.

## Escalate a Connect Support conversation

If an escalation path is defined for a Connect Support conversation, you can use a shortcut to escalate a Connect Support conversation to a different queue.

**Before you begin**

Define an escalation path for the queue, using the Escalate to field on the Chat Queue [chat_queue] table. For more information, see Administer Connect Support queues.

**Procedure**

1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (≡) to open the Connect actions menu.
3. In the Connect actions menu, select Escalate. A confirmation dialog box appears.
4. In the dialog box, click Escalate.
   The system automatically removes you from the conversation and the conversation enters the escalated queue.
Create an incident from a Connect Support conversation

You can use a shortcut to create an incident on behalf of a user, directly from a Connect Support conversation.

Before you begin
Role required: none

About this task
You might want to create an incident if you cannot resolve the user's issue over chat or if you want to create a record of the conversation to share with the user. When you create an incident from a support conversation, the system copies the conversation history to the incident activity stream as comments and work notes. Future messages are tracked in the incident as well.

Note: Administrators can customize the behavior of the Create Incident Connect action. For more information, see Administer Connect actions.

Procedure

1. Open a Connect Support conversation.

2. At the bottom of the conversation, click the menu icon (≡) to open the Connect actions menu.

3. In the Connect actions menu, select Create Incident.
   In the conversation tools area to the right of the conversation, a new incident form opens in a record tab. The system automatically sets the Caller field to the user who opened the support conversation.

4. Complete the form as necessary and click Submit.
   Any comments or work notes in the record conversation appear as comments on the incident form. Work notes do not appear in the chat for the ESS user. The chat agent can select whether a message is a Comment or Work Note in the conversation.

   a. In the record conversation, by the text entry field, click the message type icon (💬).

   b. Select Comment or Work Note.

   c. Enter a message.
   By default, record conversation messages are added as comments.

   Note: If you add an attachment to a record conversation, it is attached to the underlying record as well.
The system automatically shares the record in the conversation, copies the conversation to the record activity stream, and references the record on the Chat Queue Entry [chat_queue_entry] table. Any new journal fields added to the record do not appear in the chat. The system also changes the document ID for the conversation to reference the incident number instead of the entry in the Chat Queue Entry table.

**Connect Support chat states**

Connect Support chats move through specific states.
## Connect Support chat states

<table>
<thead>
<tr>
<th>Composite state</th>
<th>State</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Waiting</td>
<td>• Requester/end user enters a queue by sending a message. Agent has not yet accepted it.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Requester/end user rejoins a session that is in a Reopenable state.</td>
</tr>
<tr>
<td></td>
<td>Work in Progress</td>
<td>• Agent accepts a chat from a queue. Both requester and agent engage in a chat session.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Requester/end user temporarily leaves an ongoing conversation; requester or agent does not end the session; requester rejoins session.</td>
</tr>
<tr>
<td>Reopenable</td>
<td>Closed Abandoned</td>
<td>Requester/end user clicks <strong>End Chat</strong> button before agent accepts the request.</td>
</tr>
<tr>
<td>Permanently closed</td>
<td>Closed by Client</td>
<td>• Requester/end user clicks <strong>End Chat</strong> button after agent accepts the request.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Requester/end user times out.</td>
</tr>
<tr>
<td></td>
<td>Closed Escalated</td>
<td>Agent escalates an ongoing conversation by performing the Escalate action from the menu icon.</td>
</tr>
<tr>
<td></td>
<td>Closed Complete</td>
<td>• Agent ends the session.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• During a chat, if an agent creates an incident or case and closes it, the chat session closes automatically.</td>
</tr>
</tbody>
</table>

## Connect Support administration

Administrators can configure various performance settings and features of Connect Support.

ℹ️ **Note:** There are also settings that apply to both Connect Chat and Connect Support. For more information, see [Connect administration](#).
Migrate from legacy chat to Connect Support

Connect Support is an extension of Connect. Users designated as support agents have access to the support tab of the connect sidebar. Do not use Connect Support concurrently with legacy chat.

Before you begin
Before you activate Connect Support, inform your support agents to close out any existing chats.

Legacy chat uses a different field to determine which state a help desk chat is in. A fix script is included in the Connect Support plugin that circumvents this issue by closing out any existing help desk chat sessions. Manually closing out any existing chats before allowing this script to run helps prevent any loss of chat information.

If you do not close out existing help desk chats, your metrics and chat queue will not work accurately.

Procedure

1. Activate the Connect Support plugin.
   When you activate the Connect Support plugin, the `glide.connect.support.enabled` property redirects the legacy chat URL to Connect Support.
   For more information, see Activate Connect Support.

2. Hide the Social IT application.
   Activating Connect Support does not completely eliminate the legacy chat module. To prevent users from using the legacy chat, hide the Social IT application menu. For more information, see Enable or disable an application menu or module.

Properties for Connect Support

The Connect Support Properties page provides several configuration options specifically for Connect Support.

These properties are available for Connect Support.
Properties for Connect Support

Users with the admin role can access these properties by navigating to Connect > Support Administration > Properties.

ℹ️ **Note:** The Connect Properties page contains many general Connect properties that impact Connect Support.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Should Connect be used for handling chat queue entries | Disables or enables Connect Support. When the property is enabled, the Service Desk Chat button in the Employee Self-Service portal opens the conversation in Connect Support, rather than legacy chat. Additionally, the Support tab appears in the Connect sidebar.  
  • **Type:** true | false  
  • **Default value:** true  
  • **Location:** Collaborate > Support Administration > Properties |
| glide.connect.support.enabled                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Number of support conversations an individual agent can have at one time (-1 is unlimited) | Determines how many support conversations an individual agent can have at one time. When the value is set to -1, an agent can participate in an unlimited number of conversations.  
  • **Type:** integer  
  • **Default value:** -1  
  • **Location:** Collaborate > Support Administration > Properties |
| connect.support.conversation_limit           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Show agent avatar in Connect Support conversations. | Determines whether an agent's avatar is shown.                                                                                                                                                                                                                                                                                                                                                          |

Administer Connect Support queues

You can define the support agents, default messages, schedule, and escalation path for each Connect Support queue.

Before you begin
Role required: admin

About this task

Note: Both Connect Support queues and legacy chat queues are stored on the Chat Queue [chat_queue] table. Do not use Connect and legacy chat concurrently.
**Procedure**

1. Navigate to **Connect > Queues**.
2. Click **New** or open an existing queue from the list.
3. Complete the Chat Queue form, as appropriate.

### Chat Queue form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>Active</td>
<td>Not used in Connect.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>User group that contains the support staff for the queue. Any user in the group can view the queue in the Connect sidebar and accept chats. No other users can access the queue. This field must be populated.</td>
</tr>
<tr>
<td>Average wait time</td>
<td>Average time it takes for an agent to accept a chat in the queue. This value is automatically calculated. Do not manually edit.</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>Not used in Connect.</td>
</tr>
<tr>
<td>Escalate to</td>
<td>Different queue to which an agent can escalate a chat. For example, there is a queue for high priority support chats. When a queue is defined in this field, agents can access the <strong>Escalate</strong> option in conversations.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>Message that users see when an agent accepts their chat. For example, <em>Thank you for contacting support. We are looking into your question now and will be with you shortly.</em></td>
</tr>
<tr>
<td>Not available</td>
<td>Message that users see when they attempt to start a chat outside the defined queue <strong>Schedule</strong>. You can use HTML to format the message and include links or media.</td>
</tr>
<tr>
<td>Question</td>
<td>Initial phrase that users see when they start a new chat in the queue. For example, <strong>How can I help you?</strong></td>
</tr>
<tr>
<td>Schedule</td>
<td>Schedule that defines when the queue is available. Leave the field blank to make the queue available all the time. Users cannot start a new conversation in the queue outside the schedule hours.</td>
</tr>
</tbody>
</table>
4. To review conversations associated with the queue, add the Chat Queue Entries related list and review the records for the following information.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>How long the user waited and the result</td>
<td>Review information in the State and Wait time columns.</td>
</tr>
<tr>
<td>Who is actively helping employees in the queue</td>
<td>Review the names of agents in the Assigned to column.</td>
</tr>
</tbody>
</table>

**Make a Connect Support queue accessible to end users**

To make a Connect Support queue accessible to end users, use the accepted URL format.

**Before you begin**
Create a queue. Create agents for the queue by assigning users to the assignment group associated with the queue.
Role required: admin

**About this task**
For example, you might create a module or add a link to a portal.
The accepted URL format is `https://<instancename>.service-now.com/$chat_support.do?queueID=<sys_id>`.

**Procedure**
1. Navigate to Connect > Administration > Queues.
2. Right-click the name of the queue to which you want to link.
3. In the context menu, select Copy sys_id. Follow browser instructions to copy the sys_id if browser security measures restrict this function.
4. Preview the support queue by navigating to `https://<instancename>.service-now.com/$chat_support.do?queueID=<sys_id>`.
5. Create a module or other link to the queue using the URL.

**Add a scripted extension point for Connect Support chats**

Implement the ConversationServerInteractionService extension point, which enables you to create custom scripts that use context variables from pre-chat surveys presented to requesters in the Agent Chat client.
Before you begin
Role required: admin

Procedure

1. Navigate to **System Extension Points > Scripted Extension Points** and select the **ConversationServerInteractionService** scripted extension point.

2. Click the **Create implementation** related link to create a new custom script include.

3. In the Script Include form, create the code that uses the pre-chat context variables to route chats to the appropriate Connect Support queue.

4. Click **Update**.

Results

The custom script is created and registered against the **ConversationServerInteractionService** scripted extension point.

Connect Support metrics

Optional plugins provide a homepage and Performance Analytics dashboards, which contain helpful Connect Support metrics.

The reporting homepage is ideal for support managers who want a simple solution to track the recent performance of the support organization. The Performance Analytics dashboards provide a more full-featured solution for support managers who want to analyze trends over time.

Users with the admin role can activate the following plugins to use these features.

<table>
<thead>
<tr>
<th>Connect Support homepage and dashboard plugins</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connect Support Manager's Dashboard [com.glide.connect.managers_dashboard]</td>
<td>Provides a homepage for Connect Support, and all required configuration records. Though the plugin name contains the term dashboard, the plugin does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but</td>
</tr>
<tr>
<td>Plugin</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Performance Analytics - Context Sensitive Analytics for Chat [com.snc.pa.chat.context_sensitive_analytics]</td>
<td>Provides in-form analytics for Connect Support. These analytics are available as a related link on the Chat Queue Entry [chat_queue_entry] form, and also as the Context Sensitive Analytics - Chat dashboard.</td>
</tr>
</tbody>
</table>

Note: For more information about these plugins, including which other plugins they activate, see Additional plugins for Connect Support.

Related information

Use the Connect Support homepage
Use the Connect Support homepage to view key indicators and metrics related to support conversations, queues, and agents.

Before you begin
Activate the Connect Support Manager's Dashboard plugin (com.glide.connect.managers_dashboard) to view this homepage.
Role required: chat_admin

About this task
The homepage is called Service Desk - Chat.

Procedure
1. Navigate to Connect > Support Administration > Reporting Dashboard.

Note: Though the module name contains the term dashboard, the module does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.
The Connect Support homepage, which is called **Service Desk - Chat**, opens.

2. Click a widget to drill down into its data.

**Use the Connect Support dashboards**

Use the Connect Support dashboards in Performance Analytics to understand trends in your support organization's performance over time.

**Before you begin**

Activate one or both of the following plugins, according to your analytics needs:

- Performance Analytics - Content Pack - Service Desk Chat (com.snc.pa.chat)
- Performance Analytics - Context Sensitive Analytics for Chat (com.snc.pa.chat.context_sensitive_analytics)

Role required: both chat_admin and pa_viewer

**About this task**

The Performance Analytics - Content Pack - Service Desk Chat plugin (com.snc.pa.chat) includes the **Service Desk Chat Monitor** dashboard, which contains the following tabs:

- **Chat Monitor By State**: Contains metrics related to closed support conversations.
- **Overview**: Contains several metrics related to support conversations, queues, and agents.
- **KPI Process**: Contains metrics that are key performance indicators (KPIs) of the Connect Support process, including the average queue response time, the average duration of support conversations, and the number of new support conversations per day.

The Performance Analytics - Context Sensitive Analytics for Chat plugin (com.snc.pa.chat.context_sensitive_analytics) includes the **Context Sensitive Analytics - Chat** dashboard. The dashboard contains additional metrics related to support queues, including the number of support conversations closed.

**Note**: You must license Performance Analytics to collect scores for the indicators on the dashboards. Without Performance Analytics premium, the dashboards display the indicators with no data.
Procedure

1. Navigate to Performance Analytics > Dashboards.
   The last dashboard you viewed opens.
2. In the dashboard picker, under the Connect Chat group, select the dashboard you want to view.
3. View the indicators.

Related information

Configure the add support users property
To enable support agents to add users to a Connect Support conversation, add the glide.connect.support.add_members property.

Before you begin
Role required: admin

About this task
When the glide.connect.support.add_members property is added and enabled, support agents can add users to a support conversation. Any added user can also add other users. Only the assigned agent can create an incident from the chat. When non-support agents are added to a chat, the chat appears in their chat tab.

⚠️ Note: Make sure you are in the Global scope when adding this property.

Procedure

1. Enter sys_properties.list in the navigation filter.
   The entire list of properties in the System Properties [sys_properties] table appears.
2. Verify that the property does not exist by searching for the property name. If it does exist, update the property with the information in the following table.
3. Click New.
4. Complete the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.connect.support.add_members</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>-------</td>
<td>-------</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

## Service Desk Chat Analytics and Reporting Solutions

Analytics and Reporting Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With Analytics and Reporting Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

⚠️ **Important:** Set up and test Analytics and Reporting Solutions on a non-production instance before enabling them in production.

⚠️ **Note:** Analytics and Reporting Solutions provide all the configuration records required to analyze default applications. Customize these records for use in your production environment. For more information, see Configure Analytics and Reporting Solutions.

To enable the solution for Service Desk Chat, an admin can navigate to **Performance Analytics > Guided Setup**. Click **Get Started** then scroll to the section for Service Desk Chat. The guided setup takes you through the entire setup and configuration process.

### Related information

- Analytics and Reporting Solutions
- Activate your Performance Analytics subscription

### Connect Support and Service Portal

Use Connect Support in your portal to allow your users to ask questions or submit requests to support agents. You configure the instance options to control the appearance of your widget and how it functions.

The Connect Support and Service Portal integration creates a Connect Support widget that you can add to a page in the Service Portal.
Activate Connect Support for Service Portal

Activate the Connect Support and Service Portal integration plugin so you can add the Connect Support widget to a portal page.

Before you begin

Important:
Starting with the Paris release, Connect Support no longer receives enhancements or non-priority bug fixes. Consider moving to ServiceNow® Advanced Work Assignment and Agent Chat in workspace to automatically assign chat requests and other work items to agents. For details, see Move from Connect Support to Advanced Work Assignment and Agent Chat.

Role required: admin

About this task
Activating the Connect Support and Service Portal integration plugin automatically activates the Connect Support plugin.

Procedure
1. Navigate to System Definition > Plugins.
2. Search for and activate the Connect Support and Service Portal integration plugin [com.glide.connect.support.service-portal].

What to do next
After activating the plugin, the Connect Support widget appears in the list of widgets under Service Portal > Widgets. Use Connect Support in a portal by adding the widget to any page within the portal. For more information on adding a widget to a page, see Create and edit a page using the Service Portal Designer.

Connect Support widget

Chat Support

Click here to start a chat

Avg wait: 30 Seconds
Configure Connect Support widget instance options

You can control the appearance of your widget and how it functions by configuring the instance options.

Before you begin
Role required: admin

Procedure

1. Navigate to Service Portal > Service Portal Configuration and open the Service Portal Designer.

2. From the Service Portal Designer, select the page you added the Connect Support widget to. If you have not yet added the widget to a page, see Create and edit a page using the Service Portal Designer for more information.

3. Click the edit icon in the corner of the widget to open the instance options menu.

4. Complete the fields using the following table. Depending on the functionality you want to add, you may not need to add all these fields. For example, if you include the Queue ID, you do not also need to include the Queue Name or the Queue URL.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>Select a color for your widget from a list of common bootstrap colors. Themes control the overall color of a widget, but if you want your widget to be a specific color, you can select it from the list.</td>
</tr>
<tr>
<td>Queue URL</td>
<td>The URL for the Connect Support chat queue that you want questions to be directed to. For example, https://&lt;instancename.service-now.com/$chat_support.do?queueID=&lt;sys_id&gt;</td>
</tr>
<tr>
<td>Queue Name</td>
<td>The name of the queue you want the questions to be directed to. You can find a list of queue names in Collaborate &gt; Connect Support &gt; Queues.</td>
</tr>
<tr>
<td>Queue ID</td>
<td>The sys_id of the queue you want questions to be directed to. You can find this ID by going to the support queue and either copying the queue ID from the support link, or by selecting Copy sys_id from the context menu.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Message</td>
<td>The text for the button in the Connect Support widget</td>
</tr>
<tr>
<td>Window</td>
<td>Use this option to open the chat in another tab rather than in a new window.</td>
</tr>
<tr>
<td>Title</td>
<td>The name in the widget header</td>
</tr>
</tbody>
</table>

**Content Management System**

The Content Management System (CMS) is a ServiceNow application that enables users to create a custom interface for the ServiceNow platform and ServiceNow applications.

The CMS application is powerful and flexible. Customers use it for a wide variety of projects, from creating entire websites to integrating with other products. The Content Management application is active by default.

This video provides an overview of the CMS application.

**CMS application**

A CMS typically requires a systems administrator or a web developer to set up and add features. Non-technical users can use the CMS application as a tool for website maintenance. You also want to consider the timing of the addition of content management, and the maturity level of ServiceNow data. For more information, see [CMS Planning](#).

Following are several CMS project ideas:

- Design a company-wide service catalog that offers a collection of services.
- Present a customized UI for a knowledge base.
- Create customized login pages, search pages, views of lists, tables, charts, or graphs.
- Design a complete website.
- Integrate ServiceNow with other company applications.
- Build a tailored self-service portal for end users that is in compliance with a corporate style guide.

**Example CMS sites**

There are two common interface approaches within the ServiceNow community:

- An image and text-based interface similar to Amazon.com
- A search-based interface similar to Google

© 2021 ServiceNow, Inc. All rights reserved.
Both approaches have been used successfully. The approach you select depends on the needs of the people using the data and how easy it is to train them. While the two design philosophies are different, both approaches share the common goal of UI simplicity.

**Activating CMS**

You must request the Content Management System (CMS) application from ServiceNow personnel. Instead of activating CMS, use Service Portal for new development. Service Portal is an alternative to CMS with a refined user experience, and is active by default in the base system. See Service Portal and Content Management and Service Portal.

**Content Management design**

Before building a website in the CMS, it is important to have a good understanding of what to build and who the audience is.

A high volume of content can heavily influence the look and feel of the site and the site hierarchy. When deciding the content, design for ease of maintenance for the people who take care of the system. This level of planning can be time-consuming, but is important.

Review website design prerequisites to help you set expectations, scope deliverables, and define reasonable time lines. Consider both the planning and execution of site design, to understand how sites are built, and to provide a working overview of the CMS.

Timing is important when considering the addition of content management. Successful deployments of the content management system usually take place after phase 1 processes (for example, Incident, Problem, Change, Catalog, and Knowledge) are in place. This is especially true if the team has limited website design experience. Waiting until phase 2 of deployment gives administrators time to work in ServiceNow and to understand how the organization uses the system and what business needs it meets.

Also consider the maturity level of data in the ServiceNow system. Depending on the ITIL processes used, content management is only useful and effective once the data within ServiceNow is established. Ensure that hierarchies, tasks, and workflows are well-defined. For example, before creating a catalog interface, confirm that the service catalog has been in place for some time, has been used, and contains data. The same is true for a knowledge management interface, particularly when high ratings or view counts define article placement on the page.
Content organization

Before you begin to build the CMS website, list all the content that you want to include and take the time to organize it.

A site created in CMS relies on two different types of content.

• CMS site information, such as site pages, images, and menus
• System information, such as knowledge base articles and catalog items

CMS content

Begin by listing all the content you want to host on the CMS pages. Examples include help pages, My Requests, My Approvals, and specific catalog items. Think about current solutions that you can implement immediately, and note ideas for future implementation phases.

Within CMS, you group pages to define the top-down menu structure. You establish a home or starting page, and other pages in the site reference the home page in the Parent Page reference field.

There are several ways to group, such as by audience or the purpose of the website. After listing the content to host, group it logically and identify a common name for each group, as shown in the following examples.

<table>
<thead>
<tr>
<th>IT environment groups</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Content built for</td>
<td>Common name</td>
</tr>
<tr>
<td>End user</td>
<td>End User Page</td>
</tr>
<tr>
<td>IT professional</td>
<td>IT Professional Page</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>General groups</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose of site</td>
<td>Common name</td>
</tr>
<tr>
<td>Reports</td>
<td>Reporting Page</td>
</tr>
<tr>
<td>Help and knowledge</td>
<td>Knowledge page</td>
</tr>
</tbody>
</table>

System content

Organize the content so the interface is easy to navigate and understandable to the user. Determine the organization based on the data that you are leveraging, both in the CMS (using sites, parent pages, pages, and navigational menus) and throughout the rest of the system. For example, within the catalog you have "category," and in the knowledge base you have "category" and...
"subcategory." You can use these hierarchies with filtered lists for good search results.

Organizing CMS content logically is important for long-term maintenance of the site, however, the data typically comes from other ServiceNow applications. Communicate with the administrators for these applications, such as the knowledge base, service catalog, and business service portfolio. Work with them to offer the application data appropriately through the CMS pages you create. For example, the team that created the ServiceNow corporate website in CMS began by evaluating the naming conventions used in the corporate knowledge base.

**Branding elements**
Branding refers to the logo, name, colors, and symbols that identify an organization. It imposes consistency in design and use of terms. Your marketing department defines branding elements and can provide them to you as you plan your CMS pages. Consider how to incorporate the following branding elements.

- Logos
- Color palette
- Tag line
- Trademarked elements
- Graphics

**Site design**
During planning, consider providing a core set of features with a standard appearance throughout the site. The following web design elements are often used to create a consistent look.

- Page templates
- Navigation schemes
- Header
- Breadcrumbs
- Footer
- Forms

**ServiceNow features**
Analyze and organize the following ServiceNow features in your instance if you plan on using any of them with CMS pages.
Team member identification

Identify the team members who assist you with website design, branding, and development.

Engage team members for each listed function before you begin to build pages for the CMS website. Each function can be performed by the same or different people.

- Gather corporate style design guidelines.
- Define the written terminology and content for the site.
- Gather and define the site flow.
- Manage the CMS project as the webmaster. The CMS webmaster is responsible for executing the design and making the site work. The following skills are required:
  - Basic ServiceNow administration skills
  - HTML
  - CSS
  - Graphic design
  - Web design

After you identify the project team members, establish who is responsible to complete the tasks involved in building the CMS website.

- Determine who owns each page.
- Set a page update schedule so owners do not overwrite each other.
- Formalize content management processes, including content review and page updates.

Data preparation

It is important that there is enough data in the ServiceNow instance before you begin to build the CMS website.
Ensure that the necessary data and content are available in the instance by taking the following actions.

- Review the ITIL processes that you intend to implement in the CMS. Ensure that the data in the instance is a mature representation of the applications being used, for example, service catalog, knowledge management, and incident management.

- Review the defined hierarchies, such as the categories and subcategories for the knowledge base or service catalog. You use these categories to design the entry page into the application.

**Corporate style guide**

When you build a CMS website, you design the look and feel based on guidelines in the corporate style guide.

A corporate style guide provides detailed information for designing any corporate interface, including corporate websites.

**Corporate design team**

Many organizations have a web development team that designed the corporate website. Contact this team and involve the designers early in the planning, as they provide help and give their approval to the interface you design. Without approval, there is the risk of having to redesign the entire site because it does not adhere to the organizational guidelines.

**Corporate style guide**

A corporate style guide takes the guesswork out of designing the CMS website. The example style guide shown is defined down to the pixel. Creating a site with the style guide makes it easy to create clean CSS and HTML. Without the style guide, building the site can take a great deal of time.

**Design considerations**

Some modifications to the base design for forms may be necessary. The content area of any CMS design should be no smaller than 860px, or service catalog forms are clipped. The sample style guide entry specifies the content area to be 576px, which clips service catalog forms.
Prototypes and rapid web design

Many user interface designers use prototypes and rapid web design techniques to visualize the final product before it is developed.

Design revisions are the most time consuming and expensive phase of site design. When the team analyzes and then uses prototypes to create pages, revisions to the published pages are minimal.

Develop the prototype and print it. Review the design with the appropriate team members and annotate the prototype, and annotate what to update on each page.
Define the following elements within the prototype.

- The site map for the entire site.
- A detailed prototype of every intended page, including elements such as links, link destinations, content, page names, and page descriptions.

**Content Management navigation**

After you design the hierarchical structure of the site, begin planning site navigation.

Consider the following as you plan site navigation.

- Placing navigation elements on every page.
- Locating navigation elements in the same place on every page.
- Using either text or images for navigation.
- Providing visitors with an easy way to understand where they are in the site, for example, with breadcrumbs or a specific color scheme.
- Adding a site map, which is a one-page, hyperlinked, hierarchical outline of the site.
- Providing a link to the home page from every site page, as visitors often enter the site on a page other than the home page.
- Designing navigation to help visitors find information quickly with as few clicks as possible.

In the CMS, navigation menus define your site navigation. Build menus as navigational blocks to create navigation paths. The menu chosen for the task depends on the size and complexity of your site. Available menu options include the following items.

- List menus
- Two types of tab menus
  - Vertical, clickable list, usually placed on the left side
  - Horizontal blocks
- Vertical blocks
- Super menu (a menu of menus)
**System content management**

Most of the content in a CMS site is managed in different locations throughout the system.

For example, if you are building a knowledge website, the pages and blocks exist in CMS, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. It is important to take time to understand the table structure of data to become acquainted with content.

Links to content are typically static, however, take time to look at the document tree and review how field values are formatted for use within the CMS. To understand the information provided below, right-click within forms in the platform and select **Show XML** to view the document tree for the referenced table. To see the table values for each field, right-click the form label and choose **Show - (field name)** or **Configure Dictionary** for reference.

Look at several internet news sites for ideas on how to format dynamic list data and also the full article detail. Research blog sites, shopping sites, and any other site you find easy to use, as layout and usability design can be time-consuming. If you find a site that inspires you, emulate it in your design.

- This [New York Times example](#) has two separate list formats.
- The [CNN example](#) has several list formats on the page.
- Several different list formats are used on the ServiceNow website.

**Knowledge articles - kb_knowledge table**

When you right-click and select **Show XML** on any form within the system, the document tree for the referenced database table becomes reference-able. Review the following selected subset of the document tree so you can acquaint yourself with the content readily available to your site design.

```xml
<kb_knowledge>
  <active>true</active>
  <author display_value= "First Last Name" >Use this field value if author name is important</author>
  <short_description>Use this field value as the link to the full article detail</short_description>
  <description>Provide this field value as a 1-2 sentence summary of the article</description>
  <number>Unique ID can be leveraged in a number of different ways</number>
  <published>Published time stamp of the article</published>
  <rating>This field value provides a 1 to 5 star rating similar to iTunes</rating>
  <sys_updated_on>Add to supplement article published timestamp</sys_updated_on>
  <sys_view_count>8</sys_view_count>
</kb_knowledge>
```
Useful field value in creating hierarchical breadcrumbs

Also useful in organizing articles hierarchically

Use this similar to Facebook's "like" feedback, answer to the question was this useful

<?xml version= "1.0" encoding= "utf-8" ?>
<j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" >
<div class = "cms_knowledge_list customer_success" >
<g:for_each_record file = "${current}" max = "${jvar_max_entries}" ><br />
<table cellspacing = "0" cellpadding = "0" border = "0" class = "background_transparent" >
<tr><td class = "cms_knowledge_list_image" >
<j:if test = "${current.u_logo.getDisplayValue() != ''}" >
<div class = "knowledge_article_logo" >
<a href = "knowledge.do?sysparm_document_key=kb_knowledge,${current.sys_id}" >
<img src = "${current.u_logo.getDisplayValue()}" alt = "${current.text}" width = "110px" />
</a>
</div>
</j:if>
</td>
<td width = "100%" >
<a href = "knowledge.do?sysparm_document_key=kb_knowledge,${current.sys_id}" target = "_top" >
<span class = "cms_knowledge_list_link" >${current.short_description}}</span>
<p class = "kb_description" >"${current.description}"
</p>
</a>
</td></tr>
</g:for_each_record></div>
</j:jelly>
Domain separation and the Content Management System

Domain separation is supported in the Content Management System. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

• The domain field may exist on data tables but there is no business logic to manage the data.
• This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Domain separation for service providers

Configure Content Management sites

Planning a CMS site involves obtaining resources, communicating with others about design, and gathering content.

Before you begin
Role required: content_admin or admin

About this task
The following steps are a high-level overview of how to set up a site.

Procedure
1. Plan and design your content.
2. Create a site.
   The site is the container that holds all the content. To simplify your process, you can copy an existing site and edit its components. For more information on creating a site, see Create a site. For more information on copying a site, see Copy a site.
3. Add pages to the site.
   Pages contain blocks of information for the site. For more information, see Create a content page.
4. Create content blocks to customize the layout, headers, menu navigation, lists, and static and dynamic content.
Content blocks are chunks of actual HTML that make up the content page. There are various content block types available to help with your customization. For more information, see Content blocks.

5. Add style to your site using themes, style sheets, and frames. Neither content sites or content pages reference style sheets directly. Configure them using the Themes or Style Sheets options. For more information, see Style in Content Management.

6. Test the site.
After you create or modify a site, test the site to ensure that content displays properly and all links work correctly. For more information, see Test the site.

Related information
Content Management design

Content sites
A content site is a group of related content pages that have the same basic theme, layout, and URL suffix.
Content sites are made up of a series of basic building blocks. The Employee Self-Service site is an out-of-box sample site that is included in the CMS activation. It provides existing, working examples or each CMS component, which you can use like a template to build your own site.

Site components

[Diagram of site components]
Create a site

Configure a site by either creating a new site with CMS or by editing a copy of either the ESS Portal or the Service Management Portal.

Before you begin
Role required: content_admin or admin

About this task
If you are creating a catalog site in CMS, follow the steps in Manage catalog sites in Service Catalog

Procedure
1. Navigate to Content Management > Sites.
2. Click New.
3. Complete the form.
   Since you have not yet created pages, you cannot select the Home, Search, Login, and Gauge target pages. Add them to the site record after you create them.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the site.</td>
</tr>
<tr>
<td>URL suffix</td>
<td>The URL suffix that identifies the site. The URL suffix is case-sensitive, the suffix you enter impacts the CMS site URL used to launch the site. It is incorporated into the URL as follows: http://&lt;instance name&gt;.service-now.com/url_suffix/page.do</td>
</tr>
<tr>
<td>Note:</td>
<td>Do not use portal and cms in the URL suffix. They are reserved terms and return a Page not found if you use them.</td>
</tr>
<tr>
<td>Home page</td>
<td>The page to display when the user does not specify a page name in their URL: http://&lt;instance name&gt;.service-now.com/url_suffix/</td>
</tr>
<tr>
<td>Search page</td>
<td>The page that displays search results when a user searches from any page within the site.</td>
</tr>
<tr>
<td>Login page</td>
<td>The page to use for logging in to the site. If specified, users must log in to access the pages on the site. If left blank, no login is required to access the pages within the site.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Gauge target page</td>
<td>The page that displays gauge content. When the user clicks a gauge on the new site, the gauge target page opens to show the gauge content. The gauge target page replaces the CMS page in the current tab.</td>
</tr>
<tr>
<td>Title</td>
<td>A title for the site. The title can be the same as or different from the Name.</td>
</tr>
<tr>
<td>Description</td>
<td>A full description of the site.</td>
</tr>
<tr>
<td>Default layout</td>
<td>The layout for pages to use by default. Any page in the site that has a blank Layout field uses the layout selected in this field.</td>
</tr>
<tr>
<td>Default theme</td>
<td>The theme for pages to use by default. Any page in the site that has a blank Theme field uses the theme selected in this field.</td>
</tr>
<tr>
<td>Simple catalog display</td>
<td>Selecting this option simplifies catalog pages in the site by hiding the search bar, breadcrumbs, and the results per page choice list. It also prevents you from adding attachments from record producers to your CMS site.</td>
</tr>
<tr>
<td>Use external cart</td>
<td>Option to omit the default cart when rendering catalog pages within a site that contains catalog pages. Provide a catalog cart block somewhere on the site to allow users to make catalog requests.</td>
</tr>
</tbody>
</table>

**Note:** If you use an external cart, the no cart check box on a service catalog item has no effect. The external cart appears for all items.

4. Click **Submit**.

**Example:**
The following is the site record for the ESS Portal:
Related information

Copy a site

Copy a site

To create a new site quickly, you can copy an existing site.

Before you begin

Role required: content_admin or admin

About this task

The site copy option creates a complete standalone copy of the site and all its resources. If you are copying a site to create a second site, use this option after the first site is complete, tested, and production ready. This consideration is important because the blocks, CSS, and pages are duplicated to support the new site. There are various reasons why site copying is useful, such as site versioning, branding, or creating a backup.

Images are not included when you use the Copy Site option. They are stored separately in the sys_attachments table.

To copy just a few pages without duplicating all the resources (CSS, blocks, menus), use the page copy option. Page copy duplicates the page but not the resources used in the page. For more information, see Copy a page.
Procedure

1. Navigate to Content Management > Sites > [Site Name].
2. On the Site form, click Copy.
3. In the dialog box that opens, type a name for the new site.
   This name is a prefix for all the site elements that are duplicated. Do not use Portal or CMS in the site name.
   A progress bar shows the copy process. When the process is complete, the Site form shows information for the new site.

Related information

Create a site

Content Management security

There are several methods for securing CMS sites and pages. Site security is set in the Login page field on the site record. You can control if a page is public or private through the URL.

Every content page has its own URL that users can access outside of the platform. Depending on how the Login page or roles are defined, the URL may or may not be public.

- If the content page has no defined Read role or there is no defined Login page, any internet user can navigate to the URL and view the content page.
- If there is a defined Read role, then anyone who goes to the URL is asked to log in before they can view the site.
- If there is a defined Login page on the site record, all pages in the site are private.

Content Management URLs

The format for Content Management URLs is as follows.

<path to the instance> + /<site suffix> + /<page suffix> + .do

The <site suffix> is defined by the URL Suffix field on the site form. The <page suffix> is defined by the URL Suffix field in the page form. The URL suffix is case-sensitive.

For example, the page Austere - Site Entry has a site URL Suffix of austere and a page URL Suffix of entry. The constructed URL looks like the following URL.

<instance name>.service-now.com/austere/entry.do
If the site **URL Suffix** field is left blank, the `<site suffix>` is **cms**, as shown in this example:

```
instance.service-now.com/cms/page.do
```

If the page **URL Suffix** is left blank, the name of the page is used as shown in this example:

```
instance.service-now.com/austere/Page Name.do
```

Special characters in the name of the page have to be escaped.

**Login pages instead of login rules**

You set a login page on the site record to allow users to log in or out directly through the content site.

Login rules were used in earlier versions to dictate what users saw after logging in, based on their roles or permissions. Login rules still work, but their use is deprecated.

**Configure CMS sites to use single sign-on (SSO)**

To configure CMS to use SSO, make the view_content page private.

**About this task**

Because public pages do not require login, and CMS sites are public by default, CMS pages do not use SSO. Use the following procedure to turn off public-facing content pages and enable SSO.

**Procedure**

1. Navigate to Public Pages [sys_public.list].
2. For the view_content page, set **Active** to **false**.

**Content pages in CMS**

Content pages are the core of the Content Management System. A content page is a web page that displays blocks of content.

Pages are built from content blocks and organized into sites. Pages display as regular webpages that are rendered in HTML. Constructing a content page requires a basic knowledge of HTML. Content pages are formed by arranging content blocks in predefined layouts. They can be used to present login pages, search pages, or ServiceNow content.
Create a content page

Pages are built from content blocks and organized into sites.

Before you begin
Role required: content_admin or admin

Procedure
1. Navigate to **Content Management > Sites**.
2. Open the site to add the page.
3. In the **Pages** related list, click **New**.
4. Complete the form.

**Page form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the page. Prefix each page name with the name of the site followed by a dash and the page function. For example, <strong>ESS - Catalog Detail</strong> and <strong>ESS - Search Results</strong> are page names within the <strong>ESS</strong> site.</td>
</tr>
<tr>
<td>URL suffix</td>
<td>The URL suffix that identifies the page. It is incorporated into the URL as follows: <a href="http://instance">http://instance</a> name.service-now.com/site/url_suffix.do</td>
</tr>
<tr>
<td>Parent page</td>
<td>The existing page that is the parent of the current page. Parent pages keep sections sortable on the site list of pages and are used to create breadcrumbs dynamically. Use CSS to define menus that give the Parent page context within the user interface.</td>
</tr>
<tr>
<td>Layout</td>
<td>The layout to use for the page. Layouts define dropzones where content blocks can be added to the page. If this field is left blank, the page inherits the default layout of the site. If the site does not have a default layout, there is a single dropzone for the entire page.</td>
</tr>
<tr>
<td>Content theme</td>
<td>The theme to use for the page. Themes bundle CSS style sheets that are applied to all content within the page. If this field is left blank, the page inherits the default theme of the site. Use the default theme unless the page requires a different set of CSS style sheets from the other pages in the site.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Frame buster</td>
<td>Select the check box to remove any restrictions placed by frames that contain the page. This way you avoid frame-within-frame issues that sometimes occur with improper linking.</td>
</tr>
<tr>
<td>Content site</td>
<td>The site associated with the content page. If you created the page from the related list in the site, the value defaults. The content site provides the &lt;site_suffix&gt; in the page URL, as follows: http://&lt;instance name&gt;.service-now.com/site_suffix/page_suffix.do</td>
</tr>
<tr>
<td>Read roles</td>
<td>Users with the selected roles can view the page. Click the lock icon to select roles.</td>
</tr>
<tr>
<td>Model document</td>
<td>A document ID of a record to display by default.</td>
</tr>
<tr>
<td>Page status</td>
<td>The status for the page, such as Draft or Published.</td>
</tr>
<tr>
<td>Created by</td>
<td>The user who created the page. If your role has higher privileges than your user name and you enter your user name, the field defaults to the role. For example, if you are logged in as an Admin and you type your name, which has lower privileges, this field displays Admin.</td>
</tr>
<tr>
<td>Title</td>
<td>The title for the page. The title displays on the browser tab when the page is accessed.</td>
</tr>
<tr>
<td>Description</td>
<td>Type a description of the page that displays for users when they access the page.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Add content to a page

After you define the page settings, set the content of the page by adding content blocks. Setting content blocks is similar to how you add content to homepages.

Before you begin
Role required: content_admin or admin
Note: Do not add any type of report, such as a calendar, to iFrames. For more information on adding a report directly onto a page without using iFrames, see Embedding reports in Jelly.

Procedure
2. Click Add Content.
3. Select a content block from the picker.
4. Select the dropzone where the content goes.
   Create content blocks by adding one of the content blocks named *New [block type] to the page.

Related information
Content blocks
Copy a page

Copying pages is an efficient way to avoid duplicating the same work and to create pages quickly from a guiding base template.

Before you begin
Role required: content_admin or admin

Procedure
1. Navigate to Content Management > Sites and select the site.
2. Select the page to copy.
3. Click Copy.
4. Rename the page.

Note: Do not use service_catalog to rename a page. It is already a valid page in the system.
5. Edit the page fields.
6. Click Update.

Assign a page to a site

If you have created multiple sites, you can add pages from one site to another site.

Before you begin
Role required: content_admin or admin

Procedure
1. Navigate to Content Management > Sites.
2. Select a site.
3. In the Pages related list, click Edit.
4. Select other pages to include in the site.
5. Click Save.
6. Update the site.
Add a page to an application

Homepages and content pages are not added automatically to update sets and applications. They must be manually added.

Before you begin
Role required: content_admin or admin

Procedure
1. Navigate to Content Management > Pages.
2. Right-click a content page record.
   The page is added to the current application and to the current update set.

Configure a private UI page for CMS links

With single sign-on (SSO) in place, you can generate email links that take users directly to tickets and applications through the CMS interface.

Before you begin
Role required: content_admin or admin

About this task
You accomplish this procedure by creating a private UI page to redirect CMS links. Because the page is not public, it requires authentication and redirects to SSO appropriately.

Procedure
1. Check that your CMS site is private by completing the following steps.
   a. Navigate to Content Management > Sites > [Your Site]
   b. Verify that the Login page field has a page listed.
2. Create a new UI page by completing the following steps.
   a. Navigate to System UI > UI Pages.
   b. Click New.
   c. Enter a Name, for example, redirector.
   d. Enter the following Adobe Jelly code into the HTML field.
The CMS now supports email links with following format:

http://<path to instance>/<UI page>.do?uri=/<CMS suffix>/<record type>.do %26sys_id=<record ID>

For example:

http://<instance name>.service-now.com/redirector.do?sysparm_uri=/ess/incident.do%26sys_id=46e3e949a9fe19810069b824ba2c761a

Note: If you are using SAML 2.0 update 1 for SSO, use the UI page saml_redirector instead of creating a new UI page. For example, an email link to a SAML 2.0 redirector page would use the URL format: http://<instance name>.service-now.com/saml_redirector.do?sysparm_uri=/ess/incident.do%26sys_id=46e3e949a9fe19810069b824ba2c761a.

Content Management templates

Templates are content pages that are reused to provide a consistent look and feel.

Templates are useful when creating CMS sites for the following reasons.

<table>
<thead>
<tr>
<th>Create new pages rapidly without risk by copying pages</th>
<th>Using a template to create new pages saves time because you do not have to keep repeating the same steps.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provide a restore point for pages within the system</td>
<td>Have a working template available if something goes wrong in one of the blocks or in the theme CSS. It is often easier to start over from the template instead of trying to undo complex changes.</td>
</tr>
<tr>
<td>Provide a functional reference for editors on the site project</td>
<td>Having the template as a reference ensures that pages continue to conform to the style guide.</td>
</tr>
</tbody>
</table>

Page templates

Every page that is part of the site needs a template.
Critical page reference fields
When you build a new site, there are four page reference fields on the site record that are critical. Understanding these pages and how they are used helps you define page templates and site defaults.

- Home page: landing page for the site. A home page is mandatory.
- Search page: page that displays search results when a user searches from any page within the site. A search page is mandatory for your site to have a Search Results block.
- Login page: a standalone login page, which is useful to force authentication for the entire CMS site.
- Gauge target page: page used to display the drill-through content from a gauge. When the user clicks a gauge, the gauge target page opens showing the drill-through content for that gauge.

Detail pages
Depending on the data or tables that you plan to use, you may need detail pages. These detail pages use one of the content types in the following list.

- Knowledge detail page: displays a full knowledge article detail (mandatory for a knowledge site).
- Incident page: detail page for an incident record.
- Catalog page: detail page for all items, content items, order guides, and record producers.

Templates for creating sections
There are two page templates you can use when creating sections:
• Parent page: keeps sections within large sites organized and sortable on the site list of pages. Parent pages are also used to create breadcrumbs dynamically.

• Detail page: differs from the parent page in that the content area displays a full article or detail instead of a selection of related content. Detail pages must have a Current Document block.

These pages are mandatory if you plan on accessing system data. For example, if you plan on showing the service catalog in your CMS, you need the following items.

• A service catalog content type that references the [sc_cat_item table].
• A detail page that provides the full view of the item.

New templates
If the base system sample site pages are not suitable, you can create a template from scratch. Create a page and then use it as a template. For more information, see Create a Content Page.

When you save a new template, include the word “template” in the page name.

Configure a base template
An easy way to create a base template is to copy the existing ESS sample site and customize it to suit your own needs. You can also configure a base template from scratch.

Before you begin
Role required: content_admin or admin

About this task
Follow these steps to create a single base page and generate all important components within the site.

Procedure
1. Design a layout.
   Regardless of the interface, a site can be distilled into a few simple layouts.

2. Create a theme.
   The theme defines the structure of the layouts in CSS and the base styles, such as fonts and colors. For more information, see Design themes.

3. Build the common blocks.
Pages are composed of content blocks. Most content blocks are reused on multiple pages. For the base template, create basic blocks such as a header, side navigation, and some basic content for the main content area of the page. More detailed content can be added later, but define content for reuse on many of the site pages here. For more information, see Content blocks.

4. Build a site entry page.
Use the common content blocks you just created to design the first page that users see when they enter the site. For more information, see Create a content page.

5. Build a detail page.
Design the detail pages to determine how pages such as knowledge articles, catalog items, and search results are displayed. You can build a detail page by copying the site entry page and adding additional content blocks. For more information, see Copy a page.

6. Assign the pages created to the new site.
Create the site and apply the layout and theme to the site defaults. Then, navigate to the All Pages list and specify the base template site in the Site column for each of the base template pages. For more information, see Create a site.

Customize a copy of a page template

One good source for templates is the base system sample site. It is easy to copy pages and restyle them into new page templates to meet different business requirements.

Before you begin
The Employee Self-Service portal is provided as a working example and design template in the following procedure.

Procedure
1. Navigate to Content Management > Sites > Employee Self-Service.
2. Select a page.
   For example, to copy the ESS sample site homepage, select Portal.
3. Click Copy.
4. Rename the page.
5. Right-click in the header and select Save.
7. Point your cursor to the content block to change and click the edit icon that appears on the right. For example, change the menus, alter the layout, or add a different logo.

8. Click **Update**.

9. Use the page in other sites you created by assigning pages to a site.

**Content types**

Content types provide site-specific control of how system data defined by templates is rendered.

In the site, one page displays a list of knowledge articles, and another page displays catalog items or incidents or a combination of the two. Different themes can be used for types of content and each theme can provide different user interaction. Content types define the pages that display content from a table. Each content type corresponds to a table.

Every type of document that the CMS displays has an associated content type. Changing the content type requires knowledge of Apache Jelly scripting. However, the common content types (such as service catalog or knowledge base) come in the base system. Content types can be associated with particular sites. This association allows different sites to use different detail pages for the same content type.

Content types define three features of associated documents.

- What does a link to one of these documents look like? For example, if a list of these documents is displayed on a page, how does each entry appear?
- What does a detailed view of one of these documents look like?
- What detail page is used to display the document? This decision is important and is often an area of confusion for new CMS users.

The document content type determines the page that a list of documents points to, the list itself does not determine the page. The content from a link is displayed in a detail content block on a page. The content type determines in which detail block on a page the document content is displayed.

For example, the list block **Catalog Top 5** displays the top five items in the Service Catalog table [sc_cat_item]. Because the table is [sc_cat_item], the content type **sc_cat_item** controls how the **Catalog Top 5** list is displayed. Clicking any item in the list displays the Service Catalog Detail page with the item displayed on it according to the detail template script. These content types are applied:
• in search results to link to the correct page.
• in the Current Document block to display the current record.
• in links on lists and other places that link to record types.

Several content types are available by default for tables such as Catalog Item [sc_cat_item], Gauge [sys_gauge], and Page [content_page].

Content type defaults that are set for CMS can be overridden for individual sites. Use the Content Types related list on the site record to customize content types.

Note: To learn more about the properties that affect use of content types, see the following topics in Instance Security Hardening Settings:

Configure a content type

Users with the content_admin role can create a content type.

Before you begin
Role required: content_admin or admin

Procedure
1. Navigate to Content Management > Content Types.
2. Click New.
3. Complete the Content Type form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select the table whose content will be rendered in Content Management.</td>
</tr>
<tr>
<td>Content site</td>
<td>Select the site that will use this content type.</td>
</tr>
<tr>
<td>Media type</td>
<td>Enter one of the following media types to use with this content type.</td>
</tr>
<tr>
<td></td>
<td>• doctype: UI15 desktop interface only</td>
</tr>
<tr>
<td></td>
<td>• m: Smartphone interface only (not for CMS use)</td>
</tr>
<tr>
<td></td>
<td>• tablet: Tablet interface only (not for CMS use)</td>
</tr>
<tr>
<td>Field</td>
<td>Input Value</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Default detail page</td>
<td>Select which page loads after a user clicks a link.</td>
</tr>
<tr>
<td>Gauge page</td>
<td>Select which page is the drill-through target for any gauge. If you display a gauge on a CMS page, then clicking the links loads the page specified here.</td>
</tr>
<tr>
<td>Summary Template</td>
<td>Write an XML script that determines how the list is displayed in the list block, if the link is displayed in a list block.</td>
</tr>
<tr>
<td>Detail Template</td>
<td>Write an XML script that determines how to display the associated information after a user clicks the link.</td>
</tr>
</tbody>
</table>

**CMS gauge support**

Gauges are a graphical way to display information from an instance.

A gauge might, for example, show a bar chart breaking down all open incidents by category. Gauges are fully supported within the CMS system. This means:

1. You can put a gauge on a CMS page
2. You can control what will happen when a user clicks on a cell within that gauge

**Put a gauge on a CMS page**

You have control over the gauges on a CMS page.

**Procedure**

1. Bring up the CMS page in edit mode.
2. Click **Add Content**.
3. Select the gauge you want to add.
4. Place the gauge on the page in the desired location.

**Related reference**

- Control what happens on a click

**Related information**

- CMS gauge support
Control what happens on a click

Since a CMS system uses multiple pages you have to tell the system which page to use to display drill through content.

In the normal (non CMS) system, when you click a bar in a bar chart or a wedge on a pie chart, you drill through and your current screen is replaced with a list of records meeting the chart's criteria. For example, if you have a gauge of Incidents by Category and you click the bar labeled Hardware you drill through to a list of all incidents with a category=hardware.

Within the CMS system, there is a similar drill through mechanism at work, but you must manually specify which page to display.

There are two different models of the drill through, use an in-place target frame to receive the content, or use another page to display the content.

Using an In-Place Target

An in-place target is a named iframe on the same CMS page as the gauge. When the gauge is clicked, the drill-through content appears within that iframe rather than changing out the CMS page. The gauge (and the rest of the page other than the target) remain in place and active.

Using a Gauge Target Page

A gauge target page is a separate CMS page that is used to display the drill-through content from a gauge. When a gauge is clicked, the current CMS page is replaced with the gauge target page and the drill-through content is rendered within that second page.

• Gauge Target Page

To set a site default, select Gauge Target Page, on the site configuration page. This page is used as the drill-through target for any gauges in the system that do not have a more specific gauge page specified in their content type.

• Gauge Page

To set a content-type specific page, you can specify a Gauge Page, on a content type page. Any gauges for this type of content then use that page for any drill through.

Note: The gauge target on a particular content type overrides the default, site level, gauge target.

• Gauge Target block

A gauge target page is a normal CMS page, with one special requirement. Somewhere on that page, there must be a Gauge Target block. This market block tells the system where to output the drill through data.

Put a gauge on a CMS page

View content types
The following is an example of where you might use Content Types.

Before you begin
This example uses the out-of-box Employee Self-Service (ESS) site as an example.
Role required: content_admin or admin

About this task
Use any out-of-box instance of a CMS site.

Procedure
   The Issue Status, or incident_status CMS page contains two content blocks:
   Common Answer and Current Issues. These content blocks both use Content Types to render results.
   This block matches the Common Answers section of the Issue Status page. The Table field describes the Content Type associated with Common Answers.
4. Use the link to view existing Content Types.
5. Click the Content Type to view the XML that determines how the list and record are rendered in CMS.
   The Default Detail Page field indicates a CMS page that displays a record selected from a List of Content block.
6. Click the Information icon next to the Default Detail Page, to go to that page.
7. From the Default Detail Page, under Related Links, click Edit Page.
   The Detail Block contains a content type formatter. When editing or viewing the page, it is looking for a URL to be passed to determine the record to display, which is why it says "Detail record could not be located".
8. Click the pencil icon to edit and view the Detailed Content block.
   The Type drop down list has "Show the page's current document" selected, which indicates that the document_id must be passed to this block from the CMS pages, then it can display the record based on the content type listed in the document_id.
9. From the Common Answers block, on the Self Service page, select a record. The page opens with a URL similar to: https://<instance name>.service-now.com/ess/knowledge.do?sysparm_document_key=kb_knowledge,02255450d731310013ab49547e61038e

The table sysparm_document_key=kb_knowledge and sys_id 02255450d731310013ab49547e61038e determine the record. The associated content type, kb_knowledge, renders the content on the Default Detail Page, Portal - Knowledge Detail / url_suffix=knowledge.

**Content blocks**

A block is a defined piece of content within the system that can be reused. A content page is constructed by arranging customized blocks of content on a page. Content blocks are an important part of a CMS site. Existing content such as reports, gauges, and record lists are automatically available as content blocks and more can be created within the CMS.

After defining content blocks, use them on any content page by adding them to drop zones. For more information, see Add content to a page.

Create content blocks after sites and pages have been designed.

**Configure a content block**

To configure a content block, define it in the appropriate form.

**Before you begin**

Role required: content_admin or admin
Procedure

1. Perform one of the following actions to create a content block.
   • Navigate to Content Management > Blocks > [Block type] > New. The form for creating the selected block type opens.
   • Navigate to Content Management > Blocks > All and select the type of content to create from the list.
   • Edit a content page and add a stub block of the desired content block type. Click the link in the stub block.

2. Complete the content block form and save it.

3. Add the content block to any content page.

View CMS block tags

A CMS block tag is used for advanced block creation and site flexibility.

Before you begin
Role required: content_admin or admin

About this task

It is constructed as <g:content_block> {{Jelly_Tags|Jelly}} and can be used in either of the following ways.

• Blocks: to display a block inside a block.
• Layouts: to display a block inside a layout.

The tag appears in the format, <g:content_block type="<type>" id="<sys_id>"/>.

An example of the block tag is included in the ESS Portal sample site.
Procedure

1. Navigate to **Content Management > Design > Frames**.
2. Click **cms_admin_home_frame**.
3. View the code.

```html
<style>
DIV.cms_administration_home {
    background: url(gray_${current_page.getURLSuffix()}.pngx) no-repeat right top;
}
</style>

<div class="cms_administration_home">
  ${body}
<br/>
<!--[if test="${current_page.getURLSuffix()=='administration'}"]>
  <g:content_block type="content_block_menu" id="7afc342def002000914304167b2256ac"/>
<![endif]-->
  The defaults use the page URL suffix to define sub menus
  <!--[if test="${current_page.getURLSuffix()=='community_inspired'}"]>
  <g:requires name="ess.portal.globals.jsdbx"/>
  <g:content_block type="content_block_menu" id="ccd4b8c7efb7000914304167b22566e"/>
  <![endif]-->
<br/>
</div>
```

4. To see what the page looks like, navigate to the ESS Portal administration page. For example, [http://instance name.service-now.com/ess/administration.do](http://instance name.service-now.com/ess/administration.do).

Configure a header block
A header block is a visual element placed at the top of pages. It provides a place for branding and other important site-wide functionality.

Before you begin
Role required: content_admin or admin

About this task
Some of the options that are available in headers include, global search, text size toggle, menus for navigational purposes, and the user name with logout link.

Procedure
1. Navigate to Content Management > Blocks > Headers.
2. Click New.
3. Complete the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the header block.</td>
</tr>
<tr>
<td>Background</td>
<td>Select a background for the header logo and menus.</td>
</tr>
<tr>
<td>- None</td>
<td>No background is rendered.</td>
</tr>
<tr>
<td>- Gradient/Image</td>
<td>Specify an image or gradient image to serve as the background.</td>
</tr>
<tr>
<td>- Colored Bars</td>
<td>Specify colors for three different sections of the header, top, middle, and bottom.</td>
</tr>
<tr>
<td>Image</td>
<td>If <strong>Background</strong> is <strong>Gradient/Image</strong>, upload an image for the header block background. For gradients, upload a gradient image.</td>
</tr>
<tr>
<td>Top bar color</td>
<td>If <strong>Background</strong> is <strong>Colored Bars</strong>, enter a CSS color or color name to use as the background for the top menu.</td>
</tr>
<tr>
<td>Middle bar color</td>
<td>If <strong>Background</strong> is <strong>Colored Bars</strong>, enter a CSS color or color name to use as the background for the logo and text.</td>
</tr>
<tr>
<td>Bottom bar color</td>
<td>If <strong>Background</strong> is <strong>Colored Bars</strong>, enter a CSS color or color name to use as the background for the bottom menu.</td>
</tr>
<tr>
<td>Logo</td>
<td>Select a logo image. The image is also a link to the main page.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Text</td>
<td>Type the text to display beside the logo.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select the check box and type any scripted conditions to apply in the <strong>Condition</strong> script field that appears.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the header block. The category also determines the detail page in which header block links open. Detail pages often display information in different ways.</td>
</tr>
<tr>
<td>Top Menu</td>
<td>Select a navigational menu block to use as a menu above the logo.</td>
</tr>
<tr>
<td>Bottom Menu</td>
<td>Select a navigational menu block to use as a menu below the logo.</td>
</tr>
<tr>
<td>Height</td>
<td>Specify the height for the header.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Search</td>
<td>Select this check box to add a search element in the header.</td>
</tr>
<tr>
<td>Font sizer</td>
<td>Select this check box to include text sizing controls in the header.</td>
</tr>
<tr>
<td>Login</td>
<td>Select this check box to include a login link in the header. If the user is logged in, this element displays the user name and a logout link. If you specify a login page on the site record, it is important to include a login link so users can enter their username and password.</td>
</tr>
<tr>
<td>Chat Queue</td>
<td>Select the chat queue that users access by clicking the <strong>Help Desk Chat</strong> button in the header. Clear the field to remove the button. This field appears only if the Chat plugin is active.</td>
</tr>
</tbody>
</table>

**Related information**

Configure a content block

**Create a navigation menu block**

Navigation menu blocks enable you to create a menu of links to different content pages.

**Before you begin**

Role required: content_admin or admin

**About this task**

The following three objects define navigation menus.

- **Menu block**: The menu block defines the entire menu block and how it displays.
- **Menu section**: The menu sections define groups of links displayed within the block.
- **Menu item**: The menu items define the links within each menu section.

**Procedure**

1. Navigate to **Content Management > Navigation Menus**.
2. Click **New**.
   
   A gallery of available navigation menu blocks displays.
3. Select the desired menu block style.
4. Complete the Navigation Menu form to define the block.

**Navigation Menu form**

Menu style customization

Configure menu sections

Menu sections define groups of links displayed within the navigation menu block.

Before you begin

Role required: content_admin or admin

Procedure

1. Navigate to Content Management > Blocks > Navigation Menus and select a block.
2. In the Menu Sections related list, click New.
3. Complete the Menu Section form.

Menu Section form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the menu section.</td>
</tr>
<tr>
<td>Content block menu</td>
<td>Select the navigation menu on which this menu section appears.</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select what appears when a user clicks the menu section name and icon.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the URL to display when a user clicks the menu section title and icon. This field is available only if Redirect to is set to The specified URL.</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the content page to open when a user clicks the menu section title or icon. This field is available only if Redirect To is set to A content page.</td>
</tr>
<tr>
<td>Left image DB</td>
<td>Select the image database where your site images are stored.</td>

**Configure menu items**

Menu items are the links that appear within each menu section.

**Before you begin**

Role required: content_admin or admin
About this task
Not all navigation menu sections require menu items. Use menu items to link users to other pages or additional information. These steps use the ESS sample portal site as an example.

Procedure
1. Navigate to Content Management > Blocks > Navigation Menus and select a navigation menu.

   **Example**
   For example, select the Documentation Menu.

2. From the Menu Sections related list, select a menu section.

   **Example**
   For example, select Getting Started.

3. From the Menu Items related list, click New.

4. Complete the form.

### Menu Item form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the menu item.</td>
</tr>
<tr>
<td>Menu section</td>
<td>Select the menu section in which this item appears.</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select what appears when the menu item name and icon are clicked.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the URL to open when the menu item title and icon are clicked. This field is available only if Redirect to is set to The specified URL.</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the content page to open when the name or icon is clicked. This field is available only if Redirect To is set to A content page.</td>
</tr>
<tr>
<td>Image</td>
<td>Select an icon to appear with the name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the menu item available for use.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate where this item appears on the menu relative to other menu items.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the menu item only if the user is logged on.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>

<td>The vertical list menu renders the menu sections as headings with menu items as links below them.</td>
</tr>
<tr>
<td>Vertical Blocks</td>
<td></td>
<td>The vertical blocks menu renders the menu sections as block headings with menu items as links within the block. The blocks are arranged vertically.</td>
</tr>
</tbody>
</table>

Menu style customization

You can customize menu styles in the style sheets your site uses.

Navigate to Content Management > Design > Style Sheets to customize style sheets.

Supplementary page navigation menu example code

In the following example, look at the CSS class selectors and rules. Also, review how the block containers (div.cms_menu_section_blocks) are defined based on the outer container (TD.layout_content_submenu_column). The outer container is actually a part of the site layout.

This concept is clearer if you compare the styles to the styles used in the super menu further down in the example. This example shows that there is no need to make a completely new menu system. You can use CSS to change the look and feel of existing menus.

```
/*
 **********************************************
 "SUB MENU VARIATIONS FOR HORIZONTAL MENUS" - Section Blocks Menu (cms_menu_section_blocks UI Macro)
 **********************************************

TD.layout_content_submenu_column DIV.cms_menu_section_blocks { 
  width: 156px; 
  height: auto; 
  float: left; 
  position: relative; 
  border-style: solid; 
} 
```
Super menu sections example code

The following menu is a simple float grid. The defaults are written first. Then, below the "SUPER MENU VARIATIONS..." comment, the defaults are overwritten by adding a containing div with a unique class. In the code that renders the header for the base system, the bottom menu resides in a table cell with the class of `cms_header_bottom_menu` (refer to the `TD.cms_header_bottom_menu` CSS selector).

```
/
******************************************************************************
************************************************************
SUB MENU VARIATIONS FOR HORIZONTAL MENUS - Section Blocks Menu (cms_menu_section_blocks UI Macro)
******************************************************************************
="/*
TD.layout_content_submenu_column DIV.cms_menu_section_blocks {
    width: 156px;
    height: auto;
    float: left;
    position: relative;
    border-style: solid;
    margin: 0px 0px 0px 0px;
    border: 0px solid #e0e0e0;
    padding: 0px;
    background: none;
    padding: 24px 12px 0px 12px;
}

TD.layout_content_submenu_column DIV.sub_menu_section {
    width: 156px;
    height: 20px;
    float: left;
    border-style: solid;
    border: 0px solid #e0e0e0;
    padding: 0px;
    background: none;
    padding: 0px 12px 0px 12px;
} 
*/
```
4.2 2. Super Menu Sections Example Code

This menu is essentially a simple float grid. The defaults are written first. Then, below the "SUPER MENU VARIATIONS..." comment, the defaults are overwritten by adding a containing div with a unique class. In the code that renders the header for the base system, the bottom menu resides in a table cell with the class of "cms_header_bottom_menu" (note the TD.cms_header_bottom_menu CSS selector).
Example menu items and content links

The method for choosing a link target (current window, iFrame, or new window) and referencing the item linked (page, attachment, or URL) are similar. Review examples of how to link within these elements.

• A content page reference helps you select the desired page. For example, the value `home.do` links to the site homepage.

• An attachment reference allows you to reference a single file attached to the menu item or section record. If there is more than one attachment, only the
first attachment is referenced. The link is then generated automatically and displays a Browser File Save prompt.

- The specified URL reference allows you to link to a full URL string in your instance or from another system. For example, `com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=66c313e7c0a8016b008ebel1a8e3d97f5&sysparm_nameofstack=b654d15bef9210091430416` links to the Ask a Question record producer. Use this reference to link to a page in an existing intranet system.

Menu items can be seen as featured links from each section. There are many choices in URL definitions and link options. Links within the ESS Portal open content pages within the site. In turn, each page has an iFrame or set of blocks that houses the corresponding data. This method is useful for rapid prototyping, but consider where to create dynamic detail pages and use the available linking options.

Menu items are similar to content links except they are called by the list block, not as part of a navigation menu block. Menu items and content links function the same as far as how they are defined and the options available for linking to items. Content links are meant to be called through a list block that calls the Content Link `[content_link]` table. Content links do not have the Logged in field or the Roles option used to control the UI experience for various roles.
Before you begin
Role required: content_admin or admin

About this task
For example, link behavior determines which page opens when the link is clicked and how it opens, such as in a new page or a new frame. Use the following procedure to view a sample menu section.

Procedure
2. Click Portal - Block Menu.
3. In Menu Sections related list, click Order Things.
4. Click the reference icon next to Detail Page to open the page.
5. In Related Links, click Edit Page.
   By default, the link goes to the Order Things page with the Portal - Order Splash Menu (Vertical Block Menu) in the page content area.

   In most default CMS menus, the menu section has the menu title with secondary text, a separation line, and the links you define as menu items. Although the design is versatile and flows well between pages, there could be questions about linking and scalability to large catalogs. This practice may only be useful for a small catalog with limited items.

6. To view an example of dynamic content, follow these steps to look at the request catalog list/grid view on the ESS Portal.
a. Add /ess/manage.do to your instance URL. For example, https://<instance name>.service-now.com/ess/manage.do.

b. In the Code Example Demos section, click Request Catalog List / Grid View.

c. Browse the catalog items.

Configure dynamic blocks
Use dynamic blocks to use scripting or to pull information from the system. Dynamic blocks are where most of your content resides.

Before you begin
Role required: content_admin or admin

About this task
A good use of dynamic blocks is job postings. Store the postings in knowledge articles and display the postings with a dynamic block.

Several dynamic blocks are predefined, including the following items.

• **New Content**: Each of the new content blocks allows for creating blocks while editing content pages.

• **Clean Login**: The default login page requesting user name and password, which includes a “Remember Me” check box. After the user logs in, this block triggers login rules.

• **Login**: An area that allows a logged out user to log in and a logged in user to log out. This block is especially useful on publicly available content pages.

• **Search**: The global text search field. Currently, global text search is the only form of search that can be included in a content page.

• **Search Results**: An area for displaying global text search results.

For information about Apache Jelly, see .

Procedure
1. Navigate to **Content Management > Dynamic**.
2. Click **New**.
3. Complete the Dynamic Content form.
Dynamic Content form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the dynamic content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the dynamic block. The category also determines the detail page in which dynamic block links open.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the dynamic block. For more information, see Format a frame.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Enter any scripted conditions to be applied. If selected, adds a Condition script field to the form.</td>
</tr>
<tr>
<td>Two phase</td>
<td>Select this check box to allow two phase Jelly tags.</td>
</tr>
<tr>
<td>Dynamic content</td>
<td>Enter the XML script field that determines the behavior of the dynamic block.</td>
</tr>
</tbody>
</table>

Catalog cart block

The catalog cart block is a dynamic block provided in the base system.

This block provides the same cart that is available within the service catalog. If the site definition has the Use external cart option selected, include this block in the site so users can interact with their catalog cart.

Catalog cart block is available when the glide.sc.use_cart_layouts property is set to false.

**Customize the list block**
List blocks are content blocks that dynamically generate a list of links to records within the instance. When a user clicks a link in a list block, the associated information is displayed in a detail page determined by its content type.

**Before you begin**
Role required: content_admin or admin

**About this task**
Make the list using a simple query on any table or by scripting a more advanced query. Lists are powerful and flexible. Here are some places that allow you to have complete control over the list display.

**List control**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frames</td>
<td>Frames provide a method to create decorative containers for content blocks and other elements within the site. When frames are used with the <strong>Type</strong> field, the designer has complete control over list placement.</td>
</tr>
<tr>
<td>List Type</td>
<td>The List Definitions module defines the type of lists available for content pages. On the List Block form, select a list definition in the <strong>Type</strong> field.</td>
</tr>
<tr>
<td>List Filtering</td>
<td>Provides every field in the referenced table for more granular results.</td>
</tr>
<tr>
<td>Max Entries</td>
<td>Limits the results from a table to fit the design of the block.</td>
</tr>
<tr>
<td>Order and Order Direction</td>
<td>Allows sorting by any field in the referenced table, in either ascending or descending order.</td>
</tr>
</tbody>
</table>

You can also use list blocks to create a list of links to information outside your instance. Create the external links as records on the Content Link [content_link] table, and then follow the steps in this procedure.
Procedure
1. Navigate to Content Management > Lists.
2. Click New.
3. Complete form.

List Block fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the list content block. It is used to identify the record in the instance and is not displayed on the content page. Use the Title field for that purpose.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the list content block.</td>
</tr>
<tr>
<td>Type</td>
<td>Select a list definition UI macro to format the list of links.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to enable generating a list from a script, rather than from a simple filtered query.</td>
</tr>
<tr>
<td>Query</td>
<td>Filters the results using a condition builder.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Title</td>
<td>Enter the name to display at the top of the list block when it appears in a content page.</td>
</tr>
<tr>
<td>Maximum entries</td>
<td>Set the maximum number of entries to display in this list block.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table to query for the list items. The table determines which detail page displays when a user clicks a link in the list block. For more information, see Configure a content type</td>
</tr>
</tbody>
</table>

Note: The list shows only tables and database views that are in the same scope as the list block.

Conditional | Select this check box to enable the use of scripted conditions. If selected, a Condition script field appears. Other fields that
### Configure list definitions

List definitions, similar to content management frames, are decorative containers that control the look and feel of lists.

**Before you begin**
- Role required: content_admin or admin

**About this task**
- Specifically, list definitions are UI macros that use Apache Jelly script to define how a list is rendered inside a list block. Site design often requires multiple list styles within the layout. Lists are often the primary form of navigation within a site, so it is important to have control over their formatting.
- Configuring list definitions requires a knowledge of Apache Jelly.

**Procedure**

1. Navigate to **Content Management > Configuration > List Definitions > ..**
2. Click **New**.
3. Complete the List Definition form.

**Related reference**
- [Content Management and the Apache Jelly engine](#)

### Configure a static HTML block

Use static blocks for text that does not change. For example, use a static block for a site footer with only the company or organization name. A static HTML block allows any HTML code to be run within a page.

**Before you begin**
- Role required: content_admin or admin

**About this task**
- Anyone who edits their own HTML, Jelly, or Javascript may find the HTML editor in the static block limited. The HTML editor can also add tags or formats that
advanced coders find unnecessary. For more advanced options, use dynamic blocks.

Procedure

1. Navigate to Content Management > Blocks > Static HTML.
2. Click New.
3. Complete the Static Content form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the static HTML content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the static HTML block.</td>
</tr>
<tr>
<td></td>
<td>The category also determines the detail page in which static HTML block</td>
</tr>
<tr>
<td></td>
<td>links open. Detail pages often display information in different ways.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the static HTML block. For more information, see</td>
</tr>
<tr>
<td></td>
<td>Format a frame.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Enter any scripted conditions to be applied. If selected, adds a Condition</td>
</tr>
<tr>
<td></td>
<td>script field and Logged on check box to the form.</td>
</tr>
<tr>
<td>Static Content</td>
<td>Enter HTML code that determines the behavior of the static HTML block.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Related information

- Configure a content block
- View CMS block tags

Format an image as a static HTML block

An easy way to add an image to a CMS page is to use a static HTML block. After the block is created, you can reuse it throughout the site.

Before you begin

Role required: content_admin or admin
Procedure

1. Navigate to Content Management > Design > Images.
2. Click New.
3. Select a Category to help organize the images.
4. Type the file name of the image, including the extension (such as .png).
5. Upload the file by selecting Click to add and browsing for the image.
6. Click OK.
7. Click Update.
9. Paste the following code into the HTML block, substituting the image name as uploaded in the previous step. The "x" at the end of the filename is required for image caching.

   ```html
   <img src="<image_name>.gifx"/>
   ```

   Now the image is a static HTML block and you can add it to any content page. Use standard HTML code to alter the image in the content block.

Configure Flash movie blocks

Use a Flash movie block to embed any Flash movie (.swf file) as an attachment or by referencing a URL in a content page.

Before you begin

Role required: content_admin or admin

About this task

To add streaming video or Flash video (.flv), for example, to a knowledge article, see Embed videos in HTML fields.

Procedure

1. Navigate to Content Management > Specialty Content > Flash Movies.
2. Click New.
3. Complete the Flash Movie form.
Flash Movie form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the Flash movie block.</td>
</tr>
<tr>
<td>Source</td>
<td>Specify where the Flash movie is found.</td>
</tr>
<tr>
<td>• Attachment: If this choice is selected, upload the Flash movie to this record.</td>
<td></td>
</tr>
<tr>
<td>• Link to External Object: If this choice is selected, a URL field appears. Specify the Flash movie URL and ensure that the Flash movie is publicly accessible.</td>
<td></td>
</tr>
<tr>
<td>Height</td>
<td>Enter the height of the Flash movie in pixels.</td>
</tr>
<tr>
<td>Width</td>
<td>Enter the width of the Flash movie in pixels.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Configure content links
Content links are the predecessors to navigation menus. You can use content links to create navigational links to information outside of your instance.

Before you begin
Role required: content_admin or admin

About this task
After the content link is configured, it must be defined in a list block. List blocks use content links to reference information outside of your CMS.

Procedure
1. Navigate to Content Management > Specialty Content > Content Links.
2. Click New.
3. Complete the Content Link form.
### Content Link form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the content link</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select the location of the external link</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the list content block.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the site URL to open when the link is clicked. This field is available only if Redirect to is set to The specified URL.</td>
</tr>
<tr>
<td>Open in</td>
<td>Select the behavior of the clicked link.</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the page where the link opens when it is clicked. This field is available only if Redirect to is set to A content page.</td>
</tr>
<tr>
<td>iFrame</td>
<td>Enter the name of the iFrame where the link opens when it is clicked. Make sure that there is an iframe on the page where the link opens. This field is available only if Open In is set to Named iFrame.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

5. From **Content Management > Blocks > Lists**, create a list block that references the content links by selecting **Content Link** in the table field.

6. Create a query to determine which external links display on the page. For example, the query **Category is Search** displays any external links that have a category defined as **Search**.

7. Click **Update**.

### Configure iFrames

An iFrame embeds a URL on a page within a frame. It can embed external pages or render ServiceNow content.
Before you begin
Role required: content_admin or admin

About this task
Configure an iFrame with forms you create in the instance and link to the page in which the iFrame resides.

Note: Do not add any type of report, such as a calendar, to iFrames. For more information on adding a report directly onto a page without using iFrames, see Embedding reports in Jelly.

Note: To deliver ServiceNow content from a web page, see Service Portal instead.

Note: To learn more about this property, see in the Instance Security Hardening Settings.

Procedure
1. Navigate to Content Management > Specialty Content > iFrames.
2. Click New.
3. Complete the iFrame form fields.

<table>
<thead>
<tr>
<th>iFrame form fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Frame name</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>URL</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>
### Field Input value

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sizing</td>
<td>Select an option for iFrame block size.</td>
</tr>
</tbody>
</table>

**Note:** The *Expand to fit content* choice only works with ServiceNow content. If *Fixed Size* is selected, height and width fields are displayed for you to enter the size in pixels.

**Note:** Some browsers suppress iFrames because they use an X-Frame-Options header value of SAMEORIGIN. The X-Frame-Options header was introduced in Internet Explorer 8 RC1, to help detect and prevent frame-based redressing. The SAMEORIGIN value causes the browser to render a blank page instead of the target page of the `<frame>` or `<iframe>` when the frame target is not on the same origin as the page itself. Support for this header has been implemented in Safari 4.0, Chrome 4.1.249.1042, and Firefox 3.6.9 and above.

### Integrate Live Feed with CMS

You can provide access to Live Feed from pages built in the Content Management System (CMS). For example, allow an end user to access your company feed via the ESS portal.

### About this task

The ESS Portal template includes the **Portal - Live page** and **Live Feed** dynamic block (requires the Live Feed plugin). To provide access to Live Feed from CMS pages, add the **Live Feed dynamic block** to a CMS page or include the **Portal - Live page** in a site.

### Procedure

1. Navigate to **Content Management > Specialty Content > iFrames**.
2. Click **New**.
3. Complete the iFrame block form with the following values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name: Live Frame</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Frame name</td>
<td>Type a frame name: <strong>live_frame</strong></td>
</tr>
<tr>
<td>URL</td>
<td>Enter <strong><a href="https://instance">https://instance</a> name/live_feed.do?sysparm_doctype=true</strong>. Replace instance name with your instance URL, for example, <code>&lt;myinstance&gt;.service-now.com</code>.</td>
</tr>
<tr>
<td>Sizing</td>
<td>Select <strong>Fixed Size</strong> and enter height and width pixel dimensions according to the page on which you plan to display the feed. For example, enter a width of 1024 and height of 768.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

5. Complete the steps in **Add the block to a page**.

**Related information**

- **Content blocks**
  - **Configure a content block**

**iFrame methods**

The following examples show how system records are pulled into an iFrame that is placed on a content page.

For system lists or forms, use the frame name **gsft_main** so that links work properly.

- **Order Hardware** is an example of linking to a catalog category.
  - **URL**: com.glideapp.servicecatalog_category_view.do?
    sysparm_parent=d258b953c611227a0146101fb1be7c31&sysparm_view=
  - **Frame name**: **gsft_main**

- **My Approvals List** is an example of linking to a list with a view filter and a JavaScript that reference the authenticated user.
  - **URL**: sysapproval_approver_list.do?
    sysparm_query=approver=javascript:getMyApprovals()&sysparm_view=ess
  - **Frame name**: **gsft_main**

- **Service Catalog Home Page (system)** references the system catalog page within the Service Catalog application. If you are satisfied with the way the catalog looks, this method is an easy way to bring the page into a CMS design.
  - **URL**: catalog_home.do?sysparm_view=catalog_default
  - **Frame name**: **gsft_main**
**Problem Management Overview** references a homepage. .. / makes the URL string relative to system homepages. Without it, the URL string resolves to the default CMS homepage reference in the site.

- URL: ../home.do?sysparm_view=problem_overview
- Frame name: gsft_main

**Configure a detailed content block**

A detailed content block displays the content of an existing document, such as an incident, knowledge article, or service management request. The document type determines the page that a list of documents points to.

**Before you begin**

Role required: content_admin or admin

**About this task**

The block works with content types in the **Default detail page** field. For more information, see Configure a content type.

If you plan to use a script to find a document, configure the form to add the **Script** field if it is not displayed.

**Procedure**

1. Navigate to **Content Management > Configuration > Page Detail Settings**.
2. Click **New**.
3. Complete the Detailed Content form.

**Detailed Content form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the Detailed Content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the detailed content block. If the block Type is <strong>Show the page's current document</strong>, the category displays content from any link of the same type.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the detailed content block. For more information, see Format a frame.</td>
</tr>
<tr>
<td>Model Document</td>
<td>Select the document to display by default.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the behavior for the block.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Show a Specific Document</strong>: Displays the Model Document.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Show the page's current document</strong>: Displays the currently selected document.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Use a script to find a document</strong>: Uses the Script field to select a particular document.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select the check box and enter any scripted conditions to be applied. Selecting this check box adds a Condition script field and Logged on check box to the form.</td>
</tr>
<tr>
<td>Script</td>
<td>Enter a script to find an appropriate document if the Type is set to <strong>Use a script to find a document</strong>. Set the Return to the GlideRecord of the desired document.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Content Management and the Apache Jelly engine

Apache Jelly is a Java-based and XML-based scripting and processing engine for turning XML into executable code.

The Apache Jelly engine closely resembles XML and should be comfortable for developers familiar with JavaScript, XML, XHTML, or HTML. In the ServiceNow instance, the Apache Jelly engine renders items such as forms, lists, and UI Pages. Apache Jelly code renders well within a dynamic content block, but can have issues when used in static blocks. You can use Jelly tags, calls, and statements, but HTML acts just like XHTML.

```xml
<?xml version= "1.0" encoding= "utf-8" ?>
<j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" >
  <j:if test = "${current_page.getName()=='Solutions'}" >
    <h1 class = "page_name" > <b> <a href = "solutions.do?" title = "${gs.getMessage('Solutions')}">${gs.getMessage('Solutions')}</a> </b> </h1>
  </j:if>
</j:jelly>
```
Ensure that all tags are closed. If the tag is not a naturally closing tag, then place a forward slash before the end bracket. For example, a `<BR />` or an `<IMG src="cms.png" />`.

If you are unfamiliar with Jelly scripting, review these topics:

-  

- Jelly escaping types

Include the following tag with all Apache Jelly scripts.

```jelly
<j:jelly trim= "false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "null" xmlns:g2= "null">
</j:jelly>
```

The tag looks complex, but keep the following information in mind.

- Apache Jelly script uses multiple namespaces.
- There are two types of prefixes in tags: j and g. The j prefix is used for tags that are natively part of Apache Jelly. The g prefix is used for tags that the ServiceNow platform created and is using for platform purposes.

The j2 and g2 prefixes are just like j and g, except that they are processed in a second phase. The Apache Jelly script parser runs through each j and g tag respectively. For example:

```jelly
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
<j:set var="jvar_phase1" value="Hello" />
<j2:set var="jvar_phase2" value="World" />
${jvar_phase1} ${jvar_phase2}
</j:jelly>
```
In phase 1, the parser runs through all the j and g tags. It then caches the result. Before it runs the second phase, it takes the j and g namespaces and moves the namespaces to the second phase. It looks something like the following code.

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="jelly:core"
xmlns:g2="glide">
    <j2:set var="jvar_phase2" value="World" />
    Hello ${jvar_phase2}
</j:jelly>
```

For subsequent calls of this script, only phase 2 is parsed.

⚠️ **Note:** If you plan to use phase 2 Jelly tags (g2 and j2) on the Content Type [content_type] or Dynamic Content [content_block_programmatic] tables, select the **Two phase** option on the content form.

Another example is to create a report of all open incidents assigned to each group. For this purpose, you could use a report and save time, but it is a good example for learning Jelly. Start with the Jelly tag:

```xml
<j:jelly trim= "false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "null" xmlns:g2= "null">
</j:jelly>
```

First, you need a list of open incidents. Use a g2:evaluate tag. The evaluate tag runs the script. Anything inside the tag is parsed like a business rule, so, for example, you can call global business rules, script includes, and gliderecord.

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
    <g:evaluate var="jvar_groups" object="true">
        var now_GR = new GlideRecord("sys_user_group");
        gr.orderBy('name');
        gr.query();
        gr;
    </g:evaluate>
</j:jelly>
```

This script is in phase 1 because frequent changes to incident assignment groups are not expected. Also notice the `var` attribute on the evaluate tag. This attribute specifies what variable is set from this block. At the end of the script, there is a `gr` on a line by itself. That last line is what sets the variable.

You can omit the `jvar_groups` variable, but then all the variables in the evaluate tag become Apache Jelly variables. The `object=true` specifies that the variable is not a primitive data type. If `object=true` is omitted, the script would break because `jvar_groups` would only be able to hold items like integers and strings.
After the evaluate tag, loop through these groups and find the incidents for each one.

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
  <g:evaluate var="jvar_groups" object="true">
    var now_GR = new GlideRecord("sys_user_group");
    gr.orderBy('name');
    gr.query();
    gr;
  </g:evaluate>
  <table>
    <tr>
      <th>Name</th>
      <th>Incidents</th>
    </tr>
    <j:while test="${jvar_groups.next()}">
      <tr>
        <td>${HTML:jvar_groups.getValue('name')}</td>
        <td></td>
      </tr>
    </j:while>
  </table>
</j:jelly>
```

You can include normal XML in the Apache Jelly script at any time. Since there is no namespace, the Apache Jelly script does not try to parse the XML tags. Notice the `j:while` loop. It is a normal while loop and can iterate through a GlideRecord object. Also notice that you output a value with `${HTML:jvar_groups.getValue('name')}`. Here are the important elements:

- The outer brackets, `{}`, specify the output of the variable and the phase in which the variable is output: `{}` means first phase, `[]` means second phase.
- HTML before the expression is for escaping the output. The expression `jvar_groups.getValue('name')` is being escaped for HTML. For other types of escaping, there are JS (Javascript), NS (No Script), and some other options.

To select only one record and not iterate through many records, the code looks like the following example:

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
  <g:evaluate var="jvar_groups" object="true">
    var now_GR = new GlideRecord("sys_user_group");
    gr.orderBy('name');
    gr.query();
    gr;
  </g:evaluate>
```
Content management and Jelly code examples

Code examples

Header Example Code

This dynamic content block needs to be active and have the "Two Phase" option clicked. The g:requires tag is including the UI script defined in the system whose name is "servicenow.website.globals". The file extension in the call is .jsdbx and is used only in the call to the UI script, not in the name of the script in the system. For JSDBX, the file being called is a JavaScript(.js) defined within the database (db) that needs to be cached (x).

```xml
<?xml version= "1.0" encoding= "utf-8" ?><j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" >
  <g:requires name = "servicenow.website.globals.jsdbx" />
</j:jelly>
```

Page Title and Description Example Code

This dynamic content block needs to be active. There are two actions within this code snippet. First is a forward-looking string container that allows site translation, the ${gs.getMessage('Your Text')} string call). The second action pulls in the page title and description, ${current_page.getName()} and ${current_page.getDescription()}.

```xml
<?xml version= "1.0" encoding= "utf-8" ?><j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" >
  <j:if test = "${current_page.getName()}=='Solutions'" >
    <h1 class = "page_name" > <b> <a href = "solutions.do?" title = "${gs.getMessage('Solutions')}">${gs.getMessage('Solutions')}</a> </b> </h1>
    <p class = "page_description" >
      ${current_page.getDescription()}
    </p>
  </j:if>
  <j:if test = "${current_page.getName()}=='IT 3.0'" >
    <h1 class = "page_name" > <b> <a href = "solutions.do?" title = "${gs.getMessage('Solutions')}">${gs.getMessage('Solutions')}</a> </b> |
      ${current_page.getName()}
    </h1>
    <p class = "page_description" >
      ${current_page.getDescription()}
    </p>
</j:if>
</j:jelly>
```
List Block Pulling From Knowledge Articles Example Code

This code example contains one of the best tricks in the CMS. Using the type field with draws from a number of defined list definitions to make slight, or very dramatic changes, to list display. Because the UI is open to configuration and innovation, this is a good opportunity to use design skills. Anyone who can use HTML and CSS knows that a basic list can be turned into a float grid or be made inline. The combinations are limited only by what the designer can dream up and code.

In the code example, there is a custom logo field (u_logo) added to the Knowledge form. The custom field displays customer logos, partner logos, and award images on the awards page. There are a number of different sections that use this list definition so efficient reuse is taking place.

- **div class="cms_knowledge_list customer_success"** - Begin by creating an outer container with a unique class name that can be used as a basis for CSS style selectors and rules. From the outer container, many of the child elements can be accessed for theming.

- **<g:for_each_record file="${current}" max="${jvar_max_entries}"** - Loop for list creation that calls the selected table record and the entries set on the list form.

- **<a href="knowledge.do?sysparm_document_key=kb_knowledge,"${current.sys_id}"><img src="${current.u_logo.getDisplayValue()}" alt="${current.text}" width="110px"/>** - Defines linking to the article detail in the knowledge base. For further reference, look at content types within the site definition and you will see some similarities. The knowledge.do? portion of the URL points to the knowledge detail page which (as mentioned above) is mandatory if you plan to call the knowledge base in your CMS site. The rest of the URL represents the syntax for calling a knowledge article by its sys_id. Each and every item housed within the system has a unique sys_id.

- **<tt>${SP}-${SP}${current.author.first_name}${SP}${current.author.last_name}</tt>** - This example is commented out and not used, but it is still interesting in that it has a jelly call ${SP} and it pulls the knowledge article's author by first and last name.

```xml
<?xml version= "1.0" encoding= "utf-8"?><j:jelly trim = "false" xmlns:j = "jelly:core"
xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null">
<div class = "cms_knowledge_list customer_success" ><g:for_each_record file = "${current}" max = "${jvar_max_entries}" /><br/>
<table cellspacing = "0" cellpadding = "0" border = "0"
```

Content Management and the Apache Jelly engine

Style in Content Management

Content pages can be styled with CSS, just like any HTML website.

Three elements control CSS styles:

- **Style Sheets** are records containing CSS declarations.
- **Themes** are groups of style sheets that can be invoked together.
- **Frames** are UI macros that define the outer border of individual content blocks as they appear on a content page. Frames work by calling on particular definitions in the style sheets.

Related information

- Define a frame in a style sheet
- Create a frame UI macro
Style sheets

Stylesheets are standard Cascading Style Sheets (CSS) that define the look and feel of all elements within the interface.

Cascading Style Sheets (CSS) can either be internal (stored in the database) or external (hosted on the server), based on organizational needs. To define an internal style sheet, use standard CSS in the style field. Using external CSS allows the Content Management System to use the same CSS as a corporate website or other online resource.

Use an external style sheet by defining a URL that points to the .cssx file. If you upload a .cssx file to the platform, you can reference the .cssx file using a URL.

Content pages do not reference style sheets directly. To invoke a style sheet, you assign the style sheet to a Theme using the related list on the Theme form.

Related information
- Customize a design theme

Design themes

Design themes are the convergence of structure and styling, making them a critical tool for creating a powerful user interface.

For a successful project, review the corporate style guide and communicate with the corporate website art team. If the organization has an art or design department that maintains branding, include them in this process.

A theme is a collection of one or more style sheets (CSS files) that define a consistent look for a set of pages. In most environments, many pages share a few themes. Use multiple themes within a site to create stylistic differentiators between site areas. You can also use a single theme to create one unified look and feel for the site.

Related information
- Define a frame in a style sheet
- Create a frame UI macro

Customize a design theme

A theme is a collection of one or more style sheets (CSS files) that define a consistent look for a set of pages.

Before you begin
Role required: content_admin or admin
About this task
Themes can be invoked in any of the following ways.
• Directly by content pages.
• As the default theme of a content site.
• On the configuration page as a global default.

Procedure
1. Navigate to Content Management > Design > Themes.
2. Click New.
3. Type a name for the theme and mark it as Active.
4. Right-click the form header and click Save
   The Style Sheet related list appears.
5. Use the Style Sheet related list to add style sheets to the theme.

Doctypes
The view_content html page template on which all CMS is based defaults to
doctype=html.

The code looks like the following HTML source code.

```html
<!DOCTYPE HTML>
```

If your CMS site does not render properly, remove the doctype from the page by
setting the following property:

• `glide.html.doctype.pages =` chat_desktop,live_feed,live_feed_small,navigator,navpage11,image_browse

The following is the default for this property.

• `glide.html.doctype.pages =` chat_desktop,live_feed,live_feed_small,navigator,navpage11,image_browse,view_content

Setting this doctype offers these benefits for building new sites:
• Incorporating common practice: Use a practice that is becoming widely adopted across the Internet and can prevent certain browsers from running in quirks mode.

• Cleaner CSS and markup: Write more standards-based CSS and markup to promote code sharing.

• A step towards browser compatibility: Find solutions that work across browsers and avoid browser-specific workarounds.

**Format a frame**

Frames provide a way to manage decorative containers for content blocks and any other elements within the site. For example, one frame can be a container, made of div or span tags, that is styled with rounded corners.

**Before you begin**

Role required: content_admin or admin

**About this task**

Individual content blocks use a frame UI macro to define the frames. When viewing a content block form, the **Frame** field offers a choice between the different frame UI macros. The frame UI macro does not, however, have the definition for the frame within its Jelly script. Instead, it references a particular frame as defined in a style sheet.

Configuring a new frame is a two-step process.

**Procedure**

1. Define the frame in a style sheet.
2. Create the frame UI macro to invoke the frame definition.

**Define a frame in a style sheet**

Add style definitions for any custom frame UI macro you create.

**Before you begin**

Role required: content_admin or admin

**About this task**

Each frame has its own class name.
Procedure

1. Navigate to Content Management > Design > Style Sheets.
2. Select a style sheet to contain the frame definition.
   Base system themes use a separate Frames style sheet.
3. Add the following code, substituting the desired frame name and style:

   ```html
   div.FRAMENAME{border:STYLE;}
   ```
4. Click Update.

Create a frame UI macro

Copy an existing frame UI macro to display content in a custom frame.

Before you begin
Role required: content_admin or admin

About this task
Create a custom frame UI macro if you want to control the style of the frame with your own style sheet definitions.

Procedure

1. Navigate to Content Management > Design > Frames and select one of the existing frame UI macros.
2. Change the name to match the FRAMENAME you used in the style sheet.
3. Right-click the header bar and select Insert and Stay.
4. Update the frame name in the XML field as shown:

   ```xml
   <div class="FRAMENAME">
   ```
5. Click Submit.

What to do next
- In any content block form, select the UI macro.
- Define the frame in a style sheet.

Content blocks
Content Management meta tags

Meta tags are special tags in web pages that contain information about the page but are not rendered with the page. You can define custom meta tags for content pages.

Meta tags are not noticeable to a page visitor unless the visitor looks at the page source code. Web search engines read meta tags as they "crawl" the web, identifying and organizing content. Modern website designers often use meta tags to embed "hints" to search engines about how to index or otherwise crawl the site.

Structurally, a meta tag consists of a tag and a name/content pair and looks similar to the following code.

```html
<meta name="generator" content="MediaWiki 1.16wmf4" />
```

The Content Management System allows you to define both site level and page level tags.

Configure a page level meta tag

A page level tag is a meta tag defined on a specific page and included on only that page.

Before you begin
Role required: content_admin or admin

About this task
If an individual page has a specific tag with the same name as the site, the page tag takes precedence.

Procedure
1. Navigate to Content Management > Pages.
2. Open the page.
3. If not already included, add the Meta Tags related list to the form.
4. In the Meta Tags related list, click New.
5. Type a Name and Content for the tag.
6. Click Submit.

Configure a site level meta tag

A site level tag is a meta tag is defined on a site and included on every page within that site.
Before you begin
Role required: content_admin or admin

About this task
If an individual page has a specific tag with the same name as the site tag, the page tag takes precedence.

Procedure
1. Navigate to Content Management > Sites.
2. Open the site.
3. If not already included, add the Meta Tags related list to the form.
4. In the Meta Tags related list, click New.
5. Enter a Name and Content for the tag.
6. Click Submit.

Configure DIV-based layouts
After you create your site, you can change the site layout with DIV tags.

Before you begin
Role required: content_admin or admin

About this task
Many web page layouts use tables for a consistent look and feel. Tables are effective for numbers and statistics, but can be limiting for designing other types of information. DIV tags are flexible block-element tags. To use DIV tags for layouts, give the tag an ID and assign attributes using CSS.

Changing to CSS and DIV tags help in the following ways:

• simplify code
• reduce the amount of code
• increase page load speed
• separate content from presentation
• help pages adapt to different device resolutions
• make pages easier for search engines to crawl
• make code more compliant with evolving web page design standards
A theme named **Administration Theme - Charcoal** is included as an example of CSS-driven, DIV-based layouts. To view the **Administration Theme - Charcoal** DIV-based layout, complete the following steps.

**Procedure**

1. Navigate to **Content Management > Design > Layouts**.
2. Click **Admin 1 Column**
3. Review the code.

**Content meta tag hierarchy**

Page and site level meta tags are included in a content meta tag hierarchy.

**Site and page level tags**

CMS supports page level and site level tags. The system behavior is to show the sum of all page level and site level tags. For example, if you have two tags on the site and one tag on the page, all with different names, you see three tags on the page. Two are from the site and one is from the page. If both the site and the page have a tag of the same name, only the page tag is used.

⚠️ **Note:** The Content Management System does not support some commonly used meta tags. For example, you cannot use the X-UA-Compatible meta tag, which allows you to specify which version of Internet Explorer a site should be rendered in.

**Example: all tags have unique names**

<table>
<thead>
<tr>
<th>Site Level</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Content</td>
<td></td>
</tr>
<tr>
<td>breakfast</td>
<td>eggs</td>
<td></td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Page Level</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Content</td>
<td></td>
</tr>
<tr>
<td>dinner</td>
<td>steak</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Content</td>
<td></td>
</tr>
<tr>
<td>breakfast</td>
<td>eggs</td>
<td></td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
<td></td>
</tr>
<tr>
<td>dinner</td>
<td>steak</td>
<td></td>
</tr>
</tbody>
</table>
Example: page level tag overrides site level tag

<table>
<thead>
<tr>
<th>Site Level</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>eggs</td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Page Level</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>lunch</td>
<td>tacos</td>
</tr>
<tr>
<td>dinner</td>
<td>steak</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>eggs</td>
</tr>
<tr>
<td>lunch</td>
<td>tacos</td>
</tr>
<tr>
<td>dinner</td>
<td>steak</td>
</tr>
</tbody>
</table>

Content Management integration points

Integration points use content blocks in CMS to link different applications together using static and dynamic methods.

By using integration points, users can connect to different systems from a single page. The power of the CMS is that it can display any data within the ServiceNow platform. The ESS portal, for example, connects users to a service catalog, a knowledge base, and a help and incident reporting site. Each section contains a set of links to additional content. List blocks offer the easiest way to display data dynamically. Content types define how lists link to the detailed data they reference.

Generating lists from the ServiceNow platform is straightforward, especially if you use filtering. When the CMS was first introduced, lists were the only method available to create navigational systems for sites. Content types define system record links using specific templates to define the list and the details.

- Summary template: defines the list
- Detail template: defines the detail as it is rendered in a page.

The templates work together to pass data attributes or unique record identifiers (sysid) into a single detail page that manages the data. Any attribute variations use the URL sent to the page.

Understanding how content types work can mean the difference between a site with 20 pages versus a site with 200 pages. There is a time for both types.
of data calls. Depending on the task, there are appropriate times to use static content and times for dynamic methods.

**View links between system elements and URLs**

You can view the links between your system elements and their URLs to render more specific content within your site.

**Before you begin**

Role required: content_admin or admin

**About this task**

See the [page](#) for an overview of URL syntax in the ServiceNow platform.

The Incidents list offers a quick example of viewing a form within its own tab. This viewing method illustrates how to append the URL string to render more specific content within your site.

**Procedure**

1. Navigate to **Incident > All**.
2. Right-click in a blank area within the content frame and select **Open Frame in New Window** or **Open Frame in New Tab**.

   The URL returned looks similar to this example.

   `<instance_name>/incident_list.do?
sysparm_userpref_module=b55b4ab0c0a80009007a9c0f03fb4da9`

   The URL is comprised of the following elements.

   - **incident_list.do?** is the call to the list with no parameters passed into it. Explore context menu options and list filtering variations to see how the URL string is appended with each action.
   - **incident_list.do?sysparm_query=&sysparm_view=ess** is an example of how the view is passed in the URL string.
   - **incident_list.do?sysparm_query=GROUPBYactive&sysparm_view=** is how the URL looks when the **group by** option is chosen from the context menu.
   - **incident_list.do?sysparm_query=category%3Dsoftware** is the result of applying a **category is software** filter to the list.

   Explore all the options available within the right-click menu. Click through to the Incident form itself (incident.do) to see what the URL string does when parameters are passed into it.
Element link examples

View examples that show how to create a site pointing to various system data in several different data tables.

The following examples illustrate setting up access to the following system data.

- Knowledge: building a versatile front end for a knowledge base, from overview page to variations on the list definitions used in the site.
- Catalog: ideas for a business-to-consumer shopping experience that pulls various items and forms from your service catalog.
- Service Portfolio: using the business service portfolio to contain all defined services offered by your organization.
- Featured reports: methods for linking to the most important reports.

Example links to system data

Page source view

Use the tools available in your browser to view the frame source page and understand what URL address bars pass between system frame sets.

The Firefox browser, for example, has the developer tools option. This option provides an easy way to view records that render within the main content frame (`gsft_main`) of the ServiceNow platform. Also, Firefox quickly builds menus and links to records within the system.
This Firefox functionality is useful when stepping through the menu items section.

Static methods

Static methods in the CMS application were created for ease of use.

Form-based menu management and WYSIWYG code editing can be useful to both advanced and entry-level users. The technical ability of subject matter experts (SMEs) managing the language of your site can vary considerably. Letting SMEs write the content and having a technical resource manage the linking expedites menu and link creation within the system.
Navigation Menu Links

Use base system templates to group similar links for placement on the page. Though the terminology is different (menu sections and menu items), this type of linking behaves the same way as content links. For more information on creating a navigation menu block, see Create a navigation menu block.

Static HTML Details

Content blocks that are useful for areas administered by developers unfamiliar with HTML or markup. Anyone familiar with markup can use dynamic blocks because they are extendable. For more information on static HTML, see Using Content Blocks.

Content Links

The predecessors to navigation menus from when the CMS was first introduced. Use content links to make navigational links by defining several content links under the same category. Then, call the links as a list referencing the Content Link [content_link] table.

iFrame Details
Used both dynamically and statically throughout the system. Using them is an easy way to bring any form or list into your CMS pages. For more information on iFrame methods, see Using Content Blocks.

**Dynamic methods**

While static methods are a powerful navigational tool, you have more control over data rendering using the dynamic methods.

Reference common code in the system to make long-term maintenance of the site easier. Coding skills are useful when implementing dynamic methods.

**Static and dynamic methods**

**Dynamic Blocks**

These blocks are where the majority of your work resides. For more information, see Configure dynamic blocks.

**Frames**

Frames are meant to be decorative wrappers around any block in the system. They are mentioned with dynamic blocks because frames are essentially UI macros with the category of Frame. Frames apply the \$\{body\} variable to a block and define where the block is inserted when rendered on the page.
Lists

Lists generate links to records based on the filtering rules you define. Lists can be sorted for presentation by any field in the corresponding record. Lists help supplement navigation and pull data from outside the CMS. For more information, see Customize the list block.

Content Types

Content types provide site-specific control of how system data defined as templates is rendered. The rendering of lists is considered first (summary templates). The next consideration is the detail template, which allows control over the record rendering.

List Definitions

List definitions enable you to extend the summary template defaults defined on the site level. Used with frames, list definitions render the same data differently based on the placement on the page or site. For more information, see Configure list definitions.

Detailed Content

Detailed content in page detail settings) are blocks that display the content of an existing document as a block on a content page. For more information, see Configure a detailed content block.

Example integration points

Each element on the page links to a specific URL point.

Business Services links to a content page (CMS page referenced: Business Service Portfolio, URL: business_service_category.do) that pulls the system service catalog homepage into a frame within the content area. Each link within this section uses the browse by category page, where you pass in the name of the category to return results.
• Target page iFrame URL: catalog_home.do?
sysparm_nameofstack=aabdae07ef22100914304167b22567d&sysparm_view=business&sysparm_clear_stack=yes

• Target page frame name: gsft_main
  ◦ Desktop Computing URL: category_browse.do?category=Desktop Computing
  ◦ Business Applications URL: category_browse.do?category=Business Applications
  ◦ Communications Services URL: category_browse.do?category=Communications Services
  ◦ Infrastructure Services URL: category_browse.do?category=Infrastructure Services
  ◦ Hosting Services URL: category_browse.do?category=Hosting Services

**Featured Services** links to a content page which pulls a small subset of services into an iFrame.

• iFrame URL: com.glideapp.servicecatalog_category_view.do?
sysparm_parent=d67c446ec0a80165000335aa37eafbc1&sysparm_view=

• Frame name: gsft_main
  ◦ Install Software URL: catalog.do?
    url=com.glideapp.servicecatalog_cat_item_view.do?
sysparm_id=10d69689c611227600ffeba41c664824
  ◦ Email Account URL: catalog.do?
    url=com.glideapp.servicecatalog_cat_item_view.do?
sysparm_id=d67a86b6c0a80165009386c752cd4a09
  ◦ Electronic Messaging URL: catalog.do?
    url=com.glideapp.servicecatalog_cat_item_view.do?
sysparm_id=533798810a0a0b2600f1a03593e19058
  ◦ VPN RSA Token URL: catalog.do?
    url=com.glideapp.servicecatalog_cat_item_view.do?
sysparm_id=d67b099ac0a80165019d0c276b772502
  ◦ Shared Storage (SAN) URL: catalog.do?
    url=com.glideapp.servicecatalog_cat_item_view.do?
sysparm_id=cedd458a0a0b8300c3b1e32e7a3ac2

**Reporting** links to a content page that pulls the reports page into an iFrame. All links within this menu leverage homepages in the system, which creates an issue with the home.do URL. Notice in the following links that ../ is used to create a relative URL outside of the CMS site home.do definition. Without this path, the site homepage would render within the iFrame.
Content Management testing

Test your site to ensure that all pages display correctly, links go to the specified address, and images are not broken. It is important to test the site as you build it. Do not wait until just before launch to begin testing.

Also, test templates as you create them so any issues are resolved before creating other content based on the templates. Recruit as many people as possible to help you test.

Here are some general site testing guidelines:

• Test on the browsers and platforms your site visitors use
• Test on various monitors (for example, LCD and CRT)
• View pages using different screen resolutions
• View pages using different color settings
• Test all navigation and links
• Test items that can be downloaded (for example, PDF files)
• Test the search functionality
• Test site security
• If necessary, test for accessibility (for guidelines, see the W3C Website Accessibility Initiative)
Global search in Content Management

When you add global search to a CMS site, two different search result blocks can display, depending on the user role: global or no global.

Roles are defined at **System Properties > Global Text Search**.

- **Search Results (Global)**: For users with permission to use the global search within the normal frame set. The normal frame set is defined as the default, non-CMS user interface with the set of frames.
- **Search Results (No Global)**: For users without permission to use the global search. Searches only the knowledge base and the catalog.

The header search bar and the Search dynamic block in the base system both automatically handle the permissions and direct the user to the appropriate search results. In the base system, the search result blocks are deployed on the same Search Results content page.

In order for the global search to work properly, it is important to ensure that the DEFAULT directs users to a working content page. If not, the results from the global search link back to the frame set, not to pages within the CMS site.

⚠️ **Note**: The global search is similar to the normal frame set user interface and ties to the same roles ().

**Search Results (Global)**

Before you use the **Search Results (Global)** dynamic block, define content types to control the behavior a search result is clicked. If no content type is defined for a table, selecting a link on that table renders the results according to the DEFAULT content type. It is good practice to point the DEFAULT content type to a page with a normal "Current Document" detailed block. Set the content type detail (Detail Template field) to have just an iFrame.

The **Search Results (No Global)** dynamic block does not require any additional configuration.

**CMS translation**

You can translate CMS sites by activating internationalization plugins and manually translating custom interface strings.

Two tables support the translation of a CMS site into other languages.

- **Translated Name / Field [sys_translated]**: Stores strings that are shared or commonly used within a site. These include menu section names, menu item names, site breadcrumb names, link names, and footer menu links.
Internationalization plugins typically provide translations for these strings. See Localization settings.

- Translated Text [sys_translated_text]: Stores unique string translations which you create when you manually translate interface elements. See.

**View a translated CMS site**

Activating an internationalization plugin provides a quick way to see translated strings for CMS menus, breadcrumbs, and links. For a full translation, you must translate the instance manually.

**About this task**
The following example explains how to view a translated site in Japanese.

**Procedure**

1. Navigate to System Definition > Plugins.
2. In the Go to filter, select Name, enter i18N, and then press the Enter key.
3. Activate both the I18N - Japanese Translations and the I18N: Knowledge Management Internationalization Plugin v2 plugins.
4. Refresh the browser.
6. Browse the site to see the translated language strings.
7. Navigate to the ESS Portal. The path is: http://Instance Name.service-now.com/ess/.
8. Browse the site to see the translated language strings in the ESS Portal.

**Related information**

**Conversational Interfaces**

Enable your users to engage with live agents, virtual agents, or both using ServiceNow® Conversational Interfaces. These interfaces provide tools for creating and managing optimal conversational experiences for your users, in the chat channels that they prefer.

**Conversational Interfaces operational impact**

Conversational Interfaces includes Virtual Agent and Live Agent. These interfaces empower you to enable the solutions that you prefer for your
organization. You can reach your operational goals and improve end-user satisfaction in the following ways:

- Achieve greater levels of productivity and satisfaction by simplifying and automating your user experiences.
- Increase scalability of your organization, as well as user productivity, with automation support.
- Enable your technicians and agents to better manage their daily interactions and workload.
- Integrate with a number of messaging channels that are already familiar to your users.
- Monitor user engagement analytics and metrics with a configurable dashboard.

Conversational Interfaces applications, features, and channels

For first time set up, you can access the Conversational Interfaces guided setup interface that walks you through setting up and configuring your conversational interfaces. Conversational Interfaces are available to support organizations throughout your enterprise with applications, features, and supported channels, including:

Conversational Interfaces Guided Setup

Work through the steps necessary to setup and configure your conversational interfaces for the first time with this helpful interface.
Create a personalized setup process for the conversational interface features you need.

**Workspace Agent Chat**

Provide your agents with a workspace that has built-in productivity features for engaging with customers. Your agents can:

- Use shortcuts, known as **quick actions**, for common activities, such as transferring a chat to another queue or displaying contextual info related to the chat.
- Reuse common responses, such as greetings or answers to frequent questions, with **response templates**.
- Get possible solutions for issues, derived from searches of related issues in Knowledge articles, Q&A, and previous incidents or cases with **Agent Assist**.
- Interact with customers in their native language using **Dynamic Translation for Agent Chat**.
- Manage work assignments delivered to agents’ inboxes, enabling them to set their availability and accept, reject, or transfer chats.
- Trigger a Virtual Agent self-service topic that walks end users through a task with **Agent Autopilot**.
- Provide agents with the option to add work notes or updates after they finish a support session with **Interaction wrap up**.

**Advanced Work Assignment**

Automatically assign and route work to your agents by using work item queues, routing conditions, and other items that affect your support staff, such as agent availability, agent work history, relationships with certain customers, capacity, and skills.

Advanced Work Assignment provides supervisors with management tools to:

- Set the service channels you prefer, such as chat, messaging for assigning work to your agents, and more.
- Monitor agent presence, capacity, and unassigned work items. You can also Reassign chats that timeout.
- Privately converse with agents to provide guidance or assistance during support chats or publicly join customer chats as needed with **Agent Whisper**.
• Automatically handle queue overflows.
• Set the controls that agents use to set their availability and accept or reject work items with inbox controls.

Virtual Agent

Augment customer service with a virtual agent that handles common support issues, using pre-built conversations.

• Determine the pre-built Virtual Agent conversations best suited for your organization through a quick analysis of your incidents and cases using Topic Recommendations.

• Create bot conversation flows using Virtual Agent Designer.
  ◦ Use Natural Language Understanding (NLU) models, including multi-language support.
  ◦ Extend search functionality in conversations using AI Search.
  ◦ Reuse subflows created in Flow Designer.
  ◦ Update ServiceNow NLU models from Virtual Agent Designer.
  ◦ Use categories to manage how topics are organized and displayed.

• Transfer to Live Agent.

• Control Virtual Agent chat experiences for end users with Custom Greetings and setup.

• Use Virtual Agent to intercept and resolve common incidents and issues submitted by users with Incident Auto-Resolution.

• Access the Custom Chat Integration Framework.

Conversational channels

Several supported channels are available across conversational products, including:

• Synchronous – Chat channels such as, web client, ServiceNow mobile, pre-built conversational integrations.

• Asynchronous – Messaging channels for long running conversations.
  ◦ SMS channel.
  ◦ Web and mobile channel configured for messaging rather than chat.

• Conversation management based on channel type.
◦ Conversation timeouts for chats in Virtual Agent and Agent Chat.
◦ Conversation timeouts for long-running chats.

Conversational integrations

Run Virtual Agent or Agent Chat in chat or messaging channels familiar to your users, using integrations for Slack, Microsoft Teams, and Workplace by Facebook.

If you’re using messaging channels different from the supported pre-built channels, you can create custom integrations for them.

Conversational analytics

Use pre-built dashboards to monitor user engagement with Virtual Agent conversations and metrics related to Agent Chat.

Conversational Interfaces benefits

User satisfaction

Provide better self-service by helping users and customers get what they need quickly with always-on, omni-channel experiences.

Enable your users to get immediate help, day or night, with Virtual Agent.

Boost user and customer satisfaction by offering a personalized Virtual Agent experience, whereby user information is remembered and applied during the conversation.

Increased productivity

Fuel agent and technician productivity with Workspace Agent Chat and its built-in productivity features.

Users and customers contacting support also reap the benefits of this productivity by experiencing a seamless, quick, and professional response to requests and issues.

Automation support

Scale your support organizations and deliver great experiences for your users, customers, and your agents and technicians with Advanced Work Assignment.

Manage queue overflows by automatically assigning and routing work to available agents.
Configure work to route to agents with special skills to handle an interaction or to agents with an interaction history with a particular user or customer.

Connections and Credentials

Credentials and connection information are required to gain access to a computer or network device for Discovery, Service Mapping, and Cloud Management or to perform work using Orchestration. When adding content to Share or AppStore, you can configure connections and credentials relevant to your environment without modifying built content.

Introduction to credentials, connections, and aliases

All application integrations in the Now Platform use connections, credentials, and aliases to enable applications to access resources.

Before you can execute an application integration in the Now Platform, you must create and configure connection information, corresponding credentials, and add an alias. To understand how ServiceNow defines these terms:

Connection

A connection is an integration with a system, such as an IP address or endpoint with protocols. It contains specific details, such as database particulars, when integrating with a database.

Credential

A credential is the authentication data required to make the connection, such as an ID and password.

Alias

An alias is a naming convention, or tag, that ties to a set of connections or credentials on your instance. An alias contains the necessary connection and credential information to make an application integration. Rather than enter that information every time you integrate, you can use an alias. For example, you can designate an alias to house your QA, development, and production credentials for the same application integration. The alias resolves the application integration for each environment. The Now Platform distinguishes different types of aliases:

Credential Alias

This alias associates to credential data only, and resolves during runtime.

Connection and Credential Alias

This alias associates to connection information and the credential data required to complete the integration, and resolves during runtime.

Within connection and credential aliases, you can also create additional aliases called child aliases. Child aliases allow you to create multiple connections within the same application integration. When you create a child alias, the alias you created it under becomes a parent alias. While child aliases inherit properties from their parent alias, child aliases carry their own connection and credential information.
Benefits to using Connections, Credentials, and Aliases

- Central location to store and manage credentials to an external service
- Define once and reuse for multiple platform features
- Minimize configuration of other platform features
- Allow non-administrators to use predefined connections and credentials
- Increased security

Features using Connections, Credentials, and Aliases
The following features use connections, credentials, and aliases:

- Flow Designer
- IntegrationHub
- Cloud Management
- Discovery
- Orchestration
- Service Mapping

You can set up aliases on the Now Platform in one of two ways:

- Using the Connections and Credentials module. See Create a Connection & Credential alias.
- In the Connections dashboard of IntegrationHub. See Add a connection.

Note: IntegrationHub requires a separate subscription. For more information, see Request IntegrationHub.

Credential synchronization on MID Servers

Each MID Server in your network synchronized with the instance keeps a copy of every credential that you create. The Management, Instrumentation, and Discovery (MID) Server is a Java application that enables communication and the movement of data between a ServiceNow instance and external applications, data sources, and services. This synchronization speeds up the reading of credentials when applications like Discovery or Service Mapping need to access multiple devices on the network. The MID Servers synchronize when they find a credentials_reload job in the ECC Queue. The reload job instructs the MID Server to make a SOAP call to the instance to get the entire list of credentials in the Credentials [discovery_credentials] table, including all the field values. To learn more, see MID Server.

The SOAP response that your instance sends to each MID Server also includes custom fields that you added to any credential form that you customized. If
you added reference fields, the data in the referenced table is also sent as part of the SOAP response. This can lead to performance issues when credential synchronization occurs with multiple MID Servers. To control this, manually add these properties to the System Properties [sys_properties] table:

⚠️ **Note:** To change the values in these properties, add them to the System Properties [sys_properties] table. If you do not add them, the system uses the default value.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.snc.credentials_user_fields</td>
<td>Includes all customized fields in credential sync. Set this property to false if you do not want to include the fields that you added to credential forms.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> true</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> true</td>
</tr>
<tr>
<td>com.snc.credentials_recursion_depth</td>
<td>Defines the number of tables to traverse when the credential-sync mechanism collects fields from reference tables. Lower this number if you are experiencing performance issues and you have customized credential forms that include reference fields to tables that also have reference fields.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 3</td>
</tr>
</tbody>
</table>

**Scope protections for Credentials and Connections**

You can classify certain types of Connection & Credential records as belonging to a scope, and extend scope protections to them. These scope policies protect records you create in a table, and prevent interactions with records that are private to another scope.

An **Application** field is available in the Connection [sys_connection] and Discovery Credentials [discovery_credentials] tables for associating these types of records to specific scopes. It is not visible on UI forms in Rome, but you can easily add it to them. To learn more about these record types, and adding the field to their UI forms, see:

- Getting started with connections
- Getting started with credentials
• Credential aliases for Discovery
• Configuring the form layout

Restricting the use of a Connection & Credentials record to a specific scope is important for managing applications that require enforced security. These applications include HR Service Delivery or Security Operations Connection & Credentials records created in scoped administered applications are not visible to admin users. Associating a Connection & Credentials record to a specific application scope affords the following protections:

• Applies Access Control List rules (ACLs) to restricted scopes. To learn more about scoped ACLs, see Access control list rules.

ℹ️ Note: Some applications using scope administration and enforced security may require additional setup. To learn more, see Manage HR roles

• Protects records when queried using a script. If you do a query from the Global scope, and the Connection & Credential record is in a protected scope, it doesn’t appear in the query, unless given access to it.

You can customize and grant access to query-restricted records by using Restricted Caller Access. To learn more, see Restricted caller access privilege settings. Scoping restrictions also apply to all children tables of the Connection [sys_connection] and Discovery Credentials [discovery_credentials] tables. Empty fields and other scopes are not restricted.

ℹ️ Note: Scope protections are only enabled for specific secured scopes to avoid confusion when setting up new records. If someone makes a connection in their scoped application scope, it doesn’t have automatic scope restriction.

**Domain separation and Credentials and Connections**

Domain separation is supported in Credentials and Connections. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.
Support level: Standard

- Includes Basic level support.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview

Credentials are tied to various ServiceNow features which access systems outside the instance. Credentials follow the domain separation tied to the feature employing the credentials.

Connections are protocol-specific information referencing a target host outside the instance. A connection can specify the domain to run an activity.

How domain separation works in Credentials and Connections

Credentials access resources outside of the instance, and are used by the Orchestration, Orchestration, and Orchestration applications. These credentials are not tied to a specific domain, rather, they can be bound to an application and then follow the domain separation that the application uses. Credentials can also be assigned to a MID Server, and then follow the domain separation specified by the MID Server configuration.

Connections access a target host using a JMS, JDBC, or HTTP(s) connection. You can specify global or a specific domain to which the connection belongs.

Related information

Domain separation for service providers

Connection & Credential configuration templates

Enable users with the admin and flow_designer roles to set up spoke integrations with third-party systems using a single, customizable form.

For example, you can set up an OAuth integration, which registers an OAuth provider, generates a token, and creates connection and credential records.
An action designer or developer can use a configuration template to set up the spoke in one place and the system creates the associated records.

**Benefits**

Configuration templates enable:

- Admins or flow designers to set up a complex integrations using a single form.
- Developers to set static values in an integration, simplifying the setup process for admins and flow designers.

**Supported credential types**

You can create configuration templates for integrations with these credential types:

- Basic auth
- API key
- OAuth JWT Bearer grant type
- OAuth Authorization Code grant type
- Custom authentication

**Configuration template components**

**Default Data Template**

Sets static information that applies to every integration. For example, you can set the API and token URL if the value applies to every integration.

**Dynamic Data Template**

Defines the information that the user must complete to set up the integration. For example, you can add user name and password key-value pairs to gather user-defined values.

**Post Processing Script**

Creates additional records required by the integration. For example, if your spoke includes custom tables, you can create records in those tables based on user input in the configuration template. This script executes after the connection and credential records are created.
Demo data
The Connection & Credential Templates [sys_alias_templates] table includes example templates to demonstrate how to set up templates for common authentication types. Use these examples as a guide when creating your own.

Configure a template for OAuth JWT Bearer grant type
This example configuration template sets up Credential and Connection records using the JWT Bearer grant type to authenticate requests to Docusign.

Default data template
Each top-level item in the default data template creates an associated record. The template includes these sections:

- **Credential**: Creates a record in the Credentials table.
- **Connection**: Creates a record in the Connections [sys_connection] table and any associated connection records.
- **Additional**: Optionally creates records in a custom table. The post processing script tells the system what to do with these records.

The following example creates the records required for OAuth JWT Bearer grant type authentication.

```json
{
  "credential": {
    "oauth_entity": {
      "oauth_entity_profile": [
        {
          "grant_type": "urn:ietf:params:oauth:grant-type:jwt-bearer",
          "name": "Docusign Profile",
          "default": true,
          "oauth_entity_profile_scope": [
            "users:read.email"
          ]
        }
      ],
      "code_challenge_method": "S256",
      "type": "consumer",
      "oauth_entity_scope": [
        {
          "oauth_entity_scope": "users:read.email",
          "name": "email"
        }
      ]
    }
  }
}
```
"client_id": "<provider-client-id>",
"use_mutual_auth": false,
"revoke_token_url": "https://<provider-domain-name>.com/oauth2/revoke",

Dynamic data schema

The dynamic data schema defines what the user sees when they create a Connection & Credential alias and collects their input. Use dot-walking syntax to map user input to fields created in the default data template. For example, `connection_fields` maps user input to the `connection_url` field in the `connection` object created by the default data template.

```json
{
  "connection_fields": [
    {
      "name": "connection.connection_url",
      "label": "Connection URL",
      "type": "text",
      "defaultValue": "https://demo.docusign.net",
      "hint": "Connection URL for Docusign"
    }
  ],
  "additional_fields": [
    {
      "name": "additional.docusign_account_id",
      "label": "Docusign Account Number",
      "type": "text",
      "hint": "Docusign Account Number"
    },
    {
      "name": "additional.docusign_account_name",
      "label": "Docusign Account Name",
      "type": "text",
      "hint": "Name to identify the Docusign account"
    }
  ]
}
```
{  
  "name": "additional.docusign_account_email",
  "label": "Docusign Account Email",
  "type": "text",
  "hint": "Docusign Account Email"
},
"credential_fields": [
  
  {  
    "name": "credential.oauth_entity.client_id",
    "label": "OAuth Client ID",
    "type": "text",
    "hint": "Client ID for Docusign"
  },
  {  
    "name": "credential.oauth_entity.redirect_url",
    "label": "OAuth Redirect URL",
    "type": "text",
    "defaultValue": "https://<instance-name>.service-now.com/oauth_redirect.do",
    "hint": "Callback URL for Docusign"
  },
  {  
    "name": "credential.jwt_provider.jwt_claim_validation[0].value",
    "label": "Issuer (iss) Claim value",
    "type": "text",
    "hint": "The integrator key (also known as client ID) of the application"
  },
  {  
    "name": "credential.jwt_provider.jwt_claim_validation[1].value",
    "label": "Subject (sub) Claim value",
    "type": "text",
    "hint": "The user ID of the user to be impersonated"
  },
  {  
    "name": "credential.jwt_provider.jwt_claim_validation[2].value",
    "label": "Audience (aud) Claim value",
    "type": "text",
    "defaultValue": "account-d.docusign.com",
    "hint": "The URI of the authentication service instance to be used e.g. account.docusign.com"
  },
  {  
    "name": "credential.jwt_provider.jwt_keystore_aliases.kid",
    "label": "Key ID (kid)"
  }
]
Post processing script

The following post processing script maps user input to fields in the sn_docusign_spoke_accounts table.

```javascript
(function execute(aliasId, connectionSysId, jsonDefaultData, jsonDynamicData) {
    var jsonDynamicDataP = JSON.parse(jsonDynamicData);
    var accountGR = new GlideRecord("sn_docusign_spoke_accounts");
    accountGR.setValue("account_name", jsonDynamicDataP["additional.docusign_account_name"]);
    accountGR.setValue("alias", aliasId);
    accountGR.setValue("email", jsonDynamicDataP["additional.docusign_account_email"]);
    accountGR.setValue("id", jsonDynamicDataP["additional.docusign_account_id"]);
    accountGR.insert();
})(aliasId, connectionSysId, jsonDefaultData, jsonDynamicData);
```

Resulting Docusign Connection and Credential configuration form

When the user navigates to the associated Docusign Connection & Credential Alias and selects Create New Connection & Credential, the following dialog appears.
Create a configuration template

Create a template that defines the inputs required to set up a spoke. Set static key-value pairs to create records and set values that apply to every integration. Set dynamic key-value pairs to gather user input and set field values that may vary. Using this template, admins and flow designers can set up the spoke from a single form.
Before you begin
Role required: admin or action designer

Procedure
1. Navigate to **IntegrationHub > Connections & Credentials > Configuration Templates**.
2. Click **New**.
3. Select the type of configuration template you want to create. Selecting a type provides starter data to help you configure the template.

<table>
<thead>
<tr>
<th>Configuration type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP Connection with OAuth Authorization Code grant type</td>
<td>Creates a template to register the third-party system as an OAuth provider using an authorization code.</td>
</tr>
<tr>
<td>HTTP Connection with OAuth JWT Bearer grant type</td>
<td>Creates a template to register the third-party system as an OAuth provider using a JSON Web Token.</td>
</tr>
<tr>
<td>HTTP Connection with Basic Auth Credential</td>
<td>Creates a template to integrate with the third-party system using basic authentication.</td>
</tr>
<tr>
<td>HTTP Connection with API Key Credential</td>
<td>Creates a template to integrate with the third-party system using an API key.</td>
</tr>
<tr>
<td>Other Configuration</td>
<td>Creates a blank template, enabling you to set up a template for custom authentication.</td>
</tr>
</tbody>
</table>

4. In the **Name** field, add a name to easily identify the template.

5. In the **Default Data Template** field, make any required changes. This field sets static information that applies to every integration. For example, you can set the API and token URL if the value applies to every integration.

These objects in the default data template are required:

- `credential`: Creates a credential record with the required fields.
- `connection`: Creates a connection record with the required fields. Access connection attributes using the `extended_attributes` child object. For example:

```json
"connection": {
    "extended_attributes": {
        "api_version": "v1"
    }
```
You can use the additional object to set up data for a custom table, and use the post processing script to insert the data into the table.

**Note:** In the default data template for the OAuth Authorization Code grant type, the values for the `oauth_entity_profile_scope` and the `oauth_entity_scope` keys must match. In the following example, both keys have the Read user's email value.

```json
"oauth_entity_profile": [
  {
    "grant_type": "authorization_code",
    "name": "<provider-name> Profile",
    "default": true,
    "oauth_entity_profile_scope": [
      "Read user's email",
      "email"
    ]
  },

  "code_challenge_method": "S256",
  "type": "consumer",
  "oauth_entity_scope": [
    {
      "oauth_entity_scope": "Read user's email",
      "name": "email"
    }
  ]
]
```

6. In the **Dynamic Data Schema** field, make any required changes. This field defines the information that the user must complete to set up the integration. For example, you can add user name and password key-value pairs to gather user-defined values.

Fields in the dynamic data schema include these properties:

- **name**: The field that the user's input maps to. For example, to map user input to the Connection URL field in the Connection record, enter `connection.connection_url`.
- **label**: The field label. This is the label that the user sees when completing the template.
- **type**: The field type. Make sure that this data type matches the data type of the field you are mapping the value to.

- **defaultValue**: Optional. The field's default value. If no default is provided, the hint displays.

- **hint**: Optional. Hint text to display when there is no default value.

**Note:** If setting up a template for OAuth JWT Bearer grant type authentication, you may want user input for a single key-value pair in the `jwt_claim_validation` array. You can refer to a single key-value pair in the dynamic data schema by referring to its index in the array. For example, your default data template might include this snippet.

```json
"jwt_claim_validation" : [ {
  "name" : "iss",
  "is_standard" : true,
  "data_type" : "string",
  "value" : "<docusign-iss-claim>"
}, {
  "name" : "sub",
  "is_standard" : true,
  "data_type" : "string",
  "value" : "<docusign-sub-claim>"
}, {
  "name" : "aud",
  "is_standard" : true,
  "data_type" : "string",
  "value" : "<docusign-aud-claim>"
}, {
  "name" : "scope",
  "is_standard" : false,
  "data_type" : "string",
  "value" : "signature impersonation"
} ]
```

Refer to the `iss` key-value pair using the item's zero-based index: `credential.jwt_provider.jwt_claim_validation[0].value`.

**7. Optional:** In the **Post Processing Script** field, add a script that creates additional records required by the integration. For example, if your spoke includes custom tables, you can create records in those tables based on user input in the configuration template. This script executes after the connection and credential records are created. The post-processing script has access to these global objects.
<table>
<thead>
<tr>
<th>Global object</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aliasId</td>
<td>Sys_id of the alias record from the Connection &amp; Credential Alias [sys_alias] table.</td>
</tr>
<tr>
<td>connectionSysId</td>
<td>Sys_id of the connection record created by the template.</td>
</tr>
<tr>
<td>jsonDefaultData</td>
<td>JSON content from the <strong>Default Data Template</strong> field in String format.</td>
</tr>
<tr>
<td>jsonDynamicData</td>
<td>JSON content from the <strong>Dynamic Data Template</strong> field in String format.</td>
</tr>
</tbody>
</table>

8. Add the template to a Connection & Credential alias.
   a. Navigate to **IntegrationHub > Connections & Credentials > Connection & Credential Aliases**.
   b. Open the alias record for the spoke.
   c. In the **Configuration Template** field, click the Lookup icon.
   d. Select the template you created from the list.
   e. Click **Update**.

**Results**
When the user navigates to the associated Connection & Credential alias and selects **Create New Connection & Credential**, a dialog appears to collect their input. If you created a template for the OAuth Authorization Code grant type, you can also retrieve an OAuth token from this dialog.

**What to do next**
Test the template by navigating to the associated Connection & Credential alias and selecting **Create New Connection & Credential**. Verify that the dialog collects the expected data and creates the required records in the system.

**Getting started with connections**
Use the connections table to set up a Basic, JMS, JDBC, or HTTP(s) connection to a target host.

**Connection Table**
The Connection table (sys_connection) is the base table for all connection tables. You can set up connections for the following protocols:
• Basic connection for PowerShell and SSH
• JDBC
• JMS
• HTTP(s)

The connection table references the connection alias table, which couples the connection alias to connection information. Every connection records the following information:

**Base connection properties**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the connection. This field must be unique on the table.</td>
</tr>
<tr>
<td>Credential</td>
<td>Specify the credential to use with this connection. This is optional.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>The connection alias resolves your connection and credentials at run time. Only one connection is active per Connection alias at any one time.</td>
</tr>
<tr>
<td>Active</td>
<td>Check to make the current connection active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain to which the connection belongs.</td>
</tr>
</tbody>
</table>

Credential is unique across active connections, if not empty.

**Upgrading connection information**

• The JDBC connection [jdbc_connection] and JMS connection [orch_jms_ds] tables are existing Orchestration connection tables that now extend from the Connection [sys_connection] table. The tables originally extended from sys_metadata. The sys_metadata related data is removed.

• The tables move from the Orchestration run time plugin [com.snc.runbook_automation.runtime] to the Credentials & Connections plugin.

• The upgrade process obtains JDBC and JMS connection information and creates corresponding connection aliases and assigns the alias to its corresponding connection.

• JDBC field name changes:
- JDBC server is renamed to host
- Database port is renamed to port
- Data of the JDBC server and database migrates to host and port during the upgrade

Create a basic connection for PowerShell and SSH

Configure connection information to use with a custom activity or action that uses the PowerShell or Secure Shell (SSH) protocol.

Before you begin
Role required: admin or connection_admin

Procedure
1. Navigate to Credentials & Connections > Connections.
2. Click New.
3. Select Basic Connection for PowerShell & SSH.
4. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the connection record.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the credential record used to authorize the connection.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the alias record to associate with this connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name of the target host where the system runs the activity or action. For example, host.domain.com.</td>
</tr>
<tr>
<td>Active</td>
<td>Select to make this connection active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Determines the domain the activity runs in. Flow Designer does not support domain separation and ignores this field.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Target port used by the connection. If you leave this field blank, the system uses the default port value.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Use MID Server   | Select to connect to the target host through a MID Server. If selected, define fields in the Advanced MID Server Configuration section.  
Note: PowerShell requires a MID Server.                                                                                           |
| MID Selection    | Option to select MID Server as required.  
Note: Ensure that the IntegrationHub connection record is referred, not an Orchestration connection record.                                                                                     |
| Capabilities     | The capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Only displays if Use MID server is selected. Required capabilities determine which MID Server is selected at runtime. To learn more about how a MID Server is selected during runtime, see MID Server selection. This field is visible only when Auto-Select MID Server is selected from the MID Selection list. |
| MID Application  | The application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. Only displays if Use MID server is selected.  
To learn more about how a MID Server is selected during runtime, see MID Server selection.                                                                                             |
| MID Server       | Specific MID Server on which the step runs. This field is visible only when Specific MID Server is selected from the MID Selection list.                                                                              |

5. Click **Submit**.

Create an HTTP(s) connection

The HTTP(s) connection provides the information custom HTTP(s) actions or activities use to connect.

**Before you begin**

Role required: connection_admin
Procedure

1. Navigate to **Credentials & Connections > Connections**, click **New**, and select **HTTP(s) Connection**.
2. Add the following connection information and click **Submit**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this HTTP(s) connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the credential record used to authorize the connection.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the alias record to associate with this connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.</td>
</tr>
</tbody>
</table>
| URL builder         | Either manually enter the connection URL or use system to build the URL based on the inputs. Default is unchecked. If checked, the connection URL is calculated from the following fields:  
  - Mutual authentication — Check box if mutual authentication is used.  
  - Protocol — If mutual authentication is not used, enter protocol. The default is HTTPs.  
  - Protocol profile — If mutual authentication is used, enter protocol profile from sys_protocol_profile.  
  - Host  
  - Port  
  - Base path — Path of the connection string.  
  
  **Note**: If mutual authentication is checked, connection URL is built: **Protocol + :// + host:port +URL**. If mutual authentication is unchecked, connection URL is built: **Protocol profile + :// + host:port +URL** |
<p>| Connection URL      | If URL builder is unchecked, enter the connection URL into this field.     |
| Active              | Check the box to make this connection active.                               |
| Domain              | Determine the domain the action or activity runs in.                        |
| Use MID Server      | Check to use a MID Server for this action or activity. If selected, define fields in the Advanced MID Server Configuration section. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Selection</td>
<td>Option to select MID Server as required.</td>
</tr>
<tr>
<td><strong>Note:</strong> Ensure that the IntegrationHub connection record is referred, not an Orchestration connection record.</td>
<td></td>
</tr>
<tr>
<td>Capabilities</td>
<td>The capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Only displays if Use MID server is selected.</td>
</tr>
<tr>
<td></td>
<td>Required capabilities determine which MID Server is selected at runtime. To learn more about how a MID Server is selected during runtime, see MID Server selection. This field is visible only when Auto-Select MID Server is selected from the MID Selection list.</td>
</tr>
<tr>
<td>MID Application</td>
<td>The application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. Only displays if Use MID server is selected.</td>
</tr>
<tr>
<td></td>
<td>To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Specific MID Server on which the step runs. This field is visible only when Specific MID Server is selected from the MID Selection list.</td>
</tr>
<tr>
<td>Connection Timeout</td>
<td>Number of milliseconds the system waits for a successful host connection. If a successful connection does not occur during this time, the connection request times out. Leave this field empty to use the system default connection timeout value.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
   You are ready to create a custom HTTP(s) action or activity.

**Create a JDBC connection**

The JDBC Connection provides the information custom JDBC actions or activities use to connect to various target databases.

**Before you begin**

You must have an appropriate JAR file, whether it is supplied with the instance or a custom JAR file.
Note: The ServiceNow instance supplies mysql-connector-java-5.1.21.jar, sql-server-jdbc-4.0.jar, and ojdbc6.jar files as part of the current release, which supports MySQL, SQLServer, and Oracle databases. Other databases, such as Sybase or DB2 Universal, must use a custom JAR file that must be uploaded to the instance before setting the JDBC connection.

Role required: connection_admin

About this task
JDBC credentials are retrieved separately by the activity designer template and support external credential storage, such as CyberArk.

Procedure
1. Navigate to Credentials & Connections > Connections, click New and select JDBC Connection.
2. Complete the form using the fields in the table.
   The database selection in the Format field determines which fields are available.

<table>
<thead>
<tr>
<th>Field</th>
<th>Database Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>All</td>
<td>Unique name of this JDBC connection. For example, you might enter JDBC MySQLProd.</td>
</tr>
<tr>
<td>Credential</td>
<td>All</td>
<td>Add credentials for JDBC provider.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>All</td>
<td>Select the alias record to associate with this connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>All</td>
<td>Maximum elapsed time the JDBC query is allowed to run without a response.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>All</td>
<td>Number of seconds the system waits for a successful JDBC connection. If a successful connection does not occur during this time, the connection request times out. Leave this field empty to use the system default connection timeout value.</td>
</tr>
<tr>
<td>Active</td>
<td>All</td>
<td>Check the box to make this an active connection.</td>
</tr>
<tr>
<td>Field</td>
<td>Database Format</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Domain</td>
<td>All</td>
<td>Domain for this table. By default, the JDBC Connection [jdbc_connection] table runs in the <strong>global</strong> domain.</td>
</tr>
<tr>
<td>Format</td>
<td>All</td>
<td>Database type for this connection. The default choices are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• MySQL</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Oracle</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SQLServer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• None</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can add <strong>Sybase</strong> or <strong>DB2 Universal</strong> to the choice list by uploading the appropriate JDBC driver JAR file to the instance. Orchestration automatically recognizes these drivers when they are loaded into the system and adds them to this list.</td>
</tr>
<tr>
<td>Host</td>
<td>Oracle, MySQL, SQLServer</td>
<td>Host name or IP address of the database server.</td>
</tr>
<tr>
<td>Oracle sid</td>
<td>Oracle</td>
<td>The Oracle database site identifier. The default value is <strong>orcl</strong>.</td>
</tr>
<tr>
<td>Oracle port</td>
<td>Oracle</td>
<td>Port that the Oracle database is using. The default value is <strong>1521</strong>.</td>
</tr>
<tr>
<td>Database name</td>
<td>MySQL, SQLServer</td>
<td>Name of the database.</td>
</tr>
<tr>
<td>Port</td>
<td>My SQL, SQLServer</td>
<td>Port that the selected database is using.</td>
</tr>
<tr>
<td>Instance name</td>
<td>SQLServer</td>
<td>Instance name for the selected SQLServer</td>
</tr>
<tr>
<td>Connection URL</td>
<td>All</td>
<td>URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases.</td>
</tr>
<tr>
<td>Field</td>
<td>Database Format</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> If the format selected is not one of the default databases, you must create the connection URL manually so that the MID Server knows how to create the connection.</td>
</tr>
<tr>
<td>JDBC driver</td>
<td>None, DB2 Universal, Sybase</td>
<td>The JDBC driver to use for this connection when it is not a default database. <strong>Note:</strong> If you add a Sybase or DB2 Universal database, you must enter the driver name in this field and upload the driver JAR file to the instance.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>All</td>
<td>Check to use a MID server for this action or activity. If selected, define fields in the Advanced MID Server Configuration section.</td>
</tr>
<tr>
<td>MID Selection</td>
<td>All</td>
<td>Option to select MID Server as required. <strong>Note:</strong> Ensure that the IntegrationHub connection record is referred, not an Orchestration connection record.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>All</td>
<td>The capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Only displays if Use MID server is selected. Required capabilities determine which MID Server is selected at runtime. To learn more about how a MID Server is selected during runtime, see MID Server selection. This field is visible only when Auto-Select MID Server is selected from the MID Selection list.</td>
</tr>
<tr>
<td>MID Application</td>
<td>All</td>
<td>The application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. Only displays if Use MID server is selected.</td>
</tr>
</tbody>
</table>
### Field | Database Format | Description
--- | --- | ---
 |  | To learn more about how a MID Server is selected during runtime, see [MID Server selection](#). |
MID Server | All | Specific MID Server on which the step runs. This field is visible only when **Specific MID Server** is selected from the MID Selection list. |

3. Click **Submit**.

### Create a JMS connection

Configure your system to use Java Messaging Service (JMS) with a custom JMS activity or action.

#### Before you begin

**Role required:** connection_admin

#### About this task

The MID Server must have the correct JMS connection factories for your organization. Configure those values in the `mid.property.jms.command.allowed_factory_names` property, found in **MID Server > Properties**. The default values for this property can be changed to any value or comma-separated list of values that the third-party JMS provider advertises.

#### Procedure

1. Navigate to **Credentials & Connections > Connections**.
2. Click **New**, select **JMS Connection**, fill in the form, and then click **Submit**:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this connection factory.</td>
</tr>
<tr>
<td>Credential</td>
<td>Add credentials for JMS provider.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the alias record to associate with this connection. Using an alias enables you to update the connection record without having to recon-</td>
</tr>
</tbody>
</table>

### Create connection attributes for IntegrationHub

Define connection-specific variables that you can use in IntegrationHub integration steps.

**Before you begin**

- The admin role is required to create connection attributes.
- The connection_admin or admin role is required to assign attribute values.
- The action_designer or admin role is required to use attributes in a custom action.

Connection attributes are only used by integration steps, which require a subscription to IntegrationHub. For more information about activating IntegrationHub, see Request an IntegrationHub plugin.

**About this task**

When using an integration step, you must establish a connection with an external system. Use a Connection & Credential alias instead of defining the connection inline. An alias enables you to update the connection details once without having to reconfigure every action. Any action step that uses an alias inherits the attributes associated with it. Flow Designer displays attributes as data pills that you can drag into your action step. For example, you can create a page size attribute that becomes a REST step query parameter.

For more information about building custom Flow Designer actions, see Action Designer.

---

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>application. Only displays if <strong>Use MID server</strong> is selected.</td>
</tr>
<tr>
<td></td>
<td>To learn more about how a MID Server is selected during runtime, see <strong>MID Server selection</strong>.</td>
</tr>
</tbody>
</table>

3. Navigate to **Connections & Credentials > Credentials**.

4. Click **New**, select **JMS Credentials**, and then provide the user name and password the MID should use to communicate with the JMS provider. For more information, see **JMS credentials**.

5. Click **Submit**. You are ready to create a custom JMS action or activity.
Procedure

1. Navigate to **Credentials & Connections > Connection & CredentialAliases**.
2. Create or select an alias record.
3. From the Connection Attributes related list, click **New**. The Connection Attributes form opens.
4. Define the attribute label and field type. For a list of field types, see **field types**.
5. Click the Advanced view related link to set advanced dictionary preferences for the attribute.
   For example, to create an attribute with a dynamically calculated value. See **Dictionary entry form**.
6. Click **Submit**.
7. Define the attribute values in the connection record.
   a. Navigate to **Credentials & Connections > Connections**.
   b. Create or select a connection record with the same connection type as the alias.
   c. From **Connection alias**, select the alias with connection attributes.
   d. Save the record.
      The Attributes tab populates with the connection attributes defined in the alias record.
   e. Set values for the attributes.
      If the alias has **Support Multiple Active Connections** enabled, you can associate more than one connection record with an alias and define attribute values in each connection record. If there are multiple connection records with attribute values for the same alias, the connection used when the flow executes determines the attribute values. For example, suppose that you have one action that uses an alias with two active connections endpoints: production and test. The attribute resolves to the value defined by the connection used at runtime.
8. Add the alias to an integration step in Action Designer.
   a. Navigate to Flow Designer and create or select an action.
   b. Add an integration step to the action.
   c. Under Connection Details, add the alias you created attributes for.
The connection attributes associated with the alias display as data pills in the Data pane.

**Note:** The system does not track changes to connection attribute labels and data types after you associate the alias to a step. To refresh the connection attribute label or data type, delete the alias from the step and add it again.

## Getting started with credentials

The MID Server uses the credentials you create in the Credentials [discovery_credentials] table to access resources for Discovery, Orchestration, Service Mapping, and Cloud Management.

### How MID Servers use credentials

By default, Windows MID Servers use the login credentials of the MID Server service on the host machine to discover Windows devices in the network. You should configure these service credentials so that they have at least local administrator privileges. For Linux and UNIX machines and network devices, the MID Server uses the SSH and SNMP credentials configured in the instance in **Discovery > Credentials**.

MID Servers that Orchestration uses must have access to the necessary credentials to execute commands on computers in the network, as specified by the **Workflow activities**. Orchestration can use the same SSH and SNMP credentials as Discovery, but has two additional credentials designed for specific Workflow activities: Windows (for PowerShell) and VMware.

### Encryption and decryption

The platform stores credentials in an encrypted field on the Credentials [discovery_credentials] table. Once they are entered, they cannot be viewed.

When the MID Server requests credentials, the Now Platform decrypts the credentials using the following process:

1. The credentials are decrypted on the instance with the password2 fixed key.
2. The credentials are re-encrypted on the instance with the MID Server's public key.
3. The credentials are encrypted on the load balancer with SSL.
4. The credentials are decrypted on the MID Server with SSL.
5. The credentials are decrypted on the MID Server with the MID Server's private key.
Note: The platform does not have separate encryption keys for multi-tenant instances.

**Credential order**

Credentials can be assigned an order value in the Credentials Form, which forces the application to try all the credentials at their disposal in a certain sequence. If you do not specify an order value, the application tries the credentials in the Credentials [discovery_credential] table randomly, until it finds one that works. For example, when:

- Orchestration attempts to run a command on an SSH server, such as a Linux or a UNIX machine.
- Discovery attempts to query an SNMP device, such as a printer, router, or UPS.

After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity [dscy_credentials_affinity] table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.

Note: If Orchestration and Discovery are installed, and credential alias is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.

Ordering credentials is useful in the following situations:

- The credentials table contains many credentials, with some used more frequently than others. For example, the table contains 150 SSH credentials, and five of those credentials are used to log in to 90% of the devices. It is good practice to configure those five credentials with low-order numbers, which place them at the top of the execution list. Discovery and Orchestration work faster when they try these common credentials first. After the first successful connection, the Now Platform knows which credentials to use the next time for each device.

- The Now Platform has aggressive login security. For example, configure database credentials with a low-order value if Solaris database servers in the network only provide three failed login attempts before locking out the MID Server.

**Credential aliases**

Credential aliases are available for Discovery and Orchestration.
Aliases for Discovery enable an administrator to:

- Employ a credential filtering behavior with configurable levels of compliance.
- Assign multiple credential aliases to a Discovery schedule.
- Prevent the creation of credential affinities that use inappropriate or sensitive credentials. To learn more, see credential affinities.

Aliases for Orchestration enable workflow creators to:

- Assign individual credentials to any activity in an Orchestration workflow
- Assign individual credentials to any action in Flow Designer
- Assign different credentials to each occurrence of the same activity type in an Orchestration workflow.
- Assign different credentials to each occurrence of the same action in designer flow.

**External credential stores**

If you do not want credentials stored in your instance, you can use external credential repositories. External credential stores save the credentials in an external site that your instance can access. CyberArk is the only supported external credential store. However, other external stores can be configured using the ServiceNow API.

**Create a Connection & Credential alias**

Define an alias to label a credential or connection record.

**Before you begin**

- The admin role is required to create an alias.
- The credential_admin and connection_admin roles have read access to the alias record.

**About this task**

The Connection & Credential alias defines an alias that labels a credential or connection record. The alias contains these fields.

**Procedure**

1. Navigate to Credentials & Connections > Connection & Credential Aliases.
2. Click New.
3. Complete the fields on the form.
## Connection & credential aliases

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the alias. An alias can only contain alpha, number, and underscore characters. During an upgrade, the tag in the credential record migrates to a Connection &amp; Credential Alias. If the credential tag contains special characters other than alphabets, numbers, and underscores, it preserves the tag name after the upgrade. You can still use this migrated alias, but you cannot update the alias until you change the name to meet the naming restrictions.</td>
</tr>
<tr>
<td>ID</td>
<td>Unique identifier for the Connections &amp; Credentials alias, based on the format <code>scope_name.alias_name</code>.</td>
</tr>
<tr>
<td></td>
<td>• If the scope is Global, the ID is the alias name. For example, if you create a Workday alias in the global scope, it sets the ID to <code>workday</code>.</td>
</tr>
<tr>
<td></td>
<td>• If you create a workday alias in the HR app scope, it sets the ID to <code>x_hr_app.workday</code>.</td>
</tr>
<tr>
<td>Type</td>
<td>Select either <strong>Credential</strong> or <strong>Connection and Credential</strong>. The default is Connection and Credential.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope against which the Connection &amp; Credentials alias is assigned. The current session scope you last selected in the application picker appears.</td>
</tr>
<tr>
<td></td>
<td>• For example, <strong>Global</strong> appears if it is the current scope for this session.</td>
</tr>
<tr>
<td></td>
<td>• You can change the scope in the application picker before creating an alias. To learn more application scopes and how to select them, see:</td>
</tr>
<tr>
<td></td>
<td>◦ Application scope</td>
</tr>
<tr>
<td></td>
<td>◦ Select an application from the application picker</td>
</tr>
<tr>
<td>Connection type</td>
<td>Name of the connection type, either Basic, HTTP, JDBC, JMS. The default is HTTP.</td>
</tr>
<tr>
<td>Support Multiple Active Connections</td>
<td>Designator that indicates whether the alias supports multiple active connections. Add connections using the Connections table and associated them to the alias using the Connections related list.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Default Retry Policy</td>
<td>Retry policy for the alias. For more information, see <a href="#">Retry policy</a>.</td>
</tr>
<tr>
<td>Configuration Template</td>
<td>Configuration template to use to create a connection and credential record.</td>
</tr>
</tbody>
</table>

4. Click **Save**.
The Connections and Connection Attributes related list appears.

<table>
<thead>
<tr>
<th>Related List</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connections</td>
<td>Related connection records associated with this alias. After creating the alias, you can define connection records and associate them with the alias. If <strong>Support Multiple Active Connections</strong> is selected, you can associate more than one connection with an alias.</td>
</tr>
<tr>
<td>Connection Attributes</td>
<td>Attributes for the connection. Define data specific to a connection and use it in an IntegrationHub integration step. For more information, see <a href="#">Create connection attributes for IntegrationHub</a>.</td>
</tr>
<tr>
<td>Child Aliases</td>
<td>Child aliases associated with the parent alias. After creating a connection and credential alias, you can create child alias to configure multiple connections for the same application integration.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Related list</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connections</td>
<td>Related connection records associated with this alias. After creating the alias, you can define connection records and associate them with the alias. If <strong>Support Multiple Active Connections</strong> is selected, you can associate more than one connection with an alias.</td>
</tr>
<tr>
<td>Connection Attributes</td>
<td>Attributes for the connection. Define data specific to a connection and use it in an IntegrationHub integration step. For more information, see <a href="#">Create connection attributes for IntegrationHub</a>.</td>
</tr>
</tbody>
</table>

5. **Optional:** If you want to create a new credential and connection associated with your credential alias, under **Related Links**, click **Create New Connection & Credential**.
The resulting connection and credential records are based on a pre-defined configuration template. See connection and credential configuration templates.

6. Optional: If you want to create a child alias for your connection and credential alias, under the Child Aliases related list, select New.

   a. Enter a name for the child alias and select Submit. The child alias inherits properties from the parent alias. You can then configure a child alias to contain its own set of connection and credential information.

What to do next
Create one or more connection records to associate with the alias or child aliases. For more information about creating connections, see Getting started with connections. Add connection attributes to the alias to make connection meta data available to flows in Flow Designer.

Credential aliases for Discovery
Credential aliases for Discovery allow an administrator to use specific credentials on Discovery schedules. You can configure behaviors for your aliases that determine how strictly the system enforces their use.

Without credential aliases, Discovery schedules can access all credentials that are defined in the instance. This behavior might not be desirable in some circumstances, particularly for credentials with elevated privileges. Credential aliases provide more control over which credentials a Discovery schedule is allowed to use and prevents the unnecessary exposure of credentials with elevated privileges.

How credential aliases work
A business rule called Insert Discovery Affinity & Cred Aliases (previously named Insert Discovery Affinity) runs when a record is inserted into the ECC Queue. The business rule attaches the credential aliases defined in the Discovery schedule to the probe, so that the MID Server can perform credential filtering.

The MID Server's first task is to create the list of credentials to search. It filters the credentials by affinity and then by tags, if any exist. The affinities go to the top of the list, and the matching tags go to the bottom of the list. The MID Server iterates through the list until it finds a credential that works. The MID Server then creates an affinity for this credential.

If the business rule determines that an affinity exists for the device, the rule identifies the proper credential_id to use. This is the sys_id of the record in the Credentials [discovery_credentials] table. When the platform encounters an
affinity with a credential alias value, defined as `credential_alias` in the business rule, the business rule determines whether or not the credential referenced by the affinity has the specified alias. If it does, the business rule selects the `credential_id` of the alias and passes that value to the MID Server. If the credential does not have the specified credential alias, any other affinities that exist for the target system are checked.

Create a Discovery credential alias

Create the alias and then add that alias to a credential in the credential record. You can add a credential to multiple aliases and add multiple credentials to a single alias.

Before you begin

Role required: admin, credential_admin (read access only), connection_admin (read access only)

About this task

A Discovery schedule only uses credentials that are contained in the aliases defined for that schedule.

Note: If a credential alias is defined for a schedule, it will ignore any previously existing credential affinity between the credential and the target that is discovered in a schedule that is setup to use that credential alias.

Procedure

1. Create an alias.

   b. Click New.

   c. Enter a unique name for the alias and select Credential for the alias Type.

   d. Click Submit.
The **Credentials** related list appears. You can add new credentials for this alias in this list but not existing credentials.

2. Configure a credential for the new alias.

   **a.** Navigate to **Connections & Credentials > Credentials**.

   **b.** Select an existing credential from the list or click **New** to create a new credential.

   **c.** In the credential record, unlock the **Credential alias** field and select the alias you created.
d. Save or submit the record.

3. Return to **Connections & Credentials > Connection & Credential Aliases** and open your new alias. The credential you attached to the alias now appears in the related list.

4. To create an additional credential for this alias, click **New** in the related list and select a credential type.
The alias name is pre-populated in the **Credential alias** field of the credential record.

5. Complete the fields in the form and submit the record.

**Credential aliases for Orchestration activities**

Credential alias gives an administrator more control over the credentials used in Orchestration activities.

This is useful when an activity requires specific credentials to perform a task. You can use a credential tag to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.

Credential alias interacts with **credential affinity** to determine which credentials should be used for an Orchestration activity.

**How credential alias works**

A **business rule** called *Insert Discovery Affinity* (renamed from *Insert Credential Affinity* in the Geneva release) runs when a record is inserted into the ECC Queue. This rule determines whether a credential affinity exists for the device and identifies the proper `credential_id` (the `sys_id` of the record in the **Credentials [discovery_credentials]** table) to use. When the platform encounters an affinity with a credential alias value defined (`credential_alias` in the business rule), the business rule determines if the credential referenced by the affinity has the specified alias. If it does, the business rule selects the `credential_id` of the credential alias and passes that value to the MID Server. If the credential does not have the specified credential alias, any other affinities that exist for the target system will be checked. If no affinity references an appropriately tagged credential, the MID Server iterates through the **Credentials [discovery_credentials]** table and selects the credential with the appropriate tag. The MID Server then creates a new affinity for this credential.

**Create and test your credentials**

Create and test the credentials that Discovery, Service Mapping, Cloud Management, and Orchestration require to access hardware and software in your network.

**Before you begin**

Role required: admin

Review your security policy and options with your organization's security team.
About this task
This task contains general procedures for creating credentials. Refer to the documentation for your credential type for details on specific fields and requirements.

<table>
<thead>
<tr>
<th>Supported credential types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applicative credentials</td>
</tr>
<tr>
<td>CIM credentials</td>
</tr>
<tr>
<td>JDBC credentials</td>
</tr>
<tr>
<td>SAP credentials</td>
</tr>
<tr>
<td>VMware credentials</td>
</tr>
</tbody>
</table>

Note: To improve security, limit the scope of credentials to a specific MID Server or schedule to avoid unnecessary credentials.

Procedure
1. Navigate to one of these modules:
   - Discovery > Credentials
   - Service Mapping > Credentials
   - Orchestration > Credentials
2. Click New.
3. On the Credentials page, click a link for the credential type and complete the form. Refer to the documentation for the credential type you selected for details.
   You can submit a credential record first and then test it later, or test the credential immediately before saving it.
   Credential testing is supported for these credential types:
   - SSH private keys
   - Windows
   - SNMP v3
   - VMware
   - JDBC
   - JMS
4. Under Related Links, click Test credential.
Note: Credentials are encrypted at all times during the test.

5. Complete the fields in the Test Credential dialog box.

![Test credentials dialog box](image)

### Credential test fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Credential type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target</td>
<td>Target host on which these credentials are run. This value must be an IP address for all credential types except VMware, which can be the host URL. You can not target any MID servers.</td>
<td>All</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For JMS, this is the provider URL. The information in this URL tells JNDI how to find and access the JMS Provider. An example value for connecting to ActiveMQ V5.1, is tcp://ipAddressOrHost:61616.</td>
<td></td>
</tr>
<tr>
<td>Port</td>
<td>Port on the target to use for this test. The system pre-populates this field</td>
<td>All</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
<td>Credential type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td></td>
<td>with the default port for the selected credential type.</td>
<td></td>
</tr>
<tr>
<td>MID Server</td>
<td>MID Server to use for this test. You must use a Windows MID Server to test Windows credentials. Only <strong>Up</strong> and <strong>Validated</strong> MID Servers are available.</td>
<td>All</td>
</tr>
<tr>
<td>DB Type</td>
<td>Type of database on which to test these credentials.</td>
<td>JDBC</td>
</tr>
<tr>
<td>DB Name</td>
<td>Name of the database on which to test these credentials.</td>
<td>JDBC</td>
</tr>
<tr>
<td>Initial Context Factory</td>
<td>Name of the JNDI class that is used to create the InitialContext. Using this <strong>Initial Context Factory</strong>, various JMS objects, such as JMS Connection, are created. For example, to connect to ActiveMQ V5.10, (JMS Provider), the value in this field would be <code>org.apache.activemq.jndi.ActiveMQInitialContextFactory</code></td>
<td>JMS</td>
</tr>
</tbody>
</table>

6. Click **OK** to begin the test.

An indicator appears, showing that the system is attempting to contact the target using the credentials you have provided. When the instance connects to the target it displays a success message. If the instance encounters a problem with the test inputs you have provided, it displays the appropriate error message. The following are some common error messages.
• Incorrect target or port number:

TCP connection failure

Test Credential

Failed to connect TCP: Connection refused:

Cancel Retry

• Incorrect user name or password:

Authentication failure

Test Credential

Failed to authenticate with user: root

Cancel Retry

• Incorrect MID Server for Windows credentials:

MID Server error

Test Credential

Selected MID Server must have Powershell v2.0 or higher

Cancel Retry

7. Click Retry to open the test Credential dialog box and correct the input error.

8. When your credentials test is successful, click Submit to save the record.

Important: Testing credentials does not ensure that the credentials have the necessary privileges required for the intended Discovery or Orchestration workflow tasks.

Ansible Tower credentials

Ansible Tower credentials are required to access your Ansible configuration management account. Use these credentials to manage Ansible resources through the Cloud Management application.

To integrate Cloud Provisioning and Governance with the Ansible configuration management account, you must configure the user name and password for the administrator account in Ansible.
Form fields for Ansible Tower credentials

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Provide a descriptive name.</td>
</tr>
<tr>
<td>User name/Password</td>
<td>Enter the authentication credentials for the Ansible Tower user with administrator rights.</td>
</tr>
</tbody>
</table>

ℹ️ **Note:** You do not need to configure the other fields.

### API key credentials

An API key is a unique code that is passed in to an API to identify the calling application or user.

### API key credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter the API key.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Allow flow and workflow creators to assign individual credentials to any activity in a flow or workflow or assign different credentials to each occurrence of the same activity type in a flow or workflow.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select whether to apply these credentials to <strong>All MID servers</strong> in your network, or to one or more <strong>Specific MID servers</strong>. Specify the MID Servers that should use these credentials in the <strong>MID servers</strong> field.</td>
</tr>
<tr>
<td>Order</td>
<td>Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>
Applicative credentials

Some applications require credentials in addition to the credentials that the host machine requires. Credentials required to access these applications are referred to as applicative credentials.

A typical credential contains a user name and a password for logging into a device or application. While most applications require only one credential for accessing them, sometimes hosts and applications have separate credentials for extra security. For example, ABAP SAP Central Services (ASCS) requires applicative credentials in addition to the SSH or Windows host credentials for the server that hosts ASCS.

Note: ServiceNow applications refer to devices and applications that comprise an application service as configuration items (CIs).

Just like with host credentials, you assign applicative credentials to MID Servers.

You create applicative credentials per CI type, for example the CI type for ASCS is SAP ASCS Application [cmdb_ci_appl.sap.ascs]. The preconfigured pattern for discovering CIs belonging to this CI type contains commands that require a MID Server to use the applicative credential for this CI type. If there is more than one credential configured for this CI type, the MID Server tries using these credentials in the order you define until it finds the credential that fits.

Check the Discovery requirements information in the ServiceNow documentation to determine if you need to configure applicative credentials for specific application CIs. There is no need to configure applicative credentials, if Discovery prerequisites do not mention it.

Applicative credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the credential. Use a descriptive name like Oracle DB or London Oracle for an Oracle database. Do not use spaces or special characters for the credential name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to use the credential.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the actual user name of the applicative credential.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the actual password of the applicative credential. Do not use spaces or special characters for the credential name.</td>
</tr>
<tr>
<td>CI type</td>
<td>Select a CI type to which the CI belongs.</td>
</tr>
<tr>
<td>Credential Alias</td>
<td>Create an alias to assign specific credentials for specific discovery schedules. When assigning an alias, you must identify the table name for the CI type whose applicative credentials you are assigning.</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>

### Applies to

Select whether to apply these credentials to **All MID servers** in your network, or to one or more **Specific MID servers**. Specify the MID Servers that should use these credentials in the **MID servers** field.

### Order

Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order (or none), the instance tries the credentials in a random order.

---

**Basic authentication credentials**

The basic authentication credential type manages access to store basic authentication credentials.

These fields are available in the Credentials form for basic authentication.
## Basic Auth credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential. For example, you might call it <strong>Basic Authentication</strong>.</td>
</tr>
<tr>
<td>User Name</td>
<td>Enter the user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for these credentials in the CyberArk external credential storage system. The credential ID may be used as a safe override when multiple safes are in use. By default, the syntax in the Credential ID field is this: <code>&lt;safe name&gt;:&lt;Credential ID&gt;</code>. If the safe name is omitted, there must be a safe name defined in the <code>config.xml</code> file. To change the separator character from the default colon to another character, override the value with the optional <code>ext.cred.safe_name</code> parameter. The Credential ID field has a limit of 40 characters. This field is only visible when the External storage check box is selected.</td>
</tr>
<tr>
<td>External credential store</td>

</table>

### Chef server credentials

Chef server credentials access chef integrations with the instance.

These fields are available on the Credentials form for Chef server type credentials. This information comes from the settings you configured when you performed Chef server installation.
### CIM credentials

The CIM credential type manages access to a CIM server (also referred to as a CIMOM - Common Information Model Object Manager) for information about VMware ESX servers. This credential type is available for Discovery.

These fields are available in the Credentials form for CIM.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name. For CIM discovery, the user must have the admin role.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. The Credential ID field has a limit of 40 characters.</td>

| Windows MID Server Service Account | When active, the defined credential represents the MID Server service account.                                                                                                                                                  |
Configure NetApp storage devices for CIM credentials

NetApp storage devices require additional configuration in order for Discovery to explore them.

Before you begin
Role required: admin

Procedure
1. Install the SMI-S agent on the storage device host. See the Data ONTAP SMI-S Agent 5.2 Installation and Configuration Guide for instructions and requirements.

![Note:](image)

ServiceNow does not maintain the documentation on this site. Be aware that this document can change without notice.

2. Create a user account and password for the SMI-S agent.

3. Create a credential record for the SMI-S agent credentials. Set the credential type to CIM.

Cloud credentials

Cloud credential types manage access to cloud-based applications, including Amazon Web Services and the Microsoft Azure cloud.

AWS Identity and Access Management (IAM) roles

If you have a MID Server installed on Amazon EC2 in an AWS cloud, and if that MID Server is configured to discover resources within the cloud, you can use security credentials provided by AWS Identity and Access Management (IAM) roles rather than credentials managed on your instance. These AWS credentials grant permissions in the cloud through an instance profile, based on roles. These credentials are temporary and rotate automatically on a configurable interval. When an IAM role is defined for the MID Server, Discovery ignores any credentials stored on the instance in favor of the credentials granted by the role in the instance profile. For more information on AWS instance profiles, see IAM Roles for Amazon EC2.
AWS credentials

### AWS Credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique and descriptive name for the AWS credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to use the credential.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>The <strong>Access key ID</strong> that you generated on the AWS Management Console, such as: APIAIOSFODNN7EXAMPLE.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>The <strong>Secret access key</strong> that you generated on the AWS Management Console, such as: wPalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY.</td>
</tr>
</tbody>
</table>

### Azure Service Principal credential form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the service principal to register with the instance.</td>
</tr>
<tr>
<td>Tenant ID and</td>
<td>Paste the Azure <strong>Directory ID</strong> value from the Azure portal into the Cloud Management <strong>Tenant ID</strong> field.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Paste the Azure <strong>Application ID</strong> value of the application that you registered in Azure into the Cloud Management <strong>Client ID</strong> field.</td>
</tr>
<tr>
<td>Authentication Method</td>
<td>Select <strong>Client secret</strong>.</td>
</tr>
<tr>
<td>Note:</td>
<td><strong>Client assertion</strong> is not supported.</td>
</tr>
<tr>
<td>Secret key</td>
<td>Paste the secret key that was generated while creating the Azure Service Principal.</td>
</tr>
<tr>
<td>This field appears when <strong>Authentication method</strong> is <strong>Client secret</strong>.</td>
<td></td>
</tr>
</tbody>
</table>

### Azure Enterprise Agreement credentials

Azure Enterprise Agreement credentials are necessary for the billing functionality that the Cloud Management application provides.
### Azure Enterprise Agreement credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Enrollment number</td>
<td>Enter the enrolment number from Azure.</td>
</tr>
<tr>
<td>Access Key</td>
<td>Paste the access key that Azure provides.</td>
</tr>
</tbody>
</table>

### Cloud Management credentials

This credential type is available for Orchestration.

### Cloud Management credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential. For example, you might call it <strong>Cloud Atlanta</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>Type</td>
<td>Specify <strong>AWS</strong>.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the CIM user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the CIM password.</td>
</tr>
<tr>
<td>SSH Passphrase</td>
<td>Enter a memorable phrase for key generation. For example, you might enter <strong>Friday is a good day</strong>.</td>
</tr>
<tr>
<td>SSH private key</td>
<td>Enter the SSH private key.</td>
</tr>
<tr>
<td>Authentication protocol</td>
<td>Select the <strong>MD5</strong> or <strong>SHA</strong> authentication protocol that was used to generate the <strong>Authentication Key</strong>.</td>
</tr>
<tr>
<td>Authentication Key</td>
<td>Enter a SSH-generated authentication key.</td>
</tr>
<tr>
<td>Privacy protocol</td>
<td>Enter one of the following privacy protocols that describes encryption for the <strong>Privacy Key</strong>:</td>
</tr>
<tr>
<td></td>
<td>• <strong>3DES</strong> for Triple Data Encryption Standard (DES)</td>
</tr>
<tr>
<td></td>
<td>• <strong>AES128</strong> for Advanced Encryption Standard (AES) with 128 bit encryption</td>
</tr>
</tbody>
</table>
Cloud Management credentials form fields (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• AES192 for AES with 192 bit encryption</td>
</tr>
<tr>
<td></td>
<td>• AES256 for AES with 256 bit encryption</td>
</tr>
<tr>
<td></td>
<td>• DES for legacy DES encryption</td>
</tr>
</tbody>
</table>

Enter an additional privacy key.

Credential alias  Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.

External credential store  Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. Currently, the only supported external storage system is CyberArk.

Applies to  Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.

Classification  Enter the Application Classification for CI discovery.

Order  Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.

---

**Cloud Management (CMP) node credentials**

Cloud Management (CMP) node credentials associate credentials for a virtual server that Cloud Management provisions. The Cloud Management application automatically creates these credentials.

<i>Note:</i> You might need to deactivate these credentials if you no longer want them used, change the order precedence, or select a MID Server that is allowed to access them. Otherwise, you do not need to manually create or modify this type of credential.
### CMP node credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The automatically generated name based on the datacenter where the virtual machine is located.</td>
</tr>
<tr>
<td>Active</td>
<td>If the credentials are active.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Choose whether this credential is available to a specific MID Server or all MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
<tr>
<td>User Name and Password</td>
<td>The virtual server user name and password.</td>
</tr>
<tr>
<td>SSH passphrase and SSH private key</td>
<td>The private key and the passphrase that protects the key if the virtual server requires it.</td>
</tr>
<tr>
<td>Authentication Protocol and Authentication Key</td>
<td>The private key and the passphrase that protects the key if the virtual server requires it.</td>
</tr>
<tr>

**Field** | **Description**
---|---
External credential store | Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. External credential storage is only available when the External Credential Storage plugin is activated.

> **Note:** Currently, the only supported external storage system is CyberArk.

Applies to | Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.

MID servers | Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field.

Order | Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.

Windows MID Server Service Account | When active, the defined credential represents the MID Server service account.

**SNMP credentials**

Discovery explores many kinds of devices (switches, routers, printers, etc.) using the SNMP protocol. Credentials for SNMP do not include a user name, just a password, called the community string.

The default read-only community string for many SNMP devices is public, and Discovery will try that automatically. Enter the appropriate SNMP credentials if they differ from the public community string.

Discovering SNMP uses all community strings that are configured. This behavior does not apply to discovering SNMPv3.
The default Orchestration activity SNMP Query returns the object identifier (OID) of a device and requires SNMP credentials.

**SNMP community credentials**

The SNMP Community credential type manages access to discover many kinds of devices (switches, routers, printers, etc.) using the SNMP protocol. This credential type is available for Discovery, Service Mapping, and Orchestration.

Credentials for SNMP do not include a user name, just a password (the community string). The default read-only community string for many SNMP devices is public, and the system will try that automatically. Enter the appropriate SNMP credentials if they differ from the public community string.

These fields are available in the Credentials form for SNMP community.

### Field Description

**External credential store**

Select this check box to use an external credential storage system. When you select this option the **User name** and **Password** fields are replaced with the **Credential ID** field. External credential storage is only available when the External Credential Storage plugin is activated.

ℹ️ **Note:** Currently, the only supported external storage system is CyberArk.

**Applies to**

Select whether to apply these credentials to **All MID servers** in your network, or to one or more **Specific MID servers**. Specify the MID Servers that should use these credentials in the **MID servers** field.

**MID servers**

Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select **Specific MID servers** from the **Applies to** field.

**Order**

Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.

**Windows MID Server Service Account**

When active, the defined credential represents the MID Server service account.

### SNMPv3 credentials

SNMPv3 credentials accept a privacy protocol and an additional privacy key and are available for Discovery and Orchestration. For external storage in CyberArk, you can select a privacy account key.

These fields are available in the Credentials form for SNMPv3.
### SNMPv3 credential fields

Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the SNMP user name. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name.</td>
</tr>
<tr>
<td>Authentication protocol</td>
<td>Select the authentication type to use for this credential. The choices are <strong>MD5</strong> and <strong>SHA</strong>.</td>
</tr>
<tr>
<td>Authentication Key</td>
<td>Enter the authentication key to use for this credential.</td>
</tr>
</tbody>
</table>
| Privacy protocol  | Select the encryption protocol for this credential. The choices are:  
  • 3DES  
  • AES128  
  • AES192                                                                                                                                       |
### SNMPv3 credential fields (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>• AES256</td>
<td>• DES</td>
</tr>
<tr>
<td>Privacy key</td>
<td>Enter the key associated with the selected privacy protocol.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential provider. The <strong>Credential ID</strong> field has a limit of 40 characters. This field is only visible when the <strong>External credential store</strong> check box is selected.</td>
</tr>
<tr>
<td>Privacy Credential ID</td>
<td>Enter the privacy account key configured for SNMPv3 credentials in CyberArk. If you are using a privacy protocol in CyberArk, this field must have the same value as the <strong>Name</strong> field for the CyberArk SNMPv3 Privacy Account. This field is only visible for SNMPv3 when you select <strong>CyberArk</strong> from the <strong>Credential Store Type</strong> field. If you are not using a privacy key for CyberArk, leave this field empty.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When external storage is enabled, the <strong>Credential ID</strong> field appears. External credential storage is only available when the <strong>External Credential Storage plugin</strong> is activated and the <strong>External Storage</strong> view is selected.</td>
</tr>
<tr>
<td>Credential Store Type</td>
<td>Select the external storage provider. Select <strong>CyberArk</strong> only if you are using a CyberArk SNMPv3 privacy key. The <strong>Privacy Credential ID</strong> field appears to allow entry of the key.</td>
</tr>
<tr>
<td>Use Context</td>
<td>Select this check box to add a context value for this credential. This field is visible in the <strong>Discovery</strong> view.</td>
</tr>
</tbody>
</table>
SNMPv3 credential fields (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Contexts are not currently supported for external credential storage.</td>
</tr>
<tr>
<td>Note:</td>
<td>A context is a collection of management information accessed by an SNMPv3 credential that references a specific OID. Contexts are sometimes referenced to collect information about the device that cannot be accessed by the normal credential. A context can be provided by the manufacturer or configured separately. For additional information, see Context Name and Context ID.</td>
</tr>
<tr>
<td>Note:</td>
<td>If you have multiple SNMPv3 credentials with the same user name and keys, but some of your devices need a context and some do not, then you will need to create separate records for each device.</td>
</tr>
</tbody>
</table>

Context Name | Enter the context name value for this credential. This should only be used if you have devices that require this value for full access. This field is visible when the Use Context check box is selected.

SSH credentials

Discovery, Orchestration, and IntegrationHub explore UNIX and Linux devices by using SSH credentials to execute commands over Secure Shell (SSH). SSH commands must run with root privileges, either with root credentials or through the use of sudo. SSH private key credentials provide additional security.

Granting root privileges

Before granting root privileges, review your security policy and options with your organization's security team.

Use either of these approaches to allow users to run SSH commands with root privileges:

- Give other credentials for Discovery, Orchestration, or IntegrationHub, but grant the user in those credentials the right to execute certain commands with root privileges, using sudo. This is a secure way to grant limited privileges. Discovery, Orchestration, or IntegrationHub use sudo on any probe that has
the `must_sudo` parameter set to `true` (it defaults to `false`). However, each system must be configured to allow sudo to work. This is done by editing the `/etc/sudoers` file using the `visudo` command.

- Give root credentials. These are obviously the most powerful credentials, but may not be desirable from a security perspective. If Discovery, Orchestration, or IntegrationHub have the root credentials to any UNIX or Linux system, no further configuration is required.

### Privileged commands

The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system. For details about using sudo and other privileged commands, see MID Server privileged commands.

### SSH private key credential type

> **Note:** SSH private key credentials should be used in most cases, as they provide better security than SSH password credentials.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique and descriptive name for this credential. For example, you might call it <strong>SSH Atlanta</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter a UNIX or Linux user name. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the UNIX or Linux password. For <strong>SSH Private Key</strong> type credentials, enter the sudo password if one is required for the user name.</td>
</tr>
<tr>
<td>SSH passphrase</td>
<td>Type a secure SSH passphrase. This field is available only for <strong>SSH Private Key</strong> credentials.</td>
</tr>
</tbody>
</table>
| SSH private key| Enter a secure, private key that can be used instead of a password for SSH logins.  
  The private key must be entered in the proper format to ensure it is correctly encrypted. The private key must start with the string `-----BEGIN`.  
  Here is an example of a correctly formatted private key |
The Now Platform supports private keys in the PEM format generated by the OpenSSH ssh-keygen utility. To convert PPK keys that were generated by PuTTY:

- Open your private key in PuTTYGen.
- Export it in OpenSSH format from the menu **Conversions > Export OpenSSH key**.
- Save the new OpenSSH key.

**Credential alias**

- Allow flow designers to use aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection. For more information, see **Credentials and connection information**.
- Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.

**External credential store**

Select this check box to use an external credential storage system. When you select this option the **User name** and **Password** fields are replaced with the **Credential ID** field. Currently, the only supported external storage system is CyberArk.

**MID servers**

Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select **Specific MID servers** from the **Applies to** field.

**Applies to**

Select whether to apply these credentials to **All MID servers** in your network, or to one or more **Specific MID servers**. Specify the MID Servers that should use these credentials in the **MID servers** field.

**Order**

The order (sequence) in which the platform tries this credential as it attempts to log onto devices. The smaller the number, the
higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), Discovery or Orchestration tries the credentials in a random order.

### SSH credential type
These fields are available in the SSH credentials form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>

<td>Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

**Commands that require root privileges for Discovery, Orchestration, and IntegrationHub**

These examples assume that the user name is **Disco**. Substitute the actual user name and ensure that the paths for the commands match the paths on the system.

**Note:** Sudo commands do not work with private key credentials, because there is no password to supply to the sudo command. A solution is to add the **NOPASSWD** option to the sudo configuration. For example, you might enter: `disco ALL=(root) NOPASSWD:/usr/sbin/dmidecode,/usr/sbin/lsof,/sbin/ifconfig`.

### VMware credentials

The VMware credentials type manages access to vCenter credentials.

Applications that access VMware cloud resources need access to VMware credentials. For example, the VMware credential type allows Discovery to explore VMware's vCenter running on a Windows machine to discover ESX machines, virtual machines, and resource pools. The VMware Discovery and automation API (vCenter API) now provides the globally unique serial number for computer CIs. CIM credentials are not needed to allow access to each VMware host.

⚠️ **Note:** Windows credentials are not necessary for vCenter Discovery, when valid VMware credentials are used.

⚠️ **Important:** Do not use **VMware** Type credentials for Orchestration activities that perform work on the individual virtual machines cloned by vCenter (for example, restarting a Linux VM). For these activities, the credential **Type** depends on the operating system of the virtual machine (either **SSH** or **Windows**).
## VMWare credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for the VMware credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name you use for your VMware account. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name. The VMware credentials must have the read-only role in vCenter.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for the VMware account.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field.</td>

If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

## Windows credentials

Windows credentials provide access to Windows computers. This credential type is available for Discovery and Orchestration.

## Credential requirements

Discovery and Orchestration have the following requirements for Windows credentials:

- Install a MID Server on a Windows host as a service.
- Add Windows credentials to one of these locations:
  - An entry in the Credentials [windows_credentials] table
  - A MID Server service account to run as a specific Windows user or domain account.
Granting proper permissions
To provide sufficient permissions, Windows credentials must be one of the following:

• A domain user with local administrator access on the target Windows hosts.
• A local account that has administrator privileges and User Access Control (UAC) disabled on the same target host.
• A user who meets the requirements of Windows probes and permissions (Discovery only).
• A user who meets the requirements of the Orchestration activity to be run (Orchestration only).

Note: No logon privileges are needed. Account does NOT need to be interactive.

Security around granting privileged access can be enhanced by using JEA profiles to run Discovery. For more information, see Microsoft Just Enough Administration (JEA) for Discovery.

Workgroup computers
To run Powershell commands to discover a Workgroup computer, configure the MID Server credentials for either of these users:

• Built-in administrator account on the Workgroup computer.
• Domain user on the Workgroup computer.

Multi-domain configuration
To enable Windows credentials to function across multiple domains, make sure to use the correct name formats and MID Server configuration.

Discovery and Orchestration support Windows domain credentials in both User Principal Name and Down-Level Logon Name user name formats. For example, Domain\UserName or UserName@example.domain.com. You can provide Windows workgroup credentials in the following format: WORKGROUP \UserName.

Note: You can also provide a local account by using the . \ user name.

These additional actions are required to enable credentials to function across multiple Windows domains.
<table>
<thead>
<tr>
<th>Condition</th>
<th>Additional actions required</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server host on the same domain as the Windows target.</td>
<td>None</td>
</tr>
<tr>
<td>MID Server host on a different domain than the Windows target.</td>
<td>Ensure that PowerShell 3.0 (or higher up to 5.1) is installed on the MID Server host.</td>
</tr>
<tr>
<td>MID Server host on a different domain than the Microsoft SQL Server target.</td>
<td>See MSSQL server discovery.</td>
</tr>
</tbody>
</table>

**Windows credentials type**

These fields are available in the Credentials form for Windows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>When active, the defined credential represents the MID Server service account.</td>
</tr>
</tbody>
</table>

Configure Windows credentials for the MID Server

Configure the MID Server to use either the credentials of its own Windows service or credentials from the Credentials [discovery_credentials] table.

Before you begin
Role required: admin
Procedure

1. Configure the MID Server to use credentials from the MID Server service account.
   a. Set the MID Server service account to a user who meets the permission requirements.
   b. Verify the user name meets the name format requirements.
   c. Fill in the fields on the form, as appropriate.
   d. Verify the credentials meet domain requirements.

2. Configure the MID Server use credentials from the Credentials [discovery_credentials] table.
   a. Add individual Windows credentials to the Credentials [windows_credentials] table.
      • Verify each credential meets the permission requirements.
      • Verify each username meets the name format requirements.
      • Verify each credential meets the Windows domain requirements.
   b. [Optional] Configure the MID Server to use Powershell by setting the mid.use_powershell parameter to true. See MID Server Configuration.
   c. Select the Windows MID Server Service Account check box to create a credential that represents the windows MID Server service account to run as a specific Windows user or domain account.

Credential affinity for Discovery and Orchestration

Credential affinity is an association between a set of credentials and a device on your network.

When Discovery or Orchestration first attempts to access a device, they try all available credentials until they find the correct ones. After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity [dscy_credentials_affinity] table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.
### Credential Affinity diagram

Does an affinity exist?

- **Yes**: Look up credential for existing affinity and insert it into the probe.
- **No**: MID Server iterate through discovery_credentials table and insert appropriate credential_id. Create new affinity.

---

#### Note:
If Orchestration and Discovery are installed, and credential alias is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.

#### Credentials troubleshooting

Review the `<credentials_debug>` section of the ECC queue payload to troubleshoot issues with credentials.

Certain probes support credential debugging. Credential debugging inserts a `<credentials_debug>` section in the payload that the MID Server returns to the instance ECC queue. You can view the `<credentials_debug>` section to see detailed information about the credential lookup.

The `<credentials_debug>` section appears in the payload if:

- Credentials fail for WMIRunner probe, PowerShell probe, JMS, or SSHCommand probe.
- You set the `credentials_debug` parameter to `true` for the WMIRunner, PowerShell, or SSHCommand probes. If you set the parameter to true, the `<credentials_debug>` section appears even if the credential lookup is successful.

The `<credentials_debug>` section shows:

- Information about the credential search, such as the credential types, tags, and affinities.
- The IP address targeted.
- Information about each credential (in order) that the MID Server used, including the type, classification, tag, name, Sys ID, and external credential ID if present.
Details appear for the PowerShell parameter:

- If the local MID Server credentials were used after all the Windows credentials failed.
- If the credentials were skipped because you are trying to discover the same machine that the MID Server is on.
- If the `mid.powershell.use_credentials` parameter is set to `true`.

Details appear for the SSHCommand:

- If the credential search was skipped because the target IP is excluded.
- If the target IP was added to the exclusion list.

**Note:** The MID Server saves IP addresses for failed credential searches in an exclusion list in cache memory. This exclusion list specifies which devices the MID Server should stop trying to access. IP addresses are added to the exclusion list after every credential has failed. The IP addresses are cleared from the exclusion list cache either after five minutes, if the MID Server is restarted, or if the credential records on the instance are updated.

### External credential storage

An instance can store credentials used by Discovery, Orchestration, and Service Mapping in an external credential repository rather than directly in a ServiceNow credentials record.

The instance maintains a unique identifier for each credential, the credential type (such as SSH, SNMP, or Windows), and any credential affinities. The MID
Server obtains the credential identifier from the instance, and then uses a customer-provided JAR file to resolve the identifier from the repository into a usable credential. Currently, the ServiceNow® platform supports the use of the CyberArk vault for external credential storage.
Credential process flow
The MID Server retrieves credentials from an external store using this process:

1. MID Server downloads credential objects from the ServiceNow Credentials [discovery_credentials] table that contain the corresponding credential ID from the target vault.

2. As each probe or pattern runs from Discovery or Orchestration jobs, the MID Server requests the credential by passing information such as credential ID, target IP address, and credential type to the Credential Resolver Java Jar file. The details about the correct credential object to retrieve from the vault are determined by the Credential Resolver.

   Many Credential Resolvers such CyberArk call an application supplied by the third-party vault vendor running on same machine as the MID Server. That application can often be configured to cache credentials and knows to update the cache when a credential changes in the vault, which is very important to avoid unnecessary network calls to the vault each time MID Server requests a credential. The Credential Resolver (using optional vendor application if present) makes a call to the vault to get the actual user name, password, etc.

   For Credential Resolvers supplied out-of-box (only CyberArk today), the MID Server only caches a credential for up to several seconds using encryption in MID Server process memory. This means the MID Server can make multiple requests to the Credential Resolver for the same credential even when discovering a single device. Contact third party vendors for information about caching implementations for other Credential Resolvers.

3. MID Server executes the probe with the appropriate credential.

   Note: Credential affinity still applies. The mechanism remains the same, since the only real difference from the MID Server's perspective is that the real credential details (user name and password) come from the third party vault.

External credential storage logging
The MID Server posts log messages about external credential storage.

If the repository encounters an error while attempting to resolve a credentials request, the MID Server posts log messages with this prefix: Problem with client's CredentialResolver:

Components installed with External Credential Storage

Business rule
The External Credential Storage business rule performs the following tasks when an administrator makes any change to the Enable External Credential Storage property:

- Changes the view for the Credentials record list and form to the External Storage view. This view enables users to see the Credential ID column in the list.
- Instructs the MID Server to refresh its credentials cache in preparation for a change in the way credentials are obtained.

**Property**

A property called Enable External Credential Storage [com.snc.use_external_credentials] enables or disables the External Credential Storage plugin after it is activated. The property is located in **Discovery Definition > Properties** and **Orchestration > MID Server Properties**, and is enabled when you activate the plugin.

If you disable external credential storage with the system property, the system automatically sets all the external credentials to inactive in the instance. If you re-enable the feature with this property, the system does not reset the external credential records to active. You must reactivate each credential record manually.

**Request external credential storage for Discovery and Orchestration**

The External Credential Storage plugin is available by request.

**Before you begin**

Role required: admin

**About this task**

There are two ways to request a plugin:

- Access the Now Support Service Catalog directly by clicking **Service Catalog > Activate Plugin** on Now Support.
- Access the Now Support Service Catalog through the All Applications page on your instance by following these steps.

**Procedure**

1. Navigate to **System Applications > All Available Applications > All**.
2. On the All Applications page, click **Request Plugin** to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. On the form, fill in the fields.

**Activate Plugin request form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the <strong>Reason/Comments</strong> field.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**CyberArk credential storage integration**

The MID Server integration with the CyberArk vault enables Orchestration, Discovery, and Service Mapping to run without storing any credentials on the instance.

**Introduction to CyberArk**

CyberArk’s Application Identity Management (AIM) product uses the Privileged Account Security solution to eliminate the need to store application passwords embedded in applications, scripts or configuration files, and allows these highly-sensitive passwords to be centrally stored, logged and managed within the CyberArk vault. This approach enables organizations to comply with internal and regulatory requirements of periodic password replacement and to monitor activities associated with all types of privileged identities, whether on-premise or in the cloud.

The instance maintains a unique identifier for each credential, the credential type (such as SSH, SNMP, or Windows), and any credential affinities. The MID Server obtains the credential identifier, credential type, and IP address from the instance, and then uses the CyberArk vault to resolve these elements into a usable credential. The credential resolver can also look up the hostname, fqdn, and use reverse DNS lookup to get fqdn.
The CyberArk integration requires the ServiceNow® External Credential Storage plugin, which is available in System Definitions > Plugins. The MID Server and CyberArk AIM/API client must be installed on the same machine.

**Installed with CyberArk**

- **Business rule:** The External Credential Storage business rule performs the following tasks when an administrator makes any change to the external credential storage property:
  - Changes the view for the Credentials record list and form to the External Storage view. This view enables users to see the Credential ID column in the list.
  - Instructs the MID Server to refresh its non-external credentials cache in preparation for a change in the way credentials are obtained.

- **System property:** A property called Enable External Credential Storage [com.snc.use_external_credentials] enables or disables the External Credential Storage plugin after it is activated. This property is located in Discovery Definition > Properties and Orchestration > MID Server Properties, and is enabled when you activate the plugin.

  **Note:** If you disable external credential storage with the system property, the system automatically sets all the external credentials to inactive in the instance. If you re-enable the feature with this property, the system does not reset the external credential records to active. You must reactivate each credential record manually.

**Supported credential types**
The CyberArk integration supports these ServiceNow credential types:

- GCP
- Azure
- CIM
- JMS
- SNMP forum
- SNMPv3
- Basic Auth
- SSH Key Pair
- SSH Private Key (with key, pass phrase, and password)
- VMware
• Windows
• Applicative Credentials

Orchestration activities that use these network protocols support the use of credentials stored on a CyberArk vault:
• SOAP (with basic authentication overrides)
• REST (with basic authentication overrides)
• JDBC
• SSH
• PowerShell
• JMS
• SFTP

**Important:** You cannot manage credentials stored on a CyberArk vault and a custom external credential storage system using the same MID Server. The MID Server and CyberArk AIM/API client must be installed on the same machine.
How the MID Server handles Windows accounts

Credential lookup initially attempts to match the specified credential ID to an existing value in the CyberArk vault **Name** field. If a match is found, that credential is returned. If no match is found, the credential lookup attempts to find a match using the IP address. If the IP address lookup matches more than one credential, such as Windows and Tomcat on the same server, the lookup
fails. To avoid this issue, set the `ext.cred.type_specifier` parameter in the MID Server config.xml file to `true` to force CyberArk to return credentials that match both the credential type and the IP address. For example, if an IP address is shared by both Windows and Tomcat, a credential type of Windows returns the Windows credential only.

**CyberArk integration configuration**

These procedures include both CyberArk and ServiceNow configuration tasks, including references to the appropriate CyberArk documentation.

The credential identifier configured in the ServiceNow instance must be mapped to the credential name in the CyberArk vault. When looking up a credential, the MID Server finds the credential by matching the credential identifier to a name in vault, which must be unique. If the credential identifier is blank, then the MID Server finds the credential by IP address. To identify the credential by IP address, the system looks at the credential type to ensure that there is only one credential of that type at that address. An example of this might be when a Windows server and vCenter are both running on the same IP address. To support strict credential requirements like this in an SSH environment, a MID Server configuration parameter allows you to require that the credential type requested matches the type returned by CyberArk.

⚠️ **Note:** The Credential ID field is the only field necessary to map your credentials to CyberArk, in all cases except for SNMPv3. The Privacy Credential ID field is optional and is required only when using SNMPv3 credentials and using a privacy protocol for the credentials. See Configure the CyberArk credential identifier for more details.

To configure your instance to obtain credentials from a CyberArk vault, complete these tasks in the order in which they appear below.

**Configure the CyberArk vault and install the AIM API**

Configure the CyberArk vault to allow MID Server access and install the CyberArk AIM API on the MID Server machine.

**Before you begin**
Role required: admin
Before starting this procedure, ensure that the External Credential Storage plugin is activated.
Procedure

1. Configure the CyberArk vault with the application ID and authentication details that all MID Servers requesting credentials will use. For details, refer to the CyberArk Credential Provider and ASCP Implementation Guide.

   a. Ensure that CyberArk is configured to allow the MID Server to access the vault by creating an App-ID in CyberArk called `ServiceNow_MID_Server`.

   b. Make sure that every credential the MID Server needs is granted access to the `ServiceNow_MID_Server` App-ID.

   Note: You can override the default `ServiceNow_MID_Server` App-ID in the MID Server `config.xml` file using the `ext.cred.app_id` parameter. If you change the value in this parameter, make sure to configure a matching value in the vault.

2. Install the CyberArk Credential Provider, including the AIM API, on each machine that hosts a MID Server service that is used to access the credential store.

   a. In the CyberArk Password Safe, create the privileged accounts required by Discovery, Orchestration, or Service Mapping to access different devices and ensure that these accounts are members of the safes in which the necessary credentials are stored.

   b. Add the Credential Provider and application users as members of the Password Safes where the application passwords are stored.

Import the CyberArk JAR file

Import the CyberArk JavaPasswordSDK.jar file into the instance to make it accessible to the MID Server.

Before you begin

Role required: agent_admin or admin

Before starting this procedure, ensure that CyberArk is configured to allow the MID Server access to credentials. Ensure that the CyberArk AIM API is installed on each server hosting a MID Server that is used to access the vault.
About this task
Use this process even if the JavaPasswordSDK.jar file already exists on the MID Server.

Procedure
1. Navigate to MID Server > JAR Files.
2. Click New.
3. Complete the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>Optional version number for the file, if one is available.</td>
</tr>
<tr>
<td>Source</td>
<td>Provider of the JAR file. Source information is not used by the system.</td>
</tr>
<tr>
<td>Description</td>
<td>Optional short description of the JAR file and its purpose in the instance.</td>
</tr>
</tbody>
</table>

4. Attach the JAR file to this record.
   The AIM JavaPasswordSDK.jar file comes with the AIM SDK installation files and is typically located on the MID Server in the AIM installation directory at <install_dir>/CyberArk/ApplicationPasswordSdk.

5. Click Submit.

6. Restart the MID Server service.
   The platform makes the JAR file available to any MID Server configured to communicate with the instance.

Configure the MID Server for CyberArk
Configure the config.xml file to grant the MID Server access to the CyberArk vault.

Before you begin
Role required: admin
Before starting this procedure, import the JavaPasswordSDK.jar file into the instance.
Procedure

Manually configure the MID Server `config.xml` file with these parameters. This configuration cannot be done from the instance.

### Required configuration parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ext.cred.safe_folder</code></td>
<td>NameOfFolder</td>
<td>Folder to use for all credential lookups. For example, <code>root</code>.</td>
</tr>
<tr>
<td><code>ext.cred.use_cyberark</code></td>
<td><code>true</code></td>
<td>Boolean parameter indicating that this MID Server is integrated with CyberArk.</td>
</tr>
</tbody>
</table>

### Optional configuration parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ext.cred.safe_timeout</code></td>
<td><code>5 (sec)</code></td>
<td>Timeout of each credential lookup in the vault, specified in seconds.</td>
</tr>
<tr>
<td><code>ext.cred.safe_name</code></td>
<td>NameOfSafe</td>
<td>Default safe name used for all credential lookups. If parameters are in multiple safes, the credential ID may be specified in the format <code>&lt;safeName&gt;:&lt;CredentialID&gt;</code>. When configured like this, the <code>NameOfSafe</code> field is ignored. If all external credentials have their credential IDs specified in this format, then leave out the <code>NameOfSafe</code> field.</td>
</tr>
<tr>
<td><code>ext.cred.app_id</code></td>
<td><code>ServiceNow_MID_Server</code></td>
<td>Specifies the App-ID used to grant permission to the MID Server to access the CyberArk vault. The default value, <code>ServiceNow_MID_Server</code>, must be</td>
</tr>
</tbody>
</table>

Note: By default the separator character in this format is a colon. To assign any character you want as a separator, add this line to the `CredMap.properties` file:

```
safe.cred.split.string=<string>
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| ext.cred.type_specifie     | true    | Forces an IP address lookup to return credentials that match both the CyberArk platform ID and the IP address. For example, if an IP address is shared by both Windows and Tomcat, a credential with a platform ID starting with **Win** returns the Windows credential only. When this parameter is set to true, CyberArk looks for platform IDs that begin with:
  - Win: Windows
  - Unix: SSH
  - VMWare: VMware |
| ext.cred.check_ssh_type    | false   | When set to true, requires that the type of SSH credential returned from CyberArk matches the type of credential requested. For example, if a normal SSH username/password credential is requested and only SSH keys are available, the credential lookup fails. |

**Configure CyberArk for SNMPv2 credentials**

If your system uses SNMPv2, you can create a special file to map the attribute in a credential to the community string.

**Before you begin**

Role required: admin

Before starting this procedure, configure the MID Server to have access to the CyberArk vault.
About this task

Note: If the community string appears in the password field of the CyberArk credential, it is not necessary to perform this procedure.

SNMPv2 is not natively supported in CyberArk. If your organization has created custom SNMPv2 credentials in which the community string does not appear in the password field of the credential, use this procedure to map the attribute in the credential to the community string.

Procedure
1. In a text editor, create a file called CredMap.properties, containing this code:
   ```plaintext
   SNMPv2.Community=attribute_name
   ```
2. Save the file to the /agent directory of your MID Server installation.
   On credential lookup, the MID Server attempts to find this attribute for the credential. If the attribute is not found, the MID Server then looks in the password field. If the password field is empty, the credential lookup fails.

Configure the CyberArk credential identifier
Create the unique key that CyberArk can use to identify specific credentials in the external repository.

Before you begin
Role required: admin
Before starting this procedure, ensure that the External Credential Storage plugin is activated, and the com.snc.use_external_credentials system property is set to true.

Procedure
1. Navigate to Discovery > Credentials or Orchestration > Credentials.
2. Click New.
3. From the list of credential types, select a type that supports CyberArk external storage.
4. Complete the form using the fields from your credential type.
5. Select the External credential store check box.
   The User name and Password fields are replaced with the Credential ID field.
   Note: If the check box is not visible, click the menu icon in the header bar and select View > External Storage.
6. In the Credential ID field, enter an expression using one of these formats:
If all your credentials are in the same safe, configure this safe name in the MID Server config.xml file using the ext.cred.safe_name parameter, and then specify the credential ID by name only, as <credential ID>.

To name credentials for a given platform that reside in a specific safe, define the credential ID as <safe>:<credential ID>:<platform ID>.

If your credentials are in multiple safes, specify the credential ID in this format: <safe>:<credential ID>.

If you want CyberArk to look up the credential by IP address, using an alternate safe, specify the credential ID in this format: <safe>:

If you want CyberArk to look up the credential for an alternate platform ID in the same safe, use this format: ::<platform ID>

If you want CyberArk to look up the credential in a configured safe by the IP address rather than the credential ID, leave this field blank. This is the best practice for handling installations in which each server has a unique credential. Without this type of lookup, you must create a credential ID record in your instance for every server in your environment.

Note: The credential ID must match the value in the Name field for the CyberArk account. The Credential ID field has a limit of 180 characters.

7. If you are storing SNMPv3 credentials in CyberArk and are using the privacy protocol and privacy key, configure the ID as follows:

   a. In the Credential Store Type field, select CyberArk.
      The Privacy Credential ID field appears.

   b. Enter the Name of the CyberArk SNMPv3 privacy account in the Privacy Credential ID field.

8. Click Submit.

Configure AWS credentials on a CyberArk vault

Configure your CyberArk vault with the AWS credentials to be retrieved for use by your instance.

About this task
Store the credentials as an SSH key on the CyberArk vault. When you configure access to the vault on your instance, the name you give to the SSH key must also be used as the credential ID.
Procedure

1. In CyberArk, go to Accounts > Add SSH Key.
2. Enter the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device Type</td>
<td>Select Cloud Service.</td>
</tr>
<tr>
<td>Platform Name</td>
<td>Select Amazon Web Services - AWS - Access Keys.</td>
</tr>
<tr>
<td>AWS Access Key ID</td>
<td>Enter the AWS Access Key, as provided by AWS.</td>
</tr>
<tr>
<td>AWS IAM Username</td>
<td>Enter the AWS IAM Username, as you configured in CyberArk.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the AWS Secret Access Key, as provided by AWS.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a name for this key.</td>
</tr>
</tbody>
</table>

3. Choose Save.

What to do next
If you have not done so already, create a credential identifier on your instance to configure access to the CyberArk vault. For more details, see Configure access to external credential storage for AWS.

Configure Azure credentials on a CyberArk vault
Configure your CyberArk vault with the Azure credentials to be retrieved for use by your instance.

Before you begin
Role required: admin

About this task
To store an Azure credential, first create an Azure credential template in the CyberArk vault. This process only needs to be completed once for the vault.

Procedure

1. Log in to CyberArk in Administration mode.
2. Navigate to the Administration tab.
3. In **System Configuration**, edit **Platform Management**.

4. Navigate to **Cloud Provider Template** and duplicate it.

5. Edit the template for Azure credentials.

6. Add the following two properties:

   * **Name** as **Username** and **Display Name** as **Client ID**

   * **Name** as **Address** and **DisplayName** as **Tenant ID**

7. Apply the changes.

8. Navigate to the **Account** section and select **Add account**.

9. Select **Safe**.

10. Set the **Device Type** to **Cloud Service**.

11. Select the Azure template that was previously edited.

12. Fill in the information in for the **Client ID**, **Tenant ID**, and **Password** fields.

13. Select **Save**.

**External credential storage configuration**

Configure your instance to obtain credentials from a remote repository.

These procedures assume that you already have an external repository configured with the credentials you want to protect. The credential identifier configured in the ServiceNow instance must be mapped to the actual credential in the repository through the JAR file.

To configure External Credential Storage, complete the following tasks in order.

**Create a JAR file to resolve credentials**

Create a JAR file to resolve credential identifiers sent from the MID Server into actual credentials from the repository.

**About this task**

Make sure to include all the credential elements that the instance expects, such as the private key.

To create a JAR file to resolve credentials:

**Procedure**

Use either the templates provided on the ServiceNow github or the sample Java file.
a. Download the open source JAR files with instructions from the ServiceNow github:

- HashiCorp External Credential Resolver
- Thycotic External Credentials Resolver
- CyberArk External Credential Resolver

b. Use the following sample Java file as a template and modify it to suit your environment:

Example

```java
package com.snc.discovery;

import java.util.*;
import java.io.*;

/**
 * Basic implementation of a CredentialResolver that uses a properties file.
 */

public class CredentialResolver {

    private static String ENV_VAR = "CREDENTIAL_RESOLVER_FILE";
    private static String DEFAULT_PROP_FILE_PATH = "C:\dummycredentials.properties";

    // These are the permissible names of arguments passed INTO the resolve()
    // method.

    // the string identifier as configured on the ServiceNow instance...
    public static final String ARG_ID = "id";

    // a dotted-form string IPv4 address (like "10.22.231.12") of the target
    // system...
    public static final String ARG_IP = "ip";

    // the string type (ssh, snmp, etc.) of credential as configured on the
    // instance...
    public static final String ARG_TYPE = "type";
```
public static final String ARG_MID = "mid";

// These are the permissible names of values returned FROM the resolve() // method.

// the string user name for the credential, if needed...
public static final String VAL_USER = "user";

// the string password for the credential, if needed...
public static final String VAL_PSWD = "pswd";

// the string pass phrase for the credential if needed:
public static final String VAL_PASSPHRASE = "passphrase";

// the string private key for the credential, if needed...
public static final String VAL_PKEY = "pkey";

// the string authentication protocol for the credential, if needed...
public static final String VAL_AUTHPROTO = "authprotocol";

// the string authentication key for the credential, if needed...
public static final String VAL_AUTHKEY = "authkey";

// the string privacy protocol for the credential, if needed...
public static final String VAL_PRIVPROTO = "privprotocol";

// the string privacy key for the credential, if needed...
public static final String VAL_PRIVKEY = "privkey";

private Properties fProps;

public CredentialResolver() {
}

private void loadProps() {
    if(fProps == null)
        fProps = new Properties();

    try {
        String propFilePath = System.getenv(ENV_VAR);
        if(propFilePath == null) {
            // further handling...
        }
    }
}
System.err.println("Environment var "+ENV_VAR+" not found. Using default file: "+DEFAULT_PROP_FILE_PATH);
    propFilePath = DEFAULT_PROP_FILE_PATH;
}

File propFile = new File(propFilePath);
if(!propFile.exists() || !propFile.canRead()) {
    System.err.println("Can't open "+propFile.getAbsolutePath());
} else {
    InputStream propsIn = new FileInputStream(propFile);
    fProps.load(propsIn);
}

//fProps.load(CredentialResolver.class.getClassLoader().getResourceAsStream("dummycredentials.properties");
} catch (IOException e) {
    System.err.println("Problem loading credentials file: ");
    e.printStackTrace();
}

/**
 * Resolve a credential.
 */
public Map resolve(Map args) {
    loadProps();
    String id = (String) args.get(ARG_ID);
    String type = (String) args.get(ARG_TYPE);
    String keyPrefix = id+".\+type=";";

    if(id.equalsIgnoreCase("misbehave")
        throw new RuntimeException("I've been a baaaaaaaaad CredentialResolver!");

    // the resolved credential is returned in a HashMap...
    Map result = new HashMap();
    result.put(VAL_USER, fProps.get(keyPrefix + VAL_USER));
    result.put(VAL_PSWD, fProps.get(keyPrefix + VAL_PSWD));
    result.put(VAL_PKEY, fProps.get(keyPrefix + VAL_PKEY));
    result.put(VAL_PASSPHRASE, fProps.get(keyPrefix + VAL_PASSPHRASE));
    result.put(VAL_AUTHPROTO, fProps.get(keyPrefix + VAL_AUTHPROTO));
    result.put(VAL_AUTHKEY, fProps.get(keyPrefix + VAL_AUTHKEY));
    result.put(VAL_PRIVPROTO, fProps.get(keyPrefix + VAL_PRIVPROTO));
    result.put(VAL_PRIVKEY, fProps.get(keyPrefix + VAL_PRIVKEY));
System.err.println("Error while resolving credential id/type["+id+"/"+type+"]) 

return result; 
}

/** 
 * Return the API version supported by this class. 
 */ 
public String getVersion() { 
return "1.0"; 
}

public static void main(String[] args) { 
CredentialResolver obj = new CredentialResolver(); 
obj.loadProps(); 

System.err.println("I spy the following credentials: "); 
for(Object key: obj.fProps.keySet()) { 
 System.err.println(key+": "+obj.fProps.get(key)); 

}

}

Import a JAR file to resolve credentials
Import a JAR file created to resolve credential identifiers sent from the MID Server into actual credentials from the repository.

About this task
After you create the JAR file, import it into the instance, where it becomes accessible to the MID Server.

Procedure
1. After creating the JAR and properties files, copy the properties file to the MID Server. 
2. Navigate to MID Server > JAR Files. 
3. Click New. 
4. Complete the following fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>A version number for the file, if one is available.</td>
</tr>
<tr>
<td>Source</td>
<td>Location of the JAR file for reference purposes. Source information is not used by the system.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of the JAR file and its purpose in the instance.</td>
</tr>
</tbody>
</table>

5. Click the paper clip icon in the banner and attach the JAR file to the record.

**Example**

![Attaching a JAR file](image)

6. Click **Submit**.

7. Restart the MID Server service.
   The platform makes the JAR file available to any MID Server configured to communicate with the instance.

Configure the credential identifier
Configure the credential identifier in the instance.

**Before you begin**
Role required: admin
Verify the following items:

- The **External Credential Storage** plugin must be active.
- The **Enable External Credential Storage** Discovery property is enabled.
Procedure

1. Navigate to Discovery > Credentials or Orchestration > Credentials.
2. Click New.
3. Select a credential type.
4. Select the External credential store check box.
   The User name and Password fields disappear, and the Credential ID field and Credential storage vault menu appear.
5. From the Credential storage vault menu, select either None, the CyberArk vault, or a custom external credential storage vault.

Note:
If CyberArk vault is selected, the Lookup key menu appears with four lookup key choices: Credential ID, Lookup key, FQDN, All of the above. Selecting All of the above can degrade performance because it requires accessing the vault multiple times.

a. To use a custom external credential storage vault, navigate to Vault Configurations [vault_configuration.list] in the instance.

b. Create a new record using a name associated an imported JAR file for a custom credential resolver.
   See the procedures Create a JAR file to resolve credentials and Import a JAR file to resolve credentials for information on creating a custom external credential storage vault.

6. Complete the Credentials form using the fields from the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
</tbody>
</table>
| Credential ID   | Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. This is the ID passed to the Java class in the parameter map:  
                  
                  public static final String ARG_ID = "id";                                                                                             |
<p>|                 | The MID Server uses this identifier to resolve the actual credentials on the repository.                                                    |</p>

Configure the credential identifier for AWS

Configure your instance to obtain credentials from a remote repository.

Before you begin

Role required: cloud_admin

Verify that these plugins are active, and the MID Server has been installed:

- Discovery [com.snc.discovery]
- Cloud Provisioning and Governance [com.snc.cloud.mgmt]
- External Credential Storage [com.snc.discovery.external_credentials]

About this task

These procedures assume that you already have an external repository configured with the credentials you want to protect. The credential identifier configured in the ServiceNow instance must be mapped to the actual credential in the repository through the JAR file.

Procedure

1. Navigate to Discovery > Credentials.
2. Select a credential that your external credential storage provider supports.
3. Complete the form, using the fields from the table.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWS Account</td>
<td>Enter your AWS account ID if your AWS credentials are on an external storage provider.</td>
</tr>
<tr>
<td>MID Servers</td>
<td>Select one or more MID Servers that can use these credentials.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the Name under which this credential is stored in the external credential storage provider.</td>
</tr>
<tr>
<td>Privacy Credential ID</td>
<td>Enter the name of an SNMPv3 privacy key from CyberArk. This field is only visible for SNMPv3 when you select CyberArk from the Credential Store Type field. If you are not using a privacy key for CyberArk, leave this field empty.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Select an alias for this credential that contains specific behaviors. See Credential aliases for Discovery for more information.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When external storage is enabled, the Credential ID field appears. If this check box is not visible, click the menu icon in the header bar and select View &gt; External Storage from the context menu.</td>
</tr>
<tr>
<td>Credential Store Type</td>
<td>Select CyberArk only if you are using a CyberArk SNMPv3 privacy key. The Privacy Credential ID field appears to allow entry of the key.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Configure an authentication algorithm**

Configure an authentication algorithm so that you can sign outbound HTTP requests.

**Before you begin**
You should have a script include configured before you configure an authentication algorithm.
Role required: admin

**Procedure**

1. Navigate to **Credentials & Connections > Authentication Algorithms**, and click **New**.
2. On the form, fill in the fields.
The database selection in the **Format** field determines which fields are available.

### Authentication form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this algorithm.</td>
</tr>
<tr>
<td>Algorithm</td>
<td>Outbound request type.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of what your algorithm does.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope that your application runs in.</td>
</tr>
<tr>
<td>Instance Authentication Script</td>
<td>Script that you select from the Script Includes table.</td>
</tr>
<tr>
<td>MID Authentication Script</td>
<td>Script that you select from the MID Server Script Includes [Discovery view] table.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

### Check IP service affinity for Discovery and Orchestration

You can check the IP Services table for a list of IP addresses that are associated with a protocol.

**Before you begin**

Role required: admin

**About this task**

The IP Services table maps a port to a protocol. Several mappings are provided by default for commonly used port-protocol combinations, such as port 80 for HTTP, port 22 for SSH, and port 161 for SNMP.

A system property called `glide.discovery.ip_service_affinity` allows Discovery to remember the last port of the IP address that was discovered. This property is set to **false** by default.

⚠️ **CAUTION:** You should not modify IP services unless your organization uses custom ports.
Procedure

1. Navigate to Discovery Definition > IP Services.
2. Filter the list to find the appropriate IP service.
3. Click the name of the service to go to that IP service page.
4. Click the IP Service Affinities tab for the list of IP addresses associated with that service.

IP Service Affinities

Data Certification

Data Certification manages scheduled and on-demand validations of the configuration management database (CMDB) data.

Information is added to the CMDB by Discovery, by importing from third-party tools, or manually. For regulatory or procedural reasons, information in the CMDB requires checks for accuracy and certification. The person or team responsible for certification can define what information requires verification and a verification schedule. The schedule then generates a checklist for verifying the data. Individuals assigned to certification tasks answer a series of questions to verify the data.

Data certification can be performed against specific fields on specific tables. Based on the certification schedule, certification tasks are automatically
created and assigned. For example, you can set up a certification to validate key information fields, such as Operating System and CPU count, on all Windows servers located in Chicago. You can then assign the tasks to the appropriate team member automatically.

Domain separated systems can use the Data Certification application.

Activate Data Certification

Activate the Data Certification plugin to access the application. Activating this plugin also activates the Version Management plugin, which manages certification filter versions.

**Before you begin**
Role required: admin

**Procedure**

1. Navigate to System Applications > All Available Applications > All.
2. Find the Data Certification plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.

3. Click Install, and then in the Activate Plugin dialog box, click Activate.

   🌟 Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

**Installed With Data Certification**

Activating the Data Certification plugin installs the following components.

Demo data is available with Data Certification. The demo data provides information including filters, schedules, instances, and tasks.

**Tables**

Data Certification adds the following tables:
### Table Description

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certification Audit Definition [cert_audit_definition]</td>
<td>Stores collections of certification schedules that can be run as a single entity.</td>
</tr>
<tr>
<td>Certification Audit Definition Elements [m2m_cert_audit_def_cert_sched]</td>
<td>Lists the certification schedules in each certification audit definition.</td>
</tr>
<tr>
<td>Certification Audit Instance [cert_audit_instance]</td>
<td>Stores the certification instances associated with a specific audit definition.</td>
</tr>
<tr>
<td>Certification Element [cert_element]</td>
<td>Stores the data elements that are grouped into certification tasks.</td>
</tr>
<tr>
<td>Certification Filter [cert_filter]</td>
<td>Stores the data that requires certification using a filtering condition for the certification.</td>
</tr>
<tr>
<td>Certification Instance [cert_instance]</td>
<td>Stores a collection of certification tasks representing a single instance of a scheduled certification. This table extends the Audit [cert_audit] table.</td>
</tr>
<tr>
<td>Certification Schedule [cert_schedule]</td>
<td>Stores certification for a specific set of information on a specific table, what user or group the tasks are assigned to, and how often this certification is done.</td>
</tr>
</tbody>
</table>

### Script Includes

Data Certification adds the following script includes:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CertificationAjax</td>
<td>Provides utilities that enable individual certification elements to be certified, rejected, or reverted.</td>
</tr>
<tr>
<td>CertificationTaskCreate</td>
<td>Custom code that extends the standard code for certification tasks.</td>
</tr>
<tr>
<td>CertTaskEscalationTimerPercentage</td>
<td>Updates time and percentage complete information for a certification.</td>
</tr>
</tbody>
</table>
### Client Scripts
Data Certification adds the following client scripts:

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alert If Boxes Checked</td>
<td>Certification Task [cert_task]</td>
<td>Provides a warning if the certifier attempts to leave a record without certifying the checked elements</td>
</tr>
<tr>
<td>Check Table Name</td>
<td>Certification Schedule [cert_schedule]</td>
<td>Updates the table name when a different filter is selected.</td>
</tr>
</tbody>
</table>

### UI Policies
Data Certification adds the following UI policies:

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hide next scheduled run</td>
<td>Certification Schedule [cert_schedule]</td>
<td>Hides the Next Scheduled Run field when the schedule is set to run once or on demand only.</td>
</tr>
<tr>
<td>• Hide &quot;run&quot; associated fields when active is set to false</td>
<td>Certification Schedule [cert_schedule]</td>
<td>Hides the Run field when Active is set to False.</td>
</tr>
<tr>
<td>• Hide Run When Not Active</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Make table name read only</td>
<td>Certification Schedule [cert_schedule]</td>
<td>Makes the Table field read-only.</td>
</tr>
<tr>
<td>Hide Table field</td>
<td>Certification Element [cert_element]</td>
<td>Hides the Table field on the certification task form.</td>
</tr>
</tbody>
</table>
### Name | Table | Description
--- | --- | ---
Make percent complete field read only | Certification Instance [cert_instance] | Makes the Percent complete field read only when the State is Work in Progress, Closed Complete, Closed Incomplete, or Cancelled.
Show Assign to fields | Certification Schedule [cert_schedule] | Shows the Assign To field when the assignment type is User and hides the Assign To field for all other assignment types.
Show Group field | Certification Schedule [cert_schedule] | Shows the Assignment Group field when the assignment type is Group and hides the Assignment Group field for all other assignment types.
Show User field | Certification Schedule [cert_schedule] | Shows the User field when the assignment type is User.
Show Assignment Fields | Certification Schedule [cert_schedule] | Shows the Assign To Empty option when the assignment type is User Field or Group Field.

### Business Rules
Data Certification adds the following business rules:

### Name | Table | Description
--- | --- | ---
Adjust dates for cert tasks | Certification Instance [cert_instance] | Adjusts dates for tasks belonging to the certification instance when the dates are changed for an active certification.
Cancel Instance | Certification Instance [cert_instance] | Cancels all open certification tasks when an active certification is canceled.
certification audit instance events | Certification Audit Instance [cert_audit_instance] | Sends an inserted event when an active certification audit instance is created. Sends a completed event when an active certification audit instance is marked as complete or incomplete.
<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification element events</td>
<td>Certification Element [cert_element]</td>
<td>Sends a failed event when an element of a certification is marked as failed.</td>
</tr>
<tr>
<td>certification instance events</td>
<td>Certification Instance [cert_instance]</td>
<td>Sends an inserted event when an instance of a certification is created. Sends a completed event when an instance of a certification is completed.</td>
</tr>
<tr>
<td>Certification Instance Rollup</td>
<td>Certification Task [cert_task]</td>
<td>Updates the Percent complete field on the certification instance record.</td>
</tr>
<tr>
<td>certification task events</td>
<td>Certification Task [cert_task]</td>
<td>Sends an inserted event when a task is inserted. Sends a completed event when a task is deactivated. Sends a canceled event when a task is canceled.</td>
</tr>
<tr>
<td>Certification Task Values</td>
<td>Certification Element [cert_element]</td>
<td>Updates the percent complete of the parent task when a certification element is updated.</td>
</tr>
<tr>
<td>Check Certification Audit Progress</td>
<td>Certification Instance [cert_instance]</td>
<td>Updates the completion status of the audit instance as a whole when a certification that is part of an audit is complete.</td>
</tr>
<tr>
<td>Clean Certification Views</td>
<td>Certification Instance [cert_instance]</td>
<td>Cleans all related records when a certification instance is deleted.</td>
</tr>
<tr>
<td>Copy certification schedule fields</td>
<td>Certification Instance [cert_instance]</td>
<td>Copies changes to the certification schedule to the certification instance.</td>
</tr>
<tr>
<td>Merge Certification Tasks</td>
<td>Certification Task [cert_task]</td>
<td>Merges two tasks together when a task is reassigned and there is another task for the same instance with the new user.</td>
</tr>
<tr>
<td>Prevent delete of Filter with Schedule</td>
<td>Certification Filter [cert_filter]</td>
<td>Prevents the deletion of a filter that is used in a schedule.</td>
</tr>
<tr>
<td>Name</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Reassign Notification</td>
<td>Certification Task [cert_task]</td>
<td>Sends out a notification to the new and previous assignees when a task is reassigned.</td>
</tr>
<tr>
<td>Rollup State</td>
<td>Certification Task [cert_task]</td>
<td>Updates all necessary parent items when task state is changed.</td>
</tr>
<tr>
<td>Update audit reference</td>
<td>Certification Task [cert_task]</td>
<td>Makes Data Certification records compatible with Desired State records. This rule makes sure that the Audit field is correctly completed when a record is inserted using Insert and Stay.</td>
</tr>
<tr>
<td>Update audit result</td>
<td>Certification Element [cert_element]</td>
<td>Makes Data Certification records compatible with Desired State records for reporting purposes. This rule puts certified values in the Desired value column when an audit is Certified. It also puts actual values in the Discrepancy value column when an audit is Failed.</td>
</tr>
<tr>
<td>Update follow_on_task &amp; audit references</td>
<td>Certification Element [cert_element]</td>
<td>Makes Data Certification records compatible with Desired State records for reporting purposes. This rule makes certification tasks compatible with follow-on tasks and displays all tasks, regardless of origin.</td>
</tr>
<tr>
<td>Update next run time</td>
<td>Certification Schedule [cert_schedule]</td>
<td>Updates the Next scheduled run field when a schedule runs Daily, Weekly, Monthly, or Periodically.</td>
</tr>
<tr>
<td>Verify Fields</td>
<td>Certification Schedule [cert_schedule]</td>
<td>Verifies that no field is used in both Display and Certification fields when the fields of a certification schedule are changed.</td>
</tr>
</tbody>
</table>

**Formatter**

Data Certification adds the following formatter:
**Formatter**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certification Task Elements</td>
<td>Enables custom user interface formatting of elements on a certification task. For example, displays the green check mark and red exclamation point to use when certifying an element.</td>
</tr>
</tbody>
</table>

**Properties**

**Properties**

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.cert_task_activity.fields</td>
<td>System Properties [sys_properties]</td>
<td>Defines which journal field is the task activity field. Default: work_notes</td>
</tr>
</tbody>
</table>

**User Roles**

Data Certification adds the following user roles:

**User Roles**

<table>
<thead>
<tr>
<th>Role</th>
<th>Contains Roles</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification_admin</td>
<td>certification</td>
<td>Can:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Create and configure certifications</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Override provided answers</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Perform certification tasks for certification task owners</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Send certification task notifications to users and owners at any time</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Cancel or delete certifications in any state</td>
</tr>
<tr>
<td>certification_filter_admin</td>
<td>certification</td>
<td>Can create and manage all data certification filters.</td>
</tr>
<tr>
<td>certification</td>
<td>none</td>
<td>Can update active or incomplete tasks assigned to them or to groups of which they are a member. Can also update configuration items owned by them or by groups of which they are a member.</td>
</tr>
</tbody>
</table>
User Roles (continued)

<table>
<thead>
<tr>
<th>Role</th>
<th>Contains Roles</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>member. Receives email notifications when assigned certification tasks.</td>
</tr>
</tbody>
</table>

Events
Data Certification adds the following events. The ServiceNow system uses these events to send email notifications to task owners and managers about changes in certification records.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cert_audit_instance.completed</td>
<td>A certification audit instance has been completed.</td>
</tr>
<tr>
<td>cert_audit_instance.inserted</td>
<td>A certification audit instance has been inserted.</td>
</tr>
<tr>
<td>cert_element.failed</td>
<td>A certification element has failed certification.</td>
</tr>
<tr>
<td>cert_instance.complete</td>
<td>A certification instance has been completed.</td>
</tr>
<tr>
<td>cert_instance.inserted</td>
<td>A certification instance has been inserted.</td>
</tr>
<tr>
<td>cert_task.cancelled</td>
<td>A certification task has been canceled.</td>
</tr>
<tr>
<td>cert_task.completed</td>
<td>A certification task has been completed.</td>
</tr>
<tr>
<td>cert_task.escalate</td>
<td>A certification task record has been escalated.</td>
</tr>
<tr>
<td>cert_task.inserted</td>
<td>A new certification task has been created.</td>
</tr>
<tr>
<td>cert_task.notifications</td>
<td>A certification task notification has been resent to a user.</td>
</tr>
<tr>
<td>cert_task.overdue</td>
<td>A certification task is past its specified completion date.</td>
</tr>
<tr>
<td>cert_task.reassign</td>
<td>A certification task has been reassigned.</td>
</tr>
<tr>
<td>cert_task.warning</td>
<td>A new task escalation point has been reached.</td>
</tr>
</tbody>
</table>

Email Templates
Data Certification adds the following email templates:
<table>
<thead>
<tr>
<th>Name</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification.task.cancelled</td>
<td>A certification task assigned to you/your group as part of the data certification and management process has been canceled.</td>
</tr>
<tr>
<td>certification.task.reminder.inserted</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process requires attention.</td>
</tr>
<tr>
<td>certification.task.reminder.outstanding</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process requires attention.</td>
</tr>
<tr>
<td>certification.task.reminder.overdue</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process is overdue.</td>
</tr>
</tbody>
</table>

**Certification schedules**

A certification schedule defines the information that requires certification and the frequency of execution.

At each time interval specified, or on-demand, the certification schedule generates a set of certification tasks based on set conditions. Use the Preview Certification Tasks related link to preview the certification tasks generated from a certification schedule.
Certification tasks

A certification task represents the work of verifying the data associated with a particular record.

Task owners are responsible for performing the certification tasks. Tasks have an associated workflow that sends reminders to the task owner and, if necessary, the manager of the owner at regular intervals.
Certification task

**Certification data for Certification Task TSK00009072**

UNIX Servers

- **All**
- **CPU speed (MHz)**
- **RAM (MB)**
- **CPU core count**

<table>
<thead>
<tr>
<th>CPU speed (MHz)</th>
<th>RAM (MB)</th>
<th>CPU core count</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.600</td>
<td>8.192</td>
<td></td>
</tr>
<tr>
<td>1.600</td>
<td>8.192</td>
<td></td>
</tr>
<tr>
<td>1.600</td>
<td>8.192</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** If the message

```
Record cannot be certified until the instance is finished creating all certification tasks and elements. Reload the page to try again
```

appears, it signifies that:

- A large amount of data is present in the cmdb_ci and cmdb_ci_server tables.
- Data certification task processing is not complete (Data Certification jobs are still in process).

As directed, reload the page and wait for the processing to complete.

**Clean up invalid elements**

Use the **Clean up invalid elements** UI action to query and delete certification elements that reference invalid records. Each certification task has a certification schedule, and each certification schedule has Table and Filter fields. When you use this UI action, it performs the following processing:
1. Collects all available records from Table field in the certification schedule with filters that are available in certification schedule.

2. Collects all certification elements associated with the current certification task.

3. Deletes the certification elements that are no longer available for the data collected in the previous step.

4. After deleting invalid records, it recomputes the certification completion percentage using the following formula:
   \[(1 - \text{(number of certification elements pending / total no of certification elements associated)}) \times 100;\]

5. If there are no certification elements with a Pending status, it marks the associated certification task as Closed, and deactivates it.

6. If there are remaining certification elements with a Pending status, it activates the associated certification task and changes its status to Work in Progress.

**Certification elements**

Each element of each record being certified is tracked in its own certification element record.

Also tracked are the date and time when the element was certified, comments, and the original and certified values of the field. You can view elements on individual certification tasks.
Certification elements

A certification instance is the collection of certification tasks for one execution of a certification schedule.
Certification audit instances

A certification audit instance is a collection of the certification instances and tasks generated by a single execution of the certification audit definition.

Certification audit definition

A certification audit definition is a collection of certification schedules that can be run at once.
Data Certification Overview module

The Data Certification Overview module displays various data certification-related reports on the Data Certification Console homepage.

The Overview module is a type of homepage.

The different levels of access are:

<table>
<thead>
<tr>
<th>Role</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification</td>
<td>View (view overview page and refresh reports)</td>
</tr>
<tr>
<td>certification_admin</td>
<td>• View (view overview page and refresh reports)</td>
</tr>
<tr>
<td></td>
<td>• Customize (refresh, add, delete, and rearrange reports)</td>
</tr>
<tr>
<td>admin</td>
<td>• View (view overview page and refresh reports)</td>
</tr>
<tr>
<td></td>
<td>• Customize (refresh, add, delete, and rearrange reports)</td>
</tr>
<tr>
<td></td>
<td>• Edit (can edit reports)</td>
</tr>
</tbody>
</table>

Data Certification Overview Module

The Overview module includes the following reports:

<table>
<thead>
<tr>
<th>Data Certification Overview Module Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>report</td>
</tr>
<tr>
<td>30/60/90 Day Aging</td>
</tr>
<tr>

</tr>
<tr>
<td>Certification Progress Report</td>
</tr>
<tr>
<td>Certification Task Completed Report</td>
</tr>
</tbody>
</table>
### Data Certification Overview Module Description (continued)

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exceptions To Date</td>
<td>Lists all task elements that have comments added and a state of Failed or In Progress.</td>
<td>Certification Element</td>
</tr>
<tr>
<td>Functional Roll Up</td>
<td>Lists the managers that have groups with assigned certification tasks. The report is a horizontal bar chart, grouped by status, with each bar representing a manager of an assignment group.</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Hierarchical Roll Up</td>
<td>Shows the managers that have employees with assigned certification tasks (task owners). The report is a horizontal bar chart, grouped by status, with each bar representing a manager of a task owner (identified in the Assigned to field).</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Upcoming Schedules</td>
<td>Lists all schedules that are scheduled to run within the next 30 days.</td>
<td>Certification Schedule</td>
</tr>
</tbody>
</table>

### Related information

Use the Data Certification Overview module

### Use the Data Certification Overview module

View the status of data certification tasks.

### Procedure

1. Navigate to **Data Certification > Overview**.

2. Click elements within the reports to obtain more information.
   
   For example, click any of the colored bars in the **Functional Roll Up** bar chart and detailed information replaces the Data Certification Console screen.

3. Update some fields directly on the overview page.

   **Example:**
   
   For example, in the red box on the image shown, a certification schedule is being updated in the certification instances report.

Data Certification planning
Initial planning can make the certification process more successful.

By defining certification schedules and certification audit definitions, users with the certification_admin role establish when certifications are performed, who performs it, and what data must be certified.

Required Roles
Users with the certification_admin role can view filter versions. These users can create, update, and delete filters, if they have the proper access to necessary tables. In the base ServiceNow system, certification_admin users have limited system rights and do not have access to all the tables required for creating a filter. When assigning compliance resources, make sure to grant additional roles to the certification_admin user as needed. For example, this user requires roles that grant access to these tables:
Planning Data Certification
Planning the data certification process requires defining:

- The certification schedule defines certification for a particular set of information on a particular table. It also generates certification tasks to perform that certification. One certification task is generated per task owner and a certification instance record groups the tasks.
- The optional certification audit definition groups some certification schedules to be performed together and generates certification audit instances to perform them.

The following questions require answers for each certification schedule:

- What information requires certification?
- When is the due date for certification?
- Who must perform the certification?

Create a certification filter
A filter is a subset of configuration items from any ServiceNow table that is created with a standard condition builder.

About this task
An example is a filter that selects all UNIX servers in the Australian data center.

With filters, you can:

- Create multiple versions of a filter and then select the version you want to use.
- Use one filter on multiple certification schedules.
- View the number of records that match your filter as you create the conditions.

⚠️ Note: Be sure to create certification filters before creating certification schedules.

Procedure
1. Navigate to Data Certification > Certification Filters.
2. Click New.
3. Fill in the form (see table).

4. Click **Submit**.
   This action saves the filter as version 1.

5. To create another filter version, modify the filter conditions and click **Update**.
   The system saves the new filter and increments the version number.

By default, the Certification Filters list shows only the current version of each filter. To see all filter versions, click **All** in the breadcrumbs.
6. To make an inactive filter the current version, open the inactive filter and click Revert. This action creates a new, active version of the filter and makes all previous versions inactive.

7. To delete a single filter version, open that version record and click Delete.

8. To delete inactive versions of a filter, click Delete inactive versions under Related Links in that filter record.

You cannot delete a filter that is used in a schedule definition. The system displays a warning and the filter is not deleted.
### Creating certification filters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Filter name.</td>
</tr>
<tr>
<td>Description</td>
<td>[Optional] Brief description of the filter.</td>
</tr>
<tr>
<td>Number</td>
<td>[Read-only] Automatically assigned filter identification number.</td>
</tr>
<tr>
<td>Table</td>
<td>Table containing the records to be filtered. Use of the Database View [sys_db_view] table is limited by version.</td>
</tr>
<tr>
<td>Active</td>
<td>Control to make the filter available for use from the Filter field on the Certification Schedule form.</td>
</tr>
<tr>
<td>Version</td>
<td>Current version of this filter. Any significant changes to the filter make the current version inactive. The system copies the updated filter, marks it as active, and increments the version number. The system saves all versions of the filter and makes them available to users. More than one version of a filter can be marked active.</td>
</tr>
<tr>
<td>Filter condition</td>
<td>Field, operator, and value to create the condition. The available options depend on the table selected. You can view the number of records that match the filter by clicking the refresh icon.</td>
</tr>
</tbody>
</table>

**Refresh Conditions**

If the filter does not match any records, the system marks the certification instance as **Closed Complete**, with the **Percent complete** value set to **100%**.

### Related information

**Data Certification planning**

**Define a certification schedule**

A certification schedule specifies the fields to display, the fields that require certification, certification task assignments, completion requirements for task owners, frequency of schedule, and detailed instructions.
About this task
Use the preview option to see what tasks are created before saving the schedule. If the tasks are not what you want, edit the schedule and preview the tasks again. The system creates certification tasks automatically when it executes a schedule.

To schedule a certification:

Procedure
1. Navigate to Data Certification > Schedule Definitions.
2. Click New
3. Fill in the fields (see table).
4. Click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A schedule name.</td>
</tr>
<tr>
<td>Filter</td>
<td>A certification filter for this schedule.</td>
</tr>
<tr>
<td>Table</td>
<td>[Read-only] The table holding the records to be certified. To change the table name, select a different Filter or create a new Filter.</td>
</tr>
<tr>
<td>Display fields</td>
<td>The fields displayed in the Certification Task list to provide context. These do not require certification themselves. For example, although users are not required to certify the Name field of a record, it displays so that users know what record they are certifying.</td>
</tr>
<tr>
<td>Certification fields</td>
<td>The fields to certify on this certification schedule.</td>
</tr>
<tr>
<td>Assignment type</td>
<td>A choice list to select how the certification schedule assigns the certification tasks.</td>
</tr>
<tr>
<td></td>
<td>• <strong>User Field:</strong> Select a user reference field on the table being certified. As an example, select the user named in the Managed by field to identify the user who performs the task. This selection displays the Assign to and Assign to empty fields. If the reference field on the record is empty, the value in the Assign to empty field is used.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Specific User:</strong> Select a specific user to perform the tasks. This selection displays the User field.</td>
</tr>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Group Field</strong>:</td>
<td>Select a group reference field on the table being certified. As an example, select the Support group field to identify the user who performs the task. This selection displays the <strong>Assign to group</strong> and <strong>Assign to empty</strong> fields. All members of the group from the reference field on the record are assigned to the tasks. If the reference field on the record is empty, the value in the <strong>Assign to empty</strong> field is used.</td>
</tr>
<tr>
<td><strong>Specific Group</strong>:</td>
<td>Select a specific group to perform the tasks. This selection displays the <strong>Group</strong> field. All members of the named group are assigned to the tasks.</td>
</tr>
<tr>
<td><strong>User</strong></td>
<td>This field appears when:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Assignment type</strong> is <strong>Specific User</strong>. This system assigns this user to all certification tasks for this schedule.</td>
</tr>
<tr>
<td></td>
<td>• The <strong>Assign to empty</strong> field is set to <strong>Create Assigned Task</strong>, and you have selected <strong>User Field</strong> as the assignment type. The system assigns this user to certification tasks containing unassigned records.</td>
</tr>
<tr>
<td></td>
<td>You can only select users with the certification role.</td>
</tr>
<tr>
<td><strong>Assign to group</strong></td>
<td>The group field that defines the group assigned to the certification tasks. This field is available only when the <strong>Assignment type</strong> is <strong>Group Field</strong>.</td>
</tr>
<tr>
<td><strong>Group</strong></td>
<td>The specific group to which certification tasks are assigned for this schedule. This field is available only when the <strong>Assignment type</strong> is <strong>Specific Group</strong>.</td>
</tr>
<tr>
<td><strong>Assign to</strong></td>
<td>The user field that defines which user is assigned to the certification task. This field is available only when the <strong>Assignment type</strong> is <strong>User Field</strong>.</td>
</tr>
<tr>
<td><strong>Assign to empty</strong></td>
<td>The behavior to use if the field selected in <strong>Assign to</strong> or <strong>Assign to group</strong> is blank on the record being certified. For example, if a task must be assigned to a manager, but no manager is identified, the value in this field determines what happens. This field appears only when the <strong>Assignment type</strong> is <strong>User Field</strong> or <strong>Group Field</strong>. The possible selections are:</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Do Not Create Task</td>
<td>No task is created when the Assign to or Assign to group field is empty.</td>
</tr>
<tr>
<td>Create Unassigned Task</td>
<td>Create a task, but do not assign it to any user or group. The task can be manually assigned later.</td>
</tr>
<tr>
<td>Create Assigned Task</td>
<td>Create a task and assign it to the user or group specified. If you selected an assignment type of User Field, the User field is available. If you selected the Group Field type, the Group field is available.</td>
</tr>
</tbody>
</table>

The schedule automatically creates certification tasks for all records that do have "Assign to" populated, regardless of which selection you make for "Assign to empty."

<table>
<thead>
<tr>
<th>Days to complete</th>
<th>[Required] The number of days that task owners have to complete the certification tasks. When the certification schedule is part of a certification audit definition, the Days to Complete audit definition value overrides the value set for the certification schedule.</th>

**Related information**

**Data Certification planning**

**Preview a certification task**

Previewing certification tasks saves any changes to the Certification Schedule form and displays the tasks that are created when you execute the certification schedule.

**About this task**

Previewing tasks is especially useful if you want to test different combinations of options in the Assignment type, Assign to, and Assign to empty fields.

**Procedure**

1. Navigate to Data Certification > Schedules > Schedule Definitions.
2. Click a certification schedule Name.
3. In Related Links, click Preview Certification Tasks. The tasks to be created appear at the top of the screen.

Certification info message

- 0 Servers
  One Certification Task would be created unassigned to certify 31 Servers
  One Certification Task would be created for Bow Ruggeri to certify 7 Servers
  One Certification Task would be created for Bud Richman to certify 1 Server
  One Certification Task would be created for David Loo to certify 1 Server

Use a certification schedule notification

After you define a certification schedule, the system automatically sends notifications to specific users based on the information in the schedule.

About this task

The following notifications are sent automatically:

<table>
<thead>
<tr>
<th>Time elapsed to end date</th>
<th>Email template name</th>
<th>Notification message is sent to</th>
</tr>
</thead>
<tbody>
<tr>
<td>0% (when task is created)</td>
<td>certification.task.reminder.inserted</td>
<td>Task owner or assignment group, if specified</td>
</tr>
<tr>
<td>50%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner or assignment group, if specified</td>
</tr>
<tr>
<td>75%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner, assignment group, if specified, and manager of the task owner, if specified</td>
</tr>
<tr>
<td>95%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner, assignment group, if specified, and</td>
</tr>
</tbody>
</table>
Certification Schedule Notifications (continued)

<table>
<thead>
<tr>
<th>Time elapsed to end date</th>
<th>Email template name</th>
<th>Notification message is sent to</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>manager of the task owner, if specified</td>
</tr>
<tr>
<td>100%</td>
<td>certification.task.reminder.overdue</td>
<td>Task owner, assignment group, if specified, and manager of the task owner, if specified</td>
</tr>
</tbody>
</table>

The email templates used in the notifications can be edited, for example, to change the email message text.

Executing a Certification Schedule

Executing a certification schedule generates certification tasks based on the schedule.

**Procedure**

1. Navigate to **Data Certification > Schedules > Schedule Definitions**.
2. Click a certification schedule **Name**.
3. Click **Execute Now**.

   The related lists **Certification Instances** and **Certification Tasks** display the instances or tasks generated by the schedule. The amount of time it takes to generate all certification tasks depends on the size of the table selected and how many fields require certification.
Define and create a certification audit

A certification audit is a collection of certification schedules that can be run as a single entity.

About this task

Certification audits can be useful when there are multiple certification schedules. After creating a certification audit definition, you can generate a certification audit instance. The certification audit instance is a collection of the certification instances and tasks generated by a single execution of the certification audit definition.

Procedure

1. Navigate to **Data Certification > Audits > Audit Definitions**.
2. Click **New**.
3. Fill in the fields (see table).
4. Right-click the header bar and select **Save**.
5. In the **Certification Schedules** related list, click **Edit**.
6. In the **Collection** list on the left, select one or more schedules and click **Add**.
7. Click **Save**.
8. In **Related Links**, click **Create Certification Audit Instance**. The system generates an audit instance based on the certification schedules selected. All audit instances based on this audit definition are listed in the **Certification Audit Instances** related list.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the audit definition.</td>
</tr>
<tr>
<td>Days to Complete</td>
<td>The number of days that task owners have to complete the certification tasks created by this audit definition. Overrides the identical field on the certification schedule.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the intended audit.</td>
</tr>
</tbody>
</table>

Define a certification schedule

Fulfill certification tasks

After you execute a certification schedule manually or at a scheduled time, the ServiceNow system performs certain actions.

• Creates tasks for any records that meet the filter requirements in the specified table, like tasks from the Configuration Item \texttt{[cmdb\_ci]} table.

• Assigns the new tasks to the user or group identified in one of these certification schedule fields:
  
  ◦ Assign to
  ◦ User
  ◦ Assign to group
  ◦ Group

• Places the new tasks in the Work in Progress state.
• Adds the certification schedule *Short description* and *Assigned to* values to the corresponding fields on the certification task record.

• Adds the certification schedule *Days to complete* and *Complete by date* fields to the certification task record, based on when the task is created.

**Note:** If the certification filter does not match any CIs, the system sets the *State* to *Closed Complete* and the *Percent complete* to 100.

To view tasks assigned to you, navigate to **Data Certification > Tasks > My Tasks**.

The following information is tracked on the certification task record:

### Certification task record

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>An identification number for the certification task.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>The user responsible for certifying the data.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>The group responsible for certifying the data.</td>
</tr>
<tr>
<td>Complete by</td>
<td>[Read-only] A date field containing a deadline for the task. This field is automatically filled in based on the <em>Days to Complete</em> field on the certification schedule.</td>
</tr>
<tr>
<td>State</td>
<td>[Read-only] The current state of the certification task. The selections are: Work in Progress, Closed Incomplete, Closed Complete, and Cancelled.</td>
</tr>
<tr>
<td>Percent complete</td>
<td>The task progress as a percentage. This field is read-only when a task is in a Closed Incomplete, Closed Complete, or Cancelled state.</td>
</tr>
<tr>
<td>Escalation</td>
<td>[Read-only] The escalation level of the task. When 0–49% of the time to Complete By has elapsed, this field is set to Normal. At 50%, this field changes to Moderate and an email reminder is sent to the task owner. At 75%, this field changes to High and an email reminder are sent to the task owner and the manager of the task owner. At 95%, this field remains set to High, but a second email reminder is sent to the task owner and manager.</td>
</tr>
<tr>
<td>Short Description</td>
<td>A short description of the task. This field is automatically filled in with the text from the certification schedule of the Task description field.</td>
</tr>
</tbody>
</table>
Export the certification list

Users with the certification_admin role can export the certifications list and save the list in Excel, CSV, XML, or PDF format. This list is useful when you have a long list of certification elements or if many different users are assigned to certify elements on a single certification schedule.

**About this task**
For general information and common export steps, see [List export](#).

**Procedure**
1. Navigate to **Data Certification > Tasks > All Tasks**
2. Open a task.
3. Open any column context menu in the certification data list and complete the export.

Certify an element

The Certification Task form contains a list of all elements to be certified.

**About this task**

⚠️ **Note:** After you certify all the elements in a task, no elements can be reverted.

**Procedure**
1. Navigate to **Data Certification > Tasks > My Tasks**.
2. Open a certification task with a State of **Work in Progress**.
3. In the upper right corner of the list, select records that require certification for this task or all records that are part of this certification task.
4. Select the check box beside a certification element.

5. In *Optional comment for checked elements*, above the list, enter information that would be useful to others.

Certification list

<table>
<thead>
<tr>
<th>Certification list</th>
<th>Certifications required for Certification Task TSK0009065</th>
<th>Task</th>
<th>Server not at the designated location</th>
<th>Server &quot;applicationServerPeopleSoft&quot;</th>
<th>Server &quot;AS400&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

6. Do:

- Click the green check mark to certify the element.
- Click the red exclamation point to fail the element.

7. To see the certified or failed element, set the view to *Show All Records*.

A green check mark or red exclamation mark appears beside the element.

8. Point to an icon to see any certification comments.
9. Ensure that all elements have the correct certification, either accepted or rejected.

After you certify all elements, no elements can be reverted. When all elements of a certification task are certified or rejected, the task State changes to Closed Complete.

View an audit result
View audit results after you certify the elements.

Procedure
1. Navigate to Data Certification > Schedules > Audit Results.

The list of data certification audit results appears, grouped by certification instances. Certified configuration items show the Original value only. Failed CIs contain the Certified value and the Original value.

2. Click the links in the list to open any of the related records.

Reset certifications
You cannot reset any element after all elements are certified.

• To reset individual certifications, right-click the element in the certification list and select Revert Certification.

• To reset the entire task to its starting point, click the Reset all Certifications to Pending related link.
Track a task with a certification instance

The Certification Tasks related list on the certification instance record provides information about associated tasks.

**About this task**

The *State* field on the certification instance record is read-only and is based on the cumulative states of the certification tasks associated with the instance. The *Percent complete* column allows users with the certification_admin role to track task progress quickly. For more information, see Track Certification Tasks.

To track a certification instance:

**Procedure**

1. Navigate to **Data Certification > Schedules > Instances**.
2. Click a certification instance *Number*.
3. View and edit the following fields as necessary.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>[Read-only] Automatically generated identification number for the instance.</td>
</tr>
<tr>
<td>Certification Schedule</td>
<td>The certification schedule used to create the certification instance.</td>
</tr>
<tr>
<td>State</td>
<td>[Read-only] Current state of the certification instance: Work in Progress, Complete, Closed Incomplete, or Cancelled. For more information, see Track Certification Tasks.</td>
</tr>
<tr>
<td>Created</td>
<td>[Read-only] Date and time the certification instance was created. Date is filled in automatically when the Execute Now button clicks the associated certification schedule.</td>
</tr>
<tr>
<td>Complete by</td>
<td>[Required] Date and time when the certification instance must be completed. The system updates this field when it executes the schedule, using the deadline specified on the instance. All certification tasks associated with the certification instance must be marked Complete, Closed Incomplete, or Cancelled before the instance is complete.</td>
</tr>
</tbody>
</table>
### Cancel a certification instance

Users with the certification_admin role can cancel a certification instance.

**About this task**

The instance must have a State of Work in Progress. Canceling a certification instance:

- Changes the certification instance State to Cancelled.
- Changes all associated Work in Progress certification tasks to Cancelled.

To cancel a certification instance:

**Procedure**

1. Navigate to Data Certification > Schedules > Instances.
2. Click a certification instance Number.
3. Click Cancel.

### Track a certification task

Use the certification task state to track the progress of a task.

**About this task**

The available task states are Work in Progress, Closed Complete, Closed Incomplete, and Cancelled.

When the state of a certification task changes, the certification instance state also changes in the following cases:
If any certification task is in Work in Progress state, the certification instance is placed in Work in Progress state.

If all certification tasks are in Cancelled state, the certification instance is placed in Cancelled state.

If all certification tasks are in Cancelled or Closed Complete state, the instance is placed in a Closed Complete state. For example, if three certification tasks are Cancelled, and one task is Closed Complete, the instance state is changed to Closed Complete.

When one certification task is Closed Incomplete and the remainder of the tasks are Cancelled or Closed Complete, the instance is placed in Closed Incomplete.

To view the state of certification tasks:

**Procedure**

1. Navigate to Data Certification > Tasks and select My Tasks or All Tasks.
2. View the State column for each task.

**Escalate a certification task**

Users with the certification_admin role can escalate a task in the Work in Progress state. To escalate a task, the task owner identified in the Assigned to field on the task record must have an associated manager.

**About this task**

Personalize the User form to see the Manager field.

Escalating a task:

- Sends an email message to the task owner and the manager of the task owner stating that the task has been escalated.
- Sets the manager as the new task owner.

The event that triggers the escalation is named cert_task.escalate and the email notification is named Escalation Notification. To edit the text of the email message that is sent, edit the Escalation Notification email notification directly.

For more information, see Email notifications.

To escalate a certification task from the Certification Task form:
Procedure
1. Navigate to Data Certification > Tasks > All Tasks.
2. Click a certification task Number.
3. Click Escalate. If the Escalate button is not available, the user in the Assigned to field does not have an associated Manager.

**Escalate a certification task from the certification task list**
Escalate a certification task to notify the manager of the current task owner.

**Before you begin**
To escalate a task, the task owner identified in the Assigned to field on the task record must have an associated manager.

Procedure
1. Navigate to Data Certification > Tasks > All Tasks.
2. Select the check box to the left of a certification task Number. Multiple check boxes can be selected.
3. From the Actions on Selected Rows menu below the list, select Escalate. If the Escalate button is not available, the user in the Assigned to field does not have an associated Manager. Select multiple tasks from the list. The menu option shows how many tasks are not eligible for escalation, such as Escalate (4 of 6).

**Reassign a certification task**
If you have the certification_admin role, you can reassign any certification task in the Work in Progress state. Tasks in Closed Complete, Closed Incomplete, or Cancelled state cannot be reassigned. When a task is reassigned, the current task owner and the new task owner are sent a message.

**Before you begin**
Role required: certification_admin

**About this task**
The event associated with the reassignment is named cert_task.reassign and the email notification is named Certification Task Reassignment. To edit the text of the email message that is sent, edit the Certification Task Reassignment email notification directly.

For more information, see Email notifications.
To reassign a certification task:

**Procedure**

1. Navigate to Data Certification > Tasks > All Tasks.
2. Click a certification task Number.
3. Enter a new name in the Assigned to field.

**Send certification task reminders**

The Certification Task Escalations workflow sends automatic email reminders.

The Certification Task Escalations workflow sends automatic email reminders to the:

- Certification task owner.
- Assignment group, if the assignment group was specified on the Certification Task form.
- Manager of the certification task owner, if necessary and if a manager was specified on the User form.

The reminders are based on the Complete by field on the certification task record. If the Complete by date is changed, the reminder schedule automatically adjusts to reflect the new date.

**Certification task reminders**

<table>
<thead>
<tr>
<th>Time elapsed to end date</th>
<th>Email reminder is sent to</th>
<th>Escalate field on task record reads</th>
</tr>
</thead>
<tbody>
<tr>
<td>50%</td>
<td>task owner and assignment group (if specified)</td>
<td>Moderate</td>
</tr>
<tr>
<td>75%</td>
<td>task owner, assignment group, and manager of the task owner</td>
<td>High</td>
</tr>
<tr>
<td>95%</td>
<td>task owner, assignment group, and manager of the task owner</td>
<td>High</td>
</tr>
<tr>
<td>100%</td>
<td>task owner, assignment group, and manager of the task owner</td>
<td>High</td>
</tr>
</tbody>
</table>
To set reminders for different or more intervals, edit the workflow Certification Task Escalations. In addition to the email reminders sent automatically, users with the certification_admin role can send email reminders manually at any time.

**Send an email reminder from the certification task form**

How to manually send email reminders from the Certification Task form.

**Procedure**

1. Navigate to Data Certification > Tasks > All Tasks.
2. Click a certification task Number.
3. Right-click the header bar and select Resend email notifications.

**Send an email reminder from the certification task list**

How to manually send email reminders from the Certification Task list.

**Procedure**

1. Navigate to Data Certification > Tasks > All Tasks.
2. Select the check box to the left of a certification task Number. Multiple check boxes can be selected.
3. From the Actions on Selected Rows menu below the list, select Resend email notifications. Select multiple tasks from the list. The menu option shows how many notifications are outstanding and how many were sent, such as Resend email notifications (15 of 18).

**Mark a certification task as closed incomplete**

Mark a task as closed incomplete if, for example, only some of the elements can be certified.

**About this task**

The following users can mark a task as closed incomplete:

- Users with the certification_admin role.
- User identified in the Assigned to field on the certification task record.

To mark a task as closed incomplete:
Procedure

1. Navigate to Data Certification > Tasks and select All Tasks, or My Tasks.
2. Click a certification task Number.
3. In Work Notes, enter information about why the task could not be completed.
4. Click Close Incomplete.

If at least one task on a certification instance is marked Closed Incomplete, the Completed date and Percent complete fields on the certification instance record are not updated. A user with the certification_admin role can:
- Complete the incomplete task or tasks.
- Cancel the incomplete task or tasks.

When all tasks on the certification instance are Closed Complete or Cancelled:
- The system sets the Completed date field on the certification instance record to the current date and time.
- The Percent complete field on the certification instance record is set to 100 percent.

Certification tasks cancellation

Users with the certification_admin role can cancel a certification task in the Work in Progress or Closed Incomplete state.

When a certification task is cancelled, a notification email is sent to the task owner or assignment group assigned to the task. The task owner or assignment group manager is not notified.

Cancel an individual task

Cancel a particular data certification tasks in the Work in Progress state.

Procedure

1. Navigate to Data Certification > Tasks > All Tasks.
2. Find a task with a State of Work in Progress.
3. Click the task Number.
4. Click Cancel.
Cancel all tasks in an instance
Cancel data certification tasks in the Work in Progress state.

Procedure
1. Navigate to Data Certification > Schedules > Instances.
2. Find an instance with a State of Work in Progress.
3. Click the instance Number.
4. Click Cancel.

All tasks in the instance with a state of Work in Progress are cancelled. The task owner or assignment group is notified.

The email template used for the notification is named certification.task.cancelled. The email templates can be edited to change the email message text, for example.

Domain separation and Data Certification
Domain separation is supported in Data Certification processing. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic
• Business logic: Ensure data goes into the proper domain for the application’s service provider use cases.
• In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all consider domain at production run time.
• The owner of the instance needs to be able to set up the application to function normally across multiple tenants.

Use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the client must be able to see my response.

How domain separation works in Data Certification
• Data Certification has only basic domain separation. As long as the Certification Instances (CIs) or records that must be certified are correctly domain-separated and the users who must certify the CIs or records are in a domain that can view the data, Data Certification works as expected.
• Recommendation: The instance owner must be responsible for assigning Certification Tasks and Certification Instances to the correct domain. Changing the domain for these records does not change functionality, but limits the view of the records.

How to set up domain separation for Data Certification

After enabling the Domain Separation plugin, there are no additional steps required to set up domain separation for Data Certification.

• instance owners determine which CIs or records that need to be certified can be domain-separated.
• Customers can configure a domain-separated environment by assigning tasks to a domain, but if the data is already domain-separated, then only users with the right domain permissions can view the data in a certification task.

How tenant domains manage their own application data

It's not necessary to set the domain on the certification tables but it can be done if the instance owner should want that. As long as the CI’s or records that must be certified are domain-separated, users with the correct domain permissions can view them.

Domain-separated tables

• cert_instance – Changing the domain on this table does not change any functionality, nor does it change the domains of the tasks created from the table.
• cert_task – Changing the domain on this table changes the domain viewing permissions of the task.
• cert_element – It is not recommended to change the domain on these records. As long as the CIs or records to be certified are already domain-separated, cert_element records will reflect that.
• cert_filter – Changing the domain on this table changes the domain viewing and filtering of CIs or records.

Use cases

Instance owners who have multiple clients that certify the infrastructure they own can assign domains to those CIs and the Certification Tasks to restrict the view from one client to another.

Related information

Domain separation for service providers
Decision Tables

Use decision tables to help you resolve a complex decision that depends on multiple factors.

Use decisions tables to help you reach outcomes that depend on multiple factors. In these tables, each factor is a decision input. For example, if you are trying to make a decision about car insurance coverage, your inputs might include the location where the insured person lives, the age and accident history of the insured person, the car make, the car model, and the car year. This logic can save time and present a more organized, readable format than using a script. Decision tables provide a single point where you can create, view, and modify decisions.

To interact with Decision Tables in script, use the Decision Table API.

Components of a decision

- **Decision Table [sys_decision] records**
  Decision table records represent a single decision. In this record, you specify which table you want to use for your answers. This record also contains related lists where you can create your decision inputs and decisions.

- **Decision inputs [sys_decision_input] records**
  Decision input records represent your inputs that are used to obtain answers in a decision. These inputs can include a variety of types, including strings, references, true/false inputs, and dates. Each decision input has a specified input type and can be assigned a default value.

- **Decision [sys_decision_question] records**
  Each decision record represents a decision that is based on your inputs. Use the condition builder on the decision record form to create a condition that is based on the inputs for this decision. Then, you can select an answer record for this decision. The answer record can be any record from the table that you have defined in the Decision Table record. You can select the same answer record for more than one decision.

- **Answer records**
  Answer records represent answers that are reached using different decision input values. Answers records can be records on any table, but you need to choose the table when creating your Decision Table record. You could, for example, use the sys_choice table to use existing choice records. From the example about insurance
coverage, you could create a table where each record contains details about the levels of insurance coverage.

**Example: Use a decision table to determine a discount rate**

The following example shows a decision table. In this example, you see two inputs, Units Ordered and Cash on Delivery. The two possible answers, Yes and No, are reached depending on the answers to the two questions. For example, a customer would qualify for a silver discount when ordering more than 50 items or paying in cash, and get a gold discount if doing both.

**Sample decision table — discount rates**

<table>
<thead>
<tr>
<th>Decision inputs</th>
<th>Decision input entries</th>
</tr>
</thead>
<tbody>
<tr>
<td>More than 50 units ordered</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Yes</td>
</tr>
<tr>
<td>Cash on delivery</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>No</td>
</tr>
</tbody>
</table>

**Decision Answers**

<table>
<thead>
<tr>
<th>Discount</th>
<th>Silver Discount</th>
<th>Bronze discount</th>
<th>Gold discount</th>
<th>Silver discount</th>
</tr>
</thead>
</table>

**Create a decision table to resolve complex decisions**

Create a decision table to help you resolve a complex decision that depends on multiple factors.

**Before you begin**

Role required: decision_table_admin

**Procedure**

1. Create or select a table to use for your decision answer records. You will associate an answer record to each decision on your decision table in later steps. This answer record is returned when that decision is reached based on your inputs. For information on creating a table, see Create a table.

2. Ensure that one field on the table that you use for your decision records has been set as the display value. This field is used as a label when you display decision answers in Flow Designer.

   You can use an existing table or create a new table to use for your decision records.

3. Create a record on this table to each answer in your decision.
If you have modified an existing table, you may need to customize the form to show the new fields that you have added.

4. Create a decision table record.

   a. Navigate to System Definition > Decision Tables, and click New.

   b. On the form, fill in the fields.

     **Decision Table form**

     | Field            | Description                                                                 |
     |------------------|------------------------------------------------------------------------------|
     | Name             | Descriptive label for this decision.                                        |
     | Application      | Application scope of this decision. This field defaults to the current scope.|
     | Answer table     | Table that this decision uses for answer records. Select the table that you created in the previous steps. |
     | Accessible From  | Option to limit the availability of this decision to the current scope. Select All application scopes or This application scope only. |

   c. Right-click the form header and select Save. The form refreshes with the Decision Inputs and Decisions related lists.

5. Create decision input records.

   a. In the Decision Inputs related list, click New.

   b. On the decision input form, fill in the fields.

     **Decision Input form**

<pre><code> | Field | Description                                                                 |
 |-------|------------------------------------------------------------------------------|
 | Name  | Name of the decision that is associated to this decision input. This field is automatically populated. |
</code></pre>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application scope of this decision input. This field defaults to the current scope.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of data that is used for this input. When you use this decision in a flow, you can only use data pills that match this type.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this input. This field is selected by default.</td>
</tr>
<tr>
<td>Label</td>
<td>Descriptive label for this input.</td>
</tr>
<tr>
<td>Read only</td>
<td>Check box to make this decision input read-only.</td>
</tr>
<tr>
<td>Column name</td>
<td>Column name for this input. This field is automatically populated when you give the Label field a value.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to make this decision input mandatory.</td>
</tr>
<tr>
<td>Display</td>
<td>Check box to indicates that this decision input is the display value for reference fields.</td>
</tr>
<tr>
<td>Choice</td>
<td>Select a method for users to see a list of suggested values:</td>
</tr>
<tr>
<td></td>
<td>• List menu without -- None --</td>
</tr>
<tr>
<td></td>
<td>• List menu with -- None --</td>
</tr>
<tr>
<td></td>
<td>• Suggestion field type</td>
</tr>
<tr>
<td></td>
<td>If a choice is used, define your choices in the Choices related list at the bottom of the form.</td>
</tr>
<tr>
<td>Default Value</td>
<td>Default value for this input.</td>
</tr>
</tbody>
</table>

**c. Click **Submit.  
Your changes are saved and the decision table record reopens.

**6. Create decision records.**
a. In the Decisions related list, click **New**.

b. On the Decision form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Descriptive label for this decision table.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of this decision. This field defaults to the current scope.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the flow evaluates decisions. The order can be important in flows that use the First decision that matches option and ends after the first match is found.</td>
</tr>
<tr>
<td>Answer</td>
<td>Answer that is used when the conditions in this decision are met.</td>
</tr>
<tr>
<td>Default Answer</td>
<td>Check box to enable this decision as the default for your decision table.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions that are needed to reach this decision. The fields available for your condition are the Decision inputs that are associated with this decision table.</td>
</tr>
</tbody>
</table>

c. Click **Submit**.  
Your changes are saved and the decision table record reopens.

**What to do next**  
With Flow Designer, you can add your decision to the **Make a decision** flow logic. For more information about the **Make a decision** flow logic, see **Make a decision flow logic**.
Decision table properties

Use decision table properties to set limits on the maximum number of allowed inputs and questions for decision records.

These properties are available for decision tables.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Properties for decision tables

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| com.glide.decision_table.max_inputs | Maximum number of decision inputs that can be defined on a model (sys_decision) record.  
• Type: integer  
• Default value: Empty. There are no limits on inputs when this property is left empty.  
• Location: System Property [sys_properties] table |
| com.glide.decision_table.max_questions | Maximum number of decision questions that can be defined on a decision table (sys_decision) record.  
• Type: integer  
• Default value: Empty. There are no limits on inputs when this property is left empty.  
• Location: System Property [sys_properties] table |

Document Services

Document Services provides a broad range of services related to document management, creation, maintenance, and conversion, and integrating with third parties such as Microsoft SharePoint.

Document Services offerings

Document Management
Manage large numbers of documents efficiently. Document Management provides storage space and a tracking system to easily upload, retrieve and delete documents.

**Document Viewer**

View documents directly in the Now Platform rather than having to download them. Document Viewer supports viewing various file types in the platform. The maximum document file size is 50 MB. To use Document Viewer, enable it at the instance level and the tables with which you want to use it.

**Managed Documents**

Control electronic documents within your instance. After parameters have been set by the administrator and the Knowledge Document plugin installed, documents move through the managed document cycle.

**Document Management**

With the ServiceNow Document Management application you can manage large numbers of documents efficiently. Document Management provides storage space and a tracking system to easily upload, retrieve and delete documents.

**Overview**

With Document Management you can create documents and track them, uploading and annotating the documents throughout the lifecycle of the workflow.
Service providers need to collect and manage many documents for each customer case. When customers want to include additional information on their documents, they can create an overview checklist and upload the documents accordingly. For example, when customers submit documents such as loan, policy, or student applications, the submission form can have a checklist of action items and user interface commands. These features make it easier to add comments and note and track the status of the submission.

Action items might include phases of a workflow such as Uploaded, Reviewed, Filed, Rejected and so on. There are also additional UI action options that ServiceNow admins and customers can configure.

The Document Management plugin

The Document Management plugin (com.snc.platform_document_management) can be installed by the System administrator. You can then search for Documents in the filter navigator and then select Documents. Using the Documents tab you can create Documents and create Versions under them. This is an independent plugin with no dependencies on any existing plugins.

Related information

Document Management plugin

Document Management plugin

With the Document Management plugin (com.snc.platform_document_management), you can create documents and then track each version of those documents. Search for “Documents” in the filter navigator and then select Documents with the Documents tab. The plugin is independent, with no dependencies on existing plugins. The plugin has been built on the existing sys_attachment framework.

Overview

When customers want to include additional information on their documents, they can create an overview checklist and upload the documents accordingly. For example, when customers submit documents such as loan, policy, or student applications, the submission form can have a checklist of action items and user interface commands that make it easier to add comments and note and track the status of the submission.

There are a total of four roles assigned by the system admin used to maintain the lifecycle of documents:
• platform_document_management_admin – Storage application features: create, read, update and delete.

• platform_document_management_delete – Delete operation in documents and its related tables.

• platform_document_management_reader – Read access in documents and related tables.

• platform_document_management_writer – Write access on documents and related tables.

The system admin installs the plugin and then assigns users with one of these roles.

**Tables**
The following tables are contained within the plugin:

• ds_document

• ds_document_version

• ds_document_lists

• ds_document_list_entry

• ds_document_references

**Document Viewer**

Document Viewer enables you to view documents directly in the Now Platform rather than having to download them.

Document Viewer supports viewing various file types in the platform. The maximum document file size is 50 MB. To use Document Viewer, enable it at instance level and for the tables for which you want to use it.

⚠  **Note:** Document Viewer now supports FedRAMP instances.

You can view the following file types:

• MS Word (.doc) and (.docx)

• MS PowerPoint (.ppt) and (pptx)

• MS Excel (.xls) and (.xlsx)

• PDF

• PNG

• JPEG
Other document types, for example, .zip or .exe files, are automatically downloaded without requiring Document Viewer.

**PDF view in Document Viewer**

The following table describes the icons used in Document Viewer.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="folder.png" alt="Folder" /></td>
<td>Toggle the sidebar to see a preview of all the pages in the document.</td>

Enable Document Viewer

Enable Document Viewer

Enable Document Viewer to view documents directly rather than download them to view them in their native applications.

Before you begin
Role required: admin

About this task
Document Viewer is enabled by default. Activate it at the instance level and then enable it at the table level for the tables where you want to use it. Ensure that the system property `com.snc.documentviewer.enable_document_viewer` is set to true or create it if it does not already exist. To de-activate Document Viewer, create the system
property `com.snc.documentviewer.enable_document_viewer` manually and set it to false.

**Procedure**

1. Activate Document Viewer at the instance level
   a. Navigate to **System Definition → Plugin**.
   b. Enter **Document Viewer** in the Search field.
   c. Click **Install**

2. Activate **Document Viewer** for the tables where you want to use it.
   a. Navigate to **System Definition → Dictionary**.
   b. Open the table **Collection** record to update.
   c. Enter `use_document_viewer=true` in the **Attribute** field.

Document Viewer is enabled at the table level. Repeat this procedure for each table for which you want to enable Document Viewer.

**Related information**

- **Disable Document Viewer**

**Document Viewer plugins**

With Document Viewer, you can view documents directly in the ServiceNow Platform rather than having to download them. Two new plugins enhance the experience and provide more options for document viewing. You can collaborate with other people, copy, delete, restore, and view version history directly in a ServiceNow instance.

**Overview**

In previous ServiceNow releases, not all documents could be shared and used for team collaboration. With new plugins for the Platform Document Viewer, now you can:

- Collaborate (edit, share) with Microsoft OneDrive and copy documents to your ServiceNow instance.
- Upload a policy document authored in your ServiceNow instance as a Microsoft Office 365 document in Microsoft Office 365 SharePoint.
- Attach shared links to a record. Clicking the link opens the document in Microsoft Office 365 SharePoint.
• The link can be shared with a co-worker, who can view and edit the document in real time.
  ◦ The current version is also viewable in the ServiceNow instance.
• Use collaboration tools such as Microsoft Office 365 for review and co-authoring documents.

Plugins
To use this feature, install the following plugins:
• Microsoft OneDrive Spoke
• Microsoft OneDrive document service Spoke
• Microsoft Azure AD Spoke for IntegrationHub
• Multi Provider Document Service Framework

See List of plugins (Rome) for a complete list of ServiceNow plugins.

After installation, you can use the base system subflows or customize them. Configure the subflows in the Document actions table. Once configured, they can be invoked as UI actions from List views or can be invoked through Script Include APIs.

Microsoft OneDrive integration plugin
Collaborate in Microsoft OneDrive and perform copy, delete, restore, and version actions on documents directly in a ServiceNow instance. This integration is bi-directional (performs in both directions): Changes are reflected in both Microsoft OneDrive and in the instance.

Microsoft Azure AD Spoke for IntegrationHub
The Microsoft Azure AD Spoke for IntegrationHub provides actions that a Process Analyst can use when designing flows. The actions allow them to automate the management of users, security groups, and office groups. User management includes applying licenses that result in user provisioning into Office 365.

Multi Provider Document Service Framework plugin (glide plugin)
Plugin contains the data model needed to integrate with third-party document service providers.
Note: To activate a plugin:
1. Navigate to System Definition→Plugin.
2. Enter the plugin name in the Search field.
3. Select install.

**Related information**
  Document Viewer

**View attachments with Document Viewer**
View documents within the platform using Document Viewer rather than having to download them to your own file system.
Before you begin
Make sure that Document Viewer is enabled for the table containing the record. For more information, see Enable Document Viewer.
Role required: none

About this task
Document Viewer supports inline viewing of certain document types within the platform.

Procedure
1. Navigate to a record (incident, form, list, and so on) with an attachment.
2. Click View next to the file attachment name.
   Document Viewer displays the document.
   If the document does not display, Document Viewer does not support inline viewing in your situation and a message instructs you to download the document. The possible reasons are:
   • The document uploaded is platform encrypted or edge encrypted.
   • The file size exceeds the maximum allowed value of 50 MB.
   • The document is password-protected but it is not a PDF file.
   Click Download Document to view the document in the relevant external application.

**Enable Document Viewer**

**Managed Documents**

Use the ServiceNow® Managed Documents application to control electronic documents within your instance.

After parameters have been set by the administrator and the Knowledge Document plugin installed, documents can move through the managed document cycle.

**Managed Document features**

Managed Documents is a lightweight, ITIL-based solution for creating and managing electronic documents within your instance.

This application adds a layer of control around any document by providing workflow, storage, security, and categorization options. It can be used for a variety of internal documents, such as policies and procedures, compliance documentation, and knowledge articles. Because it is integrated within the instance, Managed Documents offers a seamless alternative to 3rd-party systems.
## Features

<table>

### Managed Document concepts

The following concepts explain Managed Documents: Managed Document, Document Collection, Document Revisions, and Document Parameters.

## Concepts

<table>
<thead>
<tr>
<th>Concept</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Managed Document</td>
<td>The Document [dms_document] table contains the documents controlled through the managed documents process.</td>
</tr>
<tr>
<td>Document Collection</td>
<td>The Document Collection [dms_collection] table allows related documents to be grouped together.</td>
</tr>
<tr>
<td>Document Revisions</td>
<td>Because managed documents must have clear records of individual versions of a document, revisions (including the file) are attached to the primary document record through a related list. Document revisions are controlled to keep a standard naming scheme and consistent version numbers. Once a document revision is ready, it can be submitted for review.</td>
</tr>
</tbody>
</table>
Concepts (continued)

<table>
<thead>
<tr>
<th>Concept</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document Parameters</td>
<td><strong>Attention:</strong> Parameters do not control application or document security. Parameters only organize documents, they do not affect who can access documents. To grant access to the Managed Documents application, you can assign a role. To grant access to a specific document, set user and group permissions. Each document can be associated with predefined parameters. The parameters can help with grouping documents.</td>
</tr>
<tr>
<td></td>
<td>• Type: Defines the type of document being controlled. Documents of the same type use the same controls.</td>
</tr>
<tr>
<td></td>
<td>• Classification: Defines document restriction level, such as public, restricted, or confidential.</td>
</tr>
<tr>
<td></td>
<td>• Audience: Defines the groups with access to the document, such as internal or external.</td>
</tr>
<tr>
<td></td>
<td>• Name Formats: Defines the format of document names, ensuring that documents of the same type have the same name scheme assembled from name components.</td>
</tr>
<tr>
<td></td>
<td>• Name Components: Defines the document values used in the name formats.</td>
</tr>
<tr>
<td></td>
<td>• Approval Rules: Defines the approvals the document must have before it can be published.</td>
</tr>
</tbody>
</table>

**Install the Managed Documents plugin**

The Managed Documents plugin is available for activation by users with the admin role.

**Procedure**

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   - If the plugin depends on other plugins, these plugins and their activation status are listed.
3. [Optional] Select the **Load demo data** check box.
Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Click **Activate**.

**Managed Documents plugin**

This page describes the applications and modules, database table structure, scripts, and roles.

**Database table structure**

The following tables are added:

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revision [dms_revision]</td>
<td>The document revisions.</td>
</tr>
<tr>
<td>Classifications [classification]</td>
<td>The document restriction level, such as public or confidential. (Does not define access to the document. Document security is set in user and group permissions.)</td>
</tr>
<tr>
<td>Type [dms_type]</td>
<td>The document purpose.</td>
</tr>
<tr>
<td>Component [dms_component]</td>
<td>The components of name formats. The value field is a dot-walking expression that is evaluated. An exception is made for the revision because it does not exist when the revision name is generated.</td>
</tr>
<tr>
<td>Name format [dms_name_format]</td>
<td>The composition of components to generate revision names.</td>
</tr>
<tr>
<td>Approval sequence [approval_sequence]</td>
<td>The approval sequences that users need to follow.</td>
</tr>
</tbody>
</table>
## Tables (continued)

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Rule [dms_approval_rule]</td>
<td>The criteria that records of the dms_document table must match. Used to automatically add approvers to a document.</td>
</tr>
<tr>
<td>Collection [dms_collection]</td>
<td>The document groups created by the user.</td>
</tr>
</tbody>
</table>

## Scripts

### Business rules that are added to sys_script

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Document</td>
<td>Changes the state of a document depending on its revisions.</td>

### Roles

This plugin introduces two new roles:

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>document_management_user</td>
<td>This role enables a user to access the Managed Documents plugin, create documents, and search for documents. Document reviewers and approvers need the document_management_user role to access the Managed Document plugin. (Please note that reviewers and approvers can also access a document revision from an approval record.)</td>
</tr>
<tr>
<td>document_management_admin</td>
<td>This role enables a user to change administrative settings for the Managed Documents plugin.</td>
</tr>
</tbody>
</table>
Note: Each document has individual permissions, so even if a user is given the document_management_user role and has permissions to the application, the user can only view documents to which they have been given access.

Create a new managed document record
Configure the properties and policies for a managed document.

Procedure
1. Navigate to Managed Documents > Create New.
2. In the Name field, type Policy.
3. In the Requested by field, add your name.
4. In the Owner field, add your name.
5. In the Reviewer field, add your name.
6. In the Type field, select Policy.
7. In the Classification field, select Confidential.
8. In the Audience field, select Internal.
9. Under Revision Settings, select the Auto increment revision option.

Example

10. Click Submit.

Check in a document after making changes
After making changes to a document, check the revised document into Managed Documents.

Procedure
1. Open the document record.
2. Click the Upload/Check in Revision related link.
3. Click Choose File, select the revised file, and click Open.
4. Check that the Name and Revision Number contain the updated number.
5. Ensure that the **Check in** option is selected.

6. Click **OK**.

   The Document Revisions list updates to contain the most recent revision.

<table>
<thead>
<tr>
<th></th>
<th>Name</th>
<th>Revision number</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Policy POL_0.1</td>
<td>0.1</td>
</tr>
<tr>
<td>2</td>
<td>Policy POL_0.2</td>
<td>0.2</td>
</tr>
</tbody>
</table>

### Check out a document to make changes

After a document is added to a managed document record, check the file out to make changes. Checking documents in and out keeps a record of document changes and ensures that only one person at a time is editing the document.

#### Procedure

1. Open the document record.
2. Select the **Check Out Document** related link.

   ![Check out latest revision of document: Policy](image)

   - **Name**: Policy POL_0.1
   - **Revision**: 0.1
   - **Created by**: joseph, 2011-07-11 20:07:14
   - **Last modified by**: joseph, 2011-07-11 20:07:22
   - **Document type**: Policy
   - **Download file**: ✔

   ![Check Out button](image)

3. Select **Download file**.
4. Click **Check Out**.
5. Open the file and make a small change.
6. Save the document with the same name, but a new revision number. For example, **Policy_POL_02.txt**.

### Publish a document in Managed Documents

After the document is reviewed and approved, publish the document within Managed Documents.
Procedure

1. Open the document record.
2. In the Document Revisions list, click the name of the revision that was approved and is listed in the Ready for Publishing stage.
3. In the header bar, click **Publish Revision**.

4. In the Publish revision dialog box, check that the name and revision number are correct and click **Publish**.
   In the Document Revisions list, the revision you just published is now in the Published stage.

Send a document out for review and approval

When a document is ready, send it out for review and approval. If a reviewer or approver is not identified in the document record, the document is moved directly to the publishing stage.

Procedure

1. In the Document Revisions list, right-click the revised document and select **Submit Revision**.

   Because you identified yourself as the reviewer, you receive an approve request email message.

2. In the email message, click the link next to **Click here to view Approval Request**.
3. (Optional) View the document by clicking the attachment name under Document Revision.

4. Click Approve.
   The Approvals page displays and lists the document you just approved.

5. Open the document record.

6. In the Document Revisions list, the revision you approved is now in the Ready for Publishing stage.

Upload a document as an attachment

After creating a document record, add the document to the record as an attachment.

Procedure

1. Open the document record.

2. Select the Upload/Check in Revision related link.

   ![Update Delete]

   Related Links
   Upload/Check In Revision

3. Click Choose File.

4. Select a simple document, such as a text file, and click Open.

5. Check that the name reads Policy_POL_0.1.

6. Click OK.
   The document is listed under Document Revisions.

Defining Document Parameters

Before using the Managed Documents application, the user with the document_management_admin role needs to set the parameters that define the kinds of documents to be managed through the application. Managed Documents provides both base and custom parameter options.

Defining Document Parameters
The following document parameters should be defined:
• **Type**: identifies the purpose of the document. The type also determines the default document format and name format.

• **Classification**: indicates the security level assigned to the document and determines who can view or edit the document.

• **Audience**: specifies the intended readers of the document.

• **Name format**: specifies the name format to use when a document revision is added.

• **Name components**: are individual identifiers used inside a name format. Name components define a reference path (often by dot-walking) that holds the value specific to the document.

• **Approval rules**: determine which approvers are added to documents (in addition to the **Reviewers** specified on the document record).

### Defining Types

To define a new type, navigate to **Managed Documents > Administration > Type** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the type.</td>
</tr>
<tr>
<td>Code</td>
<td>A short code for the type. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the <strong>Type</strong> choice list.</td>
</tr>
<tr>
<td>Name Format</td>
<td>The name format that documents of this type will use.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating the type's sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following types are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Name format</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>-- None --</td>
<td>null</td>
<td>-- None --</td>
<td>null</td>
<td>1</td>
</tr>
<tr>
<td>policy</td>
<td>POL</td>
<td>Policy</td>
<td>Default Policy</td>
<td>2</td>
</tr>
<tr>
<td>guideline</td>
<td>GUI</td>
<td>Guideline</td>
<td>Default</td>
<td>3</td>
</tr>
<tr>
<td>procedure</td>
<td>PROC</td>
<td>Procedure</td>
<td>Default</td>
<td>4</td>
</tr>
<tr>
<td>contract</td>
<td>CON</td>
<td>Contract</td>
<td>Default</td>
<td>5</td>
</tr>
</tbody>
</table>
Note: For documents with a Type of Contract, a Contracts related list appears on the document record, listing any contracts the document is associated with.

Defining Approval Rules

To define a new approval rule, navigate to Managed Documents > Administration > Approval Rules and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the approval rule.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box indicating whether this approval rule is used.</td>
</tr>
<tr>
<td>Condition</td>
<td>A condition builder that determines which documents use this approval rule.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the approval rule.</td>
</tr>
</tbody>
</table>

Once the approval rule is saved, the Approvers related list defines which approvers are added if the conditions in the Condition field are met.

The following approval rules are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internal policy</td>
<td>type=Policy ^ audience=Internal</td>
</tr>
<tr>
<td>Development policy</td>
<td>type=Policy ^ department=Development</td>
</tr>
</tbody>
</table>

Defining Document Parameters

Defining Audiences

To define a new audience, navigate to Managed Documents > Administration > Audience and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audience Name</td>
<td>A unique name for the audience.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
**Audience Code** | A short code for the audience. Referenced as a name component for the name format.
**Label** | A label to display in the Audience choice list.
**Order** | A number indicating this audience’s sequence in the choice list.

The following audiences are available in the base system.

<table>
<thead>
<tr>
<th>Audience</th>
<th>Audience code</th>
<th>Label</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>internal</td>
<td>INT</td>
<td>Internal</td>
<td>1</td>
</tr>
<tr>
<td>external</td>
<td>EXT</td>
<td>External</td>
<td>2</td>
</tr>
</tbody>
</table>

Defining Document Parameters

**Defining Classifications**

Define a new classification on the Classification form.

Navigate to **Managed Documents > Administration > Classification** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>A unique name for the classification.</td>
</tr>
<tr>
<td><strong>Code</strong></td>
<td>A short code for the classification. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td><strong>Label</strong></td>
<td>A label to display in the Classification choice list.</td>
</tr>
<tr>
<td><strong>Order</strong></td>
<td>A number indicating this classification’s sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following classifications are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>P</td>
<td>Public</td>
<td>1</td>
</tr>
<tr>
<td>restricted</td>
<td>R</td>
<td>Restricted</td>
<td>2</td>
</tr>
<tr>
<td>Name</td>
<td>Code</td>
<td>Label</td>
<td>Order</td>
</tr>
<tr>
<td>---------</td>
<td>------</td>
<td>-----------</td>
<td>-------</td>
</tr>
<tr>
<td>confidential</td>
<td>C</td>
<td>Confidential</td>
<td>3</td>
</tr>
</tbody>
</table>

### Defining Name Components

Name components define the document values used in the name format.

For example, the name component `document.audience.code` dot-walks from the document record to the audience **Code**.

To define a new name component, navigate to **Managed Documents > Administration > Components** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the name component.</td>
</tr>
<tr>
<td>Short Description</td>
<td>A short description of the name component value.</td>
</tr>
</tbody>
</table>
| Value          | The path to the field holding the value used for the name format. Defined relative to a current revision record. For example:  
  - Enter `revision` to use the revision **Number** field on the revision record.  
  - Enter `document.name` to use the **Name** field on the revision's referenced document.  
  - Enter `document.audience.code` to use the **Code** field for the audience referenced by the document. |

This dot-walking approach makes it possible to get any value related to the revision into the name format.

**Note:** The **revision** component is a special component replaced by the appropriate revision number (rather than querying a value related to the current record). The revision is either automatically incremented or uses the latest revision number, depending on the setting on the document form.

The following components are defined in the base system.
Defining Name Formats

The name format automatically generates a name for a document revision by arranging name components in a standard code to match naming conventions.

For example, a name format with the name components **Type Code**, **Document Name**, and **Revision Number** and the separator `-`, would be formatted as:

```
TYPECODE-Name-RevNumber.fileformat
```

In this example, a policy (code POL) named IT Off-Boarding Policy, with revision number 1.0, and uploaded as a `.docx` file would have the name:

```
POL-IT Off-Boarding Policy-1.0.docx
```

To define a new name format, navigate to **Managed Documents > Administration > Name Formats** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the name format.</td>
</tr>
<tr>
<td>Separator</td>
<td>A separator to put between each of the components. Hyphens (-) and underscores (_) are commonly used. Using alphanumeric characters can create a confusing name format.</td>
</tr>
<tr>
<td>Description</td>
<td>A description of the name format.</td>
</tr>
</tbody>
</table>

Use the related list to add name components. Use the **Order** field to set the sequence in which name components are used.
The following name formats are defined in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Separator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>_</td>
<td>The default format. Document name and revision separated by an underscore.</td>
</tr>
<tr>
<td>Default Policy</td>
<td>_</td>
<td>The format for the policy document type.</td>
</tr>
<tr>
<td>Development documentation</td>
<td>(no separator)</td>
<td>The format for the software documentation type.</td>
</tr>
<tr>
<td>Development Sources</td>
<td>(no separator)</td>
<td>The format for the development and code sources type.</td>
</tr>
<tr>
<td>Intranet Improvement</td>
<td>(no separator)</td>
<td>The format for documents that describe intranet use.</td>
</tr>
</tbody>
</table>

**Defining Document Workflow**

In the base system, all managed documents use the Managed Documents workflow after the **Active** check box is selected.

The document parameters defined in the workflow are often used as conditions to trigger more specific workflows, such as type-specific workflows.
or classification-specific workflows. If different kinds of documents should follow different workflows, use the Graphical Workflow Editor to create new workflows.

### Knowledge document

The Knowledge Document plugin extends the Managed Documents plugin by providing the functionality for managed documents to be published to the knowledge base.

### Installed with knowledge document

These elements are installed with the knowledge document plugin.

### Dependencies

The Knowledge Document plugin depends on the Managed Documents plugin. Activating Knowledge Document activates Managed Documents.

### Tables

<table>
<thead>
<tr>
<th>Display Name [table_name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>

## Link documents to knowledge articles

Manage a document and access the latest version of the document from an article by linking the document to a knowledge article.

### Before you begin

Your administrator must have activated the following plugins:

- Knowledge document plugin (com.snc.knowledge_document)
- Knowledge Management Advanced plugin (com.snc.knowledge_advanced)

The document is already uploaded and published. For more information, see [Upload a document](#) and [Publish an approved revision](#).

You must have contribute access to the knowledge base within which the article linked to the document is stored.

If a knowledge article is already linked to the document, you must have contribute access to the article.

Role required: document_management_user and knowledge

### About this task

You can link the initial or revised version of a document to a knowledge article. The document appears as an attachment to the linked article. Revising a document doesn’t automatically update the document attached to the linked knowledge article. Therefore, every time you revise a document, you must again link the revised document to the knowledge article.

**Note:** As the owner of a document or an administrator, you can link the document to a published article. If the article is checked out by another user, you can't link the document to the associated article, unless the article is published.
**Procedure**

1. Navigate to Managed Documents > Documents > All.
2. Click the document.
3. In the Knowledge Settings related list, fill in the fields.

### Knowledge settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Behavior</strong></td>
<td>Process performed when the <strong>Link to Knowledge</strong> related link is clicked. A behavior is one of the following types:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Always create record</strong>: A new knowledge article is created and linked with the latest published revision of the document as an attachment.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Update existing record</strong>: The linked knowledge article is updated with the latest published revision of the document as an attachment. If no knowledge articles exist for the document, a new knowledge article is created.</td>
</tr>
<tr>
<td></td>
<td>⚠ <strong>Note</strong>: Once you select a behavior setting for a document, you can’t modify it later when revising the document.</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Knowledge base in which the knowledge article is stored. You can associate a knowledge article with one knowledge base only. If you are using an article template, you can modify this value only if the template is available in the other knowledge base.</td>
</tr>
<tr>
<td>Type</td>
<td>Article template to create a knowledge article using defined fields and values.</td>
</tr>
<tr>
<td></td>
<td>⚠ <strong>Note</strong>: when a knowledge article is created, the <strong>Type</strong> field becomes read-only.</td>
</tr>
<tr>
<td>Valid to</td>
<td>Date that the article expires. Adds valid to date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Short description</td>
<td>A few words or short phrase describing the knowledge article. Adds the short description to the same field in the knowledge article.</td>
</tr>
</tbody>
</table>
4. Click the **Link to Knowledge** related link.

5. **Optional:** In the information message that is displayed, click the message link to view the knowledge article.

**Results**

The uploaded document is added as an attachment to a knowledge article. Depending on the **Behavior** field value specified in the Knowledge settings related list, the knowledge article is created or updated with the document.

**Create a document**

After Managed Documents parameters have been set by the administrator, documents can be created, requested, checked out, edited, checked in, copied, and, if necessary, rolled back to an earlier version.

Once documents have been added to the Managed Documents application, they can be grouped into document collections.

**Approval process**

During the approval process, the approver approves or rejects the document. A document goes through the approval process after the review process.

**Approval workflow**

After the document has been reviewed, submit the document for approval. If the document does not have an approver, the approval process is omitted.

When the document is **Active**, the workflow **Document Management Default** is used to manage approvals:
If the approver rejects the document, the author and owner are notified and the document review is cancelled. The author, owner, and approver should discuss what changes need to be made to the document. When the document is ready, a new review can be initiated.

If the final approver approves the document, the author and the owner are notified. Once final approval is successful, the document stage changes to Ready for Publishing in the Document Revisions list:
Process modification for multiple approvers

If there are multiple approvers, the approval process works in sequence and multiple approvers can be assigned to a single sequence. For example:

Sequence 1: approvers A and B
Sequence 2: approvers C and D
Sequence 3: approver E

Because the sequences take place in ascending chronological order, approvers A and B receive the approval request first (approvers C, D, and E are not part of the process yet). Similar to the review process, the first approver to act within a sequence dictates what happens to the document. If approver A acts first and rejects the document, the approval process stops and the state is set to Cancelled. Approver B's status is changed to No Longer Required. If approver A acts first and approves the document, the process stops and approver B's status is changed to No Longer Required. Then, the document moves to approval sequence 2. After at least one approver in each sequence approves the document, the author and the owner are notified that the document has been approved.

Review process

During the review process, the reviewer approves or rejects the document. Sometimes a document will have multiple reviewers.
If the reviewer rejects the document, the author and owner are notified and the review is cancelled. The author, owner, and reviewer should discuss what changes need to be made to the document. If the reviewer approves the document, the author and owner are notified that the review was successful and the document can move to the approval stage.

If multiple reviewers are assigned to a document, the first reviewer to act dictates what happens to the document. For example, there are two reviewers, A and B. If reviewer A acts first and rejects the document, the review process stops and the revision state is set to Cancelled. Reviewer B receives a notification email stating that the review was rejected and their status is changed to No Longer Required. If reviewer A acts first and approves the document, the review process stops and the document can move to the approval stage. Reviewer B's status is changed to No Longer Required.

Enable electronic signature for approval

This topic explains how to enabling electronic signatures for approval. Electronic signatures are helpful if you must obtain a digital signature for compliance or auditing purposes.

About this task
You can activate the Approval with E-Signature plugin to require that users type in a user name and password when reviewing and approving documents.

The digital signature is not tracked or stored in the document record. Users must simply type in a user name and password after clicking the Approve or Reject button.

![Digital signature](Image)

After activating the Approval with E-Signature plugin, ensure that a row in the e-signature registry table is created for the dms_document_revision table.
Procedure

1. Navigate to System Definition > e-Signature Registry.
2. Check if dms_document_revision is already listed and Enabled is set to true.
3. If not listed, click New.
4. In Table name, select Document Revision.
5. Select Enabled.

Example

```
        e-Signature Registry

<table>
<thead>
<tr>
<th>Table name:</th>
<th>Document Revision [dms_document_revision]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled:</td>
<td>✔</td>
</tr>
</tbody>
</table>
```

6. Click Submit.

Publish an approved revision

This topic explains how to publish a document revision that has been approved.

About this task

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

Publish the approved revision from the Document Revisions list.

Note: Publishing documents to the Knowledge Base requires the Knowledge Document Plugin.

Procedure

1. Navigate to the document record.
2. In the Document Revisions List, click the revision marked Ready for Publishing.
3. Click Publish Revision to display the Publish dialog box.
Example

The revision number matches the latest revision number. If your standard is to change the revision number when the document is published, such as incrementing the version number to 1.1 or 1.0.1, the change can be made on this dialog box manually.

4. Click Publish.

The published revision is highlighted in green and the stage of previous revisions is automatically changed to Retired:

Note: If the approval and publishing process is repeated, the published revision is retired when the new revision is published. Any workflows running against previous revisions are canceled when the document is published.

Submit a revision for draft review

This topic explains how to submit a document draft for review.

About this task

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.
When a draft of the document is ready, submit the draft for review. If the document does not have reviewers identified in the Reviewers field of the document record, the review process is omitted.

Procedure
1. Navigate to the document record.
2. Right-click the appropriate revision.
3. Select **Submit Revision**.
   The revision stage is set to Awaiting Review.

The document name and parameters are changed to read-only. The document state is set to **Active**.

Create or request a new document
Once an administrator has set parameters for the Managed Documents application, you can create or request new documents.

Procedure
1. Navigate to **Managed Documents > Create New**.
2. Complete the following fields:
### New document fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>An identifying number for the document. Automatically generated using number maintenance.</td>
</tr>
<tr>
<td>Name</td>
<td>A name for the document. Note that the name for the document is combined with other naming components (as defined by the name format) to create the names for each document revision.</td>
</tr>
<tr>
<td>Requested by</td>
<td>The person asking that the document be created or updated.</td>
</tr>
<tr>
<td>Owner</td>
<td>The approver of the document request. Also responsible for setting completion date with requesters and authors.</td>
</tr>
<tr>
<td>Reviewers</td>
<td>The user or users who review the document and provide feedback to owners and authors.</td>
</tr>
<tr>
<td>Department</td>
<td>The department responsible for the document.</td>
</tr>
<tr>
<td>Type</td>
<td>The document purpose. This is a choice list derived from the type parameters.</td>
</tr>
<tr>
<td>Classification</td>
<td>The document classification, based on security, audience, and confidentiality. This is a choice list derived from the classification parameters.</td>
</tr>
<tr>
<td>Audience</td>
<td>The document readers, such as external or internal. This is a choice list derived from the audience parameters.</td>
</tr>
<tr>
<td>State</td>
<td>The current status of the document in the editing and publication process.</td>
</tr>
<tr>
<td>Checked out by</td>
<td>The user who currently has the document checked out.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the document.</td>
</tr>
<tr>
<td>Revision Settings</td>
<td></td>
</tr>
<tr>
<td>Name format</td>
<td>The format for the name of each individual revision of the document. For more information, see Defining Name Formats.</td>
</tr>
<tr>
<td>Revision format</td>
<td>A choice between the two digit (0.x) or the three digit (0.0.x) revision format.</td>
</tr>
</tbody>
</table>
### Field | Input value
--- | ---
Auto increment revision | If selected, the revision number automatically increments each time the document is revised.

The *User Permissions* related list determines which users have rights to view and contribute to the document:

**User permissions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>A reference to a user who is entitled to read but not contribute to a document.</td>
</tr>
</tbody>
</table>
| Type | A choice list describing how the user can interact with the document. Options are:  
  - Reader - The user can read the document versions.  
  - Editor - The user can upload new versions.  
  - Owner - The user can edit the document. |

The *Group Permissions* related list determines which groups have rights to view and contribute to the document:

**Group permissions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group</td>
<td>A reference to a group of users who are entitled to read and contribute to the document.</td>
</tr>
</tbody>
</table>
| Type | A choice list describing how group members can interact with the document. Options are:  
  - Reader - Group members can read the document versions.  
  - Editor - Group members can upload new versions.  
  - Owner - Group members can edit the document. |

**Specify an approver**

You can specify approvers for a document record after you save it.
About this task
You can have one approver or multiple approvers. For example, set multiple approvers to have one person do a quality check of the document and a different individual to serve as a final approver. Approvers are assigned a number. The lowest number (usually number one) approver always goes first, then any other approvers in ascending chronological order. Multiple approvers can have the same sequence number. For example, two approvers can do a quality check and be assigned sequence number 1. Then, two individuals can be final approvers and be assigned sequence number 2.

Procedure
1. Navigate to the document record.
2. Right-click in the document header bar and select Add Approver.
3. Add a user name.
4. Select a sequence number from the drop-down list. (Lower numbers approve before higher numbers. For example, approver number one approves before number two.)
5. Click Add User.
6. Repeat steps 2-5 to add more approvers.

Check in a document
Check in the document after you revise it so other users can check out the document.

Procedure
1. Navigate to the document record.
2. Select the Upload/Check In Revision related link.
3. Click Browse and navigate to the revised file.
4. Click Open.
5. Check the Name and Revision Number.
6. Click OK.
The Document Revisions related list updates to contain the most recent revision:

### Copy a document

A document can be duplicated at any time. This is useful if you have an existing document that you want to use as a base for a new document.

**Procedure**

1. Navigate to the document record.
2. Right-click the header bar and select **Copy Document**.
   
   An information message with a link to the new document displays:
3. Click **OK**.
   
   The new document is renamed and includes the word "Copy."

*Note:* Only the latest revision is copied.

### Deactivate a document

To change the document state to **Inactive**, deactivate the document. This is useful when changes to a document have been put on hold. An inactive document can be reopened at any time.

**Procedure**

1. Navigate to the document record.
2. Right-click the header bar and select **Deactivate Document**.

*Note:* To activate a document, right-click on the header and click **Reopen Document**.
Reopen a deactivated document
A document that has been deactivated can be reopened.

Procedure
1. Navigate to the document record.
2. Right-click the header bar and select **Reopen Document**.

Roll back a document
A document can be rolled back to an earlier revision at any time. Before rolling back to an earlier revision, ensure that the document is not checked out and that you have Editor or Owner permissions for the document.

Procedure
1. Navigate to the document record.
2. In the Document Revisions list, click the revision to which you want to roll back.
3. Right-click the header bar and select **Rollback**. The Rollback to Revision dialog box displays. The name and revision number are new. The note specifies the revision to which you are rolling back.

![Rollback to revision dialog box](image)

4. Change any information on the Rollback to Revision dialog box as necessary.
5. Click **OK**. The latest revision is now the revision you selected for rollback.

Cancel a document
Change the document state to **Cancelled** when no more changes will be made to the document.
About this task
When canceling a document, there is no confirmation message, so ensure that you want to cancel the document.

Procedure
1. Navigate to the document record.
2. Right-click the header bar and select **Cancel Document**.
   An info message confirms the cancellation:
The **State** is set to **Cancelled**:

![MDOC cancel 3](image)

Check out a document
Documents in the Managed Documents application can only be revised by one user at a time. Check out the document to revise it.

Procedure
1. Navigate to the document record.
2. Select the **Check Out Document** related link.
3. Select **Download file** to download the current version of the document when it is checked out.
4. Click **Check Out**.
   After checking out a document, you can edit the document and make any necessary changes.
Create a document collection

A document collection is a set of individual documents. After documents have been uploaded into Managed Documents, organize the documents by grouping them into collections.

Procedure

1. Navigate to Managed Documents > Document > My Collections.
2. Select New.
3. Type in a Name.
4. (Optional) Type in a Description.
5. Click Submit.
6. Click the name of the collection you created.
7. Click Edit.
8. On the left, double-click an available document or select a document and click Add.
9. Click Save. The Document Collection page displays and the individual documents in the collection are listed:
Upload a document

Upload a document into a saved record. You can upload text files, spreadsheets, presentations, PDF files, and more.

Procedure

1. Navigate to the document record.
2. Click the **Upload/Check In Revision** related link.
3. Click **Choose File** and navigate to the file.
4. Click **Open**.
5. Check the Name and Revision Number.
6. Click **OK**.

   After the initial document is uploaded, subsequent revisions can be created by checking out the document.

Domain separation and Managed Documents

Domain separation is unsupported in Managed Documents. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see [Application support for domain separation](#).

Dependency Views

ServiceNow® Dependency Views graphically displays an infrastructure view for a configuration item (CI) and the application or business services that it is part of and that it supports. Dependency Views indicates the status of its configuration items, and allows access to CIs related alerts, incidents, problems, changes, and services.
If Service Mapping is activated, Dependency Views maps are enhanced to display dependencies that reflect connections in service maps.

**Supported browsers for Dependency Views**

The latest version or service pack of internet browsers are required to view and manipulate Dependency Views maps.

The Dependency Views module supports the latest version or service pack of the following browsers:

- Firefox with the latest ESR
- Chrome latest version
• Safari version 8 or later (latest is recommended)
• Microsoft Internet Explorer (IE) version 11 and Microsoft Edge.

The Dependency Views module is not supported on tablets and on mobile devices.

Domain separation and Dependency Views

Domain separation is unsupported in Dependency Views. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

• Business logic: Ensure that data goes into the proper domain for the application’s service provider use cases.
• The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
• The owner of the instance must set up the application to function across multiple tenants.

Use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the client must be able to see the SP’s response.

For more information on support levels, see Application support for domain separation.

How domain separation works in Dependency Views

Dependency views are generated using both Configuration Item [cmdb_ci] and CI Relationship [cmdb_rel_ci] tables. The [cmdb_ci] table is domain separated, but the [cmdb_rel_ci] table is not. You can create relationships only by selecting two CIs. They should be in the same domain for you to be able to see them.

To be successful with domain separation in Dependency Views, make sure that relevant CIs are visible for the current domain. If the instance is domain separated, ServiceNow domain separation rules apply (see Related information link below).

Tenant domains will be able to see only their domain and global CIs.

Domain separation for service providers

Dependency Views map

ServiceNow® Dependency Views maps graphically display CIs that support application or business services and the relationships between the CIs.

A ServiceNow service (application service or business service) is work or goods that are supported by an IT infrastructure. For example, delivering email service to an employee can require services such as email servers, web servers, and the work to configure the user's account.

A Dependency Views map has one starting point, called the root CI or root node of the map. The root CI is surrounded by a darker frame that repaints itself with a pulsing effect drawing the attention to the root CI. The maps can show both upstream and downstream dependencies for the root CI. By default the Dependency Views map displays 3 levels, both upstream and downstream relationships. Administrators can configure the number of levels displayed. The map collapses and expands clusters to make them easier to view. By default, clusters are collapsed.

In a Dependency Views map, map indicators indicate if a CI has any active, pending issues. You can investigate the tasks that are connected to a CI to get more details. When you return to the map from another form, the system restores the last map viewed, using the default filter and layout settings. When you click the icon (🔍) on a CI record or on a task record that identifies a CI, the map opens.

Many of the relationships in map are created through the discovery process. You can also create, define, and delete CI relationships in the map. You can display the map from different perspectives and open specific records that relate to configuration items. The system refreshes the map automatically to reflect changes to the CMDB.

❗ Note: CIs not extended from the Configuration Item [cmdb_ci] table, are not displayed in Dependency Views maps and in CI relation formatters.

The Dependency Views module is active in all instances, and includes demo data.
When you click the map icon on a CI record or on a task record that identify a CI, a map opens.

Roles

Users with the itil and ecmdb_admin roles can view maps and perform all actions in the map. Actions include access to the map views and saved filters, both from the lists in the map and from the Saved Filters module.

Dependency Views map menus and controls

Dependency Views maps contain the following menus and controls.

Map options

The following options are available across the top of the map.
Next to the menu icon is the name of the current root node (CI) of the map.

Enter the name of a CI, application service, or business service to load into the map. Alternatively, you can start typing to have the auto-complete feature present a list of CIs and services that match your partial value.

Vertical Display the map in vertical view.

Horizontal Display the map in horizontal view.

Radial Display the map in radial view.

Force Centers the elements around the parent CI, regardless of upstream or downstream relationships.

Group Groups the elements according to their CI type.

Details Displays related lists such as Problems, Changes and Related Services that are associated with the selected CI.

- Click a service to highlight the CIs that are associated with that service.
- Click Related Services, then double-click a service to display the map in the Event Management dashboard.

If the Event Management plugin is active, then events and alerts are also displayed.

Settings Set filters for the map.

Use the navigation tools to increase or decrease the view of the map, rearrange the icons on the map, and move the map on the page.

- Use the plus sign (+) to increase magnification of the map.
- Use the minus sign (-) to decrease magnification of the map.
- Click the center dot to center the map on the page.
- Use the direction arrows to move the page in that direction.
- Use the selection tool under the navigation tool to toggle between moving the entire map or moving one CI on the map.

Map menu
The following options are available if you right-click the map background.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run Layout</td>
<td>Redraws the map with the current layout option.</td>
</tr>
<tr>
<td>Fit To Screen</td>
<td>Resizes the map to fit all the nodes in the map window.</td>
</tr>
<tr>
<td>Reset Filters</td>
<td>Performs the same action as the Filters &gt; Reset option.</td>
</tr>
</tbody>
</table>
## Node menu

The following options are available if you right-click a node.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Form</td>
<td>Displays the CMDB record of the selected CI in a new tab of the browser.</td>
</tr>
<tr>
<td>View Map</td>
<td>Reloads the map using the selected CI as the new root node, with the currently defined layout setting. This option does not display on the root node.</td>
</tr>
<tr>
<td>View Related Tasks</td>
<td>Displays all tasks or outages associated with the selected CI, including incidents, problems, change requests, and follow-on tasks. This option is always available, even if there are no tasks associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>View Affected CIs</td>
<td>Shows a list of all tasks that have the CI listed as an Affected CI. This option is only visible when you access the map from the map icon in a task record's Configuration item field.</td>
</tr>
<tr>
<td>View Related Outages</td>
<td>Displays all outages involving the selected CI. This option only appears when there is an outage associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>Add Relationship</td>
<td>This option displays a dotted green line that you can drag to another CI to create a relationship link. A popup dialog allows you to define the relationship type.</td>
</tr>
</tbody>
</table>
| Expand               | Displays all CIs and components within a clustered node, or virtual groups (virtual nodes that appear when `glide.bsm.too_many_children` is reached). This option appears only if the node is a cluster node or a virtual group node.  
  If **Load More** was previously used, then **Expand** reverts the results of the **Load More** operation.  
  The number of additional icons to display is bound by the value of the `glide.bsm.max_nodes` property. |
| Collapse             | Collapses all CIs and components within a cluster node back to a single node. Also, collapses a virtual group that has been expanded. This option only appears if the node has been expanded using the **Expand** menu item.  
  If **Load More** was previously used, then **Expand** reverts the results of the **Load More** operation. |
| Run Layout From Here | This option re-runs the chosen layout using the current node. Use this option to get a new or clearer view on the same map. |
| Load More            | Starting at the selected icon, loads the next level of the map, past the setting of **Max Levels**.  
  Virtual grouping is not applied at the newly loaded level even if the criteria for virtual grouping is met. |
The number of additional icons to display is bound by the value of the `glide.bsm.max_nodes` property.

**Relationship menu**

The following options are available if you right-click a relationship link.

<table>
<thead>
<tr>
<th>View Relationship Form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Relationship Form</td>
<td>Opens the CI Relationship form. You can modify the Parent, Type, and Child of the relationship from this form.</td>
</tr>
<tr>
<td>Modify Relationship</td>
<td>Searches for and selects a new relationship for this link.</td>
</tr>
<tr>
<td>Delete Relationship</td>
<td>Deletes a relationship. The relationship is deleted after prompting for confirmation.</td>
</tr>
</tbody>
</table>

**Cluster nodes in a Dependency Views map**

Dependency Views maps can display cluster group nodes alongside individual CI nodes, and the child nodes of these cluster groups.

Clusters are CIs in the Cluster [cmdb_ci_cluster] table. A cluster CI is an organized set of computer CIs that work together as a single system. Each node in a cluster group represents a CI, typically a server, that can have referenced hardware, such as disks and network adapters.

Cluster nodes on a Dependency Views map can display in two modes:

- **Collapsed mode**: Displays only the cluster CI node without its child CI nodes. This mode avoids unnecessary clutter in large maps.
- **Expanded mode**: Displays the cluster CI node and all its child CI nodes.

Menu options available for a clustered node include **Collapse** and **Expand** which allow you to control the density on the map.

By default, Dependency Views collapses all cluster groups and displays clusters in collapsed mode on the map.

**Annotation**

Icons for cluster nodes and cluster group CI nodes are noted by the string "Cluster" and by a unique cluster icon. The system searches through all the component nodes in a cluster CI or collapsed node looking for tasks, outages, and trouble, such as incidents, problems, or change requests. This search evaluates only the number of levels that are displayed in the diagram.
Virtual grouping of nodes in a Dependency Views map

To reduce the density on a map, Dependency Views automatically groups CIs of a similar CI type from the same level.

A large number of nodes can cause a Dependency Views map to become too dense to be helpful. Therefore, if the number of nodes with a similar CI type from same level, exceeds the value of the Maximum number of nodes (of a similar CI type and at the same level) to display before applying virtual grouping property, then those nodes are automatically grouped into a virtual group. A single node, the virtual group node is displayed to represent the virtual group, while all actual nodes in the virtual group (that are of a similar CI type), are hidden. Virtual group nodes represent CIs of a similar CI type but are not CIs by themselves and cannot have tasks assigned to them. The number of actual collapsed nodes in the virtual group is noted on the virtual group node.
By default, child nodes of a virtual group are not displayed. You can enable the **Show children of virtual groups** property to display child nodes underneath virtual groups.

Virtual grouping is not applied at the level underneath a virtual group even if the criteria for virtual grouping is met (the number of nodes with a similar CI type from that level exceeds the preconfigured property value). However, virtual grouping can happen at the following level if that criteria is met. This behavior does not depend on any property settings, and you cannot change it.

Menu options for a virtual group include **Expand** and **Collapse**, which allow you to apply virtual grouping and display only the virtual group node, or to undo the virtual grouping and display all actual nodes.

**Virtual links**

A virtual node is connected to other nodes with a **virtual link**. A virtual link denotes that there such link between at least one CI in the virtual group, to another CI node on the map.

⚠️ **Note:** Predefined filters do not apply to virtual groups. Therefore a virtual group displays even if it contains CIs that a predefined filter would have excluded. Upon the expansion of a virtual group, predefined filters are applied, and any or all of the CIs that were previously virtually grouped, might no longer display on the map.

Also, when using the node menu option **Load More**, virtual grouping is not applied at the newly loaded level even the criteria for virtual grouping is met.

Properties for Dependency Views

Use Dependency Views

Use the layout controls on a Dependency Views map to display elements in different configurations for easier management. Use the filter panel on the map to display fewer levels or to filter out elements you don’t want to see, then save the filter for use later. Draw new relationships between elements or edit existing relationships.

View a Dependency Views map

When you display a Dependency Views map using one of the options below, the map is centered on the root CI, and displays the layout and number of levels defined in the map properties. If Operational Intelligence is activated, then a Dependency Views map provides a mode that lets you directly access metrics information for the CIs on the map.

Before you begin

General role requirements:
To access a Dependency Views map from either the navigation menu, a script API, or directly from a URL, the minimum role required is the dependency_views. Some operations that are related to icons, indicators, and menu actions require the ecmdb_admin role. Some operations that are related to properties and dependency types require the admin role.

Dependency Views enforces ACL permissions on CIs, and visually hides them and their relationship from the map if the permission requirement is not met.

About this task
The maps generated by Dependency Views are based on D3 and Angular technology, providing a modern interactive graphical interface to visualize configuration items and their relationships.

If Service Mapping is activated, Dependency Views maps are enhanced to display dependencies that reflect connections in service maps. In addition, the list of related services in the Details section, includes application services, and technical and manual services if Event Management is activated. All CIs that are included in a service, are displayed underneath the service node on the map.

Maps provided by Service Mapping are for application services, including comprehensive maps from the perspective of application services. For more information, see Service Mapping.

Administrators can configure the setting for the default layout of the map and number of levels displayed. When you access the map from a saved view, the map opens using the properties in the saved view, and not the default map properties.

Procedure
Navigate to Dependency Views and open one of these modules:

- **View Map in New Tab**: Opens the map in a new, full screen tab without the application navigator.
- **View Map**: Opens the map in the content pane of the current tab.
- **Saved Views**: Opens a view of a map that you previously saved.

Click a number in the Version column, and then click the ( ) icon.

Save or load a Dependency Views map
In the View Map module, use the menu icon to save and load Dependency Views maps.
Procedure
1. Navigate to **Dependency Views > View Map**.
2. Click the view menu icon ( ).
3. Select **Save View, Load View, or Last View**.

**Delete a saved Dependency Views map view**
Use the **Saved Views** module to delete a previously saved view.

Procedure
1. Navigate to **Dependency Views > Saved Views**.
2. Use the checkbox in the first column of the table to select the map view that you wish to delete.
3. Select **Delete** from the **Actions on selected rows** drop-down menu.

**Change the layout of Dependency Views map**
You can select from different layout options for your Dependency Views map.

Procedure
1. Navigate to **Dependency Views > View Map**.
2. Select one of the following layout options from the menu across the top of the view.
   - **Vertical**: Displays the elements in a vertical tree pattern according to their upstream and downstream relationships. This is the default value for the initial display of the map.
   - **Horizontal**: Displays the elements in a horizontal tree pattern according to their upstream and downstream relationships.
   - **Radial**: Displays the elements in a radial pattern according to their upstream and downstream relationships.
   - **Force**: Centers the elements around the parent CI, regardless of upstream or downstream relationships.
   - **Group**: Groups the elements according to their CI type.
   - **Details**: Displays related alerts, incidents, problems, and related services.
**Related Services** displays application services, and if Event Management is activated then also technical services and manual services. You can double-click a service to display the map in the Event Management dashboard.

**Filter the view of a Dependency Views map**

You can filter a Dependency Views map to display specific types or categories of configuration items.

**About this task**

Use the filter panel to control which elements of the map are displayed and to save versions of a filter for later use.

**Procedure**

1. Navigate to **Dependency Views > View Map**.

2. Click the button to open **Map Settings**. Click a filter strip to expand or collapse it, and to set filter items.

<table>
<thead>
<tr>
<th>Filter panel strips and options</th>

---

**View metrics for CIs in a Dependency Views map**

Operational Intelligence processes metrics data for CIs, calculates statistics and aggregations, and detects metrics anomalies. A Dependency Views map lets you switch to metrics mode to directly access the Insights Explorer that displays metrics data for CIs on the map.
Before you begin
The Operational Intelligence (com.snc.sa.metric) plugin must be activated to enable this functionality, and metrics data needs to be processed for the CIs on the Dependency Views map.

About this task
Open a Dependency Views map in metric mode which integrates a Dependency Views map with the Insights Explorer functionality that is tailored to the map. In this mode, you can access Insights Explorer functions directly from the map, to explore metrics data for the CIs on the map. All map CIs are accessible in the right hand side pane, from where you can drill into metrics data.

Procedure
1. Navigate to Dependency Views > View Map to open a map.
2. Right-click on a CI on the map and select View Metrics to open the Dependency View map in metrics mode.
   In the panel on the right side, the CI that you selected on the Dependency View map is selected by default, and the list of all the metrics available for that CI are displayed.
3. Click the ‘<’ sign on the left of the CI to display all the CIs that you can explore metrics for.
   The Insights Explorer is scoped for exploring only the CIs that currently display on the Dependency Views map, and you cannot add or remove CIs from the list. If you use map settings or filters to filter out CIs from the map, the same filtering will apply to the list of CIs that you can explore metrics for.
4. Click on a CI in the CIs list or right-click on a CI on the Dependency Views map, to drill down to the CI’s metrics.
5. Click the Dependencies Map tab or the Metrics tab to switch modes:
   a. In Metrics mode: The full functionality of the Insights Explorer is available, you can create metric charts by dragging metrics into the canvas. You can modify chart settings, select different time ranges for the charts, and perform other actions as described in View metric values in the Insights Explorer.
   b. In Dependencies Map mode: Select a CI on the map to drill down to its metrics data, drop-down the Layout list to choose a different layout, or modify map settings.

Perform actions on nodes in a Dependency Views map
You can view various related items for the nodes in a Dependency Views map.
About this task
If the node is a collapsed node or represents a cluster, the incidents, problems and change requests are for all the collapsed nodes.

Procedure
1. Navigate to **Dependency Views > View Map**.

2. Click the ▼ icon next to a node or right-click a node on the map, to access the following menu items:

<table>
<thead>
<tr>
<th>Node Menu</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Form</td>
<td>Displays the CMDB record of the selected CI in a new tab of the browser.</td>
</tr>
<tr>
<td>View Map</td>
<td>Reloads the view using the selected CI as the new root node, with the currently defined layout setting. This option does not display on the root node.</td>
</tr>
<tr>
<td>View Related Tasks</td>
<td>Displays all tasks or outages associated with the selected CI, including incidents, problems, change requests, and follow-on tasks. This option is always available, even if there are no tasks associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>View Affected CIs</td>
<td>Shows a list of all tasks that have the CI listed as an Affected CI. This option is only visible when you access the view from the view icon in a task record's Configuration item field.</td>
</tr>
<tr>
<td>View Related Outages</td>
<td>Displays all outages involving the selected CI. This option only appears when there is an outage associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>Add Relationship</td>
<td>This option displays a dotted green line that you can drag to another CI to create a relationship link. A popup dialog allows you to define the relationship type.</td>
</tr>
<tr>
<td>Expand</td>
<td>Displays all CIs and components within a cluster node or a collapsed node. This option only appears if the node is a collapsed or cluster node. The number of additional icons to display is bound by the value of the glide.bsm.max_nodes property.</td>
</tr>
<tr>
<td>Collapse</td>
<td>Collapses all CIs and components within a cluster node or a collapsed node back to a single node. This option only appears if the node has been expanded using the Expand menu item.</td>
</tr>
<tr>
<td>Run Layout From Here</td>
<td>This option re-runs the chosen layout using the current node. Use this option to get a new or clearer view on the same map.</td>
</tr>
</tbody>
</table>
Load More

Starting at the selected icon, loads the next level of the map, past the setting of **Max Levels**.

The number of additional icons to display is bound by the value of the `glide.bsm.max_nodes` property.

## Export a Dependency Views map

You can export a Dependency Views map to an image in PNG format.

**Procedure**

1. Navigate to **Dependency Views > View Map**.
2. Configure the map view as you want the image to appear. The exported image displays the current view of the map.
3. Click the view menu icon (Ionic icon).
4. Click **Export Image**.
5. Right-click the image and select **Save Image As, Print**, or any other menu option.

   **Note:** You cannot export images from a Dependency Views map using Internet Explorer as your browser.
6. Click the "X" button to close the **Export Image** window.

## View collapsed nodes in a Dependency Views map

Cluster and virtually grouped nodes can be displayed in a collapsed mode to avoid unnecessary clutter in large maps.

**Procedure**

1. To expand a collapsed node, right-click the CI and select **Expand** from the context menu.
2. To collapse an expanded cluster node with children, right-click the CI and select **Collapse** from the context menu.

## Administer Dependency Views

Users with the admin role can control the appearance and behavior of Dependency Views by configuring map indicators, map related items, map icons, and menu actions.
Create or modify map indicators

Dependency Views maps and application service maps, use icons to display additional information for a CI by displaying its related records such as alerts, outages, incidents and problems. These icons are called map indicator.

About this task
The default configuration includes map indicators for the following record types:

- Open incident.
- Open alert.
- Unplanned current outage.
- Planned current outage, or an open problem.
- Current, planned, or recent change request.

You can filter out the display of affected CIs, alerts, current change requests, incidents and problems from the map settings menu.

The Affected CI’s map indicator appears for CIs in two related but not identical situations. It appears for CIs for which tasks such as change request, incident, or problem were directly created for, and for any CIs that were added in those tasks (parent tasks) as Affected CIs (The CI for which a task is directly created for, is automatically added as an affected CI in that task). The state of affected CI's depends on the status of the respective parent task. For as long as the parent task is active, the associated affected CIs continue to be impacted by the task issue. In a map, the Affected CI’s indicator displays for all affected CIs for as long as the parent task is active. On a map, the Affected CI tooltip displays the details of the task records in which the CI was added as an affected CI. However, the Details pane does not contain an Affected CI’s tab, and no further details about affected CIs, or the associated tasks are displayed. After the parent task is closed, the Affected CI’s indicator no longer displays for any of the tasks’ affected CIs. For information about affected CIs in Change Management, see Associate CIs to a change request.

Note: Details about affected CIs are derived from the task and the cmdb_ci tables and their extensions. Therefore, if you use custom tables to store CIs for incidents, problems and changes, it affects the details that are displayed for affected CIs.

For more information on how map indicators are used to show tasks and outages in clusters and collapsed nodes, see Cluster nodes in a Dependency Views map.
Procedure

1. Navigate to Dependency Views > Map Indicators.

2. Click New to create a new map indicator, or click the name of an indicator from the Table column to modify an existing map indicator.

3. Fill in the fields on the form, as appropriate.

Map Indicator form

<table>

</tbody>
</table>

4. Click **Submit** to enter a new map indicator. Click **Update** to modify an existing map indicator.

**Results**

For an indicator to appear in a Dependency Views map, a CI must meet all filter conditions, and **Active Dependencies** must be selected.

**Create or modify map icons**

You can upload new icons or modify existing icons to customize the icon displayed for a CI in maps in Dependency Views, Service Mapping, and Event Management.

**About this task**

The icons used in Dependency Views maps are listed in the Map Icons module. Records in the Map Icons list are arranged by CI classes, such as cmdb_ci_linux_server. The path to the default image files is https://<instance name>.service-now.com/images/app.ngbsm/<image name.svg>. For information about uploading images to the database, see Storing images in the database.

Role required: admin or cmdb_admin roles are required to access the records in this table [ngbsm_icon] to upload new icons.
Procedure

• Navigate to Configuration > CI Class Manager, and:
  1. Click Hierarchy to display the CI Classes list.
  2. Select a class to modify the icon for.
  3. In the class navigator bar, expand Class Info and then select Basic Info. On the Basic Info form, click Icon.
  4. In the Icons dialog box, select an icon and then click Update.
  5. On the Basic Info form, click Update.

• Navigate to Dependency Views > Map Icons, and:
  1. Click New to create a new map icon or click the name of an existing icon in the Label column to modify an existing icon.
  2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>Label or the informal name of the CI table that this icon represents in the view.</td>
</tr>
<tr>
<td>Icon</td>
<td>Name of the icon.</td>
</tr>
<tr>
<td>URL</td>
<td>Path to the icon image using the following format: /image name.svg Click the lock icon to enter a new path.</td>
</tr>
</tbody>
</table>

  3. Fill in the fields on the form, as appropriate.
  4. Click Submit to enter a new icon. Click Update to modify an existing icon.

What to do next
You can modify a Dependency Views map indicator to use the new icon.

Create a predefined filter
Create filters to narrow down the CIs that are displayed on a Dependency Views map. You can create filters that are based on CIs' class, CIs' attributes, or CIs' relationships.

Before you begin
Role required: ecmdb_admin
About this task
Create a predefined filter that you can then select to determine the scope of the CIs that are displayed in a Dependency Views map. Configuration type filters filter by CI class, CI filters filter by CI attributes, and relationship filters filter by relationships. Only CIs that match at least one of the configuration type filters (if any exists), and at least one of the CI filters (if any exists), and at least one of the relationship type filters (if any exists) - are displayed on the map. If no filters are defined, then no filtering is applied.

Note: Predefined filters do not apply to virtual groups. Therefore a virtual group displays even if it contains CIs that a predefined filter would have not included. Upon the expansion of a virtual group, predefined filters are applied, and any or all of the CIs that were previously virtually grouped, might no longer display on the map.

Procedure
1. Navigate to Dependency Views > Predefined Filters.
2. On the Predefined Filters page, click New.
3. Type in a Name for the filter. Click Roles, and in the Roles dialog box, select the roles that this filter will be available for.
4. Right-click on the page header, and click Save.
5. To create a configuration type filter:
   a. Click Configuration Types, and then click Edit.
   b. In the Collection slushbucket, select the classes that CIs must belong to in order to be displayed on the map, and move them to the Configuration Types List.
   c. Click Save.
6. To create a CI filter:
   a. Click CI Filters, and then click New.
   b. In the CI Filters page enter conditions to filter CIs by specific attribute values.
   c. Click Submit.
7. To create a relationship type filter:
   a. Click Relationship Type, and then click New.
   b. In the Collection slushbucket, select the relationships that CIs must have in order to be displayed on the map, and move them to the Relationship Types List.
   c. Click Save.
What to do next
After creating a predefined filter, you can apply it to a map:

1. Click the icon to open Map Settings.
2. Select a filter from the Predefined Filters list.
3. Click Apply.

Related information
Filter the view of a Dependency Views map

Set a predefined filter as default
You can set a custom predefined filter as the default predefined filter for viewing maps.

Procedure
1. Create the custom predefined filter to be used as the default predefined filter.
2. On the predefined filter form, click the context menu and select Copy sys_id.
3. Navigate to User Administration > User Preferences.
4. Click New and create a new user preference record using these values:
   - Name: ecmdb.ciview
   - Type: String
   - Value: Paste the sys_id of the custom predefined filter
   - User: Leave blank to create a system-wide setting
   - Description: Description of the predefined filter
   - System: Selected
5. Click Submit.

What to do next
In Map Settings, when you select the Default option for Predefined Filters, the custom predefined filter that was set, will be applied.

Related information
Filter the view of a Dependency Views map
Create or modify Map Related Items

The Map Related Items module relates referenced CIs to one another, which allows them to be displayed in a Dependency Views map.

About this task

The base system configuration includes the following tables and relates them to items in the Computer [cmdb_ci_computer] and Server [cmdb_ci_server] tables.

- Disk [cmdb_ci_disk]
- Network Adapter [cmdb_ci_network_adapter]
- Database [cmdb_ci_database]

Some additional referenced CIs that can be related in this manner are file systems and running processes.

In the following example, computer nodes in the map are related to network adapter nodes if the Configuration Item field of the adapter records reference the specific CI node. Access or create a network adapter record from the Network Adapter related list in the cmdb_ci_computer record.

The Dependency Views map for the *JEMPLOYEE-IBM computer shows the network adapter attached to the computer.
You can configure Dependency Views to display CIs that have no relationship record, but are related to other CIs by reference fields.

**Procedure**

1. Navigate to **Dependency Views > Map Related Items**.
2. Click **New** to create a new related item, or click in the row of an existing CI to modify an existing map related item.
3. Fill in the fields on the form, as appropriate. See the Related Items form table.
4. Click **Submit** to enter a new map related item. Click **Update** to modify an existing map related item.

**Related Items form**

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration item</td>
<td>CI that represents the base node or a CI in a table that extends the base node table. In the base system, the configuration item that represents the base node is Computer [cmdb_ci_computer], which includes all types of workstations and servers.</td>
</tr>
<tr>
<td>Related item</td>
<td>Table name of the related item. Only the cmdb_ci table and tables that extend it are displayed in the choice list.</td>
</tr>
<tr>
<td>Related field</td>
<td>Field that links this related item to the configuration item. In many cases, the appropriate value is automatically</td>
</tr>
</tbody>
</table>
Create or modify Dependency Views menu actions

To modify an existing menu option, first you create a copy of the original menu action record, and then you modify the copy.

About this task
This ensures that your instance can update the record normally during the upgrade process and allows you to quickly restore the original menu option, if necessary.

Procedure
1. To create a new menu option, navigate to **Dependency Views > Map Menu Actions** and click **New**.
   Fill in the fields on the form, as appropriate. See the Menu Action form table.
2. To modify an existing menu option, navigate to **Dependency Views > Map Menu Actions**.
3. Open the menu action you want to edit.
4. Right-click in the header and click **Insert and Stay**.
   This step creates a duplicate copy of the menu action and leaves it open for editing.
5. Change the name of the copied record to avoid confusion.
6. Modify the form fields as necessary and save the record.
7. Open the original record and disable it by clearing the **Active** check box.

Menu Action form

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name that appears as the menu option.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that allows you to enable or disable this record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition that triggers the display of this menu option. If the condition evaluates to <strong>false</strong> the menu option does not display. Script is evaluated in JavaScript in the user's browser and does not have access to all the APIs that Business Rules do. For details on available parameters, see Condition Parameters.</td>
</tr>
</tbody>
</table>
# Control and script parameters for menu actions

You can use the following condition and script parameters for menu actions.

## Condition parameters

**Note:** The usual regular expression conventions are valid in the condition field, such as `!` for NOT, `&&` for AND, and `||` for OR.

The **Condition** field contains a boolean expression that evaluates to true or false. If the condition is true or if there is no condition, the specified option appears in the menu when you right-click a CI or a relationship link. When you select the option from the menu, ServiceNow executes the associated script.

### Common Elements for Building a Condition

<table>
<thead>
<tr>
<th>Text</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Node or reference link's data on which you performed the right-click action.</td>
</tr>
<tr>
<td>item.label</td>
<td>Label of the node.</td>
</tr>
<tr>
<td>item.ci_type</td>
<td>CI's type (table), such as <code>cmdb_ci_service</code>.</td>
</tr>
</tbody>
</table>
### Common Elements for Building a Condition (continued)

<table>
<thead>
<tr>
<th>Text</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item.name</td>
<td>Name of CIs. CI’s type name or the table label.</td>
</tr>
<tr>
<td>item.location</td>
<td>Location of the CI, such as New York.</td>
</tr>
<tr>
<td>item.manufacturer_name</td>
<td>Name of the CI’s manufacturer, such as Dell Inc.</td>
</tr>
<tr>
<td>item.id</td>
<td>The sys_id of the CI.</td>
</tr>
<tr>
<td>item.is_selected</td>
<td>The item that is selected in the map.</td>
</tr>
<tr>
<td>item.level</td>
<td>The current default level.</td>
</tr>
<tr>
<td>item.locationId</td>
<td>The sys_id of the CI node’s location.</td>
</tr>
<tr>
<td>item.locationName</td>
<td>The full address of the location.</td>
</tr>
<tr>
<td>item.manufacturerId</td>
<td>The sys_id of the CI’s manufacturer.</td>
</tr>
</tbody>
</table>

### Valid Conditions for Condition Parameters

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item.isCollapsed</td>
<td>The node is a collapsed node.</td>
</tr>
<tr>
<td>item.is_cluster</td>
<td>The node is a cluster node.</td>
</tr>
</tbody>
</table>

### Script parameters

Menu action scripts are executed on the client when a user clicks the menu option. You can use the same building blocks in scripts as in conditions. Menu action scripts do not function on separators. These are some additional, useful expressions for scripts:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item.id</td>
<td>The sys_id of the CI node or relationship link.</td>
</tr>
<tr>
<td>item.source</td>
<td>The sys_id of the relationship's parent or child.</td>
</tr>
<tr>
<td>item.target</td>
<td>The sys_id of the relationship's parent or child.</td>
</tr>
<tr>
<td>item.label</td>
<td>The name of the CI node, such as IronMail-SD-02.</td>
</tr>
<tr>
<td>item.location</td>
<td>The sys_id of the CI node’s location.</td>
</tr>
</tbody>
</table>
**Create or edit a dependency type**

Use one of the dependency types provided, or create a custom dependency type with a script that will execute in real time to generate a custom view of a Dependency Views map for a specific CI.

**About this task**

Create a JavaScript to customize the map. The script must comply with JavaScript syntax guidelines and the directions in the default script template, and it can call platform APIs. Use a dependency type, for example:

- To narrow down and simplify a map, leaving out CIs that are not important for a specific task.
- To include only specific CIs that are hidden by default, such as qualifiers, endpoints, and entry points.
- To display virtual relationships that are calculated, and that otherwise do not exist in the CMDB.
- As a tool to plan a new topology deployment that is based on existing resources.

The following dependency types are available in the base system:

**Default**

The default setting in the base system. With this setting, there is no processing of the dependency map through any dependency type scripts that might filter or modify the map.

**Show All Relationships**

Returns all qualifiers, end points, and entry points. This dependency type is available in the base system and is disabled by default. Typically, you would enable this dependency type for debugging and tracking purposes.

The following dependency types are available with Service Mapping:

**Application to Network Devices**

Returns the network devices in the network paths leading to/from the given CI.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item.location_name</td>
<td>The full address of the location, such as 4616 Clairemont Drive, North Clairemont, San Diego CA.</td>
</tr>
<tr>
<td>item.manufacturer_id</td>
<td>The sys_id of the CI's manufacturer.</td>
</tr>
</tbody>
</table>
Network Device to Applications

Returns the applicative CIs which are target or source of network paths containing the given network device. In addition, returns the hosts of those applicative CIs, and for an applicative CI that is an inclusion, its parent CI is returned too.

Physical Network Connections

Returns hosts/network devices that are physically connected to the given host or network device.

Flow Dependencies

Returns all the server to server connections that were discovered using the Netflow collector. The script builds a graph based on data in the [sa_flow_server_comm] table. This table contains pairs of services represented by an IP and a listening port that are communicating with each other. For more information, see Data collection and discovery using Netflow and Data collection and discovery using VPC Flow Logs.

Procedure

1. Navigate to Dependency Views > Dependency Types.
2. In the Load Filter Scripts list view, select an existing dependency type, or click New.
3. Enter or modify a script, adhering to the guidelines and requirements in the script template that is provided.
4. Click Submit.

Results

In a Dependency Views map, you can click Dependency Type to apply a custom script defined in a dependency type.

### E-signature

Sign electronic documents from any desktop or mobile device with e-signature. E-signature is a scoped application that enables users to sign managed documents or knowledge articles with their typed or drawn e-signature, credentials, or as an acknowledgment.
Role assignment

Before you begin using e-signature, you must assign the e-signature roles to the appropriate roles, groups, or users in your application. See Components installed with e-signature for more information.

How to use e-signature templates

Users with the e-signature administrator [sn_esign.admin] or manager [sn_esign.config_manager] role can create e-signature templates. Each e-signature template pairs a document type to sign (managed document or knowledge article) with a signature type (signature, credential, or acknowledgment). For example, you could create an e-signature template for a non-disclosure agreement that requires a typed or drawn signature.

Configure an e-signature template

You can then use the e-signature template in task forms to request electronic signatures from users. In the HR Service Delivery application, for example, you can add HR tasks to HR cases or configure HR task templates to request electronic signatures per the selected e-signature template. See E-signature for HR for HR-specific examples.

Activation information

To use e-signature in your application, you must activate e-signature. For information on what components are installed with the feature, see Components installed with e-signature.

Activate e-signature

You can activate the e-signature plugin (com.snc.esign) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

About this task
E-signature activates these related plugins if they are not already active.

Plugins for E-signature

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow document viewer [com.snc.documentviewer]</td>
<td>Document viewer is a platform feature that will enable users to view enterprise class documents inline within the</td>
</tr>
</tbody>
</table>
Plugins for E-signature (continued)

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>platform attachment instead of downloading it to the local device and then opening the documents with a locally installed viewer.</td>
</tr>
<tr>
<td>Managed documents</td>
<td>Managed Documents application. To enable the ability to publish to the knowledge base, activate the knowledge document plugin.</td>
</tr>
<tr>
<td>[com.snc.document_management]</td>
<td></td>
</tr>
<tr>
<td>Signature pad</td>
<td>Provides a tool to allow a digital signature in a .pdf document. The Human Resources application uses this with various documents.</td>
</tr>
<tr>
<td>[com.snc.signaturepad]</td>
<td></td>
</tr>
</tbody>
</table>

Procedure

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Components installed with e-signature

Several types of components are installed with activation of e-signature, including tables and user roles.

   Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.
Roles installed

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>E-signature administrator [sn_esign.admin]</td>
<td>Can manage the e-signature module.</td>
<td>• sn_esign.config_manager</td>
</tr>
<tr>
<td>E-signature manager [sn_esign.config_manager]</td>
<td>Can manage the e-signature configurations.</td>
<td>• None</td>
</tr>
</tbody>
</table>

You can assign these roles to the appropriate roles, groups, or users in your application.

• To assign a role to another role, see Add a role to an existing role.
• To assign a role to a group, see Assign a role to a group.
• To assign a role to a user, see Assign a role to a user.

For further information on user administration and how to manage users, see User administration.

Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>E-Signature Configuration [sn_esign_configuration]</td>
<td>E-signature configuration table.</td>
</tr>
<tr>
<td>E-Signature Acknowledgement [sn_esign_acknowledgement]</td>
<td>E-signature acknowledgment table.</td>
</tr>
</tbody>
</table>

For further information on table administration and how to manage data, see Table administration.

Configure an e-signature template

Create or modify an e-signature template to define an electronic document and signature configuration for use in task forms. Each template is associated with a document type such as a managed document or knowledge article, and you can configure the template so that the signatory is required to sign the document with their typed or drawn signature, credentials, or as an acknowledgment.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Before you begin
Role required: sn_esign.admin or sn_esign.config_manager

Procedure
1. Navigate to **E-signature > E-signature template**.
2. Click **New** or open a record.
3. Fill in the fields on the form.

### E-signature template form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the e-signature template.</td>
</tr>
<tr>
<td>Task table</td>
<td>Task table that the e-signature template is associated with.</td>
</tr>
<tr>
<td>Document type</td>
<td>Document type of the e-signature template. Select one of the following:</td>
</tr>
<tr>
<td>HR document template</td>
<td>(HR Service Delivery only) An HR document template is the document type for signing.</td>
</tr>
</tbody>
</table>

**Note:**
- Make sure that the **Task table** field is set to HR Task [sn_hr_core_task].
- The HR document template that the signatory will sign is selected on the HR case form. See [Select an HR document template for an e-signature task](#) for more information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge article</td>
<td>A knowledge article is the document type for signing. In the <strong>Knowledge article</strong> field, select the knowledge article that the signatory will sign.</td>

</tr>
<tr>
<td>Signature type</td>
<td>Signature type of the e-signature template. Select one of the following:</td>
</tr>
<tr>
<td>Acknowledgment</td>
<td>The signatory acknowledges the document by accepting and completing the task.</td>
</tr>
<tr>
<td>Note:</td>
<td>This option is not available for HR document templates.</td>
</tr>
<tr>
<td>Credential</td>
<td>The signatory signs the document with their credentials.</td>
</tr>
<tr>
<td>Note:</td>
<td>This option is not available for HR document templates.</td>
</tr>
<tr>
<td>Signature</td>
<td>The signatory signs the document with their typed or drawn signature.</td>
</tr>
<tr>
<td>Acknowledgment text</td>
<td>Adds a check box with accompanying acknowledgment text that the user must select before the signing is completed. This option can be used with any signature type.</td>
</tr>
<tr>
<td>Note:</td>
<td>Acknowledgment text is limited to 1,000 characters.</td>
</tr>
</tbody>
</table>
Example
The following GIF shows an example of an HR agent creating an e-signature template for an intellectual property agreement.

4. Click Submit or Update.

What to do next
You can use the e-signature template in task forms to request electronic signatures from users.

The following GIF shows an example of an HR agent creating an e-signature task for an employee, Eva Seahorn, as part of an HR case.
The following GIF shows an example of the employee, Eva Seahorn, then completing the e-signature to-do in the Employee Service Center.
Edge Encryption

ServiceNow® Edge Encryption™ encrypts sensitive data on your company premises before sending it over the Internet to your ServiceNow instance (encrypted in flight), where it remains encrypted at rest.

Understanding Edge Encryption

Edge Encryption is a network encryption system that resides on your network and that encrypts and decrypts sensitive data as it travels between your data center and the ServiceNow cloud.

What is Edge Encryption

The Edge Encryption feature is an additional cost option that provides you with the ability to control the end-to-end encryption of your data and key management. Edge Encryption uses a proxy application, provided by ServiceNow and installed by you within your own network. This proxy application tokenizes specified data patterns or encrypts string fields, Date fields, Date/Time fields, and attachment data before it is sent from your environment to your
instance. The proxy application also decrypts the same data, again only within your own network, using keys stored only within your own network.

The relevant encryption keys and configuration exist only on the Edge proxy within your network and are not visible to ServiceNow. The data is encrypted from the moment it leaves your environment and is only decrypted upon retrieval. At no point is the data accessible in plaintext by ServiceNow systems or personnel.

**Who uses Edge Encryption**

Only a user logged into the instance through a proxy server on your network can view encrypted data in clear text. Likewise, only a security_admin user logged in to an instance through a proxy server in your network can configure and administer Edge Encryption.

Because the proxy server resides in your network, you own and manage the encryption keys, and they are never sent to the instance. As a result, ServiceNow never shows sensitive data in clear text.

In addition to the Edge proxy configuration and management of rules, you are responsible for the usual requirements of operating a server within your environment (including hosting, routing, backup, DNS configuration, etc.) to enable and support your Edge proxies.

**Encryption and tokenization**

Edge Encryption supports both encryption (through encryption configurations) and tokenization (through encryption patterns) as a means of protecting your sensitive information.

**Encryption configurations**

You can encrypt individual fields using encryption configurations. Edge Encryption supports AES 128-bit and AES 256-bit encryption keys. Edge Encryption supports standard, equality-preserving, and order-preserving encryption types.

In addition to attachments, you can encrypt the following field types:

- String
- Date
- Date/Time
- Journal
- Journal Input
- URL
If a Journal field marked for encryption is added to the activity stream, all user input to the field is encrypted in the activity stream.

**Note:** Multi-byte characters within supported field types can be encrypted.

### Encryption patterns

You can use encryption patterns to tokenize strings that match regular patterns such as social security and credit card numbers. While encryption configurations should be the primary method of encryption, use encryption patterns as a supplement to secure sensitive information found outside of encrypted fields.

**Note:** The Edge Encryption proxy server requires a MySQL database in your network only if using order preserving encryption or encryption patterns. Clear text values are stored in the proxy database in your network. For this reason, it is critical that you secure and regularly back up your proxy database. For recommendations, see Edge Encryption components.

---

**Edge Encryption on the Now Platform**

Edge Encryption acts as a gateway between your browser and your ServiceNow instance. Traffic from your browser passes through the gateway on its way to the ServiceNow instance. The gateway, in turn, is configured to encrypt outbound data that is marked for encryption. Inbound traffic is decrypted through the gateway, and the end user sees clear text in the browser. The advantage of this implementation from a security control perspective is that the encryption and key management are handled externally from ServiceNow.
Pros and cons

As with Platform Encryption and Column Level encryption, Edge Encryption imposes some functional limitations within an instance as a result of the additional security. The local Edge proxy does, however, also provide some additional functionality relating to sorting when compared to column-level encryption.

Pros:

• Edge Encryption provides absolute control of who sees your information and prevents data breaches.
• Information remains on your proxy server and never leaves your network unencrypted.
• Information is encrypted in transit, before it even reaches the ServiceNow instance.
• You hold and manage all your own encryption keys. No one else, not even ServiceNow personnel, can access your keys.
• You can choose the strength of the encryption algorithm: AES-128 or AES-256.
• Edge Encryption includes the ability to encrypt String text, Date and Date/Time fields, attachments, URLs, and journals.
• Edge Encryption provides Standard, Equality Preserving, and Order Preserving encryption of data at rest within the database and instance.
• Encryption rules allow you to write custom scripts that tell the proxy server specifically what to encrypt and where to put that encrypted information in the instance. This is useful when the data structure doesn’t exactly match the ServiceNow instance.
• Encryption patterns allow you to tokenize information such as passwords.

Cons:

• Edge Encryption requires an extra network hop through the Edge proxies cluster, and extra processing, which can add delay to traffic. The added processing delay of the Edge Encryption application is negligible compared to the network hop.
• Maintaining your own encryption keys can be complex and time-consuming.
• You can maintain a maximum of two keys, with no flexibility to define different keys for different subsets of columns/data, or for different roles, etc.
• Edge Encryption has the side effect that the server or platform can’t decrypt the data to perform any manipulation of the decrypted data. As a consequence, functionality and data processing on the Now Platform may be restricted when encrypting columns with Edge Encryption.
What to know before you begin

Because encryption and tokenization change the nature of your data, Edge Encryption can affect other instance processes. Before using Edge Encryption, carefully consider the impact on your instance.

Because the proxy server is installed and maintained in your network, Edge Encryption requires network administration and management. Review the network requirements to ensure a smooth implementation.

Review the following topics to understand the impact of Edge Encryption on your instance:

- Planning for Edge Encryption
- Edge Encryption system requirements
- Sizing your Edge Encryption environment
- Calculate the order-preserving and tokenization database size
- Edge Encryption limitations
- Key management for Edge Encryption

Edge Encryption components

Edge Encryption is comprised of the Edge Encryption proxy server that runs on a server in your network, and the Edge Encryption plugin that must be installed on your ServiceNow instance. If using order-preserving encryption types or encryption patterns, a proxy database must also be installed in your network.

Proxy application

When going through the Edge Encryption proxy server, the Edge Encryption plugin allows you to specify which fields, patterns, and attachments should be encrypted. You can also manage encryption rules to encrypt specific requests and schedule mass encryption jobs.

Proxy server

The Edge Encryption proxy server uses encryption rules to identify in an HTTP request what, if anything, needs to be encrypted and encrypts it before forwarding the request to the instance. For decryption, the Edge Encryption proxy server looks at the HTTP responses for any encrypted data and decrypts it before sending the response back to the client. In order for this to happen, all HTTP requests and responses must go through the Edge Encryption proxy server. This includes any requests originating from a browser, as well as any SOAP or REST requests.
Proxy database

If using order preserving encryption or encryption patterns, your proxy servers rely on a MySQL database located in your network. All proxy servers in your network must use the same database.

The proxy database contains these tables.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>db_id</td>
<td>Unique database ID</td>
</tr>
<tr>
<td>edge_token_map</td>
<td>Encryption pattern data</td>
</tr>
<tr>
<td>token_map</td>
<td>Order-preserving encryption data</td>
</tr>
</tbody>
</table>

Backing up your proxy database

Because encryption patterns rely on tokenization, clear text values are stored in your proxy database. If the database is lost, clear text values cannot be restored. It is critical that you maintain regular backups. To avoid data loss, back up your proxy database according to ServiceNow recommendations.

- Back up your database every 24 hours.
- Retain MySQL database binary log files for at least two days. After a backup has been restored, use the binary log to regenerate any data lost since the most recent backup. Refer to MySQL database backup best practices for your database version.

Edge Encryption clients

Edge Encryption uses three clients to inform the instance that the proxy is running, to synchronize requests between the proxy and the instance, and to forward all end user requests to the instance after any potential encryption.

<table>
<thead>
<tr>
<th>Client</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>heartbeat/keepalive client</td>
<td>In charge of sending a request to the ServiceNow instance every 5 seconds to let the instance know that this proxy is up and running. The requests drive the last_response_on field on the Edge proxy table, and as a consequence drive the state of the proxy. If your system has issues sending the requests,</td>
</tr>
<tr>
<td>Client</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>or if the request or request processing is delayed, the instance may mark the proxy as unresponsive, even if the other clients (including the one for user traffic) are up and running.</td>
</tr>
<tr>
<td></td>
<td>This client also controls the online status of the proxy on the instance.</td>
</tr>
<tr>
<td></td>
<td>The <code>edgeencryption.proxy.keepalive.interval</code> property controls the polling rate for this client. The default is 5 (seconds).</td>
</tr>
<tr>
<td>polling/sync client</td>
<td>In charge of various requests the proxy sends to the instance to synchronize on the Edge Encryption configuration (for example, which table, column, or attachment to encrypt, keys, jobs, rules, and tokenization patterns).</td>
</tr>
<tr>
<td></td>
<td>The <code>edgeencryption.config.poll.interval</code> property controls the polling rate for this client.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning:</strong> Do not change this setting. Changing the default setting of the proxy poll interval may result in synchronization delays when updating Edge Encryption settings on the instance.</td>
</tr>
<tr>
<td>default/user traffic client</td>
<td>For everything else, this client handles all end user requests and forwards them to the ServiceNow instance after any potential encryption. This client also handles responses from the instance, forwarding them to the end user after any potential decryption.</td>
</tr>
</tbody>
</table>
Key management for Edge Encryption

You are responsible for providing and managing the encryption keys used by Edge Encryption.

This topic refers to keys for the Edge Encryption product. If you are looking for information on the Key Management Framework, which can be used with Column Level Encryption, see Key Management Framework.

When obtaining and creating encryption keys to support the encryption types used by Edge Encryption, consider the following:

• Whether to use AES 128-bit or AES 256-bit. You must define a default AES 128-bit encryption key, even if it is not used.
• Whether to use file system, Java KeyStore, or Enterprise Key Management (EKM).
• When to rotate encryption keys.
• When and if to use a mass encryption job to re-encrypt data using the new key.

Before removing a key from the proxy configuration files and the keystore, it is critical that you decrypt all data on the instance that uses the key. You can do this by adding a new encryption key and scheduling a mass key rotation job.

Keystores

Edge Encryption supports the following types of key storage.

File store
Keys are stored in a file in a file system that is accessible by the Edge Encryption proxy. Encryption keys stored in a file are not encrypted, so it is your responsibility to protect these files.

Java KeyStore
Keys are stored in Java's JCEKS KeyStore. A Java KeyStore is protected by a password, so it is more secure than storing keys in a file in the file store. A single Java KeyStore can store multiple keys, and the keys are identified by a key alias, making it easier to manage multiple keys.

Enterprise Key Management (EKM)
Keys are stored and retrieved with the SafeNet KeySecure or Unbound Technology key management systems.

The Edge Encryption proxy ships with the Java JCEKS KeyStore file named keystore.jceks in the keystore directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.
Note: If using a keystore other than the base system Java JCEKS KeyStore, you must import the ServiceNow public key into your keystore. The public key alias is servicenow.

In addition to the encryption keys, the Java JCEKS KeyStore is used to store the RSA key pair for digitally signing the encryption configuration and encryption rules that are stored in the instance, and the digital certificate that the Edge Encryption proxy uses to establish a secure connection with the browsers and any other clients.

SafeNet key versioning for Edge Encryption

Use SafeNet key versioning to simplify changing keys. Instead of creating a new alias for every new key, SafeNet key versioning keeps the same alias and increments the version.

You must set up key versioning in SafeNet before you can configure SafeNet key versioning on the Edge proxy server.

Note: Edge proxies installed before the London release support SafeNet keys, but do not support SafeNet key versioning. If you mistakenly use a versioned key on a Kingston or earlier proxy, when you upgrade to a London or later release, the London or later proxy detects this problem, and to prevent potential data loss the proxy does not start.

You must first schedule a mass key rotation job or a single key rotation job to replace the old SafeNet versioned key with a non-versioned key, and then create a new SafeNet versioned key, if needed. This new versioned key is safe to use with the London or later proxy, and you can restart the proxy.

Encryption key configuration

If using SafeNet versioned keys, the Change Default Keys section of the Encryption Key Configuration form includes new fields for the Key version of the default 128-bit and 256-bit keys. Key version fields are grayed out and cannot be edited.
For procedures, see Configure encryption keys on the instance.

**Versioned keys**

If using SafeNet versioned keys, when you navigate to Edge Encryption Configuration > Encryption Key Configuration > All Keys, versioned keys include the **Key version**.

A version number does not appear for the initial entries you make in the Change Default Keys section of the Encryption Key Configuration form. When the proxy server requests a key from SafeNet, the system adds a new line for the alias and adds the **Key version**.

In the above example, **AES128key** is listed three times:

- The first listing, with no **Key version** indicated, is the initial entry.
- The second listing, with **1** in the **Key version** column, is the first version of the key returned from SafeNet.
• The third listing, with 2 in the Key version column, is the second version of the key returned from SafeNet.

• As other versions of the key are returned from SafeNet, new lines are added to record the Key version now in use.

Encryption configurations and patterns
With Edge Encryption, you can encrypt fields and tokenize strings.

Encryption configurations
You can encrypt individual fields using encryption configurations. Edge Encryption supports AES 128-bit encryption keys. If the Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy files are installed, Edge Encryption supports AES 256-bit encryption keys for each encryption type. Edge Encryption supports the following types of encryption configurations.

Standard encryption
The encrypted value of a field is different each time the field is encrypted, even when the field value remains the same. Standard encryption is the most robust form of encryption. Fields using standard encryption cannot be sorted, grouped by, or filtered on.

Equality-preserving encryption
The encrypted value of a field is the same when the field value remains the same. Supports equality comparisons and group by operations on a field.

Note: When equality-preserving encryption is selected for a field that already contains data, performing a group by action on the field may not group fields with the same value if one is encrypted and the other is not.

Order-preserving encryption
Uses tokens and encryption to secure data in your proxy database. Supports equality comparisons, group by operations, and the ability to sort data. The order preserving encryption type is only supported if there is a MySQL database configured for the Edge Encryption proxy server.
Note: When using order-preserving encryption and the proxy database is down, updates can be made to fields using order-preserving encryption. However, the sort order will not be correct when trying to sort data based on those fields. Groups also will not work as expected. When the proxy database is again operational, schedule an order token repair job to repair missing tokens.

Encryption types
The following encryption types are listed in decreasing security quality.

<table>
<thead>
<tr>
<th>Encryption type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard AES 256</td>
<td>Fields cannot be filtered, sorted, or compared.</td>
</tr>
<tr>
<td>Standard AES 128</td>
<td>Fields cannot be filtered, sorted, or compared.</td>
</tr>
<tr>
<td>Equality preserving AES 256</td>
<td>Fields can be filtered using equality comparisons.</td>
</tr>
<tr>
<td>Equality preserving AES 128</td>
<td>Fields can be filtered using equality comparisons.</td>
</tr>
<tr>
<td>Order preserving AES 256</td>
<td>Fields can be sorted and equality comparison filtering can be used. Requires the use of a MySQL database in your network.</td>
</tr>
<tr>
<td>Order preserving AES 128</td>
<td>Fields can be sorted and equality comparison filtering can be used. Requires the use of a MySQL database in your network.</td>
</tr>
</tbody>
</table>

Encryption Patterns
You can secure sensitive data found in strings using encryption patterns. Once an encryption pattern is stored and activated, the Edge Encryption proxy server identifies strings that match the pattern in requests. Once located, the clear text string is stored in the proxy database and replaced on the instance with a token. Use encryption patterns to tokenize strings that match regular patterns such as social security and credit card numbers. While we recommend that encryption configurations be the primary method of encryption, use encryption patterns
as a supplement to locate and secure sensitive information found outside of encrypted fields.

[Note: The Edge Encryption proxy server requires a MySQL database in your network only if using order preserving encryption or encryption patterns. Clear text values are stored in the proxy database in your network. For this reason, it is critical that you secure and regularly back up your proxy database. For recommendations, see Edge Encryption components.]

Related information

Encrypt fields using encryption configurations
Tokenize strings using encryption patterns

Installed with Edge Encryption

Edge Encryption installs tables to store encryption-related data, system properties to configure default behavior, and the edge_encryption role to administer Edge Encryption.

Tables installed with Edge Encryption

Edge Encryption installs the following tables.

- **Edge Encryption Configuration [sys_encryption_configuration]**
  - Contains encrypted fields and tables for which attachments are encrypted.

- **Edge Encryption Rule [sys_encryption_rule]**
  - Contains a record for each rule. A rule has a name, the condition when it is used, a script, and an order field.

- **Edge Encryption Invalid Insert Log [sys_edge_encryption_invalid_insert_log]**
  - Contains log messages created for attempts to save unencrypted data to an encrypted field.

- **Edge Encryption Proxy [sys_encryption_proxy]**
  - Contains information about the encryption proxy application.

- **Edge Proxy Encryption Type [sys_proxy_encryption_type]**
  - Used for enabling and disabling encryption types on the encryption form.

- **Encryption Job Execution [sys_encryption_job_execution]**
  - Supports mass encryption jobs.

- **Encryption Job Execution Chunk [sys_encryption_job_execution_chunk]**
Supports mass encryption jobs.

**Scheduled Encryption Job [sysauto_encryption_job]**

Lists scheduled jobs for encryption, decryption, key rotation, order token repair, and database recovery.

**Encryption Key Configuration [sys_encryption_key_configuration]**

Lists default encryption keys.

**Encryption Key [sys_encryption_key]**

Lists available keys and key attributes.

**Proxy Encryption Key [sys_encryption_proxy_key]**

Lists proxy encryption keys.

**Properties installed with Edge Encryption**

Edge Encryption adds the following properties.

<i>Note:</i> To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

**glide.edge.pattern.disallowed.chars**

A list of characters that are not allowed in patterns.

- **Type:** a string of a comma-separated list of values
- **Location:** System Properties [sys_properties] table

**glide.edge.pattern.min.size**

The minimum pattern size allowed. Allowing smaller patterns means finding more matches, which increases overhead.

- **Type:** number
- **Default value:** 5
- **Location:** System Properties [sys_properties] table

**sn_edge_encryption.logging.destination**

Where messages are logged.

- **Type:** string
- **Default value:** file
- **Location:** System Properties [sys_properties] table

**sn_edge_encryption.logging.verbosity**
The logging level to use.

- **Type**: string
- **Default value**: info
- **Location**: System Properties [sys_properties] table

**sn_edge_encryption.encryption.proxy.buildtag**

The proxy version registered with your instance.

- **Type**: string
- **Location**: System Properties [sys_properties] table

**sn_edge_encryption.cleartext.allowed**

When true, allows clear text to be saved in an encrypted field. This happens when a user is accessing the instance without going through the Edge Encryption proxy. When false, the system prevents clear text from being saved in an encrypted field.

- **Type**: Boolean
- **Default value**: false
- **Location**: System Properties [sys_properties] table

**Role installed with Edge Encryption**

**edge_encryption**

Edge Encryption proxies log into the instance as a user, with a user name and password. The user must have this role assigned.

Contains roles: None

**Planning for Edge Encryption**

Successful implementation of Edge Encryption requires planning and preparation.

Answer the following questions in the planning stage.

- Which fields are to be encrypted?
- Which encryption types are to be used?
- How many Edge Encryption proxies are needed? See Sizing your Edge Encryption environment for recommendations and considerations.
• If an order preserving encryption type or encryption patterns are to be used, where is the MySQL database located?

• Which key management system is to be used?

System administrators, network administrators, and security team members have different tasks to fulfill for implementing Edge Encryption.

• System administrators need the security-admin role. The system administrator needs to:
  ◦ Download the Edge Encryption proxy application.
  ◦ Set up an Edge Encryption user account for the proxies to use to connect to the instance. The user must be assigned the edge_encryption role.
  ◦ Configure encryption keys, and set the default keys.
  ◦ Configure Edge Encryption on the instance.
  ◦ Schedule encryption jobs.
  ◦ Monitor Edge Encryption.
  ◦ Create and edit encryption rules.

• Your network administrator needs to:
  ◦ Install the Edge Encryption proxy application.
  ◦ Know the network addresses for the proxy servers and the proxy database used for order-preserving encryption and encryption patterns.
  ◦ Install the proxy database to be used for order-preserving encryption and encryption patterns.
  ◦ Start and stop the proxy applications.
  ◦ Perform encryption key management.
  ◦ Determine how to map users to encryption proxy applications. This can be done with DNS settings or routing rules, and is specific to each network.
  ◦ Manage multiple proxy servers.
  ◦ Configure load balancer pools and settings.

• Your security administrator must determine the encryption types to be assigned to each field.

Edge Encryption system requirements

You can run the Edge Encryption proxy application on servers or virtual machines that run on Microsoft Windows or Linux operating systems.
For optimum performance, ensure that your configuration meets these requirements.

**Java requirements**
The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

- Java 8 update 121 (8u121)
- Java 8 update 141 (8u141)
- Java 8 update 151 (8u151) or later

ℹ️ **Note:** Java 8 update 131 (8u131) is not supported.
- Java 11.0.6 or later

ℹ️ **Note:** Before installing the Edge Encryption proxy server, check that the $JAVA_HOME variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the $JAVA_HOME variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

<table>
<thead>
<tr>
<th>Java Version</th>
<th>Enabling AES 256-bit Encryption</th>
</tr>

<td>Note: If upgrading an Edge Encryption proxy server running on Windows to a new version of Java, you may need to copy the JCE policy files from your previous Java folder to the new Java folder.</td>
</tr>
</tbody>
</table>

**Note:** Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

### Support for OpenJDK
Starting with the Orlando release, the Now Platform supports the following versions of openJDK:

- OpenJDK version 8
- AdoptOpenJDK version 8
- OpenJDK version 11

### Proxy server minimum configuration
A proxy server requires this minimum configuration:

- 4 GB of RAM per proxy server (6 GB is recommended for most deployments).

**Note:** The proxy server host requires at least 1 GB of RAM more than the proxy server. The proxy server host needs the extra 1 GB for operating system services. For example, if you configure a proxy server to use 4 GB of RAM, you must install at least 5 GB of RAM on the proxy server host.

Because the proxy server requires at least 4 GB of memory, 32-bit JREs and 32-bit operating systems are no longer supported starting with the London release.

- 3 or more GHz CPU (4-core CPU preferred for optimum performance).
- Multiple proxy servers behind a load balancer. The number of proxy servers you need depends on the number of application nodes, the number of
simultaneous users, and the number of servers needed for failover. See Sizing your Edge Encryption environment for more information.

- Ability to run concurrently with other services, depending on the server utilization and resource availability.

**Proxy server supported systems**

The following systems are supported:

<table>
<thead>
<tr>
<th>Supported System</th>
<th>Description</th>
</tr>
</thead>
</table>
| Windows Server 2012, 2012-R2, and 2016 editions | • Virtual machines or physical hardware  
• 64-bit systems |
| Linux | • Virtual machines or physical hardware  
• 64-bit systems |

On 64-bit Linux systems, you must install the 32-bit GNU C library (glibc). The installation command for CentOS is `yum install glibc.i686`.

**Proxy server connection requirements**

The proxy server that runs the Edge Encryption application must be able to communicate with machines in your network. Make sure that the proxy server has these network privileges:

<table>
<thead>
<tr>
<th>Network Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firewall access</td>
<td>Configure any firewalls between the proxy server and the client devices to allow a connection. If your network uses a DeMilitarized Zone (DMZ) to add an extra layer of security to your Local Area Network (LAN), and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a proxy server to a machine within the DMZ.</td>
</tr>
</tbody>
</table>
Network Privilege | Description
--- | ---
Network access | Configure each client to enable the proxy server to connect with it. If network security prevents you from configuring new machines that can connect to the clients, install the proxy server on an existing machine with connection privileges.

Instance access | Ensure that the proxy server has network access to the instance. Make sure that you configure the proxy server network to allow traffic over TCP port 443.

Network account | Install the proxy server with either a local or domain administrator.

### Order-preserving and tokenization database system requirements

Order-preserving encryption and encryption patterns require that you configure an Oracle MySQL database for the Edge Encryption proxy server. Order-preserving encryption allows any comparison operation to be directly applied on encrypted data, without first decrypting the data. Encryption patterns let you replace string patterns with tokens (called tokenization) before they are sent to and stored in the database. Because of the size of the MySQL database, use a dedicated proxy server to run the order-preserving and tokenization database.

The minimum database system requirements include:

<table>
<thead>
<tr>
<th>MySQL Database</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>MySQL database versions 5.5 to 5.7</td>
</tr>
<tr>
<td>OS</td>

---

### Sizing your Edge Encryption environment

Choosing the number of proxy servers for your environment is an important task. Consider the number of users, redundancy needs, and acceptable latency.

### Redundancy

Maintain redundant proxy servers in case of hardware failure. Proxy servers should be located behind a load balancer to provide a functional path for all users if a proxy server is unreachable. At a minimum, ensure that two proxy servers are always available.

### Size

Size refers to the number of proxy servers required to avoid additional latency that the encryption of data produces. Depending on use, you may want to reduce the amount of latency by adding additional proxy servers. For example, if regular mass encryptions are run, add additional proxy servers to handle the load, or run the mass encryptions when the user load is light. In addition, the hardware that the proxy server runs on influences performance and latency. Proxy servers running on hardware with faster CPUs, more CPUs, and more RAM have higher throughput than slower, limited systems.

The following guidelines assume that your proxy server is running on at least the minimum hardware requirements. To determine the number of proxy servers:

- Consider setting up one proxy server for every two application nodes on the instance.
- For redundancy, set up a minimum of two proxy servers behind a load balancer.
- Add an extra proxy server for every 500 simultaneous users.
- Depending on the desired redundancy, add additional proxy servers for failover.
For example, for an instance with 2,000 users, you should have at least five proxy servers behind a load balancer. This calculation includes one proxy server for every 500 users, with an extra proxy server for failover. Determine ahead of time when you will approach a threshold of 500 users and place another proxy server in the load balancer pool.

**Load balancers**

To balance requests and improve server response time, distribute proxy servers in a load balancer pool. Configure load balancers to use the "least connections" method. This method connects requests to the proxy server with the fewest active connections, preventing the overloading of a single proxy.

**CPU utilization**

Because data encryption and tokenization are CPU intensive operations, CPU spikes while encrypting data are normal and expected. When CPU utilization is over 80% for several minutes at a time, it likely means that the proxy server has too much work to do. When this happens, latency increases for the period that the CPU utilization is high. If latency persists, adding another proxy server may help decrease the latency.

**Memory**

The proxy server must have a minimum of 4 GB of RAM available (6 GB recommended). Set the proxy server initial and upper bound memory limits to the recommended settings.

**Calculate the order-preserving and tokenization database size**

If using order-preserving encryption or encryption patterns, determine the size of your MySQL database by multiplying the number of potential records by record size.

**About this task**

Use a dedicated machine to run the order-preserving and tokenization database. Do not run the database on the same hardware as the proxy server.

**Procedure**

1. Determine the potential number of records that could include fields encrypted with order-preserving encryption.
   a. Multiply the number of encryption configurations using order-preserving encryption by the number of records each configuration is applied to.
   b. To allow for growth, multiply the result by three.
2. Multiply the result of step 1 by 1,536.  
   1,536 is the average size of a record in bytes.

3. If using encryption patterns, perform steps 1–2 for tokenized records and add the result to the total.

**Results**
The calculated value is the recommended size in bytes for your order-preserving and tokenization database.

**Edge Encryption limitations**
Edge Encryption impacts system functions. Carefully evaluate the impact of encrypting a field.

**Field type restrictions**
You can encrypt only the following field types:

- String
- Date
- Date/Time
- Journal
- Journal Input
- URL

You cannot encrypt the following field types:

- Choice fields
- Virtual fields
- Fields in system tables, except for certain fields in sys_user
- System fields in tables
- Number fields or fields associated with an auto-numbering scheme
- Any other field type not listed above

Additional restrictions:
• When a Journal field is encrypted, the Post button is disabled, even if there are multiple Journal fields and only one of those fields is encrypted.

• Encrypted fields are not available in Go to and header filter boxes.

• When encrypting fields used as an index, you can use only order-preserving and equality-preserving encryption types. Indexed fields cannot be encrypted using the standard encryption type.

For more information, see Field types.

Filtering and searching restrictions

Standard encryption

When you select a String, Date, Date/Time, or URL field with a standard encrypted field configuration as the left operand in a filter, no filtering options are available.

Equality-preserving encryption

When you select a String, Date, Date/Time, or URL field with an equality-preserving encrypted field configuration as the left operand in a filter, the following operators are available:

• is
• is not
• is empty
• is not empty

Order-preserving encryption

When you select a String field with an order-preserving encrypted field configuration as the left operand in a filter, the following operators are available, in addition to is, is not, is empty, and is not empty:

• greater than
• less than

When you select a Date or Date/Time field with an order-preserving encrypted field configuration as the left operand in a filter, the following operators are available, in addition to is, is not, is empty, and is not empty:

• after
• before
• after or on
• before or on

Date and Date/Time pickers

For Date fields, use the date picker to specify the date:

For Date/Time fields, use the date and time picker to specify the date and time:

List condition filters

The Show Matching and Filter Out options are supported in lists. Only exact matches are returned or filtered out.

ℹ️ Note: Adding encrypted fields in condition filters is supported in scripts such as UI policies and business rules.

Configuration restrictions

Restrictions and behavior of encryption configurations:
• After you add a field to the Edge Encryption Configuration table, you cannot delete the configuration record. If you no longer want a field to be encrypted, deactivate the record in the Edge Encryption Configuration table and schedule an encryption job to decrypt the data.

• If a field in a parent table is marked to be encrypted, the field is also encrypted in all inherited tables. For example, if the Short description field in the Task table is encrypted, then the contents of the Short description field in the Incident table are encrypted.

• If a field inherited from a parent table is marked to be encrypted, the field in the parent table cannot be encrypted. For example, if the Short description field in the Incident table is marked to be encrypted, then the Short description field in the Task table cannot be encrypted. In this example, you can encrypt the Short description in the Problem table.

• When a field with an encryption configuration defined is exported to any format, the output includes encrypted values even when exported through the proxy server.

• You cannot import data to a field with an encryption configuration defined.

• You cannot encrypt inherited Date and Date/Time fields. Date or Date/Time fields inherited from a parent table are not listed on the Column field drop-down list, and you cannot create Date or Date/Time encryption configurations for those fields.

• You can encrypt a String or URL field only from a parent table or a child table, but not both.

**Instance restrictions**

Impact of using Edge Encryption on the instance:

• Back-end logic cannot process encrypted data. When the instance contains encrypted data, any business rule, back-end script, or back-end feature that relies on evaluating the data in the encrypted field does not run correctly.

  ❪ Note: Data encrypted with equality-preserving or order-preserving encryption still passes equivalence checks when compared against an identical encrypted value.

• Since email processing goes from the mail systems straight to the instance and cannot pass through the Edge proxy, data sent in or out via email cannot be encrypted or decrypted by the Edge proxy.
  - Data and attachments in inbound emails are not encrypted.
  - Data and attachments in outbound emails remain encrypted and cannot be decrypted.
• Scripts run on the server cannot change encrypted data.

• Global search is not supported. Because global search attempts to search both encrypted and clear text data, the results may not be as expected.

• Encrypted data cannot be copied and pasted into a record where the field is not encrypted.

• Depending on the type of encryption selected, the user interface functionality for the encrypted fields is reduced. For example, being able to compare, group by, sort, and search may be impacted. Generally, the stronger the encryption selected, the more functionality is reduced.

• Except for Java KeyStore, SafeNet, and Unbound Technology, no third-party software or hardware encryption key management is supported.

• Although multiple proxy servers connected to a single instance are supported, encryption proxy cluster management and monitoring are not available. Each proxy must be managed separately.

• System configurations such as workload and the number of encrypted fields can impact the performance of encrypted fields.

• The Edge Encryption proxy server can only connect to a single instance.

• If your instance uses an Oracle database and the String field you are marking to be encrypted is greater than 2925 characters, that field cannot be sorted even when order preserving encryption is selected.

• If your instance uses an Oracle database, Unicode AL32UTF8 is the only supported character set.

• Encrypted data cannot be used in reports.

Edge Encryption installation

You can install an Edge Encryption proxy manually or using the Edge Encryption interactive installer.

Java requirements

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

• Java 8 update 121 (8u121)
• Java 8 update 141 (8u141)
• Java 8 update 151 (8u151) or later
Note: Java 8 update 131 (8u131) is not supported.

• Java 11.0.6 or later

Note: Before installing the Edge Encryption proxy server, check that the 
$JAVA_HOME variable is pointing to a supported version of Java for 
each user that will run the proxy server. For example, if installing the proxy 
server as a local administrator on Windows, check that the $JAVA_HOME 
variable is pointing to the correct version of Java system-wide. If installing 
on Linux, check that each user that will run the proxy server has this variable 
correctly defined. If a supported version of Java is not found, the Edge 
Encryption proxy server will not run.

Installing the proxy server
Installing Edge Encryption includes these steps.

• Install the Edge Encryption proxy application on a server in your network using 
the interactive installer or the manual installer.

• Generate the RSA key pair for digitally signing encryption configurations and 
encryption rules.

• Install the Java Cryptography Extension (JCE), if you plan to use AES 256 
encryption.

• If you are using a secure SSL connection, obtain a server certificate and 
import it to the Java KeyStore.

• Set up your keystore and encryption key.

• If order preserving encryption types or encryption patterns are to be used, set 
up a MySQL database on a machine in your network.

• Set the desired properties. Properties are located in the 
edgeencryption.properties configuration file.

• Specify that a proxy server is a trusted source so that Edge Encryption can 
process requests coming from that proxy server.

Accessing the proxy server
Once installation is complete, point each user’s browser to an Edge Encryption 
proxy using the URL format: <host>:<port>. Values are determined by the host 
and port properties in the edgeencryption.properties file.

As an example with the following values:
A client will access the proxy server using the following address: `http://hostname.mycompany.com:8081/`.

**Note:** DNS settings and routing rules may be used. Host and port values are determined by your network administrator.

### Request Edge Encryption

The Edge Encryption plugin (com.glide.edgeencryption) is available as a separate subscription.

**Before you begin**

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Role required: none

**Procedure**

1. Navigate to **System Applications > All Available Applications > All**.
2. On the All Applications page, click **Request Plugin** to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. On the form, fill in the fields.

**Activate Plugin request form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Note: Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.</td>
<td></td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Set up an Edge Encryption user account**

The Edge Encryption proxies connect to the instance as a user to obtain and update encryption configuration information. Create a user account for this purpose and give the edge_encryption role to the user.

**Before you begin**
The Edge Encryption plugin must be installed before you can assign the role.

Role required: admin

**Procedure**

1. On your ServiceNow instance, create a user account to be used by the Edge Encryption proxy applications.

2. Assign the edge_encryption role to the user.

**Download the Edge Encryption proxy server**

Download the Edge Encryption proxy server application from your instance, and then copy the file to each computer that is to run the Edge Encryption proxy server.
Before you begin
Before starting this procedure, the Edge Encryption plugin must be installed and activated on your instance.

Note: The Edge Encryption proxy is officially supported only on Oracle JRE.

Role required: security_admin

About this task

Procedure

1. Navigate to Encryption Configuration > Installation & Downloads > Downloads.
2. If using the interactive installer, click Download. If manually installing the proxy server, select the OS version for your proxy server.

Note: Because the proxy server requires at least 4 GB of memory to run, 32-bit JREs and 32-bit operating systems are no longer supported starting with the Rome release.

3. Copy the installer to each computer that is to run the Edge Encryption proxy server. If manually installing the Edge Encryption proxy server, copy the ZIP file to each computer that is to run the Edge Encryption proxy server.

What to do next

After downloading the Edge Encryption installer, Install the Edge Encryption proxy server using the interactive installer. If installing manually, Install the Edge Encryption proxy server using the command line installer.

Install the Edge Encryption proxy server using the interactive installer

Install the Edge Encryption proxy server on a Windows or Linux computer using the interactive installer.

Before you begin

Note: SafeNet KeySecure keystore files are not supported by the Edge Encryption installer. To use a SafeNet KeySecure keystore, Install the Edge Encryption proxy server using the command line installer.

The Edge Encryption plugin must be installed and activated on your instance before you start this procedure. Ensure that the latest version of Java 8 is installed on the machine running the Edge Encryption installer.

The latest version of Java 8 is Java SE 8u171/ 8u172.
• Java SE 8u171 includes important bug fixes. Oracle strongly recommends that all Java SE 8 users upgrade to this release.

• Java SE 8u172 is a patch-set update, including all of 8u171 plus additional bug fixes.

Role required:
• security_admin on your ServiceNow instance
• local or domain administrator on a Windows host
• service user with full file system access on a Linux host

About this task
After installing a new proxy server, you can run the installer again to perform tests to detect issues with an installation or modify current settings. Your options include:

• **Install New**: Install a new proxy server.

• **Verify Installation**: Perform tests to detect and fix issues in a previous installation.

• **Reinstall Existing**: Perform tests to detect and fix issues in a previous installation and view or modify existing settings.

**Note:** If installing the proxy server on a Linux machine on a privileged port (port 80 or 443), you must run the installer as a root user with full file system access. To restrict file system access after the proxy server is installed, you can use the SetUID feature in the proxy installer. To enable this feature, start the installer as root or sudo root. When prompted by the installer, provide the username and usergroup of an unprivileged user. The proxy server will install with file system privileges of the given user. You can skip this step to continue the default installation with root privileges.

Use the installer to install multiple proxies for your instance on multiple machines, ensuring that the following criteria apply:

• All proxies must have the same encryption keys and the same RSA key pair used to digitally sign encryption configurations and rules.

• The encryption key must be the default key configured on the instance.

• When a proxy database is set up as part of the installation, all proxies must use the same proxy database.

You may need a proxy database for equality-preserving encryption, order-preserving encryption, or tokenization. If you do not use any of these features, you do not need a proxy database.
To use NVDA, an Assistive Technology screen reader designed to read accessibility-enabled Java applications built for keyboard users, see Configure a Windows 64-bit host to use 32-bit NVDA with Java applications.

What to do next
After installing the Edge Encryption proxy server, Set the proxy server initial memory limit and upper bound memory limit.

Install the Edge Encryption proxy server (interactive installer)
Install the Edge Encryption proxy on a Windows or Linux computer.

Procedure
1. Download the Edge Encryption proxy server installer.
2. Open the Edge Encryption proxy installer.

   Note: If installing on a Windows machine, you must run the installer as Administrator.

   a. To run the installer as Administrator on a Windows machine, right-click the Command Prompt and select Run as administrator.

   b. From the command line, navigate to the directory that contains the downloaded .jar file.

   c. Run the following command: java -jar <file name>.jar.
3. To install a new proxy server, select **Install New**. If a proxy is already installed, you can run the installer to:

   - **Verify Installation**: Perform tests to detect and fix issues in a previous installation.
   - **Reinstall Existing**: Perform tests to detect and fix issues in a previous installation and view or modify existing settings.

4. Configure the **Installation Location** and **Target ServiceNow Instance**.

   a. Click **Browse** to select an installation location or manually enter an installation path.

   b. Enter the URL of the target ServiceNow instance. Include the protocol and port number.

      **Example**
      
      `https://example.servicenow.com:443`

   c. Enter the user name and password for a user with the edge_encryption role on the target ServiceNow instance.

5. Click **Next**.
6. Configure the **Connection Settings** and **Proxy Settings**.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy Host</td>
<td>Fully qualified domain name of the machine on which you are installing the proxy server.</td>
</tr>
<tr>

<td>Port on the proxy for HTTPS communication.</td>
</tr>
<tr>
<td>Proxy Name</td>
<td>Name of the proxy and the service. The proxy name must be unique.</td>
</tr>
<tr>
<td>Proxy Poll Interval</td>
<td>Poll interval in seconds. With the default setting, it takes 5 seconds for the proxy to learn of encryption configuration changes. Larger values cause the instance to take longer to detect proxies that have come online.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Changing the default setting of the <strong>Proxy Poll Interval</strong> can result in detection delays when a proxy comes online.</td>
</tr>
<tr>
<td>Proxy Keep-Alive Ping Interval</td>
<td>Time in seconds between pings issued by the proxy to the instance. Pings are issued periodically to verify connectivity between the proxy and the instance. The default value is 10. The minimum value is 5.</td>
</tr>
</tbody>
</table>
7. Click **Install**.
   The Edge Encryption proxy server installs. The installation may take a few minutes.

**Configure CyberArk properties protection**

Optionally, configure CyberArk properties protection to securely store Edge Encryption passwords in a centralized and secure digital vault.

**About this task**

You must purchase and configure CyberArk AIM (Application Identity Management) before you can configure CyberArk connection parameters and protected credentials for a proxy server. As part of the installation of the AIM client, the `JavaPasswordSDK.jar` file is installed in the AIM client installation directory. The CyberArk vault is installed on an independent hardened server, and the AIM clients allow secure access to that server.

⚠️ **Note:** You must install the CyberArk AIM client on every host computer where an Edge proxy is installed.

In the Edge installer, you must specify the location of the `JavaPasswordSDK.jar` file to set up the CyberArk connection to the Edge proxy. You must also enter other values you defined during the AIM client installation.

Setting up CyberArk password storage is optional. If you do not want to set up CyberArk password storage, click **Skip** through the CyberArk screens.

**Procedure**

1. On the CyberArk Connection page of the Edge Encryption installer, enter the CyberArk connection parameters.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path to PasswordSDK.jar</td>
<td>The path to the <code>JavaPasswordSDK.jar</code> file installed on the host Windows machine during CyberArk configuration.</td>
</tr>
<tr>
<td>App ID</td>
<td>The <strong>App ID</strong> entered during CyberArk configuration.</td>
</tr>
<tr>
<td>Safe Name</td>
<td>The <strong>Safe Name</strong> entered during CyberArk configuration.</td>
</tr>
</tbody>
</table>
2. Click Next.

3. On the CyberArk Protected Credentials page of the installer, enter the credentials to be protected by CyberArk.

   - To use a single credential name for all protected passwords, select the **Apply one Credential Name to all Credentials** check box, enter the credential name, and click **Apply**.

   - Enter the credential name for one or more of the following fields. Credential names are the usernames entered for the SSH keys during CyberArk configuration.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge Encryption User</td>
<td>The CyberArk credential name for an Edge Encryption user.</td>
</tr>
<tr>
<td>Signature Key Keystore</td>
<td>The CyberArk credential name for the signature key keystore.</td>
</tr>
<tr>
<td>HTTPS Cert Keystore</td>
<td>The CyberArk credential name for the HTTPS certification keystore.</td>
</tr>
<tr>

<tr>
<td>Forward Proxy</td>
<td>The CyberArk credential name for the forward proxy.</td>
</tr>
</tbody>
</table>

4. Click Next.

**Configure the signature key**

Configure the signature key after installing the proxy server through the Edge Encryption proxy installer.
About this task
The signature key signs changes to configurations and properties made by the proxy server. The signature key must be an asymmetric RSA key pair in a JCEKS KeyStore.

Note: If installing multiple proxies, each proxy must use the same signature key.

Procedure
1. On the Signature Key page of the Edge Encryption installer, select the keystore on the host machine to store the signature key.
   - Create New Java KeyStore: Enter the directory location, name, and password for the new keystore.
   - Use Existing Keystore: Enter the keystore file location and password.
2. Click Next.
3. Select or create a signature key.
   - New Key: Create a signature key for this proxy.
   - Use Existing Key: Use an RSA key-pair from the selected keystore.
   - Import Existing Key: Import an RSA key-pair from a different keystore. Browse to the keystore file, enter the password for the keystore, and select the key alias. Provide a new alias for the key.
4. Click Next.

Configure the HTTPS certificate
To enable clients to connect to the Edge Encryption proxy server using a secure SSL connection, import the HTTPS certificate to the proxy server.

About this task
The Edge Encryption proxy provides the HTTPS certificate to clients trying to connect.

Procedure
1. On the HTTPS Certificate page of the Edge Encryption installer, select the keystore to store the certificate.
   - Create New Java KeyStore: Enter the directory location, name, and password for the new keystore.
   - Use Existing Keystore: Enter the keystore file location and password.
2. Click Next.

3. Select or import a certificate.
   The key alias is the given alias for the certificate.
   - **Use Existing Certificate**: Use an existing certificate in the selected keystore.
   - **Import from File or KeyStore**: Import a certificate from a different keystore or a .cer file. Browse to the keystore or .cer file, enter the password, and select the alias. You must provide a new alias for the certificate.

4. Click Next.

**Configure the AES 128-bit encryption key**

After you configure the HTTPS certificate through the Edge Encryption proxy installer, configure the AES 128-bit encryption key to encrypt your data.

**About this task**

The encryption key is either a plain text file inside the /keys directory or a secret key inside a keystore. If you use a keystore for your AES 128-bit and AES 256-bit encryption keys, they must both use the same keystore.

If you are updating an SSL certificate on an Edge proxy server, see Update SSL certificate.

**Procedure**

1. Select the encryption key location.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Store</td>
<td>Use a file to store a single encryption key. You can use an existing file in the /keys directory, or you can generate a new file. To generate a new file, enter an alias and click Generate. A file containing an encryption key is created.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This choice designates both the storage location and the encryption key. If you select File Store, click Next and go to step 5.</td>
</tr>
<tr>
<td>Create New Java KeyStore</td>
<td>Create a keystore to store the encryption key.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Java KeyStore File</td>
<td>Store the encryption key in an existing Java KeyStore file.</td>
</tr>
</tbody>
</table>

2. Click **Next**.

3. Select or create the encryption key.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Key</td>
<td>Create an encryption key and alias.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You must use lowercase letters and numbers for the alias name (key name, key alias), per Java KeyStore requirements. To find out more about the key-tool utility, see the Java SE Documentation.</td>
</tr>
<tr>
<td>Use Existing Key</td>
<td>Use an existing encryption key in the selected keystore.</td>
</tr>
<tr>
<td>Import Existing Key</td>
<td>Import an encryption key from a different keystore.</td>
</tr>
</tbody>
</table>

4. Click **Next**.

5. Configure the key on the instance according to the requirements defined in your installer.

   To configure the key on the instance, navigate to the instance and define a default key. See **Configure encryption keys on the instance**. Ensure that the key alias, size, and type match the requirements defined in the installer.
Default key requirements

6. Once the key is configured on the instance, return to the installer and click Next.

Configure the AES 256-bit encryption key

After you configure the AES 128-bit key through the Edge proxy installer, you can optionally configure an AES 256-bit encryption key to encrypt your data.

About this task

The encryption key is either a plain text file inside the /keys directory or a secret key inside a keystore. If you use a keystore for your AES 128-bit and AES 256-bit encryption keys, both keys must use the same keystore. If you do not want to configure an AES 256-bit encryption key, click Skip to continue installing the proxy server.

If you are updating an SSL certificate on an Edge proxy server, see Update SSL certificate.
Procedure

1. Select the encryption key location.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>File Store</strong></td>
<td>Use a file to store a single encryption key. You can use an existing file in the /keys directory, or you can generate a new file. To generate a new file, enter an alias and click Generate. A file containing an encryption key is created. Note: This choice designates both the storage location and the encryption key. If you select <strong>File Store</strong>, click <strong>Next</strong> and go to step 5.</td>
</tr>
<tr>
<td><strong>Create New Java KeyStore</strong></td>
<td>Create a keystore to store the encryption key.</td>
</tr>
<tr>
<td><strong>Java KeyStore File</strong></td>
<td>Store the encryption key in an existing Java KeyStore file.</td>
</tr>
</tbody>
</table>

2. Click **Next**.

3. Select or create the encryption key.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>New Key</strong></td>
<td>Create an encryption key and alias.                                         Note: You must use lowercase letters and numbers for the alias name (key name, key alias), per Java KeyStore requirements. To find out more about the keytool utility, see the Java SE Documentation.</td>
</tr>
<tr>
<td><strong>Use Existing Key</strong></td>
<td>Use an existing encryption key in the selected keystore.</td>
</tr>
<tr>
<td><strong>Import Existing Key</strong></td>
<td>Import an encryption key from a different keystore.</td>
</tr>
</tbody>
</table>
4. Click Next.

5. Optional: If you want to use AES 256-bit encryption, do the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java 8 update 141 or earlier</td>
<td>Install the Java Cryptography Extension (JCE) and overwrite the policy files in the Java home directory. See Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier.</td>
</tr>
<tr>
<td>Java 8 update 151 or later</td>
<td>Edit the java.security policy file to allow the use of unlimited strength keys. See Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later.</td>
</tr>
</tbody>
</table>

6. To use AES 256-bit encryption, you must also configure the AES 256-bit default encryption key on the instance by navigating to the instance and defining a default key.

   See Configure encryption keys on the instance. Ensure that the key alias, size, and type match the requirements defined in the installer.

7. After the key is configured on the instance, return to the installer and click Next.

Update SSL certificate

When updating an SSL certificate on an Edge proxy server, you must delete the old one.

Before you begin

Role required: admin

About this task

When updating the SSL certificate on the Edge proxy server, you must also delete the old certificate. If you don’t, the old certificate (in the form of an alias in the KeyStore file) continues to be used even though the Edge proxy server is configured to use the new certificate.

Procedure

1. On the Edge proxy server, list the entries in the Java KeyStore:

   ```bash
   keytool -list -keystore keystore.jceks -storetype jceks -storepass MY_SUPER_PASSWORD
   ```

2. Remove the old SSL certificate:
3. Add the new SSL certificate into the Java KeyStore.

Configure the Edge Encryption proxy database
If using order-preserving encryption types or encryption patterns, you can optionally configure the Edge Encryption proxy database properties.

About this task
To use order-preserving encryption types or encryption patterns, a MySQL database running in your network is mandatory. This task connects the proxy to the database, but it does not install or configure the database.

⚠️ Note: If using multiple proxy servers, all proxy servers must use the same proxy database. The values entered in the installer must be the same for all proxy servers.

Procedure
1. Confirm or change the database URL. This URL is the location of the proxy database.
2. In the Name field, enter the name of the proxy database. The default value is edgeencryption.
3. Enter the username and password for accessing the proxy database.
4. Click Next.

Launch the Edge Encryption proxy server
After an Edge Encryption proxy is installed and configured, you can start the proxy from the installer.

Procedure
1. After configuring keys on the instance and optionally configuring the proxy database, return to the Edge Encryption proxy installer and click Launch.
2. If an issue is detected, or to check the status of your proxy server, you can click Check Status to verify that the proxy is running.
A message displays the proxy status.

What to do next
After successfully installing the Edge Encryption proxy server, Set the proxy server initial memory limit and upper bound memory limit.

Verify and troubleshoot the Edge Encryption proxy server installation
After your Edge Encryption proxy is installed, you can verify the installation to locate problems or start and stop the proxy.

Procedure
1. Open the Edge Encryption proxy installer.
2. Select Verify Installation.
3. Click Proxy Directory and select the proxy directory.
4. Click Run Tests.
   Test results display.
5. Click Next.
If an issue is encountered, you can move through the installer to correct the configuration. If no issues are encountered, the installer jumps to the Launch page. You can check the proxy status, stop the proxy, or start the proxy from the Launch page.

Install the Edge Encryption proxy server using the command line installer
Manually install multiple Edge Encryption proxy servers in your network.

Before you begin
Roles required: security_admin on your ServiceNow instance and local administrator on the host machine.

If order preserving encryption types or encryption patterns are to be used, set up a MySQL database on a machine in your network if not already present.

Note: If using Unbound Technology encryption keys with Edge Encryption, install the proxy server using the command line installer on the Unbound client machine. The Edge Encryption proxy server must run on the same machine as the Unbound technology client.
About this task
First, set up a single Edge Encryption proxy server. After your first proxy server is successfully running, add additional proxy servers for one instance to ensure an optimal environment. See Sizing your Edge Encryption environment to determine the number of additional proxy servers needed.

Install the Edge Encryption proxy server (command line installer)
Install an Edge Encryption proxy on a 64-bit Windows or Linux computer.

Before you begin
Java 8 is required to run the installer.

About this task
Install the Edge Encryption proxy server on a machine in your network using the appropriate command for your target machine. If installing the Edge Encryption proxy server on a Windows machine, you must additionally install the proxy server as a Windows service.

When you upgrade the Edge Encryption proxy server, the system backs up the old proxy in the backup.dist-upgrade-<timestamp> directory under the current installation directory. The backup directory is generated during the upgrade process and stores the old proxy information.

When you run an upgrade via the command line, a dist-upgrade.log may be generated in the directory where the command runs. The dist-upgrade.log contains logs for the upgrade process.

In case of a failed upgrade, the system creates a failed-backup.dist-upgrade-<timestamp> directory. In addition, logs/wrapper.log in the original proxy directory may also contain failure information.

Procedure
1. Create the installation directory.
2. Download the Edge Encryption proxy archive file to the installation directory.
3. Open the terminal and change to the installation directory.

Note: If installing on a Windows machine, you must start the Windows Command Prompt with administrator privileges.

4. Run this command for the target machine and change the variables according to your configuration: java -jar edgeencryption-<version>-all.jar -m install -n <ProxyName> --instancehost <host> -p <InstancePort> --protocol https
<table>
<thead>
<tr>
<th>Option</th>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>version</td>
<td>Version number of the Edge Encryption proxy being used to perform the current operation.</td>
</tr>
<tr>
<td>-m</td>
<td>mode</td>
<td>The operation or mode to run in (install or dist-upgrade).</td>
</tr>
<tr>
<td>-n</td>
<td>ProxyName</td>
<td>The name of the encryption proxy instance. Use a unique ProxyName to be able to identify specific proxy instances.</td>
</tr>
<tr>
<td>--instancehost</td>
<td>host</td>
<td>The host name of your ServiceNow instance (for example, mycompany.service-now.com).</td>
</tr>
<tr>
<td>-p</td>
<td>InstancePort</td>
<td>The port of your instance. When the protocol is https, the port is normally 443.</td>
</tr>
<tr>
<td>--protocol</td>
<td>protocol</td>
<td>The protocol used to access your ServiceNow instance (typically https).</td>
</tr>
</tbody>
</table>

**Note:** Do not copy and paste commands from the browser. Occasionally, copy/paste operations cause unexpected characters to be pasted to the target machine and results in the command being executed incorrectly. It is best to type out the command by hand using documentation as a reference.

To see the help screen, execute this command without arguments: `java -jar edgeencryption-<version>-all.jar`

5. If installing on a Windows machine, install the Edge Encryption proxy as a Windows service.
a. Optionally change the name of the service. Open the `conf/wrapper.conf` file on the new proxy and set the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapper.ntservice.name</td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td>wrapper.ntservice.displayname</td>
<td>Edge Encryption proxy service display name.</td>
</tr>
<tr>
<td>wrapper.ntservice.description</td>
<td>Proxy server description.</td>
</tr>
</tbody>
</table>

If this step is not performed, the Edge Encryption proxy service is installed under the name **Edge Encryption**.

b. Save and close the file.

c. Open the Windows Command Prompt and `cd` to `ServerName_port/bin`.

d. Execute `edgeencryption.bat install`.

**Results**
The `ProxyName_port` directory is created in the current directory. The `edgeencryption.properties` file is updated with the host, port, and protocol values from the command line.

**Create and configure the RSA key pair for the digital signature**

Create an RSA key pair that the proxy server can use to create the digital signature for signing changes to the encryption properties and configuration.

**Before you begin**

To generate and validate the digital signature, an RSA key pair must be generated and stored in the JCEKS Java KeyStore and each proxy must be configured to use this key pair. Generate an encryption key pair using the `keytool` command.

To use the `keytool` utility with a proxy installed on SElinux (CentOS), you must enable loading of shared libraries from the proxy java-installation directory. To do this, run the following command as root.
You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

**Procedure**

1. Change to the KeyStore directory in the proxy download directory.
2. Change the default password.
   
   The default password is `changeme`.

   ```
   keytool -keystore keystore.jceks -storetype jceks -storepass -new <newpassword>
   ```

3. Create an encryption key pair.

   **Note:** Do not enter a password for the key when the keytool utility prompts for one.

   Enter this command on a single line.

   ```
   keytool -genkeypair -alias <key alias> -keyalg rsa -keystore keystore.jceks -storetype jceks -storepass <keystore password> -keysize 2048
   ```

4. Update the encryption proxy property file (`edgeencryption.properties`).

   a. Change to the `<installation directory>/conf/` directory.

   b. Open the `edgeencryption.properties` file.

   c. Enter the properties for the digital signature.

      These properties must be the same for all proxies.

5. Save and close the `edgeencryption.properties` file.

**Import and configure the certificate for secure SSL connection**

To use a secure SSL connection, import a server certificate and add it to the Java KeyStore.

**Before you begin**

You must obtain the server certificate before you can add it to the Java KeyStore.
Procedure

1. Add a server certificate to the Java KeyStore.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you have the RSA private key in the Java Keystore and generated the certificate from that key.</td>
<td>keytool -import -alias keyname -file server.cert -storetype JCEKS -keystore keystore.jceks -storepass pwd</td>
</tr>
<tr>
<td>If you have a PKCS12 (.pfx) file that contains the RSA key and the certificate.</td>
<td>keytool -importkeystore -destkeystore keystore.jceks -deststoretype jceks -srckeystore &lt;PKCS12 filename&gt; -srcstoretype pkcs12</td>
</tr>
</tbody>
</table>

Make sure that the private key password is the same as the Java KeyStore password.

You can run this command to change the password.

keytool -keypasswd -keystore keystore.jceks -alias <key alias>

For testing, you can use this command to generate a self-signed certificate.

keytool -genkeypair -alias cert -keystore keystore.jceks -storetype jceks -keyalg rsa

2. Update the edgeencryption.properties file.

   a. Change to the <installation directory>/conf/ directory.

   b. Open the edgeencryption.properties file.

   c. Enter the properties for the SSL certificate.

      The certificate must be the same for all proxies connecting to the same instance.

3. Save and close the edgeencryption.properties file.

Enable AES 256-bit encryption

256-bit encryption is more secure than 128-bit encryption, and you can optionally configure AES 256-bit encryption on the Edge Encryption proxy server host. How you enable AES 256-bit encryption depends on the Java update installed on each proxy server host.

Edge Encryption supports only AES 128-bit and AES 256-bit keys.
Note: Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

Follow the procedure for the Java version that is installed on your proxy server host:

- Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier
- Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later

Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier

Copy the Java Cryptography Extension (JCE) jurisdiction policy files to the Java home directory of each Edge Encryption proxy server host to enable AES 256-bit encryption for Java update 141 or earlier. 256-bit keys provide greater security than 128-bit keys.

Before you begin
Role required: admin

About this task
Your Java home directory includes the AES 128-bit policy files by default. To enable AES 256-bit encryption, you must overwrite the Java home directory policy files with the AES 256-bit policy files. You only need to download the JCE once, but you must update every Edge Encryption proxy server host.

Note: Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

Procedure

1. Download the JCE policy 8 ZIP file from Oracle.
2. Unzip the file.
3. On each proxy server host, copy the local_policy.jar and US_export_policy.jar files into the <Java-home-directory>/jre/lib/security folder.

Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later

Edit the java.security policy file to enable AES 256-bit encryption for Java update 151 or later. 256-bit keys provide greater security than 128-bit keys.

Before you begin
Role required: admin
About this task
Perform this task in the Java home directory of each Edge Encryption proxy server host on which you want to enable AES 256-bit encryption.

Note: Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

Procedure
1. Navigate to `<jre_home>/lib/security/java.security` on the proxy server host, where `JRE_HOME` is an environment variable for both Microsoft Windows and Linux.
2. Open the `java.security` policy file and find the line for the `crypto.policy` parameter, which is commented out by default.
3. Remove the `#` character from the beginning of the `crypto.policy` line to uncomment the line, and then save the file.

Note: If you do not uncomment the `crypto.policy` line, Java uses `crypto.policy=limited`, which restricts encryption to AES 128-bit keys.

Set up a keystore and encryption keys
Set up the keystore and encryption keys used by the Edge Encryption proxy server.

Procedure
1. Carefully determine the appropriate type of keystore to use based on your organization's needs.

<table>
<thead>
<tr>
<th>Supported keystore</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File store</td>
<td>Keys are stored in a file in a file system accessed by the Edge Encryption proxy server. Because encryption keys stored in a file are not encrypted, it is your responsibility to protect these files.</td>
</tr>
<tr>
<td>Java KeyStore</td>
<td>A Java KeyStore:</td>
</tr>
<tr>
<td>Supported keystore</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>• Stores keys in a Java JCEKS KeyStore.</td>
<td></td>
</tr>
<tr>
<td>• Is password protected and more secure than storing keys in a file in the file system.</td>
<td></td>
</tr>
<tr>
<td>• Can store multiple keys. A key alias represents each key, making it easier to manage multiple keys.</td>
<td></td>
</tr>
</tbody>
</table>

The Edge Encryption proxy ships with the Java JCEKS KeyStore file named keystore.jceks in the keystore directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.

<table>
<thead>
<tr>
<th>Enterprise Key Management (EKM)</th>
<th>SafeNet KeySecure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Keys are stored and retrieved with SafeNet KeySecure key management.</td>
<td></td>
</tr>
</tbody>
</table>

You must secure a license with Gemalto, download the libraries, and install the SafeNet KeySecure keystore on a host machine in your network before configuring the keystore on the Edge Encryption proxy server.

**Unbound Technology**

The base64-encoded wrapped encryption key is stored as text file on the Edge Encryption proxy server. The Unbound Technology implementation (previously Dyadic Security) maintains control of the wrapping key.

The Edge Encryption proxy server must run on the same machine as the Unbound technology client.

⚠️ **Note:** If using a keystore other than the base system Java JCEKS KeyStore, you must import the ServiceNow public key into your keystore. The public key alias is servicenow.

2. Set up the keystore and encryption keys in your local network.

**Set up a Java KeyStore keystore**

You can use a Java KeyStore keystore to store encryption keys.

**Before you begin**

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in <proxy install dir>/java/jre/bin/keytool.
About this task
The Edge Encryption proxy ships with the Java JCEKS KeyStore file named keystore.jceks in the keystore directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.

Procedure
1. Set up the keystore properties.
   a. Change to the <installation directory>/conf/ directory.
   b. Open the edgeencryption.properties file.
   c. Enter the properties for the Java KeyStore.
2. Save and close the edgeencryption.properties file.

What to do next
After setting up the Java KeyStore, Create encryption keys using the Java KeyStore keytool.

Create encryption keys using the Java KeyStore keytool
You can use the keytool shipped with the encryption proxy distribution to create AES 128-bit and AES 256-bit encryption keys.

Before you begin
You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in <proxy install dir>/java/jre/bin/keytool.

To find out more about the keytool utility, see the Java SE Documentation.

About this task
ℹ️ Note: The Java KeyStore requires that the alias name (key name, key alias) use lowercase letters and numbers.

Procedure
1. Change to the keystore directory, <installation directory>/keystore/.
2. To create the encryption key, run one of the following commands.

ℹ️ Note: If you choose to run these commands from a directory other than the keystore directory, that is you skipped the previous step, you must change the -keystore option to include the path from your current directory to the keystore directory. For example, if you were in the <installation directory>/bin directory, the option would be -keystore ../keystore/keystore.jceks.
### Option Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td>keytool -genseckey -alias 128bitkey -keyalg aes -keysize 128 -keystore keystore.jceks -storetype jceks</td>
</tr>
<tr>
<td>AES 256</td>
<td>keytool -genseckey -alias 256bitkey -keyalg aes -keysize 256 -keystore keystore.jceks -storetype jceks</td>
</tr>
</tbody>
</table>

You add the alias on the instance when you assign default keys.

ℹ️ **Note:** The key password must be the same as the keystore password.

## Set up a SafeNet KeySecure keystore

If you are using a SafeNet keystore, copy a set of libraries into the proxy distribution directory.

### Before you begin

You must install and set up the SafeNet keystore before performing this step. Secure a license with Gemalto in order to download the libraries.

### About this task

ℹ️ **Note:** On Linux, file paths use a forward slash (/).

### Procedure

1. Copy these files to the `<installation directory>/lib` directory:
   - ingrianNAE-<version>.jar
   - ingrianlog4j-api-<version>.jar
   - ingrianlog4j-core-<version>.jar

2. Change to the `<installation directory>/conf/` directory, and open the `edgeencryption.properties` file.

3. Enter the properties for the **SafeNet keystore**.

### Example

An example for a SafeNet keystore using username and password authentication.

```plaintext
edgeencryption.nae.retries = 3
edgeencryption.nae.enabled = true
edgeencryption.nae.server = url
```
edgeencryption.nae.port = 9000
edgeencryption.nae.protocol = ssl
edgeencryption.nae.keystore.path = keystore/safenet_truststore
edgeencryption.nae.keystore.password = password
edgeencryption.nae.user = safenet_user
edgeencryption.nae.password = safenet_password

Example
An example for a SafeNet keystore using client certificate authentication.
This authentication method eliminates the need to store the SafeNet server
username and password in the properties file.

edgeencryption.nae.retries = 3
edgeencryption.nae.enabled = true
edgeencryption.nae.server = url
edgeencryption.nae.port = 9000
edgeencryption.nae.protocol = ssl
edgeencryption.nae.keystore.path = keystore/safenet_clientcert
edgeencryption.nae.keystore.password = password
edgeencryption.nae.client.certificate = cert_name

4. Add or create a key in the SafeNet keystore.
   You add the key name (alias) on the instance when you assign default keys.

   Note: If you have deployed Java 11 proxy or plan to upgrade proxy to
   Java 11, add the folder where all SafeNet jar files are located by adding
   the following line in the wrapper.conf:

   wrapper.java.classpath.1=<directory path to the directory where you copied the jar
   files in step 1>/*

5. Save and close the edgeencryption.properties file.

Upgrade from Kingston or lower to London or higher

If you use a SafeNet NAE server for key storage with Edge, before upgrading
the proxy from Kingston or lower to London or higher, you must copy Gemalto
SafeNet client ProtectApp JAR files and add new properties.

About this task

   Note: On Linux, file paths use a forward slash (/).
Procedure

1. Copy the following files from `<installation directory>/lib` to a directory path that is completely outside of the proxy installation directory path:
   - `ingrianNAE-<version>.jar`
   - `ingrianlog4j-api-<version>.jar`
   - `ingrianlog4j-core-<version>.jar`

2. On the current version (not upgraded) of the proxy, update the `<installation directory>/conf/edgeencryption.properties` file by adding the following two properties:
   - `edgeencryption.ekm.provider.classname = com.snc.edgeencryption.encryption.CloudEdgeNaeKeyProvider`
   - `edgeencryption.thirdparty.vendor.library.path = <directory path to the directory where you copied the jar files in step 1>`

3. Save the changes.

4. Proceed with the upgrade to London or higher.

Set up Unbound Technology keys

To use Unbound Technology (previously Dyadic Security) keys with Edge Encryption, store the base64-encoded wrapped encryption key as text file on the Edge Encryption proxy server and provide the wrapping key alias. The Unbound Technology implementation maintains control of the wrapping key.

Before you begin

Role required: security_admin

In your Unbound Technology implementation, identify both the wrapping key and the wrapped key. Use the RSA/ECB/OAEPWITHSHA-256ANDMGF1PADDING algorithm for wrapping and padding. Export the wrapped key in base64-encoded text format. Save the file using the key alias as the name with no file extension.

Note: If using Unbound Technology encryption keys with Edge Encryption, install the proxy server using the command line installer on the Unbound client machine. The Edge Encryption proxy server must run on the same machine as the Unbound technology client.
Procedure

1. Add the wrapped encryption key in base64-encoded text format to the <proxy-installation-directory>/keys directory. The name of the file must be the key alias with no file extension.

2. Update the edgeencryption.properties file.
   a. Change to the <proxy-installation-directory>/conf directory.
   b. Open the edgeencryption.properties file.
   c. Enter the File store properties. Set the value of edgeencryption.keyfile.directory to keys. This property directs the proxy server to look for the encryption key in the <Java-home-directory>/keys directory.
      For more information on Edge Encryption properties, see Edge Encryption proxy server properties.
   d. Uncomment the properties for the Dyadic provider configuration. Set the value of edgeencryption.ekm.provider.rsa.wrapping.key.alias to the wrapping key alias in your Unbound implementation.
   e. Save and close the file.

What to do next
Add the encryption key alias to the instance. The encryption key alias is the file name of the wrapped encryption key added to the <proxy-installation-directory>/keys directory. For example, if the file in the directory is named myunboundkey, add this name to the Key alias field. See Configure encryption keys on the instance.

Create an encryption key stored in a file
You can use a simple text file as a keystore. Each file holds a single encryption key.

About this task
This step creates both the key storage and the encryption key.

i Note: The name of the key file must match the key alias specified in the encryption keys table in the instance. See Configure encryption keys on the instance.
Procedure

1. Create a file in the `/keys` folder of the proxy server installation directory.
2. Add the encryption key to the file.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td>Place the encryption key, exactly 16 bytes, into the file.</td>
</tr>
<tr>
<td>AES 256</td>
<td>Place the encryption key, exactly 32 bytes, into the file.</td>
</tr>
</tbody>
</table>

3. Update the `edgeencryption.properties` file.
   a. Change to the `<installation directory>/conf/` directory.
   b. Open the `edgeencryption.properties` file.
   c. Enter the properties for the file store.
   d. Save and close the file.

Configure encryption keys on the instance

Edge Encryption provides the tools to manage encryption keys without taking the proxy offline.

Before you begin
Role required: security_admin
Before setting up new encryption keys on the instance:

1. Create the encryption key.
2. Make the new key available to all encryption proxies. Either copy the file or Java KeyStore file to each proxy, or ensure that each proxy has access to the Java KeyStore or Enterprise Key Management (EKM) device.

About this task
Key aliases must be unique. Each key alias must have the same key size and type on each proxy, or the key cannot be assigned as the default.

Procedure

1. Navigate to Edge Encryption Configuration > Encryption Key Configuration > Set Up Keys.
2. On the Add New Keys section of the form, complete the following steps to add a new key.
Note: If using SafeNet versioned keys, an additional column appears for the Key version. The Key version cannot be edited.

Important: If using SafeNet versioned keys, click the Retrieve latest key versions link in the Related Links to retrieve the latest version of each key from the Edge proxy.

Rows in the list with an X in the left column can be deleted. Keys that have been used as the default or that have a Status of Available cannot be deleted.

a. Double-click in the row that says Insert a new row....

b. In the edit box, enter a name for the key, then click the check mark. Key aliases are lowercase letters and numbers. Capital letters are changed to lowercase letters when you click Update. Key aliases must be unique.

Note: If using Unbound technology keys, add the encryption key alias. The encryption key alias is the file name of the wrapped encryption key added to the <proxy-installation-directory>/keys directory. For example, if the file in the directory is named myunboundkey, add this name to the Key alias field.

c. In the same row, double-click in the Key size column.

d. In the select box, select a key size, either 128 bits or 256 bits, then click the check mark.

e. In the same row, double-click in the Type column.

f. In the select box, select a key type, either File, Keystore, SafeNet, or Unbound, then click the check mark.

g. When you are done adding keys, click Next Step. You must specify an alias, key size, and key type for each key before moving on.

3. On the Keys Status section of the form, check the State of the key and ensure that it is Available. This may take a few minutes. When the key is Available, click Next Step.

Note: If using SafeNet versioned keys, an additional column appears for the Key version. The Key version cannot be edited.
The instance tracks the status of every encryption key available to any proxy. When a key is available on all proxies, its state becomes **Available**. If the state does not change after a few minutes, check to ensure that the key is available on all proxies. If the state remains **Unavailable**, one or more of the proxies does not have the key.

### Encryption key states

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available</td>
<td>All online proxies have the key.</td>
</tr>
<tr>
<td>Unavailable</td>
<td>This is a new key and the proxies have not yet loaded the key, or at least one proxy failed to load the key.</td>
</tr>
</tbody>
</table>

4. On the Change Default Keys section of the form, do one of the following:
   - Type in the key alias.
   - Click the magnifying glass icon and select an alias.

   **Note:** If using SafeNet versioned keys, an additional field appears for the **Key version**. The **Key version** is grayed out and cannot be edited.

   **Note:** If using SafeNet versioned keys, choose only the most recent key version. If you choose an earlier version, the following message appears when you click **Update** or **Next Step**:

   ```markdown
   One of the default keys chosen is not the latest version available for the key. Please use the latest version.
   ```

   **Note:** If using SafeNet versioned keys, and if the default keys are not the latest versions of the SafeNet keys, an **Update default keys to latest version** link appears in the Related Links. Click the link to update the default keys to use the latest version.

   Click **Next Step**.

5. On the Schedule Key Rotation section of the form, schedule a mass key rotation job or single key rotation job to encrypt existing data using the new encryption key.

   If you do not run a mass key rotation job or single key rotation job, existing data remains encrypted with the old key until the data is accessed again.
Configure additional properties in the Edge Encryption properties file

After installing the Edge Encryption proxy server in your network and setting up your keystore and keys, configure the additional Edge Encryption properties.

Procedure

1. Open the `<installation directory>/conf/edgeencryption.properties` file and configure the following Edge Encryption proxy server properties:
   - Target (instance) properties
   - User account properties
   - Proxy properties
   - If using order preserving encryption types or encryption patterns, configure the Proxy database properties
   - Clear text and static IV properties

2. Save and close the file.

Configure a web proxy

If your network uses a web proxy, you can set up the Edge Encryption proxy to use the web proxy.

About this task

If your network does not use a web proxy, leave the web proxy properties in the configuration file commented out.

The Edge Encryption proxy server supports HTTP connection to and basic authentication with the web proxy.

Procedure

1. Change to the `<installation directory>/conf/` directory.
2. Open the `edgeencryption.properties` file.
3. Configure the web proxy properties.
4. Save and close the `edgeencryption.properties` file.
5. If the web proxy is using a customer-specific server certificate, add this certificate to the JVM used by the Edge Encryption proxy server to establish trust between the web proxy and the Edge Encryption proxy server.
   a. `cd` to `<Java home directory>/jre/lib/security/cacerts`
   b. Execute the command: `keytool -keystore cacerts -importcert -alias <chooseAlias> -file <certificateFile>`
Set the proxy server initial memory limit and upper bound memory limit

Set the initial memory limit and upper bound memory limit to specify how much memory the proxy server can consume. Set these limits to avoid performance issues in your Edge Encryption implementation.

About this task
As a guideline, set both the initial memory limit and the upper bound memory limit to the same value. On any machine, allocate 2 GB of the physical memory to the operating system (OS). Then allocate the rest of the physical memory to the heap using the initial memory limit and upper bound memory limit properties. For example, on a machine with 8 GB of memory, allocate 2 GB to the OS, and allocate the remaining 6 GB (6144 m) to the initial and upper bound memory.

Important: If your Edge Encryption proxy server is running, you must stop and restart the proxy server after updating these properties.

Procedure
1. In your proxy server directory, open <install dir>/conf/wrapper.conf.
2. To set the initial memory limit, add the following line at the end of the file:

   wrapper.java.additional.<number>=-Xms<min_memory_in_MB>m

   Set <number> to the next available <number> in the sequence of
   wrapper.java.additional.<number> properties defined in the wrapper.conf file.

   Example
   For example, you have the following list of wrapper.java.additional.<number> properties:

   wrapper.java.additional.1=
   wrapper.java.additional.2=

   The maximum <number> in the above list is 2. When you add the
   wrapper.java.additional.<number>=-Xms<min_memory_in_MB>m line, set <number> to
   3, the next available number.

   Important: Do not leave gaps in the numbering sequence.

   Set <min_memory_in_MB> to the number of megabytes of memory remaining
   after allocating 2 GB of memory to the OS.

3. Set the upper bound memory limit.
   Because an upper bound memory limit is not set in the base system, the proxy server can use all available memory. If other services are running on the server, you may want to set the upper bound memory limit.
Add the following line at the end of the file:

```java
wrapper.java.additional.<number>=-Xmx<max_memory_in_MB>m
```

Set `<number>` to the next available `<number>` in the sequence of `wrapper.java.additional.<number>` properties defined in the `wrapper.conf` file.

**Example**

For example, you have the following list of `wrapper.java.additional.<number>` properties:

```
wrapper.java.additional.1=
wrapper.java.additional.2=
```

The maximum `<number>` in the above list is 2. When you add the `wrapper.java.additional.<number>=-Xmx<max_memory_in_MB>m` line, set `<number>` to 3, the next available number.

-duration: Note:

Do not leave gaps in the numbering sequence.

Set `<max_memory_in_MB>` to the number of megabytes of memory remaining after allocating 2 GB of memory to the OS.

4. Save and close the file.

**Example: Example: Setting proxy server initial and upper bound memory limits**

```
wrapper.java.additional.1 = -Djava.io.tmpdir=../tmp
wrapper.java.additional.2 = -Dcloudedge.home.dist=..
# must ensure UTF8 encoding when running on Windows
wrapper.java.additional.3 = -Dfile.encoding=UTF8
# additional properties for heap settings
wrapper.java.additional.4 = -Xms6144m
wrapper.java.additional.5 = -Xmx6144m
```

**What to do next**

Start the Edge Encryption proxy.

**Start the Edge Encryption proxy**

After an Edge Encryption proxy is installed and configured, you can start the proxy from the command line.

**Before you begin**

Before starting the encryption proxy, verify the following:
• The Edge Encryption plugin is activated on the instance.
• The edgeencryption.properties file on this machine has been configured.
• If using an order preserving encryption type or encryption patterns, the proxy database is running.

⚠️ Note: The first time you set up the edgeencryption.properties file or change properties, you may not want to set the password encryption property. After you have verified that everything is working, you can set the password encryption property, shut down the proxy, and then restart the proxy.

Procedure
1. Run the proxy server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On a Linux machine</td>
<td>a. cd to ServerName_port</td>
</tr>
<tr>
<td></td>
<td>b. Execute ./startup.sh</td>
</tr>
<tr>
<td>On a Windows machine</td>
<td>Perform the following steps from the command line as admin:</td>
</tr>
<tr>
<td></td>
<td>a. cd to ServerName_port/bin</td>
</tr>
<tr>
<td></td>
<td>b. Execute edgeencryption.bat start</td>
</tr>
</tbody>
</table>

2. Check the log on the proxy server to verify that the proxy is running.

Obfuscate passwords in the properties file
You can obfuscate passwords in the edgeencryption.properties file to share the properties file without revealing clear text passwords.

Before you begin
Make sure that the Edge Encryption proxy server is set up and successfully running before you set this property. Before setting this property, Stop the Edge Encryption proxy.

About this task
Setting this property may make it difficult to debug connection and access issues during initial startup. Only set this property in production environments after the proxy has been set up and tested successfully.
Procedure

1. Change to the `<installation directory>/conf/` directory.

2. In the `conf` directory, create a text file containing a complex string or phrase that can be used as a passphrase which the proxy uses to obfuscate the passwords in the `edgeencryption.properties` file. This passphrase should be a random and complex phrase not related to the passwords themselves.

3. Open the `edgeencryption.properties` file.

4. Set the `password encryption property`.

5. Save and close the `edgeencryption.properties` file.

What to do next

After setting this property, you can Start the Edge Encryption proxy.

Manually add an additional proxy

After the first Edge Encryption proxy is properly configured and tested, you can set up additional proxies on a Linux or Windows machine. Installing multiple proxies on the same machine is not recommended.

About this task

Add additional proxy servers on additional machines to ensure an optimal environment. See Sizing your Edge Encryption environment to determine the number of additional proxies needed.

**Note:** Make sure that all proxies have the same encryption keys and the same RSA key pair used to digitally sign encryption configuration and encryption rules. If a proxy database was set up as part of the installation, all proxies must use the same proxy database.

Procedure

1. Install the proxy using the appropriate command. See Install the Edge Encryption proxy server (interactive installer).

2. Copy all the encryption keys and the `edgeencryption.properties` file from the first proxy to the new proxy.

   Encryption keys may be located in the proxy keystore, in the `/keys` directory, or in a SafeNet KeySecure keystore.

3. Open the `edgeencryption.properties` file on the new proxy.

4. Change the following properties:
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.name</td>
<td>Unique name of the proxy server</td>
</tr>
<tr>
<td>edgeencryption.proxy.host</td>
<td>The server name, IP address, or fully-qualified domain name of the computer running the proxy.</td>
</tr>
<tr>
<td>edgeencryption.proxy.http.port</td>
<td>Port on the proxy for HTTP communication. Must be unique across all processes on the machine.</td>
</tr>
<tr>
<td>edgeencryption.proxy.https.port</td>
<td>Port on the proxy for HTTPS communication. Must be unique across processes on the machine.</td>
</tr>
</tbody>
</table>

5. If installing the proxy server on a Windows machine, you must change the name of the service. Open the `conf/wrapper.conf` file on the new proxy and add the following properties.

ℹ️ Note: You must perform this step before launching the proxy server.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapper.ntservice.name</td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td>wrapper.ntservice.displayname</td>
<td>Edge Encryption proxy service display name.</td>
</tr>
<tr>
<td>wrapper.ntservice.description (Optional)</td>
<td>Proxy server description.</td>
</tr>
</tbody>
</table>

6. Save and close the file.

7. Launch the proxy using the appropriate command. See Start the Edge Encryption proxy.

**Authenticate an Edge Encryption proxy server**

Specify that a proxy server is a trusted source so that Edge Encryption can process requests coming from that proxy server.

**Before you begin**

If a proxy server is not authenticated, the console log includes the following message:
WARN This Edge Encryption proxy has not yet been authenticated by the instance. Please navigate to the matching Proxy record on your ServiceNow instance and authenticate it.

If you attempt to access the proxy, you receive the following message: This site can't be reached.

To maintain the proxy in an operational state during the upgrade process, authentication is not required until after the proxy update is successful.

Role required: admin

Procedure
1. Navigate to Edge Encryption Configuration > Proxies.
2. Select the proxy and click Authenticate.

Results
The proxy moves from Unauthenticated to Pending to Authenticated. The status changes from Unauthenticated to Pending when you start the authentication. When authentication is complete, the status changes from Pending to Authenticated, and you can access the proxy and Edge Encryption can accept requests from the proxy.

Note: If you stop and restart the proxy, the proxy remains Authenticated and restarts successfully.

Stop the Edge Encryption proxy
You can stop an Edge Encryption proxy from the command line.

Procedure
1. Stop the proxy server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On a Linux machine</td>
<td>Execute ./shutdown.sh</td>
</tr>
<tr>
<td>On a Windows machine</td>
<td>Execute edgeencryption.bat stop</td>
</tr>
<tr>
<td></td>
<td>To remove the Windows service, execute edgeencryption.bat remove</td>
</tr>
</tbody>
</table>

2. Check the log on the proxy server to verify that the proxy has stopped.
Uninstall the Edge Encryption proxy on Linux

You can uninstall the Edge Encryption proxy. If you are upgrading the proxy, it is not necessary to shut down and uninstall the current version.

Before you begin
You must have access to the computer running the Edge Encryption proxy.

About this task
Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

The encryption proxy running on Linux operates as a single process. You can end this process to accommodate such tasks as redeploying the encryption proxy to another host machine, updating the proxy version, updating the Java version, or changing the unique name of the encryption proxy when deploying the encryption proxy on multiple proxy servers.

Procedure
1. You may want to save the edgeencryption.properties file before deleting the distribution directory.
2. Execute the shutdown.sh shell script.
3. Check the log on the proxy server to verify that the proxy server is shut down.
4. Delete the files in the distribution folder.

Uninstall the Edge Encryption proxy on Windows

You can uninstall the Edge Encryption proxy. If you are upgrading the proxy, it is not necessary to shut down and uninstall the current version.

Before you begin
You must have access to the computer running the Edge Encryption proxy.

Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

Procedure
1. You may want to save the edgeencryption.properties file before deleting the distribution directory.
2. Execute edgeencryption.bat stop
3. Execute edgeencryption.bat remove
4. Check the log on the proxy server to verify that the proxy server is shutdown.
5. Delete the files in the distribution folder.

**Set up multiple provider SSO with Edge Encryption**

If implementing multiple provider single sign-on (SSO) with Edge Encryption enabled, some users may need to log in to your instance through the Edge Encryption proxy server, while other users may not. Set up multiple provider SSO to enable logging in through the Edge Encryption proxy server URL or the instance URL.

**Before you begin**

- Role required: admin
- Enable the Edge Encryption plugin (com.glide.edgeencryption) and ensure that one or more proxy servers are set up in your network.
- Determine the URL for the Edge Encryption proxy server that users will log in through using multiple provider SSO. To determine the URL of an Edge Encryption proxy server, see Edge Encryption installation.

**About this task**

- If routing all users through the Edge Encryption proxy server, set up your identity provider record and define the proxy server URL in the **ServiceNow Homepage**, **Entity ID / Issuer**, and **Audience URI** fields.
- To route some users through the proxy server and some users to the instance, create two identity provider records. Both records use the same value in the **Identity Provider URL** field. However, one of the records routes through the proxy server, while the other routes to the instance.

**Procedure**

1. Enable the duplication of identity provider URLs in identity provider records. A unique constraint prevents duplication of the identity provider URL in two different identity provider records. You can enable duplication of the identity provider URL in multiple IdP records by setting a field to false.
   
   a. Navigate to **System Definition > Dictionary**.
   
   b. Open the definition record for the **idp** field of in the Identity Providers table [saml2_update1_properties].
c. Configure the form to add the **Unique** field.

d. Ensure that the value of the **Unique** field is set to **false**.

2. Navigate to **Multi-Provider SSO > Identity Providers**.

3. Create two identity provider records for the same identity provider: one using the instance URL and one using the Edge Encryption proxy server URL. To create an identity provider record, see .

   a. For the Edge Encryption proxy server URL, complete the form using these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity Provider URL</td>
<td>Imported from IdP metadata.</td>
</tr>
<tr>
<td>ServiceNow Homepage</td>
<td>The URL for your proxy server homepage. For example: https://&lt;proxy hostname&gt;:&lt;port&gt;/ navpage.do</td>
</tr>
<tr>
<td>Entity ID / Issuer</td>
<td>https://&lt;proxy hostname&gt;:&lt;port&gt;</td>
</tr>
<tr>
<td>Audience URI</td>
<td>https://&lt;proxy hostname&gt;:&lt;port&gt;</td>
</tr>
</tbody>
</table>

   b. Click **Submit**.

   c. For the instance URL, complete the form using these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity Provider URL</td>
<td>Imported from IdP metadata.</td>
</tr>
<tr>
<td>ServiceNow Homepage</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
<tr>
<td>Entity ID / Issuer</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
<tr>
<td>Audience URI</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
</tbody>
</table>

   d. Click **Submit**.

4. **Optional**: If using more than one identity provider, modify the MultiSSO installation exit.
a. Navigate to **System Definition > Installation Exits.**
   The system displays the current list of installation exits.

b. Open the **MultiSSO** installation exit.

c. Locate the following statement in the **Script** field.

   ```javascript
   var samlResponseTxt = request.getParameter("SAMLResponse");
   if (GlideSession.get().isLoggedIn() && GlideStringUtil.notNil(samlResponseTxt)) {
       var idpRecord = this.getIdPRecord(request);
       if (idpRecord) {
           SSO_Helper.debug("IdP found based on SAML response: " +
           idpRecord.getUniqueValue());
           return new SSO_Helper(idpRecord.getUniqueValue(), false, null, true);
       }
   }
   ``

   **Note:** IdP initiated login does not work in this configuration.

d. Replace the statement with the following code.

   ```javascript
   var samlResponseTxt = request.getParameter("SAMLResponse");
   if (GlideSession.get().isLoggedIn() && GlideStringUtil.notNil(samlResponseTxt)) {
       /* // You have two profiles that use the same IdP entity id it cannot use
       // the IdP issuer / entity id from the response otherwise it may result in the
       // wrong IdP profile. IdP initiated login will not work
       var idpRecord = this.getIdPRecord(request);
       if (idpRecord) {
           SSO_Helper.debug("IdP found based on SAML response: " +
           idpRecord.getUniqueValue());
           return new SSO_Helper(idpRecord.getUniqueValue(), false, null, true);
       }*/
       return new SSO_Helper(null, true);
   }
   ``

e. Click **Update.**

5. **Optional:** If using more than one company, update the sys_id of the identity provider record depending on the user.
• To configure a user to log in through the Edge Encryption proxy server, use the sys_id of the identity provider record that uses the Edge Encryption proxy server URL.

• To configure a user to log in to the instance, use the sys_id of the identity provider record that uses the instance URL.

### Login URLs

<table>
<thead>
<tr>
<th>URL</th>
<th>Login destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>https://&lt;instance name&gt;.service-now.com/login_with_sso.do?glide_sso_id=&lt;sys_id of IdP record for the instance URL&gt;</td>
<td>Logs in through the instance.</td>
</tr>
</tbody>
</table>

### Edge Encryption proxy server properties

The `edgeencryption.properties` configuration file located in the `<installation directory>/conf/` folder contains properties used to configure your environment.

You must restart the proxy server after making changes to any proxy server properties. Changes on the instance and changes to the `log4j.properties` do not require a proxy restart.

### Target (instance) properties

- **edgeencryption.target.host**
  
  Host name for the instance. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed. For example, `instancename.servicenow.com`

- **edgeencryption.target.port**
  
  Instance port. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed.

- **edgeencryption.target.protocol**
Instance protocol. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed. Options include:

- http
- https

User account properties

edgeencryption.target.username

User name that the proxy uses to log in to the instance. The user must have the edge_encryption role. See Set up an Edge Encryption user account.

edgeencryption.target.password

Password that the proxy uses to log in to the instance.

Proxy properties

edgeencryption.proxy.host

Server name, IP address, or fully qualified domain name of the computer running the proxy. Along with the port, this property defines the URL used by the client to access the proxy server.

edgeencryption.proxy.name

Proxy name. Must be unique for each proxy.

edgeencryption.proxy.http.port

Port on the proxy for HTTP communication.

edgeencryption.proxy.https.port

Port on the proxy for HTTPS communication.

SSL certificate properties

Restart your proxy if you change the value of any SSL certificate property. The system uses the HTTPS keypair on startup to establish the proxy server connection and determine how the proxy answers client requests.

edgeencryption.proxy.https.cert.alias

Alias of the certificate provided by the proxy server to connecting clients.

edgeencryption.proxy.https.keystore.path

Path to the keystore that contains the HTTPS certificate.

edgeencryption.proxy.https.keystore.password
Password for the keystore that contains the HTTPS certificate.

**Proxy configuration locked property**

*edgeencryption.proxy.locked*

When true, the proxy does not accept encryption configuration changes or encryption rule changes from the instance. Set this property on the production instance after all encryption configurations and rules are final.

**Proxy database properties**

*edgeencryption.db.url*

Proxy database location. Must be the same for all encryption proxies connecting to the same instance.

*edgeencryption.db.user*

User name for accessing the proxy database. Must be the same for all encryption proxies connecting to the same instance.

*edgeencryption.db.password*

Password to access the proxy database. Must be the same for all encryption proxies connecting to the same instance.

*edgeencryption.db.name*

Proxy database name. Must be the same for all encryption proxies connecting to the same instance.

- Default value: edgeencryption

*edgeencryption.db.bootstrap.file*

Bootstrap file for the proxy database. The file is relative to the sql/ directory. Must be the same for all encryption proxies connecting to the same instance.

⚠️ **Warning:** Under normal circumstances, do not change this parameter.

**Digital signature properties**

*edgeencryption.proxy.signature.keystore.path*

Path and Java KeyStore file name.

*edgeencryption.proxy.signature.keystore.password*

Password. The default password is <changeme>. Change the password after installing the Java KeyStore.
edgeencryption.proxy.signature.keystore.keyalias
   The key alias given as the \texttt{-alias} argument when the RSA key pair is generated.

NAE device keystore properties
edgeencryption.nae.retries
   Number of retries to make.
edgeencryption.nae.enabled
   Setting indicates whether an NAE device is available.
edgeencryption.nae.server
   Name of the NAE server.
edgeencryption.nae.port
   Port used by the NAE server.
edgeencryption.nae.protocol
   Protocol used by the NAE server.
edgeencryption.nae.keystore.path
   Path to the keystore on the NAE server.
edgeencryption.nae.keystore.password
   NAE keystore password.
edgeencryption.nae.username
   User name to use to authenticate with the NAE device.
edgeencryption.nae.password
   Password to use to authenticate with the NAE device.
edgeencryption.nae.client.certificate
   Certificate located in the keystore on the NAE server. Set this property to authenticate using a certificate instead of a username and password.

Clear text and static IV properties
edgeencryption.customer.assigned.known.cleartext
   Clear text to let the instance verify that all proxies are using the same keys. At startup, the proxy encrypts the clear text and sends the encrypted text to the instance. The instance does not know the clear text, nor are keys sent to the instance. This property must be the same for all proxies.
edgeencryption.encrypter.static.iv

Static IV (initialization vector) used in equality-preserving and order-preserving encryption. This property must be the same for all proxies and must be exactly 16 bytes (16 ASCII characters).

Password property

edgeencryption.encrypter.properties.password

Name of the file in the conf folder that contains a string used within a secure process to obfuscate passwords in the edgeencryption.properties file.

If this property is not set, passwords in your properties file appear in clear text. Leave this property blank until after the proxy configuration has been set up and tested.

Web proxy properties

edgeencryption.webproxy.host

Web proxy name or IP address.

edgeencryption.webproxy.port

Port on the web proxy.

edgeencryption.webproxy.user

User name used to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.

edgeencryption.webproxy.password

Password to use to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.

Java KeyStore properties

edgeencryption.keystore.path

Path to the Java KeyStore. If using a file store or a SafeNet KeySecure keystore, leave this property commented out.

Example:

edgeencryption.keystore.path = keystore/keystore.jceks

edgeencryption.keystore.password

Password the proxy uses to connect to the Java KeyStore. If using a file store or a SafeNet KeySecure keystore, leave this property commented out.
File store property

**edgeencryption.keyfile.directory**

The directory specifies where key files are stored. If using the Java KeyStore or a SafeNet KeySecure keystore, leave this property commented out.

Example:

```
edgeencryption.keyfile.directory=keys
```

If using Unbound Technology keys, uncomment this property and set the value to the keys directory.

Unbound Technology provider properties

**edgeencryption.ekm.provider.classname**

Internal class name for the implementation.

⚠️ **Warning:** Do not change this property.

**edgeencryption.thirdparty.vendor.library.path**

Path to the Unbound API JAR file on the Unbound client machine.

**edgeencryption.ekm.provider.rsa.wrapping.key.alias**

Wrapping key alias in the Unbound Technology implementation.

Must be the same for all proxies.

General configuration properties

**edgeencryption.config.poll.interval**

Poll interval in seconds. The default setting means that it takes 5 seconds for the proxy to learn of encryption configuration changes. Larger values cause the instance to take longer to detect an offline proxy.

⚠️ **Warning:** Do not change this property. Changing the default setting of the Proxy Poll Interval can result in detection delays when a proxy comes online.

**edgeencryption.rules.dir**

Folder where the encryption rules are stored on the proxy.

**edgeencryption.encryption.order_preserving.cache.enable**

Setting determines whether caching is used to support order-preserving encryption types.
edgeencryption.encryption.order_preserving.cache.size
  Maximum cache size, in bytes.

edgeencryption.jobs.concurrency
  Maximum number of mass encryption jobs that can run concurrently on this proxy.

edgeencryption.jobs.requests_per_second
  Number of http job requests per second that can be sent to the instance by this proxy.

edgeencryption.attachments.request.timeout.seconds
  Attachment upload request timeout in seconds.

edgeencryption.request.buffer.size
  Size of an encryption request. If an encryption request is larger than this size, the excess is saved to disk.

⚠️ Warning: Do not change this property.

edgeencryption.httpclient.request.buffer.size
  Size of the client request. If the client request is larger than this size, the excess is saved to disk.

⚠️ Warning: Do not change this property.

edgeencryption.proxy.idle.timeout
  Time in seconds after which a transaction times out.
  • Default value: 300 (seconds)

edgeencryption.proxy.keepalive.interval
  Time in seconds between pings issued by the proxy to the instance. Pings are issued periodically to verify connectivity between the proxy and the instance.
  • Default value: 10 (seconds)
  • Minimum value: 5 (seconds)

edgeencryption.register.retry.count
  Maximum number of times the proxy pings the instance to try to register.
  • Default value: 0 (no limit)
edgeencryption.tokenization.exclusion.list

Encryption patterns cannot tokenize strings found in these fields.

Proxy server performance properties

Proxy server performance properties are not present in the configuration file by default. To change the default values, you must add the properties and restart the proxy server. For more information, see Edge Encryption diagnostics and performance.

edgeencryption.stat.collection.enabled

Enables the collection of statistics used by the Edge Encryption proxy server performance dashboard.

• Default value: true

Add this property and set the value to false to disable the collection of statistics used by the Edge Encryption proxy server performance dashboard.

edgeencryption.stat.collection.interval

Interval length in seconds during which the Edge Encryption proxy server collects statistics. The value cannot be less than 30 seconds.

• Default value: 30 (seconds)

Deprecated proxy encryption properties

edgeencryption.encrypter.default.key128

Specifies the name of the current AES 128 key. An AES 128 key must be available even if it is not used. Must be the same for all proxies.

Perform maintenance of these keys on the instance.

edgeencryption.encrypter.default.key256

Specifies the name of the current AES 256 key. Must be the same for all proxies.

Perform maintenance of these keys on the instance.

edgeencryption.encrypter.key

Specifies the key name for each key and is used to specify the default keys. This is the key alias integrated with the metadata that is included with each encrypted item and, therefore, is stored on the instance. The key name must use lowercase letters.

edgeencryption.encrypter.type
Specifies the type of encryption keystore system.

`edgeencryption.encrypter.file`

Specifies the path and file name of the text file associated with the key.

`edgeencryption.encrypter.password`

Specifies the password for accessing the keystore.

**CyberArk integration with the Edge proxy server**

Use CyberArk to store passwords in a centralized and secure digital vault to secure passwords that were previously stored in clear text and secured by file access, or that were previously encrypted via a second file.

CyberArk AIM (Application Identity Management) prevents unauthorized access by eliminating hard-coded and visible passwords. AIM stores passwords in a digital vault on an independent hardened server, where the passwords are represented as digital credentials. The AIM clients (the Edge proxy servers) use CyberArk digital credentials and access the independent server to retrieve the secured passwords. No passwords are stored on the Edge proxy servers or in the instance.

**CyberArk digital vault credentials**

You must purchase and configure CyberArk before you can set up CyberArk integration with the Edge proxy server.

To add a credential to CyberArk (which is read by the Edge proxy), set the **Platform Name** of the credential to **Unix via SSH** and make sure you either create a **Custom** credential **Name** or write down the **Auto-generated** credential **Name**. When you configure the Edge proxy to use this credential, the proxy server matches this credential **Name** to the setting in the proxy.
Each credential entry holds a **Password** that is being secured, as well as a credential **Name** used by an application to access that password.

⚠️ **Note:** CyberArk credentials are not encryption keys.

**Adding CyberArk during an Edge proxy installation**

The proxy installer includes a new configuration page for a CyberArk integration. This page is optional if you do not want to include CyberArk when installing your proxy with the proxy installer. You can also manually set up and configure CyberArk integration in the configuration file.
The proxy installer also includes a new page for CyberArk protected credentials. This page allows configurations of different properties using a single credential name or multiple credential names. This page is optional if you do not want to include CyberArk when installing your proxy with the proxy installer.
CyberArk password protection
Any password field in the Edge proxy installer that has a CyberArk credential configured in the CyberArk vault and specified on the CyberArk Protected Credentials page of the installer is grayed out and contains the message Protected by CyberArk.
Using a load balancer with the Edge proxy server

You can use a load balancer to balance the load across the proxy servers in your Edge Encryption proxy setup. If the load balancer and proxy servers are using different ports, specify the host name and HTTPS port of the load balancer to enable users to view responses on their browser.

**Important:** All production environments should include at least two Edge Encryption proxy servers for redundancy.

**Edge request processing without a load balancer**

If you are not using a load balancer, a request is processed as described below.

1. The user issues a request from a browser.
2. The browser sends the request to the Edge proxy server.
3. The proxy server sends the request to the ServiceNow instance.
4. The ServiceNow instance returns the response to the proxy server.
5. The proxy server adds its own port number in the response header before returning the response to the user's browser.

The request is completed successfully because the user can view the response from the proxy server at the port number specified in the response header.
Edge request processing with a load balancer

However, if you are using a load balancer, the user’s browser communicates directly with the load balancer, not with the proxy server. A request is processed as described below.

ℹ️ Note: The following example uses 1025 as the proxy server port number.

1. The user issues a request from a browser.
2. The browser sends the request to a load balancer Virtual IP (VIP), also known as a Virtual Server.
3. The VIP is configured to point to the proxy server (for example, 10.2.200.148:1025), so the load balancer forwards the request to the proxy server.
4. The proxy server sends the request to the ServiceNow instance.
5. The ServiceNow instance returns the response to the proxy server.
6. The proxy server rewrites the location header in the response with values configured in the properties for risk-servicenow.dev.echonet:1025.
   - Host: edgencryption.proxy.host
   - HTTP port: edgeencryption.proxy.http.port
   - HTTPS port: edgeencryption.proxy.https.port
7. The proxy server forwards the response to the load balancer with the location header pointing to the proxy server port.

The outcome depends on whether the load balancer and proxy servers are using the same port.

- If the load balancer and proxy servers are using the same port, the request succeeds because the user receives the response from the same port identified in the response header.
- If the load balancer and proxy servers are using different ports, the request fails because the user's browser communicates only with the load balancer, but the response is on the proxy server.

Solution

You could resolve the issue by simply using the load balancer and all Edge proxy servers on the same port, but this is not an ideal solution. A better solution is to enable the system to know which port the load balancer uses.
The following properties enable the Edge proxy server to reroute response messages to the load balancer if the proxy server and load balancer are using different ports.

- `edgeencryption.proxy.rewrite.location.host` specifies the host name used to access ServiceNow through the load balancer.
- `edgeencryption.proxy.rewrite.location.https.port` specifies the HTTPS port used to access ServiceNow through the load balancer.

**Configure the load balancer**

If the load balancer and proxy servers are using different ports, specify the host name and HTTPS port of the load balancer to enable users to view responses on their browser.

**Before you begin**

Roles required:
- local or domain administrator on a Windows host
- service user with full file system access on a Linux host

**Procedure**

1. Login to the proxy server host as admin, domain admin, or a service user.
2. Navigate to the installation directory for the Edge proxy and select `conf/edgeencryption.properties`.
3. Set the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| `edgeencryption.proxy.rewrite.location.host` | If your Edge configuration includes a load balancer to balance the load among proxy servers, rewrites responses to the load balancer so requests can be completed.  
  • If there is a load balancer in the proxy setup, specify the host name used to access ServiceNow through the load balancer.  
  • **Optional**: If there is no load balancer in the proxy setup, can be set to the host name used by the proxy server. |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| edgeencryption.proxy.rewrite.location.https.port | If your Edge configuration includes a load balancer to balance the load among proxy servers, specifies the HTTPS port used to access ServiceNow through the load balancer.  
- If there is a load balancer in the configuration, specify the HTTPS port used to access ServiceNow through the load balancer.  
- **Optional**: If there is no load balancer in the configuration, can be set to the HTTPS port used by the proxy server. |

4. Save the file.

**Results**
Requests can be completed because users can now view responses on their browser.

**Edge Encryption upgrades**
Both instance upgrades and proxy server upgrades require special consideration in an Edge Encryption environment.

**Instance upgrades**
Instance upgrades in an Edge Encryption environment require caution to ensure that Edge controls work properly after the instance upgrade.

During an instance upgrade, you should not add, edit, or delete the following:
- Edge Encryption configurations
- Edge Encryption rules
- Edge Encryption tokenization patterns
- Edge Encryption scheduled jobs
- Edge Encryption key configurations
- Edge Encryption scheduled upgrades
- Edge Encryption denylist IP configurations
Any scheduled job running during the instance upgrade will not complete. To complete the interrupted job, rerun the job once the instance is upgraded. When you reschedule the job, the processing that occurred before the instance upgrade is not lost, and the job continues to process only the data that has not yet been processed.

**Proxy server upgrades**
Schedule a proxy upgrade to enable the instance to upgrade the Edge Encryption proxy server, or manually upgrade the proxy server at any time.

⚠️ **Warning:** For an upgrade on Windows, you may encounter file lock issues and the upgrade may fail. For the upgrade to succeed, you should not have any files open under the installation directory. Also, there should be no existing shell in the installation directory. In particular, if you start the proxy from the command line (via `bin\edgeencryption.bat install/start`) while in the installation directory, you should close that shell or move it out of the installation directory afterward. No files under the installation directory should be opened by an editor or by any other application.

**Third party libraries**
Third party libraries, such as Gemalto, are lost during instance and proxy server upgrades if they are kept in the same directory. You can perform the following to prevent the loss of third party libraries during upgrades:

1. Manually add the following property to `edgeencryption.properties`:

   ```
   edgeencryption.ekm.provider.classname = com.snc.edgeencryption.encryption.CloudEdgeNaeKeyProvider
   ```

2. Add the `edgeencryption.thirdparty.vendor.library.path` vendor library location property and set it to `/path/to/jars`.

   For example:

   ```
   edgeencryption.thirdparty.vendor.library.path = /app/servicenow/libs
   ```

3. Copy the SafeNet JARs into that path.

After you install the third party libraries outside of the Edge Encryption installation, they are no longer lost during upgrades.

**Scheduled upgrades**
Schedule an upgrade to allow the instance to upgrade the proxy server at the scheduled time. This functionality is available by default after upgrading. A scheduled upgrade includes these events:
1. The proxy server checks with the instance to see if there is a new version available for upgrade. New versions generally become available when the instance is upgraded.

2. The administrator receives a notification upon logging in when a new version of the proxy server is available.

3. The administrator can Schedule an Edge Encryption proxy server upgrade for each proxy server.

   Note: Only users with the security_admin role can create an upgrade schedule through the proxy server.

4. Once the upgrade is scheduled, the proxy server automatically upgrades at the scheduled time. During the upgrade, the proxy server is offline for only a short time.

   Note: Because the proxy server restarts during the upgrade, it is offline for a short time. The amount of time is determined by your environment and how long it takes to stop and restart the proxy service.

5. During the scheduled upgrade, a new proxy directory is created and your configuration files are copied to the new directory. New properties are written to your existing properties file. The following files or directories in your old proxy directory are copied to the new proxy directory.

   • /conf directory
   • /keys directory
   • /keystore directory
   • java/jre/lib/security/cacerts file

   As a result, your keys, keystores, settings, and certificates are preserved.

   Note: Only the above files are copied to the new proxy directory. Any other customized files in the proxy server directory are not preserved during a scheduled upgrade. The upgrade log file can be found in the original proxy directory in the following folder: <original-proxy-directory>/tmp/upgrade-wrapper/bin.

**Prerequisites for scheduled upgrades**

Before scheduling an upgrade for an Edge Encryption proxy, ensure the following:

1. The JAVA_HOME environment variable points to a java installation on the machine that is outside the Edge Encryption proxy’s directory structure.

2. The JAVA_HOME environment variable points to a java installation that is at version 1.8_u144 or higher.
3. The `-Djava.io.tmpdir` parameter in the wrapper.conf file of the Edge Encryption proxy points to a directory that is OUTSIDE the Edge Encryption proxy’s directory structure, and the proxy has read/write/execute permissions on the directory. Optionally, you could comment out the parameter entirely so that Java uses its default tmp location.

Manual upgrades

Instead of creating an upgrade schedule, you can manually upgrade each proxy server through the command line. See Manually upgrade an Edge Encryption proxy server running on Linux or Manually upgrade an Edge Encryption proxy server running on Windows.

Proxy build status

You can easily identify whether a proxy server is out of date by navigating to Edge Encryption Configuration > Proxies > All. The status of your proxy build is indicated in the Proxy build column by the following colors:

- **Green**
  - Your proxy server is up-to-date.

- **Yellow**
  - Your proxy server is out-of-date and an upgrade is needed.

- **Orange**
  - Upgrade failed. Your proxy server reverts to the old version to ensure that there is no downtime.

Troubleshoot a failed scheduled proxy upgrade

When a scheduled proxy upgrade fails, the proxy server reverts to the version you are upgrading from. All original data, keys, and configuration files are preserved. This process may take several minutes. Contact Customer Service and Support to ensure a successful upgrade.
To determine the reason for the failure, you can check the **Failure Reason** in the upgrade schedule. In addition, the installation directory for the failed upgrade is maintained so that log files are available for troubleshooting.

⚠️ **Note:** Before deleting any extra proxy directories, always confirm which directory is current by reviewing the log files. If the log files have recent activity, the proxy might be connected to your instance.

If a scheduled proxy upgrade fails repeatedly, you can manually upgrade your proxy server. See [Manually upgrade an Edge Encryption proxy server running on Linux](#) and [Manually upgrade an Edge Encryption proxy server running on Windows](#).

### Java minimum requirements

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

- Java 8 update 121 (8u121)
- Java 8 update 141 (8u141)
- Java 8 update 151 (8u151) or later

⚠️ **Note:** Java 8 update 131 (8u131) is not supported.
- Java 11.0.6 or later

⚠️ **Note:** Before installing the Edge Encryption proxy server, check that the `$JAVA_HOME` variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the `$JAVA_HOME` variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see [Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower](#).
Mixed proxy-version environments

Although an environment running old versions of the proxy server with up-to-date versions of the proxy server is not recommended, it is supported if all proxy servers are within the same version family as your instance. For example, if you have an instance on the Rome release, your environment supports proxy servers from any Rome patch or hot fix. However, the following limitations apply.

- If one proxy server supports functionality that another proxy does not support, you will see inconsistent behavior, depending on which proxy server is used.
- If a proxy server is out-of-date, it may not include recent security enhancements.

If a proxy server from a previous release is registered with a newer release of the instance, you will receive regular notifications that the proxy server is out-of-date. To ensure an optimal and secure environment, ServiceNow recommends always upgrading your proxy server to the most recent version of the software supported by your instance.

Schedule an Edge Encryption proxy server upgrade

Create an upgrade schedule to enable the instance to upgrade an out-of-date proxy server.

Before you begin

To schedule an upgrade, you must be logged in to your instance through the proxy server.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower.

Role required: security_admin

About this task

Once the upgrade is scheduled, the proxy server automatically upgrades at the scheduled time. During the upgrade, the proxy server is offline for only a short time.

Note: Because the proxy server restarts during the upgrade, it is offline for a short time. The amount of time is determined by your environment and how long it takes to stop and restart the proxy service.
During the scheduled upgrade, a new proxy directory is created and your configuration files are copied to the new directory. New properties are written to your existing properties file. The following files or directories in your old proxy directory are copied to the new proxy directory.

- /conf directory
- /keys directory
- /keystore directory
- java/jre/lib/security/cacerts file

As a result, your keys, keystores, settings, and certificates are preserved.

**Note:** Only the above files are copied to the new proxy directory. Any other customized files in the proxy server directory will not be preserved during a scheduled upgrade. The upgrade log file can be found in the original proxy directory in the following folder: `<original-proxy-directory>/tmp/upgrade-wrapper/bin`.

If multiple proxy servers are out-of-date, you must schedule an upgrade for each proxy server individually.

**Note:** Avoid hosting multiple proxy servers on the same machine. However, if your environment includes this configuration, do not schedule upgrades to multiple proxies on the same machine at the same time.

**Procedure**

1. Navigate to **Edge Encryption Configuration > Proxies > Upgrade Schedules**.
2. Click **New**.
3. Complete the form.

**Edge Encryption Proxy Upgrade Schedule form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy server</td>
<td>Proxy server being upgraded.</td>
</tr>
<tr>
<td>Target version</td>
<td>Version to which you are upgrading your proxy server. This value is read-only and set to the most up-to-date proxy version available for your instance.</td>
</tr>
<tr>
<td>Scheduled Start Time</td>
<td>Date and time on which to start the upgrade.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the scheduled upgrade is active. If this field is not selected, the upgrade will not perform on the scheduled date and time.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the upgrade. This value is read-only. Possible statuses include:</td>
</tr>
<tr>
<td></td>
<td>• Pending</td>
</tr>
<tr>
<td></td>
<td>• Running</td>
</tr>
<tr>
<td></td>
<td>• Complete</td>
</tr>
<tr>
<td></td>
<td>• Failed</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**What to do next**
After an upgrade is executed, you can review the upgrade details to learn more about it. If your upgrade failed, review the **Failure Reason** to determine next steps.

**Upgrade details**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Version</td>
<td>The version that the server was upgraded from.</td>
</tr>
<tr>
<td>To Version</td>
<td>The version that the server was upgraded to.</td>
</tr>
<tr>
<td>Actual Start Time</td>
<td>Time that the upgrade began.</td>
</tr>
<tr>
<td>End Time</td>
<td>Time that the upgrade ended.</td>
</tr>
<tr>
<td>Failure Reason</td>
<td>Reason that the upgrade failed.</td>
</tr>
</tbody>
</table>

**Manually upgrade an Edge Encryption proxy server running on Linux**
Update a proxy running on Linux.

**Before you begin**
If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server.
host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower.

Role required: security_admin or local administrator on the host machine

**Procedure**

1. Copy the Edge Encryption update-archive file to the installation directory.
2. Change to the installation directory.
3. Run the following command:
   ```
   java -jar edgeencryption-dist-<version>-linux-x86-64.jar -m dist-upgrade -c <proxy directory>
   ```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy directory</td>
<td>The directory in the installation directory where the proxy was initially installed. This directory is created by the install.</td>
</tr>
</tbody>
</table>

If you want to see the help screen, execute this command without arguments:

```java
java -jar edgeencryption-dist-<version>-linux-x86-64.jar
```

A new proxy directory is created with a current timestamp. A backup of the old proxy directory is maintained as backup.dist-upgrade_timestamp in the new proxy installation directory. The old proxy shuts down and the new proxy starts up. Any open connections/transactions on the old proxy server are terminated.

4. Check the proxy log in the new directory and the instance to verify that the new proxy is running.

**Manually upgrade an Edge Encryption proxy server running on Windows**

Update a proxy running on Windows.

**Before you begin**

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption
policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower.

Role required: security_admin or local administrator on the host machine

**Procedure**

1. Download the Edge Encryption proxy-update archive file to the installation directory.
2. Start the Windows cmd terminal program with administrator privileges.
3. Change to the installation directory.
4. Run the following command:

   ```
   java -jar edgeencryption-dist-<version>-all.jar -m dist-upgrade -c <proxy directory>
   ```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy directory</td>
<td>The directory in the installation directory where the proxy was initially installed. This directory is created by the install.</td>
</tr>
</tbody>
</table>

If you want to see the help screen, execute this command without arguments:

```java -jar edgeencryption-dist-<version>-all.jar```

A new proxy directory is created with a current timestamp. A backup of the old proxy directory is maintained as backup.dist-upgrade_timestamp in the new proxy installation directory. The old proxy shuts down and the new proxy starts up. Any open connections/transactions on the old proxy server are terminated.

5. Check the proxy log in the new directory and the instance to verify that the proxy has been updated and is running.

**Roll back an Edge Encryption proxy server upgrade**

If a proxy upgrade is unsuccessful, you can go back to the earlier version.

**About this task**

If an upgrade fails when using the scheduled upgrade feature in the Rome release, the proxy server will automatically roll back to the old version. The old proxy server is stored unmodified in a backup directory.

If you would like to roll back a manual upgrade, you can follow these steps.
Procedure

1. Shut down the proxy.
2. Delete the new proxy directory.
3. Rename the backup directory to the proxy name.
   The backup directory is in the proxy installation directory with the name `<proxy name>_backup`
4. Start the proxy.
5. Check the proxy log and the instance to verify that the proxy is online.

Edge Encryption configuration

After the Edge Encryption proxy server is installed and running, manage Edge Encryption through the proxy server.

You must complete all the steps in Edge Encryption installation before creating encryption configurations and encryption patterns on the instance.

ℹ️ Note: To access the Edge Encryption configuration, you must log in through the proxy server and elevate to the security_admin role.

Rotate encryption keys

Perform encryption key rotation from the instance. Add a new key, change the default key assignment, and then schedule a mass key rotation or a single key rotation.

Before setting an encryption key as the default key, make the key available to each proxy. This ensures that the proxies have the key to encrypt data when the key is assigned as the default key. All proxies must have access to a key before that key can be assigned as the default key.

⚠️ Warning: Before deleting a key from the proxy, set up and run a mass key rotation job to ensure that no data on the instance uses the key. If any information is still encrypted with that key, you cannot decrypt the information after you delete the key.

Edge filtering and sorting behavior

Whenever you change default keys, be sure to perform a key rotation (either mass or single key rotation). Otherwise, you may receive unexpected results when sorting and filtering records. For example, consider the following scenario:
1. You create encrypted records using one encryption key.
2. You create a new key and set it as default.
3. You create a new set of encrypted records using the new encryption key.

If you filter by any encrypted field when connected through the Edge proxy, all records may not be filtered out correctly, or records may appear unexpectedly. The filter works only for records encrypted using the current default key. The records encrypted using the previous default key still appear in the list view.

If you sort by any encrypted field when connected through the Edge proxy, you see two groups of records with the same human readable text in the encrypted field.

**Schedule a single key rotation job**

Schedule a job to find data encrypted using a specified key alias and then re-encrypt the data with the current default encryption key. The data is decrypted before it is re-encrypted with the default key.

**Before you begin**
Role required: security_admin
Before scheduling this job, update the default key in Edge Encryption Configuration > Encryption Key Configuration > Set Default Keys.

**Procedure**
1. Navigate to Edge Encryption Configuration > Maintenance > Schedule Single Key Rotation.
2. Fill in the fields on the form as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Single Key Rotation</strong>.</td>
</tr>
<tr>
<td>Key</td>
<td>Enter the key to be retired. Verify that this key is no longer the default key in Edge Encryption Configuration &gt; Encryption Key Configuration &gt; Set Default Keys.</td>
</tr>
<tr>
<td>Estimate record count</td>
<td>Total estimated number of records to process. Not available when running a single key rotation.</td>
</tr>
</tbody>
</table>
Field | Value
---|---
Process Historical Records | Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. This field is read only and active. To learn more about audited fields, see Auditing.

Estimate Maximum Audit Record Count | Estimated maximum number of audited records to process. Not available when running a single key rotation.

Active | Clear this check box if you want to deactivate this job.

Run | Select the period between job executions.

Starting | Enter the date and time to run the job for the first time.

3. Click the menu icon in the form header and select Save. Estimate Record Count is not supported when processing audited fields.

Schedule a mass key rotation job

Schedule a job to find data encrypted with any previous key, and then re-encrypt the data with the current default encryption keys. The data is decrypted before it is re-encrypted with the current default key.

Before you begin
Role required: security_admin

Procedure
1. Navigate to Edge Encryption Configuration > Maintenance > Schedule Mass Key Rotation.
2. Fill in the fields on the form as appropriate.

Field | Value
---|---
Name | Enter a descriptive name.

Job Type | Select Mass Key Rotation.
### Estimate Record Count

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Estimate record count</td>
<td>Total estimated number of records to process. Not available when running a mass key rotation.</td>
</tr>
<tr>
<td>Process Historical</td>
<td>Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. This field is read only and active.</td>
</tr>
<tr>
<td>Records</td>
<td>To learn more about audited fields, see Auditing.</td>
</tr>
<tr>
<td>Estimate Maximum Audit</td>
<td>Estimated maximum number of audited records to process. Not available when running a mass key rotation.</td>
</tr>
<tr>
<td>Record Count</td>
<td></td>
</tr>
</tbody>
</table>

### Active
Clear this check box to deactivate this job.

### Run
Select the period between job executions.

### Starting
Enter the date and time to run the job for the first time.

3. Click the menu icon in the form header and select **Save**. **Estimate Record Count** is not supported when processing audited fields.

### Schedule an attachment key rotation job

Schedule a job to find attachments encrypted using a specified key alias, and then re-encrypt the attachments with the current default encryption key. The attachment is decrypted before it is re-encrypted with the default key.

**Before you begin**
Role required: security_admin

**Procedure**

1. Navigate to **Edge Encryption Configuration > Maintenance > Schedule Attachment Key Rotation**.

2. Fill in the fields on the form as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>--------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Attachment Key Rotation</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear the check mark if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.

4. To see an estimated count of records to be updated, click **Estimated Record Count**.

5. To run the job immediately, click **Execute Now**.

**Encrypt fields using encryption configurations**

Encrypt fields by creating encryption configurations.

To configure Edge Encryption, you must be connected to the instance through the proxy. Test all changes on a non-production instance before making the changes to the production instance.

**Define encryption keys**

After setting up one or more proxies and configuring a default encryption key, the instance verifies that the keys are available to all proxies. You cannot make an encryption key the default key unless all proxies have the key. Once a default key is defined, you can create encryption configurations.

**Assign fields and attachments to be encrypted**

Assigning fields and attachments to be encrypted means assigning an encryption type to the field or attachment. Before marking a field as encrypted, evaluate these issues.

- Determine what system features might be impacted.
- Examine all scripts for use of the field.
- Make any desired adjustments to the field size. After a field has been configured for encryption, the field size cannot be changed.

Marking a field to be encrypted expands the field size to store the encrypted data. The process of expanding the field size can take a long time, depending on the number of records in the table.
Create an encryption configuration
Select the fields to be encrypted and identify the encryption type.

Before you begin
Role required: security_admin

Procedure
2. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table that contains the field to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table. Select Column.</td>
</tr>
<tr>
<td>Column</td>
<td>The field to be encrypted. Appears only when the Type is Column. Only String, Date, Date/Time, Journal, Journal Input, and URL fields are supported.</td>
</tr>
<tr>
<td>Encryption type</td>
<td>The encryption type to use.</td>
</tr>
</tbody>
</table>

- **String and URL fields**: You can add an encryption configuration to either a parent table or a child table.
- **Date and Date/Time fields**: You can add an encryption configuration to a parent table only. You cannot add a new encryption configuration to a child table.

⚠️ Note: Depending on the number of records affected by the Date and Date/Time fields you are encrypting, it may take up to a few minutes to create the encryption configuration. Make sure that you create the encryption configuration for Date and Date/Time fields when transaction volume on the instance is low.

⚠️ Note: A specific table and field combination can have only one active configuration at a time.

3. Click Submit.
What to do next
After you add the encryption configuration record, you can create an encryption job to encrypt existing data. If you do not run an encryption job, Edge encrypts the existing data the next time the data changes.

Deactivate an encryption configuration
After configuring a field or a table’s attachments to be encrypted, you can stop encryption by deactivating the encryption configuration. After deactivating encryption, you can run a Decryption job for fields or an Attachment Decryption job for attachments to remove the encrypted data from the instance.

Before you begin
Role required: security_admin

About this task

⚠️ Warning: Deactivating an encryption configuration does not delete the encryption record and the encryption type cannot be changed.

Procedure

1. Navigate to Edge Encryption Configuration > Edge Encryption Configurations > All.
   The Edge Encryption Configurations list is shown.

2. Click on the encryption configuration to be deactivated.
   The Edge Encryption Configuration form is shown.

3. Click on the Active box.
   The Active box is clear.

4. Click Update.
   The Edge Encryption Configurations list is shown.

What to do next
You can run a Decryption or Attachment Decryption job to decrypt data on the instance. If you do not run a job, the encrypted data is decrypted the next time it is changed.

Schedule an encryption job
You can schedule a job to find and encrypt any unencrypted data in a specified field, using the default encryption key configured for the field. If you do not create an encryption job after configuring a field for encryption, only new values are encrypted.
Before you begin
Role required: security_admin

Procedure
1. Navigate to Edge Encryption Configuration > Encryption Configurations > All.
2. Click the field that you want to schedule an encryption job for.
   The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for any previous job executions.
4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Encryption.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Estimated record count</td>
<td>Total estimated number of records to process. Populates after selecting Estimate Record Count.</td>
</tr>
<tr>
<td>Process Historical Records</td>
<td>Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. To learn more about audited fields, see Auditing.</td>
</tr>
<tr>
<td>Estimate Maximum Audit Record Count</td>
<td>Estimated maximum number of audited records to process. Populates after selecting Estimate Record Count. This field is only visible when Process Historical Records is selected.</td>
</tr>
<tr>
<td>Note: The estimate may be larger than the actual number of records processed.</td>
<td></td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select Save.
6. To see an estimated count of records to be updated, click **Estimate Record Count**.

7. To run the job immediately, click **Execute Now**.

### Schedule a decryption job

You can schedule a job to decrypt data in an encrypted field, to store clear data in the instance.

#### Before you begin

**Note:** You must mark the encryption record for the field as inactive (clear the **Active** box) in order to run the decryption job.

Role required: security_admin

#### Procedure

1. Navigate to **Edge Encryption Configuration > Encryption Configurations > All**.

2. Click the field that you want to decrypt.

3. Under **Related Links**, click **Schedule Mass Decryption Job**.

   The **Scheduled Encryption Job** form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Decryption</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Estimated record count</td>
<td>Total estimated number of records to process. Populates after selecting <strong>Estimate Record Count</strong>.</td>
</tr>
<tr>
<td>Process Historical Records</td>
<td>Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted.</td>
</tr>
</tbody>
</table>
To learn more about audited fields, see Auditing.

**Estimate Maximum Audit Record Count**
Estimated maximum number of audited records to process. Populates after selecting **Estimate Record Count**. This field is only visible when **Process Historical Records** is selected.

**Note:** The estimate may be larger than the actual number of records processed.

**Run**
Select the period between job executions.

**Starting**
Enter the date and time to run the job for the first time.

5. Click the menu icon in the form header and select **Save**.

6. To see an estimated count of records to be updated, click **Estimate Record Count**.

7. To run the job immediately, click **Execute Now**.

**Encrypt attachments using standard encryption**
You can encrypt attachments for specific tables.

All attachments to a table use the same encryption type. Encrypted attachments are not searched when performing a text search. Only the standard encryption types are allowed for attachments. The order preserving or equality preserving encryption types are not allowed.

For a session bypassing the Edge Encryption proxy:

- **On a record with attachment encryption activated:**
  - The user can see that there are attachments and the attachment names.
  - The user cannot add new attachments.

- **On a record without attachment encryption activated:**
  - The user can open and download existing attachments.
  - The user can add new attachments.

For a session using the encryption proxy, the user can open and download existing attachments and add new attachments.
Configure attachment encryption

Select the tables whose attachments are to be encrypted and identify the encryption type.

Before you begin
Role required: security_admin

Procedure

2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table whose attachments are to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table. Select Attachment.</td>
</tr>
<tr>
<td>Column</td>
<td>The table field to be encrypted. This field appears when the Type is Column, and not when Type is Attachment.</td>
</tr>
<tr>
<td>Encryption type</td>
<td>The encryption type to use. For attachments, only Standard AES128 and Standard AES256 are allowed.</td>
</tr>
</tbody>
</table>

3. Click Submit.

What to do next

After the encryption record has been added, you can create an attachment encryption job to encrypt existing attachments. If you do not run an attachment encryption job, the system encrypts new attachments when you attach them.

Schedule an attachment encryption job

You can schedule a job to find and encrypt any unencrypted attachments for a specified table, using the default encryption key configured for the table.

Before you begin
Role required: security_admin
Procedure

1. Navigate to **Edge Encryption Configuration > Encryption Configurations > All.**
2. Click the table you want to schedule an encryption job for.
3. Under **Related Links**, click **Schedule Mass Encryption Job.**

The **Scheduled Encryption Job** form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Attachment Encryption.</strong></td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select **Save.**

6. To see an estimated count of records to be updated, click **Estimate Record Count.**

7. To run the job immediately, click **Execute Now.**

**Schedule an attachment decryption job**

You can schedule a job to decrypt any encrypted attachments for a specified table, to store clear attachments in the instance.

**Before you begin**

⚠️ **Note:** You must mark the encryption record for the table as inactive (clear the **Active** box) before the decryption job runs, otherwise, nothing happens.

Role required: security_admin
**Procedure**

1. Navigate to **Edge Encryption Configuration > Encryption Configurations > All.**
2. Click the table with the attachments that you want to decrypt.
3. Under **Related Links,** click **Schedule Mass Attachment Decryption Job.**
   
The **Scheduled Encryption Job** form is shown with all fields populated. The bottom of the form shows records for previous job executions.
4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Attachment Decryption.</strong></td>
</tr>
<tr>
<td>Active</td>
<td>Clear the check mark if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select **Save.**
6. To see an estimated count of records to be updated, click **Estimate Record Count.**
7. To run the job immediately, click **Execute Now.**

**Change a field or attachment's encryption type**

You can change a field or attachment's encryption type by selecting a new encryption type in the existing encryption configuration record. A specific table and field combination can only have one active configuration at a time.

**Before you begin**

Role required: security_admin

**Procedure**

1. Navigate to **Edge Encryption Configuration > Encryption Configurations > All.**
   
The **Edge Encryption Configurations** list is shown.
2. Open the record for the encryption configuration to be changed.
3. Click the **Encryption type** dropdown and select a new encryption type.
Note: For attachments, only Standard AES128 and Standard AES256 are allowed.

4. If needed, run an encryption or attachment encryption job.
   It is not necessary to run an encryption job. If you do not run an encryption job, the field or attachment is encrypted using the new encryption type the next time the field or attachment is changed.

**Tokenize strings using encryption patterns**

You can replace string patterns with tokens before they are sent to and stored in the instance.

**Before you begin**

To use encryption patterns, you must install and set up a MySQL database in your network. This is the same database used for order-preserving encryption. To create or edit encryption patterns, you must be connected to the instance through the proxy.

Role required: security_admin

**About this task**

You can use base system patterns, or create your own patterns. Base system patterns are advanced patterns. Encryption patterns include the following limitations.

- A pattern of all alpha characters is not allowed.
- The minimum pattern size is five characters. You can change this setting using a system property.
- The * and + quantifiers are forbidden in encryption patterns.
- Encryption patterns match complete words, not parts of strings embedded in a larger string. Words are defined by spaces and characters not available for inclusion in a pattern.
- If the same string is sent to the instance multiple times, it is replaced with the same token.
- Text search on exact matches is supported. The query string is exchanged with a token when sent to the instance, the search is performed on tokens, and when the search results are returned to the proxy server, the tokens are replaced with the clear text. Features such as stemming are not supported.

When using patterns, the clear text never leaves your network. When the proxy server matches a pattern in a request going to the instance, the proxy replaces the string with a token of the same size. The token is sent to instance instead of
the clear text string. When the response is sent from the instance to the proxy server, the proxy replaces the token with the string. When viewed through the proxy server, the string displays as clear text.

⚠️ Note: Encrypted fields are not checked for encryption patterns.

Procedure

1. Navigate to **Edge Encryption Configuration > Encryption Patterns > Create New**.
   Alternatively, you can navigate to **Advanced Patterns** to activate or edit a preconfigured pattern.

2. Enter the pattern name.

3. Define the **Edge pattern input type**.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic</td>
<td>A series of character types. In the <strong>Basic Pattern Input</strong> tab, click <strong>Add</strong> and select a character type. The <strong>Sample pattern</strong> displays the pattern as characters are added. Click <strong>New Block</strong> to move the next character to the next line. This enables you to group characters in a long pattern. Click <strong>X</strong> to delete the last character in the pattern.</td>
</tr>
<tr>
<td>Advanced</td>
<td>A Java RegEx expression. If advanced is selected, you cannot change the input type back to basic. In the <strong>Sample match</strong> field, enter a sample pattern to test the RegEx expression. In the <strong>Pattern</strong> field, enter a Java RegEx expression. Click <strong>Validate</strong> to verify that the expression matches the sample pattern.</td>
</tr>
</tbody>
</table>

The input type defines how you are going to enter the pattern. It does not impact how the pattern is used.

4. Click **Submit**.
Repair or recover order-preserving encrypted data

If you have the security-admin role, you can schedule jobs performed by the Edge Encryption proxy to repair or recover fields that use order preserving encryption.

You can schedule jobs to:

- Repair order tokens.
- Recreate the proxy database.

Running these jobs can be a time-consuming operation which might impact the performance of the Edge Encryption proxy. Schedule these jobs at a time when no users or a minimum set of users are using the system, such as midnight on the weekend.

Schedule an order token repair job

You can schedule a job to find and repair fields where the order token is missing.

Before you begin
Role required: security_admin

About this task
Use these jobs to repair individual fields in a table or to repair all fields using order preserving encryption. Run this job when the proxy database has been offline while the instance has been running, which results in order preserving fields that are missing order tokens.

Procedure

1. Navigate to Edge Encryption Configuration > Maintenance > Schedule Order Token Repair.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Order Token Repair.</td>
</tr>
<tr>
<td>All fields</td>
<td>Select this check box to repair all tables.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
</tbody>
</table>
3. Click the menu icon in the form header and select **Save**.

4. To see an estimated count of records to be updated, click **Estimated Record Count**.

### Schedule a proxy-database recovery job

Run this job when the proxy database has lost data. This job finds all records that have been encrypted with a token (order preserving encryption type) and sends them to the proxy so that the proxy database can be rebuilt.

**Before you begin**

Role required: security_admin

**Procedure**

1. Navigate to **Edge Encryption Configuration > Maintenance > Schedule Database Recovery**.

2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Database Recovery</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run this job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.

4. To see an estimated count of records to be updated, click **Estimate Record Count**.
Prevent an IP address in your network from sending requests to your instance

Because the Edge Encryption proxy server resides in your network, it may be subject to vulnerability scans by your network software. To prevent IP scanner or other requests from being forwarded to your ServiceNow instance, you can add IP addresses, IP ranges, or network masks to a deny list. Any connection to the proxy server from a deny listed address is terminated and is not forwarded to your instance.

Before you begin
Role required: security_admin
To place an IP address on a deny list, you must be logged in to your instance through the proxy server.

Important: Ensure that you understand your network topology before adding IP addresses in your network to a deny list. If an IP address is added to the deny list, any user with that IP address will be blocked from accessing the Edge Encryption proxy server.

Procedure
1. Navigate to **Edge Encryption Configuration > Maintenance > Denylist IP Addresses**.
   The Encryption Proxy IP Denylists [edge_encryption_ip_blacklist] list view opens.
2. Click **New**.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy server</td>
<td>The Edge Encryption proxy server that is prevented from forwarding requests from addresses on the deny list.</td>
</tr>
<tr>
<td>IP, IP range, or net-mask</td>
<td>Requests from this IP address, range, or network mask are not forwarded to your ServiceNow instance. Example values include:</td>
</tr>
<tr>
<td></td>
<td>• IP address: 10.10.10.5</td>
</tr>
<tr>
<td></td>
<td>• IP range: 10.10.10.1-15</td>
</tr>
<tr>
<td></td>
<td>• Network mask: 10.10.10.0/24</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the record is active. Only IP addresses from active records are prevented from sending requests to the instance.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the deny list record.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

5. Repeat these steps for all other proxies for which an IP address should be denied.

**Results**
The Edge Encryption proxy server terminates any connection from IP addresses, ranges, or network masks on the deny list and cannot forward the request to the instance.

**Encrypt data from a record producer**

Record producers allow end users to create task-based records, such as incident records, from the Service Catalog and Service Portal. If a record producer attempts to insert data into a field marked for encryption, an invalid insert message displays and the data is not saved to the field. To configure your Edge Encryption proxy server to allow inserts from a record producer, create encryption rules from the record producer record.

**Before you begin**

Role required: security_admin

Encrypting data from a record producer requires an encryption configuration defined for the target field. Check that you have created an encryption configuration for the target field and table before creating an encryption rule from a record producer. See [Create an encryption configuration](#). To encrypt attachments from a record producer, see [Configure attachment encryption](#).

**Procedure**

1. Log in to your instance through the Edge Encryption proxy server.
2. Navigate to **Service Catalog > Catalog Definitions > Record Producers**.
3. Create a record producer record or open an existing record producer record.
4. Under **Related Links**, select **Create Edge Encryption Rule**.
   
   Two inactive encryption rules are automatically created to encrypt data sent from the record producer to the field marked for encryption.
<table>
<thead>
<tr>
<th>Encryption rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;RecordProducerName&gt;</td>
<td>Rule created to process POST parameters from the Service Catalog and map variables to fields in the instance.</td>
</tr>
<tr>
<td>&lt;RecordProducerName&gt;Json</td>
<td>Rule created to process a JSON payload from the Service Portal and map variables to fields in the instance.</td>
</tr>
</tbody>
</table>

5. Activate the necessary encryption rules created by the record producer.

   a. Navigate to Edge Encryption Configuration > Rules > All.

   b. Depending on where the record producer will be used, open the associated encryption rule created by the record producer and select the Active flag.

      If using the record producer in the Service Catalog, activate the <RecordProducerName> encryption rule. If using the record producer in the Service Portal, activate the <RecordProducerName>Json encryption rule.

6. Optional: Examine the Encryption rule Action field and add any necessary field names or statements.

   (Optional) If a record producer directly maps a variable to a field in a table, the encryption rule automatically maps the variable to the correct field. However, if a variable is indirectly mapped through various scripts on the platform, you may need to update the rules to map each variable to the correct field.

   Example

   (Optional) The below encryption rule was created from the Report Outage record producer and processes POST parameters from the Service Catalog to map variables to fields in the instance. Replace 'FILL ME IN' with the target field.
The below encryption rule was created from the Report Outage record producer and processes a JSON payload from the Service Portal to map variables to fields in the instance. Add additional statements to map any scripted variables to the target fields.

When the payload from the record producer is examined, the error_message element contains the value for the short_description field. By adding the following statement, you can map the scripted variable error_message to the short_description field.

```javascript
if (jsonElement.getName() == 'error_message')
    jsonElement.valueFor(tableName, 'short_description');
```

The value of the **Action** field becomes:
function ReportOutageJsonAction(request) {
    var tableName = 'incident';
    // Some fields are set in script, additional parameter lines may need to be added
    // current.comments is accessed via script from notes; // assignment to current.comments
does NOT replace existing values
    // current.short_description is accessed via script from short_description;
    // current.description is accessed via script from current.short_description;
    // current.caller_id is accessed via script from gs.getUserID();
    var jsonContent = request.getAsJsonContent();
    for (var jsonElementItr = jsonContent.getIterator('variables');
        jsonElementItr.hasNext();)
        { var jsonElement = jsonElementItr.next();
            if (jsonElement.getName() == 'error_message')
                jsonElement.valueFor(tableName, 'short_description');
            else {
                jsonElement.valueFor(tableName, jsonElement.getName());
            }
        }
}

Results
The two encryption rules enable the record producer to insert values into fields
marked for encryption from either the Service Catalog or Service Portal.

Define a custom encryption rule
It may be necessary to identify and encrypt sensitive information in HTTP requests
on the way to your instance. You can write encryption rules to identify, interpret,
and encrypt data in such requests, mapping fields in the request to table-field
names on your instance.

What is an encryption rule
Encryption rules are scripts executed on the Edge Encryption proxy server to
map fields in a request to fields in a table on your ServiceNow instance. An
encryption rule tells the Edge Encryption proxy server how to encrypt data in
custom payloads.

Note: Encryption rules only support ECMAScript 3 and below.

When to use custom rules
A set of encryption rules is included as part of the Edge Encryption plugin. These
rules handle core platform use cases such as editing a field from the list edit
form, updating a record from the record form, managing direct web services,
and processing data from the REST API. Applications created using standard forms and lists should work without custom encryption rules.

If you develop scripted processors, scripted web services, scripted REST APIs, UIs, or Ajax scripts that contain data that should be encrypted, you must write encryption rules to find and map the data to Glide table-field names.

**Format of an encryption rule**

Rules include three parts:

- **Condition**: Identifies the type of request.
- **Action**: Maps fields in the request to fields in a table, encrypting values that map to fields with encryption configurations defined.
- **Order**: Priority of the rule. The lowest priority rule with a satisfied condition is the only rule that runs. Like business rules, rules run from lowest to highest.

Except for attachment requests, when an HTTP request hits the Edge Encryption proxy server, the Edge Encryption proxy server evaluates all encryption rule conditions in priority order until either all conditions return false, or one condition returns true. When a condition returns true, the action is executed on the request and the result is forwarded to the instance. No other conditions are evaluated. As a result, encryption rule conditions should be as specific as possible. A generic rule might evaluate as true for a request meant to be processed by another rule, causing the request to be processed by the wrong action. If a generic condition is unavoidable, the rule should be marked with a high-order value so that more specific rules are evaluated first.

**Guidelines for creating encryption rules**

Creating efficient, optimized encryption rules can reduce processing time for script validation.

**Overall guideline**: When rules get very long, do your best to minimize the number of blocks and break the rules apart whenever possible. Ideally, custom rules should apply to specific use cases, rather than encompassing several cases, with `if` statements in the action script.

1. Split rules whenever possible. For example,
   - Create different rules for different tables and ensure that each rule runs only on its respective table.
   - Create different rules for each record producer you are targeting, or at least for each subset of record producers. Instead of one rule targeting dozens of
sys_ids, you could create several different rules targeting smaller subsets of record producers, or even create one rule per sys_id.

Note: Creating multiple rules requires more maintenance. The trade-off is that multiple, simpler rules can be validated more efficiently than longer, more complex rules.

2. Minimize the number of blocks. Because the processing engine scans each block while evaluating scripts, a large number of blocks causes delays in validation. For example,

- Replace all if blocks with an array lookup, and replace all blocks in the array lookup with just one if block.
- Combine if blocks whenever it is possible to group them.

Encryption rule APIs

Encryption rules are written in JavaScript and utilize Edge Encryption APIs to locate and encrypt sensitive information in the body of a request. The API uses expressions similar to xPath to navigate through both JSON and XML content.

Edge Encryption APIs process the request off the stream as it is being written to the output stream. Stream parsing allows encryption rules to be network performant. However, fetching and parsing content from the body multiple times could lead to unexpected results. To account for this, requests should be processed by the action in a single pass.

When creating encryption rules, you cannot use Glide APIs, script includes, business rules, or any global parameters such as current. Because the rules are created for HTTP objects, a global request object is available.

When creating encryption rules, you cannot use APIs from the white list manager or scoped applications.

Error handling

If an encryption rule condition or action throws an exception, check the proxy log for troubleshooting information.

Inspect the client request

Before creating a custom encryption rule, you must determine the format of the client request entering the Edge Encryption proxy server.

About this task

Because encryption rules iterate over client requests and determine what, if anything, needs to be encrypted, you must understand the type of request you are creating a rule for. The format of the client request determines the structure of your encryption rule and the APIs available for use in the rule.
Procedure

1. Inspect the client request.

   Depending on the source of the request, the following tools are available to inspect the request and determine the format.

<table>
<thead>
<tr>
<th>Source of request</th>
<th>Available tools</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client browser</td>
<td>Use the developer console in your browser to inspect the client request. Useful tools include:</td>
</tr>
<tr>
<td></td>
<td>• Firefox Network Monitor</td>
</tr>
<tr>
<td></td>
<td>• Chrome Network Panel</td>
</tr>
<tr>
<td>Third-party/external source</td>
<td>Use an HTTP protocol analyzer to inspect the request. Useful tools include:</td>
</tr>
<tr>
<td></td>
<td>• Wireshark</td>
</tr>
<tr>
<td></td>
<td>• HTTP Scoop</td>
</tr>
<tr>
<td></td>
<td>Alternatively, you can often use documentation for the external source to determine the format of the request.</td>
</tr>
</tbody>
</table>

2. From the client request, inspect the packet and determine:

   • The client request method
   • The URL path of the request
   • The URL parameters
   • The POST parameters, if any
   • The format of the request body, if included

Example

```
<table>
<thead>
<tr>
<th>Headers</th>
<th>Preview</th>
<th>Response</th>
<th>Cookies</th>
<th>Timing</th>
</tr>
</thead>
<tbody>
<tr>
<td>General</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Response Headers (13)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Request Headers (14)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Form Data</td>
<td>view source</td>
<td>view URL encoded</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

system_data: 
{{"action":"Post","args":{{"_0ModelCall":true,"intention":"INSERT"},"data":{{"message":"Hello world"}}}}
```
Results
Inspecting the request provides an understanding of the fields you need to filter for and iterate over in your encryption rule. To understand the fields in the request object, see request.

Create an encryption rule
Encryption rules are used by the proxy to find content in HTTP requests that should be encrypted.

Before you begin
Role required: security_admin
Before creating an encryption rule, you must Inspect the client request to determine the format.

About this task
To create or edit encryption rules, you must be connected to the instance through an encryption proxy.

Procedure
1. Navigate to Edge Encryption Configuration > Rules > Create New.
2. In the Name box, enter a name.
3. In the Request Type, select an HTTP method.
   - HTTP Post
   - HTTP Get
   - HTTP Put
   - HTTP Patch
   - HTTP Delete
   
   Note: Pre-Jakarta instances allow only HTTP Get and HTTP Post methods.
4. In the Condition box, enter a JavaScript statement defining when the rule should run.
5. In the Action box, enter a JavaScript function to be executed when the condition is true.
6. In the Order box, enter the relative priority of the rule.
7. Click Submit, or save the form.
**Encryption rule conditions**

Encryption rule conditions determine if the rule should be executed.

An encryption rule condition must return true if the rule is to handle the HTTP request; otherwise, it must return false.

As you build your condition, keep in mind that only one rule is executed per request. As a result, the condition must be as general or specific as needed to run under the intended circumstances.

>i Note: Be careful when performing checks on content in the condition. Excessive checks can be expensive for the proxy server and may cause increased latency when handling complex requests.

The condition can use the method type, content type, URL path, or any URL query string parameters to determine if the rule should handle the request. The condition has access to these fields via the `request` object. Be sure that, prior to creating an encryption rule condition, you have inspected the client request and understand the conditions needed to trigger the rule.

>i Note: To build efficient rules, consider easy ways to rule out requests that you do not want to be evaluated by a rule. Build your condition to return false for those requests first. This method increases performance and quickly routes the request to the correct rule faster.

Encryption rule objects and APIs are available to encryption rule conditions.

**Example using path and postParams**

```javascript
/* This condition checks if the request coming in has a path ending in 
"/sample_processor.do" and if a post parameter exists in that request called myPostParam */

function SampleCondition(request) {
  if (endsWith(request.path, "/sample_processor.do") && request.postParams.myPostParam) {
    return true;
  }
  return false;
}
```

**Example using urlParams and contentType**

```javascript
/* This condition checks if a url parameter exists in the query called 
myUrlParam and if the content type contains 'xml' 
(if so, you can expect the body to be an XML payload). 
Then, it checks if the xml payload contains myXmlTag */
```
function SampleCondition2(request) {
    if (request.urlParams.myUrlParam && request.contentType.indexOf('xml') > -1 &&
    request.xmlContains('myXmlTag')) {
        return true;
    }
    return false;
}

Encryption rule actions

An encryption rule maps fields in a client request to fields in a table on your instance and identifies fields marked for encryption.

An encryption rule action only runs when the encryption rule condition returns true. An encryption rule identifies the data to be encrypted in your request payload. Because the rule iterates over the content in the request object, you must understand the form and structure of your request body and determine what in the request needs to be encrypted. The data to be encrypted might be located within:

- A POST or URL parameter.
- JSON or XML content within a POST or URL parameter.
- A JSON payload.
- An XML payload.

Before writing an encryption rule action, be sure to:

- Inspect the client request.
- Identify where the sensitive data is located in the request object.
- Determine the field and table name to insert data into, or understand how to dynamically pull this from the request.

Encryption rule objects and APIs are available to encryption rule actions and conditions.

Encryption rule objects and APIs

Use encryption rule APIs to parse and encrypt values in requests moving through the Edge Encryption proxy server to the instance.

The APIs available for your encryption rule depend on the format of the request object. For example, if the contentType parameter of the request object is XML, you can use the XML APIs to parse and encrypt values in the payload. After you
determine the type of object in your request, you can build an encryption rule using the available APIs.

Encryption rule APIs are available in both encryption rule condition and action scripts.

**request**

The `request` object is a global object available in Edge Encryption rule action and condition scripts.

The `request` object is a JavaScript object that represents the client request coming in to the Edge Encryption proxy server. You must build your encryption rule to parse the `request` object, map `request` object values to fields in a table on the instance, and encrypt any sensitive data in the `request` object.

The `request` object includes the following attributes and data from the client request:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The path portion of the URL.</td>
</tr>
<tr>
<td>requestMethod</td>
<td>GET, POST, PUT, PATCH, DELETE.</td>
</tr>
<tr>
<td>contentType</td>
<td>The Content-Type header field.</td>
</tr>
<tr>
<td>urlParams</td>
<td>The parameters in the query string. This can also be evaluated to a String.</td>
</tr>
<tr>
<td>postParams</td>
<td>If this is a form post, this contains the post parameters.</td>
</tr>
</tbody>
</table>

**request - getAsJsonContent()**

Returns the request as an iterable object of type `JsonNode`.

This method is available only in an Edge Encryption rule if the request body is a valid JSON payload. If you are not sure what format the request body includes, check the `contentType` field on the `request` object.

Once the request is returned as a `JsonNode` object, you can use the `JSON APIs` to iterate over the object and encrypt fields.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The request as an iterable JsonNode.</td>
</tr>
</tbody>
</table>

**request - getAsXmlContent()**

Returns the request content as an iterable object of type XMLContent.

This method is available only in an Edge Encryption rule if the request body is a valid XML payload. If you are not sure what format the request body includes, check the contentType field on the request object.

Once the request is returned as an XMLContent object, you can use the XML APIs to iterate over the object and encrypt fields.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request as an iterable object of type XMLContent.</td>
</tr>
</tbody>
</table>

**request - XMLContains(String path)**

Returns true if the given path exists in the XML DOM.

This method is available only if the request body is a valid XML payload. If you are not sure what format the request body includes, check the contentType field on the request object.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>String</td>
<td>XPath statement you are searching for.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the given path exists in the XML DOM.</td>
</tr>
</tbody>
</table>

### POST and URL parameter APIs

POST and URL parameters can be accessed as properties of the `request` object using `request.postParams` and `request.urlParams`.

Any single parameter can be accessed as a property of the `postParams` and `urlParams` parent objects by calling `request.postParams.myParam`. Any parameter accessed this way is an object of the underlying class `ParameterValue`. Any APIs in this class can be called on any parameter.

After inspecting the client request, it may be necessary to access and encrypt parameter values from the `request` object. Depending on the data in the client request, you can encrypt values and map them to fields on the instance in multiple ways.

### Encrypt the value of a known table and field

If you know the name of the instance table and field that will hold the encrypted data, you can explicitly define them in the encryption rule. For example, you may know that the request will be processed on the instance to create an incident and you want to encrypt the `text` parameter in the `description` field. In this case, you can create the following action.

```javascript
function SampleAction1() {
    request.postParams.text.valueFor('incident', 'description');
}
```

### Encrypt the value of a dynamically defined table and field

If, conversely, you do not know the name of the field that the encrypted data will populate, you can dynamically define them using `tableName` and `fieldName`.

The below example processes a generic request that might store data in different task tables (such as incident, problem, and change_request) on the instance.
function SampleAction2() {
    var tableName = request.urlParams.table;
    for (var parameter in request.postParams) {
        var currentParam = request.postParams[parameter];
        var fieldName = currentParam.toString();
        if (fieldName == 'text') {
            currentParam.valueFor(tableName, 'description');
        } else {
            currentParam.valueFor(tableName, fieldName);
        }
    }
}

This action:

• Gets the destination table from the URL parameters.
• Iterates over the URL parameters.
• Asks the Edge Encryption proxy server to encrypt any URL parameter with a name that matches a field marked for encryption.
• Looks for a specific parameter called text and asks the Edge Encryption proxy to encrypt the value based on the encryption configuration for the description field on the incident table.

In this example, the valueFor() method is not actually performing any encryption. Rather, the method asks the Edge Encryption proxy server to check whether the table/field pair in the request object is marked for encryption with an encryption configuration and, if applicable, encrypt it.

Encrypt JSON or XML within a parameter

A POST or URL parameter might include JSON or XML content. In this case, you can process the content within the parameter, iterate over the values, and encrypt required fields. In this example, the tableName is still accessed from a POST parameter, but the value of the field is the JSON object data.

function SampleAction3() {
    var tableName = request.postParams.table;
    var data = request.postParams.data;
    var dataIterator = data.getAsJsonContent().iterator();
    while (dataIterator.hasNext()) {
        var jsonElement = dataIterator.next();
        var fieldName = jsonElement.getName();
        if (fieldName == 'text') {
            jsonElement.valueFor(tableName, 'description');
        }
    }
}
An example of an encryption rule action that processes XML within a POST parameter.

```javascript
function SampleAction4() {
    var tableName = request.postParams.table;
    var data = request.postParams.data;
    var dataIterator = data.getAsXmlContent().getIteratorOverAllChildren();
    while (dataIterator.hasNext()) {
        var jsonElement = dataIterator.next();
        var fieldName = jsonElement.getName();
        if (fieldName == 'text') {
            jsonElement.valueFor(tableName, 'description');
        } else {
            jsonElement.valueFor(tableName, fieldName);
        }
    }
}
```

**Encrypt a query**

You might encounter an encoded query within a parameter in the client request that contains sensitive data. To match a field in a query to an encrypted value in the instance database, you must create an encryption rule that asks the proxy to check whether a field in the query is marked for encryption. The `encodedQueryFor()` method parses an encoded query on a given table, and checks if any fields in the query have encryption configurations.

In this example, the rule iterates over the parameters looking for the `filter` parameter, which is expected to be a Glide encoded query.

```javascript
function SampleAction5() {
    var tableName = request.urlParams.table;
    for (var parameter in request.postParams) {
        var currentParam = request.postParams[parameter];
        var fieldName = currentParam.toString();
        if (fieldName == 'filter') {
            currentParam.encodedQueryFor(tableName);
        } else {
            currentParam.valueFor(tableName, fieldName);
        }
    }
}
```
For example, if the value of filter is: short_description=My sensitive information^number=INC000056^category=Outage, the query would become short_description=<Encrypted(My sensitive information)>^number=INC000056^category=Outage on the instance.

ParameterValue - toString()

Converts the POST or URL parameter value to a string.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The parameter value as a string.</td>
</tr>
</tbody>
</table>

ParameterValue - getAsJsonContent()

Returns the request as an iterable object of type JsonNode.

This method is available only in an Edge Encryption rule if the request body is a valid JSON payload. If you are not sure what format the request body includes, check the contentType field on the request object.

Once the request is returned as a JsonNode object, you can use the JSON APIs to iterate over the object and encrypt fields.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The request as an iterable JsonNode.</td>
</tr>
</tbody>
</table>

**ParameterValue -getAsXmlContent()**

Returns the request content as an iterable object of type XMLContent.

This method is available only in an Edge Encryption rule. This method assumes that the request body is a valid XML payload. You can check the contentType to make sure.

Once the request is returned as an XMLContent object, you can use the XML APIs to iterate over the object and encrypt fields.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request as an iterable object of type XMLContent.</td>
</tr>
</tbody>
</table>

**ParameterValue - encodedQueryFor(String tableName)**

Specifies that the value of the element is an encoded query on the specified table.

Calling this function on a parameter tells the proxy that the value of the parameter is an encoded query for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that must be encrypted.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>
>Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**ParameterValue - valueFor(String tableName, String fieldName)**  
Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

**XML APIs**

XML APIs can be used after calling `getAsXmlContent()` on either the request object or a `ParameterValue` property.

When using XML APIs to write your encryption rule, you can follow a general format:

1. Call `getAsXmlContent()` on the request object or `ParameterValue` property. This returns an iterable object of the `XMLContent` underlying class.

2. Call `getIterator()` or `getIterator(String xpath)` on the `XMLContent` object. This returns an `XMLElementIterator` object that can be used to iterate over XML elements.

3. Call the `hasNext()` method on the `XMLElementIterator` object to determine whether another element is available.
4. Call `next()` on the `XMLElementIterator` object to return the next XML element. You cannot call `next()` without first calling `hasNext()`.

5. Call `valueFor(String tableName, String fieldName)` on the XML element. This method tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted.

   **Note:** To determine if you want to call `valueFor(String tableName, String fieldName)` on an XML element, you can use the `getName()` method to return the name of the element.

**Mapping to a known table-field on the instance**

In this example, the XML payload will be processed on the instance to insert records in the incident table. The description field will populate `short_description` on the incident.

```
<data>
  <record>
    <name>'Test Record 1'</name>
    <description>'Test Record 1 Description'</description>
    <tag>critical</tag>
  </record>
  <record>
    <name>'Test Record 2'</name>
    <description>'Test Record 2 Description'</description>
    <tag>security</tag>
  </record>
</data>
```

The following encryption rule action can apply:

```
function sampleXmlAction1() {
  var xmlContent = request.getAsXmlContent();
  // This loop iterates over all description tags that match the given path
  var xmlElementIterator = xmlContent.getIterator('data/record/description');
  while (xmlElementIterator.hasNext()) {
    var xmlElement = xmlElementIterator.next();
    xmlElement.valueFor('incident', 'short_description');
  }
}
```

This action iterates through the `description` tags and asks the proxy server to encrypt the values and insert them into `incident.short_description` on the instance.
Note: This rule finds all `description` tags within all `record` tags in the XML payload. If there is only one occurrence of a tag to encrypt, the rule still uses the XPath and iterator structure. However, it iterates only once in the loop.

Mapping to an unknown table-field on the instance

In this example, the rule iterates over the `record` tags, but does not know what tags to expect within the `record` tag. The only known is that the tags within the `record` tags match the names of the columns specified in the table URL parameter.

The rule also specifies that, if the table is incident, then the data in the `description` tag should be encrypted and stored in the short_description field on the instance.

```javascript
function sampleXmlAction2() {
  var xmlContent = request.getAsXmlContent();
  var tableName = request.urlParam.table;
  // This first iterator will iterate over all record elements
  var xmlElementIterator = xmlContent.getIterator('data/record');
  while (xmlElementIterator.hasNext()) {
    encryptFieldsInRecord(xmlElementIterator.next());
  }
}

function encryptFieldsInRecord(xmlElement) {
  // Then, iterate over all tags representing fields in the table
  var fieldIterator = xmlElement.getIteratorOverAllChildren();
  while (fieldIterator.hasNext()) {
    var field = fieldIterator.next();
    var fieldName = childElement.getName();
    // if table is incident, then description is encrypted for the short_description field
    if (tableName == 'incident' && fieldName == 'description') {
      field.valueFor(tableName, 'short_description');
    } else {
      // if table is not incident, ask the proxy to check if the given field is encrypted for the given table
      field.valueFor(tableName, fieldName);
    }
  }
}
```

In the `encryptFieldsInRecord()` function, the `valueFor()` method is called on a table and a field that are dynamically assigned based on the request. Even though the table and field names can change, the rule asks the proxy to check
whether the field in the table must be encrypted based on the encryption configurations defined.

If the field is not configured for encryption, or if the tag does not match a field in the table, the proxy skips that tag. If the tag matches a field marked for encryption, then the Edge Encryption proxy server encrypts the value.

**Using an encoded query**

In this example, all tags have the `filter` attribute, which indicates whether the tag contains an encoded query.

```xml
<data>
  <record>
    <name filter="false">'Test Record 1'</name>
    <description filter="false">'Test Record 1 Description'</description>
    <query filter="true">category=1^name=edge</query>
  </record>
  <record>
    <name filter="false">'Test Record 2'</name>
    <description filter="false">'Test Record 2 Description'</description>
    <query filter="true">category=2^severity=3</query>
  </record>
</data>
```

The following encryption rule action can apply:

```javascript
function sampleXmlAction3() {
  var xmlContent = request.getAsXmlContent();
  var tableName = request.urlParam.table;
  // This first iterator will iterate over all record elements
  var xmlElementIterator = xmlContent.getIterator('data/record');
  while (xmlElementIterator.hasNext()) {
    encryptFieldsInRecord(xmlElementIterator.next());
  }
}

function encryptFieldsInRecord(xmlElement) {
  // this time we want to iterate over all tags representing fields in the table
  var fieldIterator = xmlElement.getIteratorOverAllChildren();
  while (fieldIterator.hasNext()) {
    var field = fieldIterator.next();
    var fieldname = childElement.getName();
    // let's look at the filter attribute, if true, then encrypt as encoded query
    if (field.getAttributeValue('filter') == 'true') {
      field.encodedQueryFor(tableName);
    } else {
      // handle the rest of the tags...
    }
  }
}
```
If the **filter** attribute value is true, the rule asks the proxy server to encrypt the values in the encoded query. If false, the rule asks the proxy to check whether the field should be encrypted.

**XMLContent**

A global object that provides methods to iterate over the XML content.

You can access an `XMLContent` object by calling `getAsXmlContent()` on a `request` object.

You access XML data in a **POST or URL parameter** by calling

```java
request.postParams.<parameter name>.getAsXmlContent()
```

or

```java
request.urlParams.<parameter name>.getAsXmlContent()
```

**XMLContent - getIterator()**

Returns an `XMLElementIterator` object for the XML content.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td><code>XMLElementIterator</code></td>
</tr>
</tbody>
</table>

**XMLContent - getIterator(String xpath)**

Returns an `XMLElementIterator` object for the XML content based on the specified parameter.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath-like expression that specifies where in the XMLContent object to start.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLContent object.</td>
</tr>
</tbody>
</table>

### XMLElementIterator

Provides methods for iterating over XML elements.

You get an XMLElementIterator object by calling the `getIterator()` method of the XMLContent class.

### XMLElementIterator - hasNext()

Determines if there is another element available.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another element is available.</td>
</tr>
</tbody>
</table>

### XMLElementIterator - next()

Returns the next element in the iterator.

You cannot call `next()` without first calling `hasNext()`.
XMLElement

Provides methods for iterating through XML elements and mapping values to fields in a table.

You get an XMLElement object by calling the next() method of an XMLElementIterator object.

XMLElement - getIterator(String xPath)

Returns an XMLElementIterator object for the XML element based on the specified parameter.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath-like expression that specifies where in the XMLElement object to start.</td>
</tr>
</tbody>
</table>

XMLElement - getIteratorOverAllChildren()

Returns an XMLElementIterator object that includes all sub-elements for the XML element based on the specified parameter.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLElement object.</td>
</tr>
</tbody>
</table>
XMLElement - valueFor(String tableName, String fieldName)

Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted. If the table and field names are unknown, you can call the `valueFor()` method on a table and a field that are dynamically assigned based on the request.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

XMLElement - encodedQueryFor(String tableName)

Specifies that the value of the element is an encoded query for the specified table.
Calling this function on an element tells the proxy that the value of the element is an encoded query for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that must be encrypted.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**XMLElement - getName()**

Returns the element name.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**XMLElement - getAttributeValue(String attribute)**

Returns the value of the specified attribute.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>String</td>
<td>Attribute name.</td>
</tr>
<tr>
<td>Returns</td>
<td></td>
<td></td>
</tr>
<tr>
<td>---------</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>String</td>
<td>The attribute value.</td>
<td></td>
</tr>
</tbody>
</table>

**JSON APIs**

JSON APIs can be used after calling `getAsJsonContent()` on either the request object or a `ParameterValue` property.

When using JSON APIs to write your encryption rule, you can follow a general format:

1. Call `getAsJsonContent()` on the `request` object. This returns an iterable object of the `JsonNode` underlying class.

2. Call `getIterator()` or `getIterator(String xPath)` on the `JsonNode` object. This returns a `JsonNodeIterator` object that can be used to iterate over nodes in the JSON object.

3. Call the `hasNext()` method on the `JsonNodeIterator` object to determine whether another element is available.

4. Call `next()` on the `JsonNodeIterator` object to return the next JSON element. You cannot call `next()` without first calling `hasNext()`.

5. Call `valueFor(String tableName, String fieldName)` on the JSON element. This method tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks whether the field must be encrypted.

   **Note:** To determine if you want to call `valueFor(String tableName, String fieldName)` on a JSON element, you can use the `getName()` method to return the name of the element.

**Mapping to a known table-field on the instance**

In this example, the JSON payload is processed on the instance to insert records in the incident table. The description field populates `short_description` on the incident.

```json
{
    data: {
        records: [
            {
                "name": "Test Record 1",
                "description": "Test Record 1 Description",
            }
        ]
    }
}
```
The following rule can apply:

```javascript
function sampleJsonAction1() {
  var jsonContent = request.getAsJsonContent();
  // This loop iterates over all description elements in the records array
  var jsonNodeIterator = jsonContent.getIterator('/data/records/description');
  while (jsonNodeIterator.hasNext()) {
    var jsonNode = jsonNodeIterator.next();
    jsonNode.valueFor('incident', 'short_description');
  }
}
```

This action iterates through the `description` nodes and asks the proxy server to encrypt the values and insert them into `incident.short_description` on the instance.

⚠️ **Note:** This rule finds all `description` nodes within the JSON payload. If there is only one occurrence of a node to encrypt, the rule still uses the XPath and iterator structure. However, it iterates only once in the loop.

**Mapping to an unknown table-field on the instance**

In this example, the rule iterates over `records`, but is not sure what nodes to expect. The only known is that for each object within `records`, the nodes match the names of the columns specified in the table URL parameter.

The rule also specifies that, if the table is `incident`, then the data in the `description` node should be encrypted and stored in the `short_description` field on the instance.

```javascript
function sampleJsonAction2() {
  var jsonContent = request.getAsJsonContent();
  var tableName = request.urlParam.table;
  // This first iterator will iterate over all record elements
  var jsonNodeIterator = jsonContent.getIterator('data/records');
  ```
while (jsonNodeIterator.hasNext()) {
    encryptFieldsInRecord(jsonNodeIterator.next());
}

In the encryptFieldsInRecord() function, the valueFor() method is called on a table and a field that are dynamically assigned based on the request. Even though the table and field names can change, the rule asks the proxy to check whether the field in the table must be encrypted based on the encryption configurations defined.

If the field is not configured for encryption, or if the node name does not match a field in the table, the proxy skips that node. If the node name matches a field marked for encryption, then the proxy encrypts the value.

Using an encoded query

function sampleJsonAction3() {
    var jsonContent = request.getAsJsonContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var jsonNodeIterator = jsonContent.getIterator('data');
    while (jsonNodeIterator.hasNext()) {
        var jsonNode = jsonNodeIterator.next();
        if (jsonNode.getName() == 'records')
            encryptRecords(jsonNodeIterator.next());
        else if (jsonNode.getName() == 'query')
            jsonNode.encodedQueryFor(tableName);
    }
}

function encryptRecords(jsonNode) {
    // we iterate over all fields in the node
    var fieldIterator = jsonNode.iterator();
    while (fieldIterator.hasNext()) {
        var field = fieldIterator.next();
        var fieldName = childElement.getName(); 
        if (fieldName == 'description') {
            field.valueFor(tableName, 'short_description');
        } else {
            field.valueFor(tableName, fieldName);
        }
    }
}
var recordIterator = jsonNode.iterator();
while (recordIterator.hasNext()) {
  encryptFieldsInRecord(recordIterator.next());
}
}

function encryptFieldsInRecord(jsonNode) {
  // this time we want to iterate over all nodes
  var fieldIterator = jsonNode.iterator();
  while (fieldIterator.hasNext()) {
    var field = fieldIterator.next();
    var fieldname = childElement.getName();
    field.valueFor(tableName, fieldName);
  }
}

In this example, the rule iterates over data. As it finds records, it performs the same logic as in the second example, iterating over fields in each node. When it finds the query node, it calls encodedQueryFor() to encrypt values that should be encrypted in the query.

**JsonNode**

A global object that provides methods to iterate over the JSON content.

You can access a JsonNode object by calling getAsJsonContent() on a request object.

You access JSON content from a POST or URL parameter by calling request.postParms.<parameter name>.getAsJsonContent() or request.urlParms.<parameter name>.getAsJsonContent().

**JsonNode - getIterator(String xPath)**

Returns a JsonNodeIterator object for the JSON content.

This method can only be used on the root node, but can be used to traverse deep into the JSON object. Subsequent traversals must use the iterator() method.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath expression.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNodeIterator</td>
<td>An object that can iterate over nodes in the JSON object.</td>
</tr>
</tbody>
</table>

**JsonNode - iterator()**

Returns a `JsonNodeIterator` object that iterates over all child nodes of the current node.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNodeIterator</td>
<td>An object that can iterate over nodes in the JSON object.</td>
</tr>
</tbody>
</table>

**JsonNode - getAsString()**

Returns the current node value as a string.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The current node value.</td>
</tr>
</tbody>
</table>

**JsonNode - getAsString(String propertyName)**

Returns the string value of the specified property.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propertyName</td>
<td>String</td>
<td>Name of the property.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The property value.</td>
</tr>
</tbody>
</table>

JsonNode - getName()

Returns the name of the current JSON node.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Name of the current JSON node.</td>
</tr>
</tbody>
</table>

JsonNode - valueFor(String tableName, String fieldName)

Specifies that the JSON property maps to the specified field in the specified table.

Calling this method on a JSON property tells the proxy that the value for this property maps to the specified field in the specified table. The proxy then decides if the field must be encrypted. If the table and field names are unknown, you can call the valueFor() method on a table and a field that are dynamically assigned based on the request.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

JsonNode - encodedQueryFor(String tableName)

Specifies that the value of the JSON property is an encoded query for the specified table.

Calling this function on a JSON node tells the proxy that the value is an encoded query for the specified table. The proxy parses the encoded query and encrypts the values for fields in the encoded query that must be encrypted.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

JsonNodeIterator

You get a JsonNodeIterator object by calling the getIterator() or iterator() methods of the JsonNode class.

JsonNodeIterator - hasNext()

Determines if there is another property available.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another property is available.</td>
</tr>
</tbody>
</table>

JsonNodeIterator - next()
Returns the next property in the iterator.

You cannot call `next()` without first calling `hasNext()`.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The next JsonNode.</td>
</tr>
</tbody>
</table>

print(String message)
Prints a message to the wrapper log file: `<proxy server directory>/logs/wrapper_<date>.log`.

This method is available only in an Edge Encryption rule action script.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The message to be written to the wrapper log file.</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

### Prohibited keywords

The Edge Encryption proxy validates encryption rule scripts before saving the rule. Many JavaScript keywords are not allowed in encryption rule scripts.

**Prohibited keywords**

<table>
<thead>
<tr>
<th>Keyword</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DIR</strong></td>
</tr>
<tr>
<td><strong>FILE</strong></td>
</tr>
<tr>
<td><strong>LINE</strong></td>
</tr>
<tr>
<td><strong>parent</strong></td>
</tr>
<tr>
<td><strong>proto</strong></td>
</tr>
<tr>
<td>Error</td>
</tr>
<tr>
<td>eval</td>
</tr>
<tr>
<td>getClass</td>
</tr>
<tr>
<td>getPrototypeOf</td>
</tr>
<tr>
<td>Java</td>
</tr>
<tr>
<td>javax</td>
</tr>
<tr>
<td>javafx</td>
</tr>
<tr>
<td>JavalImporter</td>
</tr>
<tr>
<td>load</td>
</tr>
<tr>
<td>loadWithNewGlobal</td>
</tr>
<tr>
<td>new</td>
</tr>
<tr>
<td>Packages</td>
</tr>
<tr>
<td>Object</td>
</tr>
<tr>
<td>prototype</td>
</tr>
</tbody>
</table>
Prohibited keywords (continued)

<table>
<thead>
<tr>
<th>Keyword</th>
</tr>
</thead>
<tbody>
<tr>
<td>RegExp</td>
</tr>
<tr>
<td>setPrototypeOf</td>
</tr>
<tr>
<td>this</td>
</tr>
<tr>
<td>throw</td>
</tr>
</tbody>
</table>

**Edge Encryption dictionary attributes**

You can add Edge Encryption dictionary attributes to tables and fields.

To set an Edge Encryption dictionary attribute to true, you must enter `attribute=true` in the **Attributes** field. To add a dictionary attribute to a record, see .

**Edge Encryption Excluded [edge_encryption_excluded]**

When set to true, the field or table cannot be encrypted.

- Value: true/false
- Target element: field or table
- Default value: false

**Edge Encryption Enabled [edge_encryption_enabled]**

When set to true, the field is eligible for encryption through an encryption configuration. Because this attribute is used by the system and cannot be modified, it is not always displayed to the user.

**Note:** This attribute does not indicate that a field is encrypted, nor does it trigger any encryption logic on the field. Rather, the attribute determines the possibility of the field being encrypted by a user.

- Value: true/false
- Target element: field
- Default value: true for String fields

**Edge Encryption Clear Text Allowed [edge_encryption_clear_text_allowed]**
When set to true, allows server-side scripts to append non-encrypted data to an encrypted string within the field for user actions performed through the proxy server, or any server-side automated scripts, such as scheduled jobs.

- Value: true/false
- Target element: field
- Default value: false

**Domain separation and Edge Encryption**

Domain separation is unsupported in Edge Encryption. This application provides the ability to encrypt data from within the customer’s environment through the use of specific configurations, rules, and keys defined on the Edge Encryption proxy. The Edge Encryption proxy is not domain aware and cannot support domain-specific settings. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

**Support level: No support**

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

**How domain separation works in Edge Encryption**

Edge Encryption can be used where domain-specific keys, configurations, and rules are not required.

ℹ️ **Note:**

It is not recommended to install Edge Encryption on domain instances at all even for internal service provider usage.

**Related information**

Domain separation for service providers
Data integration with Edge Encryption

To integrate third-party data with an instance using Edge Encryption, you must route the data through the Edge Encryption proxy server using supported integrations. Supported integrations use base system encryption rules that map data in each payload to fields in a table.

Upload data to fields marked for encryption

Edge Encryption does not support importing data from or exporting data to Excel, CSV, XML, or other file types to or from fields with encryption configurations defined.

**ODBC driver**

Encrypt requests and query data through the Edge Encryption proxy server using the ODBC driver.

Learn more: Edge Encryption ODBC driver integration

**MID Server**

You can configure the MID Server to route data through an Edge Encryption proxy server. However, some restrictions apply.

Learn more: Edge Encryption MID Server integration

**REST/SOAP web services**

Use REST/SOAP web services to update or retrieve record data through the Edge Encryption proxy server.

Learn more:

**JSONv2 web service**

Use JSONv2 web service APIs to update or retrieve record data through the Edge Encryption proxy server. Base system encryption rules support data retrieval and data modification APIs.

- To insert a single record using the data modification API, use the `insert()` or `insertMultiple()` methods.
- To insert multiple records using the data modification API, use the `insertMultiple()` method.

Learn more:

To encrypt data from custom third-party integrations not listed above, create custom encryption rules. See Define a custom encryption rule.
Upload attachments to records marked for encryption

Attachments can be uploaded to tables with attachment encryption configured using REST and SOAP web services.

Edge Encryption ODBC driver integration

Configure your ODBC driver to query data encrypted by Edge Encryption. The Edge Encryption proxy server encrypts ODBC driver requests to the ServiceNow instance when Edge Encryption is integrated with the ODBC driver.

Encrypted responses from the instance are decrypted through the Edge Encryption proxy server before passing to the ODBC driver in your network.

For a successful integration, the ODBC driver must trust the Edge Encryption proxy server certificate. If the Edge Encryption proxy server certificate is signed by a Certificate Authority trusted by the ODBC driver, the Edge Encryption proxy server is automatically trusted. However, if a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import the self-signed certificate to the ODBC truststore.

Import a self-signed certificate to the ODBC truststore

If a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import a self-signed certificate to the ODBC truststore. You can export the certificate from the Edge Encryption proxy server and import it into the ODBC truststore.

Before you begin

To determine whether a Certificate Authority trusted by the ODBC driver has signed the Edge Encryption proxy server certificate, run the following command in the keystore directory in the proxy home directory to view a list of Certificate Authorities trusted by the ODBC driver:
keytool -keystore "<ODBC directory>\ip\Java\jre\lib\security\cacerts" -list

**Procedure**

1. Change to the keystore directory in the proxy home directory.
2. Check the keystore for the self-signed certificate.
   
   a. To check the keystore for the certificate, you can run the following command to list all the items in the keystore.
   
   ```
   keytool -list -keystore keystore.jceks -storetype jceks -v
   ```
   
   b. Locate the key alias in the list of items.
3. Using the key alias, export the certificate to a .cer file.
   
   ```
   keytool -export -alias <key alias> -keystore keystore.jceks -storetype jceks -rfc -file <file name>.cer
   ```

4. Change to your ODBC truststore directory: ODBC\ip\Java\jre\lib\security \cacerts.
5. Import the certificate to your ODBC truststore.
   
   ```
   keytool -keystore cacerts -importcert -alias $<key alias> -file <file name>.cer
   ```

**Set the ODBC driver properties**

Set the ODBC driver properties to route requests through the Edge Encryption proxy server.

**Procedure**

1. In Windows, navigate to Start > Programs > ServiceNow ODBC Management Console.

2. Expand the console tree root to: ServiceNow ODBC Manager\Manager \<installation location>\Services\ServiceNow_ODBC\Data Source Settings \ServiceNow\IP Parameters.

3. Double-click the DataSourceIPProperties attribute.

4. Change the Value to the URL of your Edge Encryption proxy server, such as https://<IP address>:<port>
5. Click **OK**.

**What to do next**
The ODBC driver is now configured to route requests to the instance through the Edge Encryption proxy server.

**Edge Encryption MID Server integration**
Configure the MID Server to route data through an Edge Encryption proxy server.

When integrated with the MID Server, the Edge Encryption proxy server acts as the MID Server's endpoint. The Edge Encryption proxy server then encrypts and decrypts data passing between the ServiceNow instance and the MID Server.

**Limitations when integrating with the MID Server**
When MID Server data is configured to pass through the Edge Encryption proxy server, the following limitations apply:

- Encryption of ECC Queue fields is not supported.
- Encrypted data cannot be used with Discovery or Service Mapping.
Point the MID Server to the Edge Encryption proxy server

To pass data from the MID Server through the Edge Encryption proxy server, update the MID Server configuration file to point the MID Server to the Edge Encryption proxy server.

About this task

When configuring the MID Server to pass through the Edge Encryption proxy server, you cannot use the web proxy properties in the MID Server configuration file to route traffic through the Edge Encryption proxy server to your instance. Instead, you must set the Edge Encryption proxy server as the MID Server's endpoint.

Procedure

1. Navigate to your local MID Server directory and open the config.xml file.
2. Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value property to the URL of your Edge Encryption proxy server. For example, http://hostname.mycompany.com:8081. This step directs the MID Server to pass traffic to the Edge Encryption proxy server instead of the instance. The Edge Encryption proxy server in turn encrypts any necessary fields and passes the payload to the instance.
3. Save and close the file.
4. If running, restart the MID Server.

Edge Encryption diagnostics and performance

Monitor Edge Encryption proxy server performance trends and drill into errors generated by the Edge Encryption proxy server.

Edge proxy performance

View key Edge Encryption proxy server performance trends using the Edge Proxy graph set on the ServiceNow Performance homepage. Monitored trends include:

- Maximum and average response times between the client, proxy server, and instance.
- CPU, disk space, and memory usage of the host machine.
- Maximum and average network latency between the proxy server and the ServiceNow instance.

Note: Edge Encryption proxy servers with duplicate names do not report performance trends.
Edge Processing (Max and Average)
Maximum and average time in milliseconds to process a request. These data points are general trends over time.

- **Total Time**: Time for the proxy server to receive a request from a client and send a response. This data point is the sum of the subsequent data points.

- **Proxy Response**: Time for the proxy server to process a response from the instance.

- **Proxy-Instance Round Trip**: Time for the proxy server to send a request to the instance and receive a response. Includes network latency between the proxy server and the instance and time spent by the instance to process the request.

- **Rules**: Time for the proxy server to evaluate a request using defined encryption rules.

- **Proxy Request**: Time for the proxy server to process a client request and forward it to the instance.

**Edge Proxy Performance (Max and Average)**

Maximum and average percentage of resources used on the host machine.

- CPU Usage
- Memory Usage
- Disk Usage

**Edge Proxy Latency**

Maximum and average network latency in milliseconds at a given point in time. Latency is determined by round-trip time for a proxy server to send a simple ping to the instance and receive a response.

**Proxy Error Reports**

Navigate to *Edge Encryption Configuration > Diagnostics and Troubleshooting > Proxy Error Reports* to view all proxy server errors collected over the past seven days.
Errors are collected over a one-minute period. Each minute, an error report is generated. The vertical axis displays the number of error reports over the last seven days that include each error. For example, even if the DEFAULT_ERROR_CODE error is thrown multiple times over a one-minute report period, the DEFAULT_ERROR_CODE bar will only reach one on the Number of Error Reports axis.

From this view, you can:

• Click each proxy error code bar to see the report on a single error for each proxy server. From this view, you can click the bar again to view the error text in the Edge Encryption Proxy Stat table [edge_encryption_stat]. Follow links in the error text to see more information and possible remediation steps.

• Click Other to see page two of the error report.

Note: If you have more than one proxy server with the same name, a single DUPLICATE_PROXY_NAME error appears in the Proxy Error Report. No other errors are reported for proxy servers with duplicate names. If you encounter this error, make sure that all proxy servers have unique names.

Additional monitoring resources
The instance tracks all encryption proxies. Each Edge Encryption proxy server registers when it starts up. The instance is notified when:

• A new Edge Encryption proxy server starts up.

• An Edge Encryption proxy server is intentionally shut down.

If an Edge Encryption proxy server attempts to register with an instance that does not have Edge Encryption installed, the proxy does not start.
All encryption configuration files are audited. Deleted records are audited on all encryption configuration files. Audit records are put in the sys_audit table. To view the history of a specific configuration record, view the record, and click History > List in the menu. The Mass Encryption Job is not audited.

Use the following additional resources to monitor your proxy servers.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invalid Insert Attempts</td>
<td>List of attempts to save the following data to encrypted fields:</td>
</tr>
<tr>
<td>[sys_edge_encryption_invalid_insert_log]</td>
<td>- Unencrypted data.</td>
</tr>
<tr>
<td></td>
<td>- Data that did not come from an Edge Encryption proxy.</td>
</tr>
<tr>
<td></td>
<td>The instance rejects and then logs any attempts to save this data. If you have the security-admin role, you can view the logs in the Invalid Insert Attempts list.</td>
</tr>
<tr>
<td>Job Failures</td>
<td>A list of jobs that did not execute successfully.</td>
</tr>
<tr>
<td>[sys_encryption_job_execution]</td>
<td>The instance periodically checks for messages from each registered proxy server. If a proxy server has not sent a message in the required time frame, an error is logged. The log message contains information about the encryption proxy and the last time the proxy pinged the instance. If the instance determines that none of the encryption proxies are online, it logs a message. These messages are added to the system log.</td>
</tr>
</tbody>
</table>

Disable or reduce Edge Proxy statistic collection

Prevent the Edge Encryption proxy server from sending Edge Proxy Graph Set statistics to the ServiceNow Performance homepage, or reduce the frequency of statistic collection.

Before you begin
Role required: admin or security_admin
About this task
By adding properties in the edgeencryption.properties configuration file, you can:

• Disable the Edge Proxy graph set.
• Change the interval during which statistics are collected by the Edge Encryption proxy server. By default, statistics are collected every 30 seconds.

Procedure
1. In your proxy server installation directory, open the edgeencryption.properties configuration file located in the <installation directory>/conf/ folder.
2. Add one of the Edge Encryption proxy server properties.
3. Restart the proxy server.

Entity View Action Mapper
Entity View Action Mapper (EVAM) is an application that standardizes how different data sources display in cards and lists.

EVAM enables you to show information as a card grid view or as a list of information in a list view. Users can page through large data sets of search results and see different views based on filtering.

Prior to EVAM, lists were restricted to a single type of data source. If there were more data sources, you would have to write a custom implementation. EVAM enables you ingest multiple lists from different data sources, and then configure specific views without the need for customization.
EVAM flow

EVAM consists of the following:

- **Entity (datasource)** - The entity that has associated data that you intend to display. For example, a community post or a user.

- **Map** – The mapping process maps the datasource data to component properties that display on the card. You can also associate actions that trigger from the card view.

- **View** – A view is how a card displays data and actions.

- **Actions** – An entity can have an action that performs on the card. For example, you can activate a user into your system.
Features of EVAM

**Use multiple datasources for a single list view**

EVAM can accept multiple disparate datasources and configure the data through sorting and filtering to return the data as a single list.

**Define view templates**

Map the datasource output to a UX component view by using view templates. You can configure multiple view templates per datasource based on a condition to customize how data displays for users.

**Create view configurations to combine conditions, database fields, and declarative actions**

Create a view configuration to combine conditions, database fields, and declarative actions with an associated view template. You can also group view configurations together to create configuration bundles.
Enable user interactions to trigger actions

EVAM enables user interactions to trigger a server script or UXF client action.

What to do

• Define a datasource
• Create an EVAM definition
• Associate a view configuration, view template, and action.

Activation information

EVAM is a Now Platform application that is active by default.

Getting started: Create a multi-data source list display in Entity View Action Mapper

This is a step-by-step process to use EVAM to take in different datasources, configure views, and show them in a card display view.

Before you begin

Role required: admin or evam_admin

About this task

A typical scenario is showing user requests and incidents in a single display view. A user might want to see requests that can be made from a catalog, such as a computer order. They also might want to see open or closed incidents. These items come from different datasources, but need to display through a consistent standard that can be easily configured.

This tutorial runs through creating an EVAM definition with two datasources, a configuration bundle for each datasource which contains two view configurations, and associated actions and view templates. Many tasks are repeated, instead of repeating each step, the following table lists the unique configurations and definitions:

<table>
<thead>
<tr>
<th>EVAM Definition</th>
<th>Datasource [Table]</th>
<th>Configuration Bundle</th>
<th>Action</th>
<th>Configuration View</th>
<th>View Template</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Requests</td>
<td>Catalog Requests [Requested Item]</td>
<td>Catalog Request Bundle</td>
<td>Navigation</td>
<td>Open Requests</td>
<td>Open Request Template</td>
</tr>
</tbody>
</table>
(continued)

<table>
<thead>
<tr>
<th>EVAM Definition</th>
<th>Datasource [Table]</th>
<th>Configuration Bundle</th>
<th>Action</th>
<th>Configuration View</th>
<th>View Template</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Closed Requests</td>
</tr>
<tr>
<td>Incidents Submitted [Incidents]</td>
<td>Incidents Submitted Bundle</td>
<td></td>
<td></td>
<td></td>
<td>Closed Request Template</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Open Incidents</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Open Incidents Template</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Closed Incidents</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Closed Incidents Template</td>
</tr>
</tbody>
</table>

**Procedure**

1. **Create an EVAM definition for user requests.**
   
   An EVAM definition houses datasources, configuration bundles with associated view configurations, data filters, actions, and templates. After you initially submit your EVAM definition, you will see the related lists to add datasources, configuration bundles, and data filters.

2. **Define datasources for your EVAM definition.**
Create and link each datasource to the User Request definition. The initial datasource is for catalog requests. You can also make one for incidents submitted.

3. Create and link a view configuration bundle.
   You should create two configuration bundles, a catalog request bundle and an incidents submitted bundle.
4. Use the Create and Link to add create and add view configurations. The first one will be for Open Requests. Use the Create and Link to add create and add view configurations. The first one will be for Open Requests.

5. Create an action definition. You can use the create and link related list.
6. Create view templates for requested items and associate with the view configuration.
Here is the template info for the Requested Items Template:

```json
{
  "component": "now-card-evam-record",
  "staticValues": {
    "highlightedHeaderIcon": {
      "key": "clock-outline"
    },
    "highlightedHeaderBkgColor": {
      "key": "positive"
    }
  }
}
```
7. Repeat steps 3-5 to add another view configuration for closed requests. You created a configuration bundle with one view configuration. Add another configuration called Closed requests. This view configuration references the same datasource [requested item], but uses different conditions to show ().

8. Associate view templates to view configurations, click update.

9. View your finished product.

Create an EVAM definition

Define the list of data sources to render. The EVAM definition is the main record for an EVAM configuration.
Before you begin
Role required: admin or evam_admin

Procedure
1. Navigate to **Entity View Action Mapper (EVAM) > EVAM Definitions**, and then click **New**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the EVAM configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the EVAM definition.</td>
</tr>
<tr>
<td>Sort Order</td>
<td>Order the data is ordered on the EVAM definition. You can select <strong>Ascending</strong> or <strong>Descending</strong>.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the EVAM definition.</td>
</tr>
</tbody>
</table>

3. Click **Submit** and then select your EVAM definition.

4. In the **EVAM Datasource M2Ms** related list, add a datasource:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create and Link</td>
<td>You can define a new data source and then link this datasource to your EVAM definition.</td>
</tr>
<tr>
<td>Link Existing</td>
<td>You can add a pre-defined datasource to your EVAM definition.</td>
</tr>
<tr>
<td>Unlink Selected</td>
<td>You can remove the selected datasource from your EVAM definition.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

6. In the **EVAM View Config Bundle M2Ms** related list, add a configuration bundle:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create and Link</td>
<td>You can define a new configuration bundle and then link this bundle to your EVAM definition.</td>
</tr>
<tr>
<td>Link Existing</td>
<td>You can add a pre-defined configuration bundle to your EVAM definition.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Unlink Selected</td>
<td>You can remove the selected configuration bundle from your EVAM definition.</td>
</tr>
</tbody>
</table>

After you link the configuration bundles, you can define an order to prioritize the bundles, with the lowest number receiving the higher precedence.

7. In the **EVAM Data Filters** related list, click **New** and fill in the form to add data filters:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Label name of the EVAM data filter.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the EVAM data filter.</td>
</tr>
<tr>
<td>Order</td>
<td>Priority that the EVAM view configuration takes over other view configurations. To give higher priority to a view configuration, enter a lower number.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the EVAM view configuration.</td>
</tr>
<tr>
<td>EVAM Definition</td>
<td>Associate an EVAM definition with the data filter.</td>
</tr>
</tbody>
</table>

8. Click **Submit**.

**Define a datasource**

The datasource is an entity that has associated data that you intend to display. For example, a community post or a user.

**Before you begin**

Role required: admin or evam_admin

**Procedure**

1. Navigate to **Entity View Action Mapper (EVAM) > Datasources**, and then click **New**.

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application scope of the datasource.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the datasource.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the datasource.</td>
</tr>
<tr>
<td>Table</td>
<td>Choose a table to use for the datasource.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition to define how to filter the data from the selected table.</td>
</tr>
<tr>
<td>Sort By</td>
<td>Table column to use for sorting the table data. For example, you can select to sort knowledge articles by the creation date.</td>
</tr>
</tbody>
</table>

Note: You can only use Sort By for datetime fields when sorting different records.

3. Click Submit.

**View configurations, view templates, and configuration bundles for EVAM**

A view configuration combines conditions, database fields, and declarative actions with an associated view template. You can also group view configurations together to create configuration bundles.

EVAM has pre-defined view configurations, view templates, and configuration bundles to make it easier to use the feature. The OOB configuration bundles include:

- Service Portal Search Bundle
- Service Portal bundle (sp_bundle)

These bundles have view configurations attached that are anticipated to fit the business unit associated. You can also create or edit configuration bundles to meet your needs.

View configurations have an associated view template, tables and conditions, designated table field with data, and associated declarative actions. You can look at the demo_evam_dataset for examples of OOB configuration views. These view configurations are ready to use and are meant to work with many use cases. You can also create or edit view configurations to meet specific needs.

The OOB view templates match an associated view configuration. The templates contain the JSON used to give the necessary information for the card display and use. For example, the Attachment Search Template contains the following:
The JSON structure has the following sections:

<table>
<thead>
<tr>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component</td>
<td>The card component name.</td>
</tr>
<tr>
<td>staticValues</td>
<td>The static text mapping to component properties. These values have the following properties:</td>
</tr>
</tbody>
</table>
These view templates are ready to use and are meant to work with many use cases. You can also create or edit view templates to meet specific needs.

**Define an EVAM view configuration**
Create a view configuration to combine conditions, database fields, and declarative actions with an associated view template.

**Before you begin**
Role required: admin or evam_admin

**Procedure**
1. Navigate to **Entity View Action Mapper (EVAM) > View Definitions > View Configurations**, and then click **New**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the EVAM view configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the EVAM view configuration.</td>
</tr>
<tr>
<td>Required Roles</td>
<td>Roles to define who can view the EVAM view configuration</td>
</tr>
<tr>
<td>View Template</td>
<td>Template to associate with the EVAM view configuration.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the EVAM view configuration.</td>
</tr>
</tbody>
</table>
3. Click **Submit**.

### Define an EVAM view template

You can configure multiple view templates per datasource based on conditions to customize how data displays for users. The view template maps fields from the view configuration to component.

**Before you begin**

Role required: admin or evam_admin

**Procedure**

1. Navigate to Entity View Action Mapper (EVAM) > View Definition > View Templates, and then click **New**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the EVAM view template.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the EVAM view template.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the EVAM view template.</td>
</tr>
<tr>
<td>Template</td>
<td>A JSON template which defines the view for a mapped datasource. For example, the default search template contains the following:</td>
</tr>
</tbody>
</table>

```json
{
    "component": "sn-search-result-evam-card",
    "staticValues": {
```

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Priority that the EVAM view configuration takes over other view configurations. To give higher priority to a view configuration, enter a lower number.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to associate with the EVAM view configuration.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions for when to use the EVAM view configuration.</td>
</tr>
<tr>
<td>Table Fields</td>
<td>Table fields to display on the EVAM view configuration.</td>
</tr>
<tr>
<td>Custom Fields</td>
<td>A custom field to display on the EVAM view configuration.</td>
</tr>
</tbody>
</table>
3. Click **Submit**.

**Create an EVAM action definition**

You can associate a declarative action with a view template. EVAM also enables user interactions to trigger a server script or UXF client action.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **Entity View Action Mapper > Action Definition**, and then click **New**.

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action label</td>
<td>Display label of the EVAM action.</td>
</tr>
<tr>
<td>Action name</td>
<td>Database name for the EVAM action name.</td>
</tr>
<tr>
<td>Implemented as</td>
<td>Implementation of the EVAM action definition. Select one of the following:</td>
</tr>
<tr>
<td></td>
<td><strong>Server Script</strong>&lt;br&gt;Executes a script on the server, for example, to assign a record to someone, or delete a record.</td>
</tr>
<tr>
<td></td>
<td><strong>UXF Client Action</strong>&lt;br&gt;Takes action on the client side, such as opening a record or making a phone call.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Specify client action | You can choose a pre-defined action. For example, SC Content Items KB Article Navigation, to display KB articles.

Note: This field appears only if you select to implement the action as a UXF client action.

Application | Application scope of the EVAM action.
Active | Option to activate the EVAM action.
Description | Description of the EVAM action.

3. Click **Submit**.

**Define an EVAM configuration bundle**

Create a view configuration to combine conditions, database fields, and declarative actions with an associated view template.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **Entity View Action Mapper (EVAM) > View Definitions > View Configurations**, and then click **New**.
2. On the form, fill in the fields.

Field | Description
--- | ---
Name | Name of the EVAM view configuration.
Active | Option to activate the EVAM view configuration.
Required Roles | Roles to define who can view the EVAM view configuration
View Template | Template to associate with the EVAM view configuration.
Application | Application scope of the EVAM view configuration.
Order | Priority that the EVAM view configuration takes over other view configurations. To give higher priority to a view configuration, enter a lower number.
Table | Table to associate with the EVAM view configuration.
### Condition

Conditions for when to use the EVAM view configuration. Click **Add Filter Condition** to select which conditions should be met.

### Table Fields

Table fields to display on the EVAM view configuration. You can choose from available table fields and move them to **Selected**. You can also order the order they are shown.

### Custom Fields

A custom field to display on the EVAM view configuration. You must supply a comma-separated list of table fields are required for the template.

---

**Flow Designer**

Flow Designer is a Now Platform® feature for automating processes in a single design environment. Flow Designer lets process owners use natural language to automate approvals, tasks, notifications, and record operations without coding.

You can expand Flow Designer to communicate with external instances and third-party systems by requesting a separate subscription to **IntegrationHub**.

**Flow Designer in action**

Watch this seven-minute video to learn how to create and test a flow in Flow Designer. Demonstrates how to create a flow in Flow Designer.

For developer training, see **Using Flow Designer** on the ServiceNow® Developer Site.

**Flow Designer benefits**

Flow Designer provides process owners and developers these benefits:

- Automates repetitive work to improve efficiency and experience.
- Describes a workflow in natural language to help non-technical users understand what it does.
- Enables creating and testing a workflow from a single interface to ensure it works as expected.
- Promotes process automation by enabling subject matter experts to develop and share reusable actions with flow designers.
- Reduces upgrade costs, with upgrade-safe Now Platform logic replacing complex custom script.
• Reduces development costs by providing a library of reusable actions.

• Enables extending Flow Designer content by subscribing to ServiceNow IntegrationHub or installing spokes.

Design considerations
While learning Flow Designer, make sure that you understand how existing Now Platform automation processes such as business rules and workflows change records to avoid creating conflicting logic. See the Architecture Overview to understand how Flow Designer works within the Now Platform. Avoid duplicating existing business logic from business rules and workflows. If you’re replacing an existing automation process, you may need to deactivate it before replacing it with Flow Designer flows and actions.

Flow Designer components
Flow Designer consists of the following components:

Flows
A flow is an automated process consisting of a trigger and a sequence of actions. Flows automate business logic for a particular application or process. For example, the VTB Sample Flow creates and assigns a VTB card whenever a priority 1 incident is created. Building and managing flows requires that you have some familiarity with the Now Platform tables and fields that the application or process uses. Process analysts can create flows using available actions or copy an existing flow to use it as a template.

Subflows
A subflow is an automated process consisting of a sequence of reusable actions, data inputs, and outputs. In contrast to flows, subflows do not have a trigger but instead run within a flow, another subflow, or a script. Building and managing subflows requires that you have some familiarity with the Now Platform tables and fields that the application or process uses. Process analysts can create subflows using available actions or use an existing subflow as a template.

Actions
An action is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the Create Record action allows process analysts to generate records in a particular table with particular values when certain conditions occur. ServiceNow core actions like Create Record require some familiarity with Now Platform tables and fields.
Action designers can create application-specific actions to preset configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

**Spokes**

A spoke is a scoped application containing Flow Designer actions and subflows for managing specific tables. For example, the **ITSM Spoke** contains actions for managing Incident and Problem records. For a list of available spokes, see Spokes. You can activate additional spokes on your instance by installing the appropriate app from the ServiceNow Store or activating the appropriate plugin. Building your own spoke requires familiarity with application development on the Now Platform.

**Action steps**

An action step or step is a single reusable operation within an action. For example, the **Create Record** step allows action designers to specify the table and field values to use during record creation. Action steps require subject matter expertise with application tables, fields, and business logic. Application developers or IT generalists add action steps to actions from the Action Designer design environment. Flow Designer provides a set of ServiceNow core action steps to automate Now Platform processes. You can add application-specific action steps by activating the associated spoke.

**Flow Designer environment**

The Flow Designer environment consists of the following interfaces:

- **Flow Designer landing page**
  - Access or create actions, flows, subflows, or their execution details.

- **Flow Designer design environment**
  - Create and edit flows by defining a trigger and adding actions. Test flows to see if they complete successfully and to review the runtime values they generate. Activate flows to make them available for execution on your instance and to preserve their current actions, inputs, and sequence as a snapshot separate from further configuration changes.

- **Action Designer design environment**
Create and edit actions by defining inputs and adding action steps. Test actions to verify if they complete successfully and review the runtime values they generate. Copy actions to use existing actions as templates. Publish actions to activate them, which makes them available to activated flows and to preserve their current action steps, variables, and sequence as a snapshot separate from further configuration changes.

**Flow and action execution details**

View runtime information about an action or flow directly from the design environment such as the current state, actions or steps run, and values produced. Open related records from embedded Now Platform editors or in a new tab.

**Getting started with flows**

Create a sample flow with a trigger and base system actions that requires an approval.

**Before you begin**

Role required: admin

⚠️ **Note:** While Flow Designer is designed to use the flow_designer and delegated_developer roles in most scenarios, this tutorial uses the admin role to illustrate functionality without requiring additional roles to set up records and approve requests.

The ITSM application is required to access the Task table.

Watch this 11-minute video for an introduction to using Flow Designer. Introduction to spokes, setting up an application, granting access, creating a flow, setting up an ATF test, and publishing the flow.

**About this task**

A flow can include these components:

- **Trigger:** An activity that initiates the flow, such as a record created in a specified table or a scheduled job.
- **Conditions:** Statements that determine when or how an action runs. For example, run an action only if a field is over a certain value.
- **Actions:** Operations executed by the system, such as a field value updated, approval requested, or a value logged.

To understand basic flows, create an expense approval flow. This flow:
1. Runs when an Expenses record is created.
2. Uses the total amount to determine which action to run.
3. Approves the request if it is under the specified dollar amount.
4. Requires manager approval if it is over a specified dollar amount. Another approver can be manually added.

Procedure
1. Create a custom application for the flow. Creating flows and actions within an application enables you to publish flows and actions to an application repository and deploy them on other instances. While this example does not use delegated development, you can optionally delegate action and flow designer development by assigning developers to the application.
   a. Navigate to System Applications > Studio.
   b. Create a custom application called Expenses Getting Started.
2. In Studio, create an Expenses table.
   a. Click Create Application File.
   b. Under Data Model, select Table and click Create. A Table form opens.
   c. Complete the form with the following values.
      • Label: Expenses
      • Extends table: Task
   d. Save the form.
   e. Add three additional columns to the table.

<table>
<thead>
<tr>
<th>Column label</th>
<th>Type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>Floating point number</td>
<td>None</td>
</tr>
<tr>
<td>Destination</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Requested for</td>
<td>Reference</td>
<td>User [sys_user]</td>
</tr>
</tbody>
</table>
3. Add four records to the Expenses table to use in Flow Designer tests. When you test your flow in later steps, you can specify which record is used as the trigger, enabling you to test specific record values.

   a. On the Expenses table record, click the Show list related link.

   b. Click New.

   c. Configure the form to add the Amount, Destination, and Requested for fields, and the Approvers related list.

   d. Complete the Destination and Requested for fields. In the Amount field, add a value under 100.00.
      Make sure that the user in the Requested for field in the test record has a manager assigned in the system. If the user in the test record does not have a manager, configure the User form to add the Manager field, and assign a manager to the user.

   e. Submit the form.

   f. Add another record to the table with an amount under 100.00.

   g. Add two more records to the table with a value over 100.00 in the Amount field.

4. In Studio, create a new flow.

   a. Click Create Application File.

   c. Select the Flow option, click Next.

   d. In the Flow Name field, enter Expense Approval.

   e. Click Submit.
      An Expense Approval flow is created in the Expenses Getting Started scope.

5. Create a trigger that runs the flow when a record is created in the Expenses table.
• Trigger: Created
• Table: Expenses [x_expenses_getting_expenses]

6. Add an if condition to the flow.
   a. Select Flow Logic > If.
   b. In the right-hand pane, expand the Trigger - Record Created category and the [Expenses Record] pill. Drag-and-drop the [Amount] pill into Condition 1. A data pill represents the value of a record or a field at a particular stage in your flow. Dragging the [Amount] data pill from the trigger populates the condition with the value of the field in the triggering record.
   c. Set Condition 1 to [Trigger->Expenses Record->Amount] [less than] [100.00].

7. Underneath action 1, click + to add an action that runs when the If condition is met.
8. Create an Update Record action that approves the request.
   - **Action:** Update Record
   - **Record:** Expand the Trigger - Record Created category and drag the [Expenses Record] data pill from the right-hand pane.
   - **Table:** Set to Expenses [x_expenses_getting_expenses].
   - **Fields:**
     - Approval: Approved
     - Work notes: Auto-approved. Amount less than $100.00

9. Add an else condition to the flow.
   - **a.** Select Flow Logic > Else.

10. Underneath action 2, click + to add an Ask for Approval action that runs when the Else condition is met.
a. Complete the fields in the Ask for Approval step.
   
   • **Action:** Ask for Approval
   
   • **Record:** Expand the [Trigger - Record Created] category and drag the [Expenses Record] data pill from the right-hand pane.
   
   • **Table:** Set to Expenses [x_expenses_getting_expenses].
   
   • **Approval Field:** Set to Approval.
   
   • **Journal Field:** Set to Approval history.

b. Define the rules in the Ask for Approval step.

   • **[Approve]** when [Anyone approves] from the field [Trigger->Expenses Record->Requested for->Manager], [OR]

   • [Anyone approves] from the [Manual User(s)] list. Select 🧵 to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see Generate approvals using the approvers related list.

   Select Add another OR rule set to define rejection rules. When defining approvals, make sure to include rejection rules to avoid creating flows that remain in a waiting state if there are no matching approval rules.

   • **[Reject]** when [Anyone rejects] from the field [Trigger->Expenses Record->Requested for->Manager], [OR]

   • [Anyone rejects] from the [Manual User(s)] list.
c. Define a due date to automatically approve, cancel, or reject an approval if the request is not approved or denied by the designated time. Adding a due date ensures that the flow does not remain in a waiting state.

- **[Approve]** if pending by **[Relative date] [1][Days]** from **[Trigger->Expenses Record->Created]**.

- **Days schedule [8-5 weekdays excluding holidays]**.

This due date automatically approves all requests that have not been approved or denied within one day from when the request was created.

11. Click **Save**.

12. Test the flow using a record with an amount below the designated limit.

a. From the flow, click **Test**.

   The Test flow modal appears.

b. In the **Record** field, select a record you created in earlier steps that has value in the **Amount** field under the 100.00 limit. This field is a reference to the table defined in the trigger.

   **Note:** Testing a flow bypasses the trigger conditions and immediately runs it. To test a flow with a record-based trigger, you must select a specific record to act as the trigger.

c. Select **Run Test**.
d. After the flow executes, click **Flow has been executed. To view the flow, click here**. The Execution Details open.

Because the amount is less than 100.00, the first condition is met and the request is approved.

13. Navigate back to the flow and run the test again using a record with an amount over the designated amount.

14. After the flow executes, open the flow Execution Details. Because the amount is over the designated limit, the request must be approved. Until a manager or a manual approver approves the request, the state is **Waiting**.
15. Approve the request. In an active flow, a user from the Approvers list would approve or reject the request. However, because the flow is being tested, an admin can approve the flow.

a. Navigate to the test record.
   The associated manager appears in the Approvers related list with Requested in the State field. Alternatively, you can edit the list to add manual approvers.

b. Change the value of the State field in the Approvers related list to Approved.

c. Navigate back to the flow Execution Details and refresh the browser.
Because the request is approved, the flow completes.

What to do next
Transform the Ask for Approval action into a reusable action using Action Designer. Actions enable flow designers to add complex actions to multiple flows with minimal configuration. See Getting started with actions.

Build your first flow in Flow Designer
Step through an example of how to build, test, and activate a sample flow in Flow Designer.

Before you begin
- Role required: admin, flow_designer, or delegated_developer
- Make sure to familiarize yourself with any features that your business uses to automate operations on the Now Platform, such as Flow Designer, business rules, and workflows. Learning about these concepts can help you avoid creating any conflicting logic in your processes.

About this task
To help you get started with building your first flow in Flow Designer, follow along with the steps below. The example flow that we'll build will start, or trigger, every time a user on the instance creates a request for a Service Catalog item. When a request is created, our flow will automatically run the following actions:
• Check if the catalog item's price is greater than $1,000.
• If the price is greater than $1,000, notify the requester's manager to approve the request.
• Otherwise, if the price is less than or equal to $1,000, automatically approve and close the request.

Procedure
1. Use the filter navigator to go to Process Automation > Flow Designer.
3. In the Flow properties window, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow name</td>
<td>Enter Approval flow for requested items</td>
</tr>
</tbody>
</table>

All other fields are optional, so simply click Submit to open your flow in the Flow Designer design environment.

4. Under the TRIGGER section, select Add a trigger.
5. In the trigger picker, either enter Service Catalog in the search field, or locate the Service Catalog trigger under the APPLICATION category. Then, select the Service Catalog trigger to add this trigger to your flow. Later, when we test this flow, we can simulate firing this trigger by creating a new Service Catalog Item Request record.

6. Click Done to finish adding the Service Catalog trigger to your flow.
7. Under the ACTIONS section, select Add an Action, Flow Logic, or Subflow. Then, select Flow Logic to open the flow logic picker.
8. In the flow logic picker, select If

9. Next to the Condition 1 input, click the pill picker icon (pill picker) to open the dot-walker.
   The dot-walker lets you access data from the trigger in your flow. Later, when you add actions to your flow, you can also use the dot-walker to access data from those actions. You can use the dot-walker to drill down into data that references other records in order to get the proper field placeholder value that you want to drop as a data pill in an action's input.
   10. Navigate, or dot-walk, to Trigger - Service Catalog > Requested Item Record > Price and select Price to add this data pill to the Condition 1 input.
11. In the condition builder's next field, choose greater than, and then enter 1000 in the final field. Now, you’ve successfully set up a condition that will check if the price of the catalog item that a user requests is greater than $1,000.

12. Click Done to finish adding the if flow logic to your flow.

13. Under your if flow logic condition, select Action.

14. In the action picker, either enter Ask For Approval in the search field, or locate the Ask For Approval action by selecting ServiceNow Core > Ask For Approval under the Default subcategory.

15. Add the following values for the Ask For Approval action's inputs:

<table>
<thead>
<tr>
<th>Input</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Click the pill picker icon ( ) to open the dot-walker. Then, navigate, or dot-walk, to Trigger - Service Catalog &gt; Requested Item Record and select Requested Item Record to add this data pill to the input.</td>
</tr>
<tr>
<td>Table</td>
<td>Leave as Requested Item [sc_req_item].</td>
</tr>
<tr>
<td>Approval Field</td>
<td>Leave as Approval.</td>
</tr>
<tr>
<td>Journal Field</td>
<td>Leave as Approval history.</td>
</tr>
<tr>
<td>Rules</td>
<td>Leave the first field as Approve. Under When, select Anyone approves from the list. Then, click the pill picker icon ( ) to open the dot-walker. Navigate, or dot-walk, to Trigger - Service Catalog &gt; Requested Item Record &gt; Opened by &gt; Manager and select Manager to add this data pill to the field.</td>
</tr>
<tr>
<td>Due Date</td>
<td>Leave as None.</td>
</tr>
</tbody>
</table>

Now, you’ve successfully set up a conditional action that will automatically ask for approval from the requester's manager for any catalog item they request that has a price greater than $1,000.
16. Click **Done** to finish adding the conditional Ask for Approval action within the *If* flow logic of your flow.

17. Select **Add an Action, Flow Logic, or Subflow**.
   Then, select **Flow Logic** and choose **Else** from the flow logic picker.

18. Under your **Else** flow logic, click the plus icon (➕) and then select **Action**.
   Finally, select the **Update Record** action from the action picker.

19. Add the following values for the Update Record action's inputs:

```
<table>
<thead>
<tr>
<th>Input</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Click the pill picker icon (🔍) to open the dot-walker. Then, navigate, or dot-walk, to Trigger - Service Catalog &gt; Requested Item Record and select Requested Item Record to add this data pill to the input.</td>
</tr>
<tr>
<td>Table</td>
<td>Leave as Requested Item [sc_req_item].</td>
</tr>
<tr>
<td>Fields</td>
<td>Select + Add field value. Then, select the Approval field and choose Approved as the field's value. Next, select the State field and choose Closed Complete as the field's value. Finally, select the Close notes field and enter Request automatically approved, as requested item's value is less than $1,000 for the field's value.</td>
</tr>
</tbody>
</table>
```

Now, you’ve successfully set up a conditional action that will automatically approve and close the catalog item request if the requested item’s price is less than or equal to $1,000.

20. Click **Done** to finish adding the conditional Update Record action within the Else flow logic of your flow.

21. In the main header, click **Save** to save the changes you’ve made to your flow.
   Your flow should look similar to the following example:
22. Next, in the main header, click Test to test your flow and see if it will trigger and run properly and without any errors.

23. In the Test Flow window, select any Requested Item Record from the list, or you can create a new one by selecting the Create new record icon ( ). Then, select Run Test.

24. Select Your test has finished running. View the flow execution details.

25. On the Execution Details page, you can see the values that populated for the trigger and each automated action in your flow. For more information, see Flow execution details.

26. Navigate back to your flow.

27. In the main header, click Activate so that your flow’s trigger fires whenever a user on your instance creates a new Service Catalog Item Request record.

What to do next
Your flow is now active and will run whenever it’s triggered. Next, you can manage your flow every time it runs by viewing your flow’s execution history. To view this history, open your flow in the Flow Designer design environment and click Executions in the main header. The resulting page shows you the state of completion for each flow execution as well as how long it took for each flow execution to run, or its runtime. To troubleshoot a flow execution for errors, select an execution from this list to open the Flow execution details.
Build a flow from a template in App Engine Studio

Step through an example of how to build, test, and activate a flow using a flow template in App Engine Studio.

**Before you begin**
Create an application in App Engine Studio. Once your application is built, you can use flow templates to create flows. For more information, see Building applications in App Engine Studio.

Role required: admin, flow_designer, or delegated_developer

**About this task**
To help you get started with building a flow from a flow template, follow along with the steps below. The example flow that we’ll build will start, or trigger, every time a user on the instance creates a request for a Service Catalog item. When a request is created, our flow will automatically run the following actions:

• Check if the catalog item’s price is greater than $1,000.
• If the price is greater than $1,000, notify the requester’s manager to approve the request.
• Otherwise, if the price is less than or equal to $1,000, automatically approve and close the request.

**Procedure**

1. Navigate to **App Engine Studio > App Engine Studio**.
2. From the My Apps page, open your application.
3. In your application, next to Automation, click the add icon (+).
4. From the gallery of automation templates, select **Create an approval for a requested catalog item**, then click **Begin**.
5. From the **Template catalog item** list, select the **Standard Laptop**.
6. In the **Ask for approval if the catalog item’s price is greater than** field, enter 1000, then click **Done**.
7. In the **Name** field, enter **Approval flow for requested items**.
8. In the **Description** field, enter **Approval flow for requested items**, then click **Continue**.
9. Once your flow is created, click **Edit this flow**.
10. On the flow page, click the **If not approved** step, then click **Delete** to remove the step.
11. At the bottom of the flow, click the Log step, then click Delete to remove the step.

12. In the same way, delete the last two log actions at the bottom of the flow.

13. Select Add an Action, Flow Logic, or Subflow. Then, select Flow Logic and choose Else from the flow logic picker.

14. Under your Else flow logic, click the plus icon (➕) and then select Action. Finally, select the Update Record action from the action picker.

15. Add the following values for the Update Record action’s inputs:

<table>
<thead>
<tr>
<th>Input</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Click the pill picker icon (➕) to open the dot-walker. Then, navigate, or dot-walk, to Trigger - Service Catalog &gt; Requested Item Record and select Requested Item Record to add this data pill to the input.</td>
</tr>
<tr>
<td>Table</td>
<td>Leave as Requested Item [sc_req_item].</td>
</tr>
<tr>
<td>Fields</td>
<td>Select + Add field value. Then, select the Approval field and choose Approved as the field’s value. Next, select the State field and choose Closed Complete as the field’s value. Finally, select the Close notes field and enter Request automatically approved, as requested item’s value is less than $1,000 for the field’s value.</td>
</tr>
</tbody>
</table>

Now, you’ve successfully set up a conditional action that will automatically approve and close the catalog item request if the requested item’s price is less than or equal to $1,000.

16. Click Done to finish adding the conditional Update Record action within the Else flow logic of your flow.

17. In the main header, click Save to save the changes you’ve made to your flow. Your flow should look similar to the following example:
18. Next, in the main header, click Test to test your flow and see if it will trigger and run properly and without any errors.

19. In the Test Flow window, select any Requested Item Record from the list, or you can create a new one by selecting the Create new record icon (➕). Then, select Run Test.

20. Select Your test has finished running. View the flow execution details.

21. On the Execution Details page, you can see the values that populated for the trigger and each automated action in your flow. For more information, see Flow execution details.

22. Navigate back to your flow.

23. In the main header, click Activate so that your flow’s trigger fires whenever a user on your instance creates a new Service Catalog Item Request record.

What to do next
Your flow is now active and will run whenever it’s triggered. Next, you can manage your flow every time it runs by viewing your flow’s execution history. To view this history, click Executions in the main header. The resulting page shows you the state of completion for each flow execution as well as how long it took for each flow execution to run, or its runtime. To troubleshoot a flow execution for errors, select an execution from this list to open the Flow execution details.
Use the Flow Designer help panel

Browse topics in the side help panel to learn more about building flows and actions, working with data and spokes, and stepping through guided tours in Flow Designer.

Before you begin
Role required: admin, flow_designer, or delegated_developer

Procedure

2. In the Flow Designer landing page's main header, select the question mark icon to open the help panel.
   You'll see help topics that you can select and browse for more information about building flows and actions, working with data, and setting up IntegrationHub spokes.

3. To close the help panel, select the question mark icon again.

4. Open any flow from the list of flows to go to the Flow Designer design environment.

5. Next to the name for any action in the flow, select the Open help panel icon.
   The help panel opens with information about the action and how to use the action's inputs and outputs in your flow. If no help content is available for your selected action, then the panel displays No help content found for: and the action's name.

6. You can also access guided tours from the help panel by selecting the question mark icon while in the Flow Designer design environment.
   After opening the help panel, locate a help card beginning with Tour: and select that card to start the tour.

Results
The help panel opens with help content about flows, actions, spokes, and guided tours.
Architecture Overview

Understand how Flow Designer works within the Now Platform to activate, trigger, and process flows and actions.

A flow consists of a trigger and one or more actions. The trigger specifies when to start the flow, which can be record-based, schedule-based, or application-based. Record-based triggers run a flow after a record has been created, updated, or deleted. The flow can use the triggering record as input for actions. Schedule-based triggers run a flow at the specified date and time. The flow can use the execution time as input for actions. Application triggers are added when the associated application is activated. For example, the MetricBase trigger is present when the MetricBase application is active.

Flow processing
Flow processing occurs in this sequence.

1. When the flow trigger conditions occur or an API directly calls the flow, the system creates an entry in the event queue to start the flow.
2. The scheduler processes the event and starts the flow in the background.
3. The system builds a process plan from the flow.

4. The system runs the process plan using the record that triggered the flow.

5. The system stores the execution details in a context record.

1. **Process flow triggers and API calls**

   Each time trigger conditions are met or an API directly calls a flow, Flow Designer creates an event entry. The system processes triggers after database operations. To learn more, see . Typically, business rules and workflows that run synchronously run before a triggered flow.

2. **Process events in the queue**

   Each flow event contains a reference to the flow to start and a reference to either the triggering record or the execution time. The system processes these events using Standard event processing where a scheduler periodically works through the current items in the event queue in the order in which they were added. Depending on what other events are in the queue, the system may not immediately start a flow. Flow designers should expect some lag time between when the trigger conditions occur and when the flow actually starts.

3. **Build the process plan**

   When Flow Designer pulls an event from the queue, it builds a process plan to actually run the flow. A process plan contains all the information necessary to execute a flow such as the sequence of published actions or subflows, the input values for each subflow or action, the action steps to run for each action, and the data provided by the trigger or subflow output.

   Flow Designer uses a just-in-time compilation scheme to ensure that process plans contain the latest changes to flows, subflows, and actions. If no changes are detected, Flow Designer uses a cached copy of the process plan. Otherwise, it builds a new process plan.

   By automatically checking for updated flows, subflows, and actions with process plans, Flow Designer enables you to apply changes from update sets and upgrades without having to edit current flows.
If you move published actions to a target instance, every flow that uses the published action will automatically update the next time it is executed.

⚠️ **Warning:** If changing subflows or actions used in activated flows, do not change the inputs and outputs used in the subflow or action. Changing inputs and outputs may cause errors when the activated flow is next triggered because it has not been configured to use the new inputs and outputs. Any currently running flows are unaffected by changes to inputs or outputs as the flow uses the compiled subflows and actions from the process plan.

4. **Run the process plan**

Flow Designer runs the process plan as the **System** user within the flow application scope.

When running a flow with a record-based trigger, Flow Designer stores the triggering record in memory as an instance that is represented in the interface as a data pill.

The instance contains the record values from when the flow started, which may be different than the current record stored in the database. For example, suppose that creating an incident record triggers a flow. Any changes a user makes to the incident record after the flow has started do not update the triggering record unless an action specifically looks up the current record value.

5. **Store flow execution details**

Flow Designer stores flow execution details in a **flow context record**, which contains this information.

- Flow outcome state
- Flow runtime duration
- Flow log messages
- Flow configuration and runtime values

Each time a flow runs, Flow Designer adds an entry to the **Flow Executions** list. Each entry has its own context record and matching execution details page.
**Note:** A flow execution context runs in a single thread. However, there may be times when you want to run flows within separate contexts even though this may consume more of your instance’s resources. To run subflows in separate flow contexts within the same flow, see [Dynamic flows](#).

A flow can have one of these outcome states.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The flow completed successfully.</td>
</tr>
<tr>
<td>In Progress</td>
<td>The flow is running. By default, a transaction quota rule prevents flows from running longer than an hour.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The flow is waiting for another event to occur. For example, a user must update a task or approval, or a record must reach a specific state. When in the waiting state, the flow is quiesced and serialized into a context record.</td>
</tr>
<tr>
<td>Canceled</td>
<td>The flow was canceled by a user.</td>
</tr>
<tr>
<td>Error</td>
<td>The flow encountered an error and has stopped running. For example, an action is missing an input value, or a quota transaction rule has stopped the flow.</td>
</tr>
</tbody>
</table>

**Flow, subflow, and action life cycle**

Flow Designer uses the flow or action status to describe the current state of configuration changes.

**Flow and subflow status and activation state**

The **Status** field indicates whether there is a process plan associated with the flow or subflow.

<table>
<thead>
<tr>
<th>Flow status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>Indicates that there are unsaved changes to a flow or subflow. Modified flows or subflows have not been saved.</td>
</tr>
<tr>
<td>Draft</td>
<td>Indicates that there are saved changes to a flow or subflow, which have not been stored in a</td>
</tr>
</tbody>
</table>
### Flow Status

<table>
<thead>
<tr>
<th>Flow status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>process plan. Draft flows have been saved but not activated. Draft subflows have been saved but not published.</td>
<td></td>
</tr>
</tbody>
</table>

| Published | Indicates that there is a stored process plan for the flow or subflow. Published flows have either been activated or deactivated. |

The **Active** field indicates whether the system runs a flow or subflow.

<table>
<thead>
<tr>
<th>Active</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>True</td>
<td>Indicates that the flow or subflow is active and runs when triggered or called. The flow has been activated or the subflow has been published. Active flows run when the trigger conditions are met or when called. Active subflows run when called.</td>
</tr>
</tbody>
</table>

| False | Indicates that the flow is inactive and does not run when triggered or called. An inactive flow has either never been activated or has been deactivated. An inactive subflow has never been published. |

When working with flows, you can:

- **Save** a flow: Creates a draft of the flow.
- **Activate** a flow: Enables the flow trigger and transform the flow into a process plan.
- **Deactivate** a flow: Disables the flow trigger and prevents new flow executions. Currently running flows continue to run.

When working with subflows, you can:

- **Save** a subflow: Creates a draft of the subflow. If the subflow is modified after being published, the subflow moves into a draft state. Any active flows that use the subflow only run the published subflow.
- **Publish** a subflow: Enables you to activate a flow containing the subflow. Publishing adds the subflow to the list of available subflows in a flow.
Action status

The Action Designer interface does not display the configuration status of actions. To view action status, navigate to the Action Types table [sys_hub_action_type_definition] and display the Draft state field.

<table>
<thead>
<tr>
<th>Action Draft status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>Indicates that there are changes to an action that have not been published. Draft actions are only available to flows when the Show draft actions option is enabled. You cannot activate a flow containing draft actions.</td>
</tr>
<tr>
<td>Published</td>
<td>Indicates that the action has been published. Published actions are available to all flows and allow flows to be activated.</td>
</tr>
</tbody>
</table>

When working with actions, you can:

- **Save** an action: Creates a draft of the action that is only available to flows when Show draft actions is enabled. If the action is modified after being published, the action moves into a draft state. Any active flows that use the action only run the published action.

- **Publish** an action: Enables you to activate a flow containing the action. Publishing adds the action to the list of available actions in a flow. Only actions in a published state run during flow execution.
Application development

When designing an action or a flow, use these design considerations as a guide.

Use standard Now Platform application development capabilities to create, manage, protect, and deploy Flow Designer content. Flow and action designers typically perform these application development tasks.

- Create a custom application to store flows and actions.
- Set application permissions to share or restrict access to application data.
- Grant application developers access to Flow Designer.
- Publish custom applications to the application repository to deploy flows and actions on other instances.

Security

Control access to Flow Designer processes and records.

- Administrators can grant users access to Flow Designer by creating an application and assigning users as developers with the Flow Designer delegated development permission. Delegated development allows administrators to control whether flow designers can access features normally restricted to admin users such as assigning user roles, creating access controls, or creating scripts. For more information, see Developer permissions.

- Administrators can grant access to Flow Designer by directly assigning users the flow_designer user role, which includes the role to view flow execution details.

⚠️ Warning: Directly granting a user the flow_designer role is equivalent to giving the user the admin role, because Flow Designer can run flows as the System user, which has access to all tables and all database operations.

- Flow and action designers can use standard to manage how their content interacts with other applications.
**Action limit**

By default, flows can have no more than 50 actions. To change the default behavior, increase the value of the `sn_flow_designer.max_actions` system property. However, consider the performance impact that a large flow may have on your instance.

**Trigger options for record updates**

Flow designers can specify how often a flow can update a particular record with the **Run Trigger** option. Use the **Once** option when you want a flow to run only once. The first time a record is updated, the flow runs, but any further record updates do not trigger the flow. Use the **Always** option when you want the flow to run every time a record is updated and there is not already an active flow running for it. For example, you might set a flow that assigns an incident record to run only once, and set a flow that notifies the incident watch list to always run. The **Run Trigger** field is only available for these trigger types.

- Created or Updated
- Updated

**Direct recursion prevention and indirect recursion limit**

To prevent instance outages and consumption of system resources, Flow Designer ignores any request to start a flow or subflow that is the result of direct recursion. Direct recursion occurs under these conditions.

- An action calls the same flow that it is part of. For example, a script step makes an API call to a flow.

- An action or subflow produces a result matching the flow trigger. For example, a flow that runs when an incident record is updated contains an update record action that updates an incident record.

Flow Designer also limits the number of times a flow can be started from indirect recursion. Indirect recursion occurs under these conditions.

- The same flow is called multiple times in a chain of subflow calls. For example, if subflow A calls subflow B, and subflow B calls subflow A, then calling either subflow produces indirect recursion.

- The same flow is triggered multiple times in a chain of subflows. For example, suppose that there are two flows triggered by record creation. Suppose that creating record A triggers flow A and also creates record B. Furthermore, creating record B triggers flow B and creates record A. Creating either record type produces indirect recursion.

By default, the system stops triggering flow runs after the run count reaches the indirect recursion limit of three runs. Administrators can change the limit by
setting the system property `com.glide.hub.flow_engine.indirect_recursion_limit` to an integer value equal to or greater than one. The system ignores any property value less than one and instead uses a limit of one. Consider the performance impact that increasing the indirect recursion limit may have on your instance.

⚠️ **Note:** By default, a transaction quota rule prevents flows from running longer than an hour.

**Flow and action testing**

Testing a flow bypasses the trigger conditions and immediately runs it. Testing a flow with a record-based trigger requires selecting a specific record to act as the trigger. Flow designers should generate appropriate sample records prior to testing.

During the design phase, you can test an inactive flow and unpublished actions by setting **Show draft actions** on the flow. If testing with draft actions, use these guidelines.

- Design flows and actions on a non-production instance. Only deploy active, working flows to your production instance.
- Leave **Show draft actions** set to true until your draft is in a final state. Once final, publish each action, set **Show draft actions** to false, and activate the flow.

⚠️ **Warning:** Disabling **Show draft actions** before publishing your actions removes all draft actions from your flow.

- Any change you make to an active flow or published action causes it to return to a draft state. If the flow is triggered, the system only runs the activated flow and published actions, and the flow execution details only display what was run. When there is a draft of an active flow, the trigger and actions listed in the flow execution details may be different than those listed in the draft flow.

**Flow Designer data**

Each time you add an action to a flow, Flow Designer adds a data pill to store its results. The data pill name indicates its sequence in the flow and its data type.

Flow designers use action result data pills to provide input for other flows, actions, or subflows. Flow designers can use the sequence value in the data pill name to ensure that they select the correct data pill as an input value. When a flow runs an action, it generates the data pill runtime value, which remains the same for the duration of the flow. For example, if a data pill for `[Trigger->Incident`
record] gets populated with incident record values at the start of a flow, the data pill preserves these values for the rest of the flow.

Data pill population
Flow Designer populates data pill values as soon as the data becomes available regardless of where the data pill is located in the flow sequence. For example, suppose that you have a flow triggered by the creation of an incident record with the following actions.

1. Update [Incident] Record that adds a text string to [Trigger->Incident Record->Short description].
2. Log the value of [Trigger->Incident Record->Short description].
3. Log the value of [1->Incident Record->Short description].

Action-1 and Action-2 both use the data pill [Trigger->Incident Record->Short description]. Since the trigger record is available as soon as the flow starts, these values are set before running these actions.

Delayed data pill population
When an action, flow logic, or step includes more than one data pill in the same input, the system delays running it until all data pill values have been populated. This delay might produce unexpected values or prevent flow logic from running at all.

For example, this flow produces unexpected values.

1. Update [Incident] Record that adds a text string to [Trigger->Incident Record->Short description].
2. Log the value of [Trigger->Incident Record->Short description].
3. Log the value of [1->Incident Record->Short description].
4. Log the value of [Trigger->Incident Record->Short description] and [1->Incident Record->Short description].

This flow produces the unexpected result of both data pills in Action-4 evaluating to the same value.

Data security and HTML sanitization
Flow Designer protects against cross-site scripting and code injection by evaluating all string data for HTML markup. The system only preserves HTML markup that is present in its inclusion list. All other HTML markup is removed from string data.
The inclusion list supports these HTML elements and attributes, which cannot be modified.

**HTML inclusion list**

<table>
<thead>
<tr>
<th>HTML element</th>
<th>Included Attributes</th>

### Flow administration modules

Identify and troubleshoot potential issues by reviewing action and flow executions, their result state, and their runtime duration.

Flow Designer provides administrators and flow operators these modules to manage flows.

**Today’s Executions**

Displays a list of flow context records for flows run today. Use this information to identify flows run today.
Active flows
Displays a list of flow context records for running flows where the State is Waiting. Use this information to identify flows that are waiting for a trigger or condition to continue.

Event Queue
Displays a filtered list of event records where the Queue is flow_engine and the State is Ready. Use this information to identify flows that are waiting on event processing.

Operations Dashboard
Displays a responsive dashboard containing a count of flows run and the average flow runtime. View statistics for today or over the last 30 days. Use this information to determine the health and performance of flow execution.

Settings
Displays the list of Flow and Action Settings records. Use this table to identify which actions and flows have had reporting disabled. Create records on this table to control whether reporting is done on an action or flow.

Properties
Displays the system properties used to configure how the system processes flows.

Complex Object Templates
Displays templates for complex objects that you can use in flows with IntegrationHub integrations. To learn more about creating and using complex object templates, see create an action and the Object data type.

Usage Overview
Displays transaction counts between your instance and third-party systems. The Usage Overview is not available in the base system and requires the ServiceNow® IntegrationHub subscription.

Flow Designer landing page
Access or create actions, flows, subflows, or their execution details.

Flows
The Flows screen contains all the flows that your installation of Flow Designer can use. Selecting a flow opens the flow in a new tab. You can see the scope the flow was created in, the internal name of
the flow, whether the flow is published or in draft status, whether the flow is active, and update information.

**Subflows**

The Subflows screen contains all the subflows that your installation of Flow Designer can use. Selecting a subflow opens the subflow in a new tab. You can see the scope the subflow was created in, the internal name of the subflow, whether the subflow is published or in draft status, whether the subflow is active, and update information.

**Actions**

The Actions screen contains all the actions that your installation of Flow Designer can use. Selecting an action opens the action in a new tab. You can see the scope the action was created in, where the action is accessible from, whether the action is active, and update information.

**Executions**

The Executions screen shows a history of actions and flows run, including the current state and duration of each run.

**Connections**

Manage your connections and credentials for IntegrationHub spokes.

**Help**

The Help landing page contains links to Flow Designer documentation, videos, and Community forum discussions.

**New**

You can create a new flow, subflow, or action by selecting an option from the list.

**Help panel**

You can click the question mark icon (❓) to open the Flow Designer help panel and browse topics and guided tours that can help you get started building flows and actions. For more information, see Use the Flow Designer help panel.
Flow Designer system properties

Configure how the system processes flows.

These properties are available for Flow Designer.

To set Flow Designer system properties, click Process Automation > Properties or navigate to the System Properties [sys_properties] table.

Flows

Automate processes with a sequence of reusable actions such as manage records, ask for approvals, create tasks, and send notifications. Define trigger conditions to start a flow and variables to pass information between actions.

Flows consist of a trigger and a sequence of actions. When you add actions to a flow, the data collected or created appears in the data panel, which you can use in other actions.

Triggers

The trigger specifies the conditions that start running the flow. When the trigger conditions are met, the system starts running the flow.

Flow Designer supports record-based, schedule-based, and application-based trigger types. For more information, see Flow trigger types.
Actions

Within Actions, flow designers can add actions, flow logic, and subflows to a flow.

Actions are reusable elements that perform specific operations. Add an action to a flow by opening the action picker. After you add an action, there are a set of inputs that you must configure in order for the action to run when your flow triggers. Enter values for inputs directly, or use data from the Data panel to configure an action’s inputs. At the start of a flow, the data may be limited to the flow trigger or subflow inputs. As you add actions to a flow, the output values of each action appear as data pills in the Data panel.

Action picker

In the ACTION section of a flow, select Add an Action, Flow Logic, or Subflow > Action to open the action picker. You can either enter text in the search window to search for an action, or browse the action categories to find an action that you want to add to your flow.

Action numbering

Sequential numbers appear next to each flow action in the Flow Designer interface. Flow action numbers start with 1 and then increment by 1 as you add more flow actions to your flow.
Note: If you upgraded from a prior release, your inline scripts may still contain references to legacy flow action numbering. See Flow action numbering to automatically update these references for your flow.

Core actions

Your instance comes with a collection of core actions, or frequently used Now Platform operations, that can be added to any flow.

Spoke actions

Some applications include spokes which add application-specific actions. Spoke actions are typically read-only but can be copied and customized.

Custom actions

Developers may also create their custom actions from the Action Designer interface.

Data panel

Flows store any data gathered or generated as variables in the data panel. Each variable has its own pill that Flow designers can use to drag the variable value to an action input or output. Flow Designer generates the pill name based on the contents and its data type. The system specifies the variable data type next to the pill.
Testing flows

You can test a flow directly from the Flow Designer interface. Each test runs your flow as if the trigger conditions were met. If the flow has record trigger, you can specify the record to use for your test. After the flow runs, use the flow execution details to verify that your flow is running properly.

**Important:** Always run tests on a non-production instance where flow record changes cannot interfere with your production data.

Flow execution details

Each time you test a flow, the system generates flow execution records, log messages, and reports. The flow context is a related record containing the current state and runtime values of the flow. The system generates a context record each time a flow is run.
Optionally, you can configure the system to generate execution details anytime a flow is run, not just during testing. For more information, see Activate flow reporting.

**Flow properties**

The flow properties contain information about your flow. In the main header, select **Properties** to view or edit your flow’s properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the flow</td>
</tr>
<tr>

<td>Application</td>
<td>Select an application for the flow. This property is set when creating the flow and cannot be changed afterwards.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the flow.</td>
</tr>
<tr>
<td>Run As</td>
<td>Use this option to specify if the flow runs as system user or the user who initiates the session. Select the user who initiates the session option when updates should come from the user who triggered the flow. For example, when you want incident record comments to come from the current user, or approval emails to originate from the approver. Settings for the Run as option in a flow don’t apply to child subflows.</td>
</tr>
<tr>
<td>Run with role(s)</td>
<td>Select the roles the flow runs with. This option is only available when Run as is set to <strong>user who initiates the session</strong>.</td>
</tr>
</tbody>
</table>

**Printing flows**

Flow Designer supports multipage printing for flows, subflows, actions, and flow execution details. For a list of supported browsers, see **Browser support**.

**Roles**

To access Flows, a user must have the flow_designer or admin roles.
**Design considerations**

**Create flows when you require the trigger data as a flow input**

Since flows always run whenever their trigger conditions are met, make sure that your flow needs a trigger. Triggered flows always provide the same trigger data as a flow input. If you need variable flow input data, create a subflow instead.

**Create subflows when you want to reuse business logic**

A subflow allows you to configure its input values differently each time you call it. For example, design a subflow to accept different record types as an input. Reuse this generic record subflow instead of writing a specific flow for each record type.

**Grant flow roles to access role-protected data and preserve user information**

Instead of running a flow as the system user, use flow roles to preserve user information and grant access to data. Adding flow roles allows a user-initiated flow access to data it would not otherwise have. The roles granted only apply to the flow. They do not apply to the user who initiated the flow.

**Use flow logic or a schedule-based trigger to control flow timing**

To pause a flow for a specific duration, use **Wait for a duration flow logic**. To run a flow at a specific time, use a schedule-based trigger. Avoid using the `gs.sleep()` method to wait within a flow.

**More Actions**

Click the **More Actions** icon to access additional options for your flow.

**Stages**

Access the stages for a flow.

**Manage flow catalog variables**

Manage the catalog variables available to Service Catalog-triggered-flows.

**Flow Variables**

Create flow variables to set and retrieve data throughout a flow.

**Copy flow**

Create a copy of the open flow in an application you specify.

**Flow preferences**
Enable or disable the **Show draft actions**, **Show triggered flows**, **Show store spokes**, and **Show inline script toggle** options.

### Create code snippet
Generate a code snippet to call a specific flow, subflow, or action.

### Manage security
Enable or disable the **Callable by Client API** option.

### Change default flow title
Change the default title for your flow by adding styled or dynamic text. For more information, see [Create a natural language title](#).

---

## Create a flow
Automate a process to run one or more actions when a trigger condition occurs.

### Before you begin
- Set up an application in Guided Application Creator to store Flow Designer content.
- Role required: flow_designer or admin

### About this task
Users with the flow_designer or admin role should know the application table structure and be aware of any existing business logic associated with the target tables of a flow or subflow. Be sure to disable any conflicting business rules or workflows before creating a flow or subflow.

Creating a custom application to contain your Flow Designer content enables you to deploy the application using the application repository or the ServiceNow Store.

Demonstrates how to create a flow in the Flow Designer.

### Procedure
1. Navigate to **Process Automation > Flow Designer**.
2. Click **New > Flow**.

### Field | Description
--- | ---
Name | Name to uniquely identify your flow. The system computes the internal name of the flow from the name.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application scope to create your flow in. Global is the default.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of your flow.</td>
</tr>
<tr>
<td>Protection</td>
<td>Selection to specify if the flow is read-only. You can only select a value when you create the flow in an application scope that you own.</td>
</tr>
<tr>
<td>Run as</td>
<td>Use this option to specify if the flow runs as system user or the user who initiates the session. Select the user who initiates the session option when updates should come from the user who triggered the flow. For example, when you want incident record comments to come from the current user, or approval emails to originate from the approver. Settings for the Run as option in a flow don’t apply to child subflows. When flows run as the user who initiates the session, the system limits flow actions by user ACL restrictions. Ensure that security restrictions don’t prevent users who trigger the flow from performing flow actions. Flows run by the initiating user also respect user-specific settings such as date/time formats. <strong>Note:</strong> Inbound email flows ignore this setting and always run as the user who initiates the session. To test access controls for an inbound email flow, impersonate a typical inbound email user and manually trigger the flow.</td>
</tr>
<tr>
<td>Run with roles</td>
<td>Select the roles the flow runs with. This option is only available when Run as is set to user who initiates the session.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Note:** If this is your first time in Flow Designer, a welcome screen appears. You can choose to either take the welcome tour or skip the tour for now.

The system displays the Flow Designer design environment.

5. Add a trigger to your flow.

a. From the Trigger list, select a trigger that will start running your flow. For more information on trigger types, see **Flow trigger types.**
The system displays a set of fields depending on the type of trigger that you’ve selected.

b. Set up your trigger by filling in the fields.
   For a record-based trigger, for example, select a table and optionally set field conditions that, when met, will start running your flow.

c. Click Done.

6. To add actions, flows, subflows, or flow logic, click Select to add an Action, Flow Logic, or Subflow.

a. Select an option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Select the desired action. Flow Designer includes a set of Actions available to flows and subflows. Alternatively, a user with the action_designer role can create additional actions to add to flows. The IntegrationHub and spoke plugins install additional actions. To add draft actions from the More Actions menu, set Show draft actions to true. To view spokes available in the ServiceNow Store, set Show store spokes to true from the More Actions menu.</td>
</tr>
<tr>
<td>Flow Logic</td>
<td>Select an option to specify conditional or repeated operations.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Select a published subflow and define input values. In addition to adding a subflow as a flow action, you can enable the Show triggered flows option from the More Actions menu to select an activated flow and define the required inputs. Running a triggered flow ignores its trigger conditions and runs all actions.</td>
</tr>
</tbody>
</table>

To change the order of an action in a flow, drag the handle on the left side of the action to the desired location.
The system displays a set of fields depending on the option selected.

b. To configure the action, flow logic, or subflow, fill in the fields.

c. Click Done.

d. Repeat adding actions until complete.

7. Click Save.
   Flow Designer saves a draft of the flow, trigger, and actions.

What to do next

• Test your flow until you're ready to activate it.

⚠️ Note: The system only triggers activated flows.

• Deploy or transfer your flow to another instance.
  ◦ Deploy your flow from the application repository when your application is complete and ready for release.
  ◦ Transfer your flow from an update set XML file when you want to test the flow on another instance. When you save a flow, Flow Designer generates a single update set file containing its subflows and actions.

Create a flow with an inbound email trigger
Start a flow when your instance receives an email.

Before you begin
Role required: flow_designer or admin

Procedure
2. Click + New > Flow.
3. Define the flow properties, and then click Submit.
   For more information, see Create a flow.
4. In the Trigger section, click the plus icon (+) to add a trigger.
5. Select Inbound Email.
6. On the form, fill in the fields.
### Field | Description
--- | ---
Email conditions | Conditions to qualify which emails start your flow. The condition builder uses fields from the Email [sys_email] table. For example, to trigger a flow for an inbound email in which a user replies to a system notification, set the condition to [Receive type] [is] [Reply].

### Results
When an inbound email meets the conditions that you set, the associated flow triggers and runs the actions.

### Allow multiple triggers to process an inbound email
Configure Flow Designer to allow an inbound email to be processed by multiple inbound email triggers in a specific order.

### Before you begin
Role required: admin

### About this task
Although you can process an inbound email with multiple inbound email actions, you can’t process an inbound email with multiple flows by default. You can add a system property to let process owners use multiple triggers to process an inbound email.

⚠️ **Warning:** Allowing multiple triggers to process an inbound email may increase maintenance and decrease system performance.
Procedure

1. **Add a property** with the following settings:
   - Name: `glide.hub.flow.inbound_email_trigger.show_advanced`
   - Type: true | false
   - Value: true
   After you activate the system property, the Order and Stop processing fields appear on the inbound email trigger.

2. Create multiple flows with an inbound email trigger.
   For more information, see Create a flow with an inbound email trigger.

3. Specify the processing order for each of the inbound email flows:
   a. Open each flow and enter a value in the Order field.
      To give the flow higher priority over other flows, enter a lower number.
   b. Enable or disable stop processing for each flow in your sequence.
      To allow an inbound email to be processed by the next flow in your sequence, clear the Stop processing option.
      To end the sequence on a particular flow, leave the option selected in that flow.

**Create a flow with a MetricBase trigger**

Start a flow when a MetricBase trigger is met. MetricBase triggers track time series data and can monitor when a threshold is reached, when a trend is detected, or when a system stops reporting data.

**Before you begin**
Role required: flow_designer or admin

MetricBase triggers are not available on the base system. The MetricBase application requires a separate subscription and must be activated by ServiceNow personnel.

**Procedure**

1. Navigate to **Process Automation > Flow Designer**.
2. Click **+ New > New Flow**.
3. Define the flow properties.
   For more information, see Create a flow.
4. In the Trigger section, add a trigger and select MetricBase.

5. Complete the trigger fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MetricBase Trigger</td>
<td>Select or create a MetricBase trigger record to start the flow. For types of MetricBase triggers, see MetricBase triggers.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only table that contains the metric.</td>
</tr>
<tr>
<td>Condition</td>
<td>Click Add filters to set field-based conditions that determine when the flow runs.</td>
</tr>
<tr>
<td>Condition Script</td>
<td>Define a script in the Additional MetricBase Trigger Filtering and Moderation table to prevent duplicate metric events from re-triggering a flow. For example, if a metric hovers at a defined trigger threshold, create a script that defines whether to run the flow once when the metric is met, or every time the triggering threshold is exceeded.</td>
</tr>
</tbody>
</table>

6. Add actions, subflows, and flow logic to the flow.

7. Test the flow. Once behaving as desired, activate the flow. For more information, see Test a flow and Activate a flow.

Results
The MetricBase application monitors time series data on the Now Platform. When the selected trigger is met, the flow runs.

Create a flow with a Service Catalog trigger
Start a flow when a Service Catalog item is requested to automate the fulfillment process.

Before you begin
Role required: flow_designer or admin

About this task
Unlike a record trigger which runs on all records in a table, the Service Catalog trigger runs on all catalog item requests for a specific item when the catalog item is configured to run a specific flow. For example, you can define a flow that runs every time there is a request for a tablet. The requested item becomes the flow trigger record.
Note: Service Catalog records are created in the global scope. They are not part of the source control or application repository transfer, and they are not part of the default Flow Designer update set.

Procedure
1. If not already created, create the catalog item to associate with the flow.
   b. Click New.
   c. Complete the fields. For a detailed description of catalog item fields, see Create or edit a catalog item.

   Note: If you plan to add stages to your flow, verify that there is not an existing workflow associated with the item that also has stages. Clear the values of the Workflow and Execution Plan fields to prevent conflicting stages from reporting to the requested item stage field.

2. Create the flow to associate with the catalog item. When triggered, this flow processes the catalog item request.
   b. Click + New > New Flow.
   c. Define the flow properties. For more information, see Create a flow.
   d. In the Trigger section, add a trigger and select Service Catalog.
   e. Optional: Create flow-specific catalog variables available only to flow actions. See Create flow Service Catalog variables.
   f. Add actions, subflows, and flow logic to the flow. Some actions enable you to manage catalog items. For example, the Create Catalog Task action generates a task for the requested item, and the Get Catalog Variables action enables you to access catalog variables as data pills in the flow. See Create Catalog Task action and Get Catalog Variables action.
g. **Optional:** Add stages to the flow to report progress to the requester. See Flow Designer stages.

h. Test the flow. Once behaving as desired, activate the flow. For more information, see Test a flow and Activate a flow.

   - **Note:** You can’t activate a flow if it references catalog variables that are inactive or don’t exist.

3. Add the flow to the **Flow** field of the catalog item you created.

   a. Navigate to the catalog item.

   b. In the **Flow** field, select the flow you created.

   - **Note:** The **Flow** field only displays flows with a Service Catalog trigger.

   c. Click **Update**.

**Results**
When the catalog item is requested, the associated flow triggers and runs the actions.

**Create flow Service Catalog variables**
Create Service Catalog variables that are only available to a specific Service Catalog-triggered-flow. Flow-specific variables are available to catalog tasks and actions in the flow.

**Before you begin**
Role required: flow_designer or admin

**About this task**
Flow Service Catalog variables display in the **Catalog Variables** field of the Create Catalog Task and Get Catalog Variables actions. They display in the **Flow:variablename** format and are only available to the flow in which they are defined.

For more information about Service Catalog actions, see Create Catalog Task action and Get Catalog Variables action.
Procedure

1. Open or create a flow with a Service Catalog trigger.

2. Click ☰ and select **Manage flow catalog variables**.
The Flow catalog variables table opens.

3. Click **New** to add a new variable available to the flow.

4. Complete the form.

Variable form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Read-only field that indicates which applications can use this variable.</td>
</tr>
<tr>
<td>Map to field</td>
<td>Maps the variable to a specific field on the table for the record producer.</td>
</tr>
<tr>
<td></td>
<td>This field appears if the variable belongs to a record producer.</td>
</tr>
<tr>
<td>Type</td>
<td>The <strong>variable type</strong> that you want to create.</td>
</tr>
<tr>
<td>Catalog item</td>
<td>Catalog item using the variable.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the variable is placed on the page for the catalog item. The variables are organized from top to bottom from least to greatest order value. For example, a variable with an order value of 1 is placed above other variables with higher-order values.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to make the variable available for use</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to make the variable mandatory as part of the ordering process.</td>
</tr>
<tr>
<td>Read only</td>
<td>Option to make a variable read only or editable.</td>
</tr>
<tr>
<td>Hidden</td>
<td>Option to hide a variable.</td>
</tr>
<tr>
<td>Unique</td>
<td>Option to disallow duplicate values for this variable within a multi-row variable set.</td>
</tr>
</tbody>
</table>

⚠️ **Note:** This behavior is applicable only on page load, and can be changed via client APIs.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>• This field appears only for a variable created in a multi-row variable set.</td>
</tr>
<tr>
<td></td>
<td>• This behavior is applicable only in Now Platform, Service Portal, and variable editor in Agent Workspace.</td>
</tr>
<tr>
<td>Selection Required</td>
<td>Check box to require users to select the check box variable. For example, use this option to require users to select an I agree check box for an agreement form. If users try to submit the agreement form without selecting the check box, an alert message is displayed to tell users that they must select the check box.</td>
</tr>
<tr>
<td>Global</td>
<td>If selected, the variable is available for all catalog tasks within service catalog workflows or execution plans by default. If deselected, the variable must be associated with individual catalog tasks.</td>
</tr>

<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>• This field is also applicable in Service Portal.</td>
</tr>
<tr>
<td></td>
<td>• The max_length attribute value is valid even when the validation regex is set.</td>
</tr>
<tr>
<td></td>
<td>• You cannot add a catalog item with regex validation errors to the wishlist.</td>
</tr>
</tbody>
</table>

| Variable attributes | Attributes that define the behavior and restrictions for a variable. For information on variable attributes, see Service Catalog variable attributes. |

### Default Value

| Default value | Default value for the variable. |

### Permission

If no role is specified in this tab for the read, write, or create actions, all users who can access the catalog item can perform these actions irrespective of their role. For example, if no role is specified for the **Write roles** field, all users who can access the catalog item can edit the variable value in the variable editor.

A user with a role that does not match any of the following roles cannot set variable values even through scripting.

These roles are not available for Label, Break, Container Split, Container End, Macro, Macro with Label, and UI Page variables.

<table>
<thead>
<tr>
<th>Read roles</th>
<th>Roles that can view the variable before or after requesting the catalog item or record producer. Only a user with the roles specified in this field can view the variable.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write roles</td>
<td>Roles that can edit the variable in the variable editor after requesting the catalog item or record producer. If a user does not have the roles specified in this field, the variable is read-only in the variable editor.</td>
</tr>
<tr>
<td>Create roles</td>
<td>Roles that can create values for the variable before requesting the catalog item or record producer. If a user does not have the specified role, the variable is read-only before requesting the catalog item or record producer.</td>
</tr>
</tbody>
</table>

</tbody>
</table>

5. Click **Submit**.

**Results**

Access the variable in the flow by adding a Create Catalog Task or Get Catalog Variables action.

**Create a flow with an SLA Task trigger**

Configure your Service Level Agreement (SLA) definition to run a flow as the action plan.

**Before you begin**

- Set up an application in Guided Application Creator to store Flow Designer content.
- Role required: flow_designer or admin

**About this task**

An SLA Task trigger only runs when a task record matches the conditions of a Service Level Agreement (SLA) definition. For example, you can run a flow
whenever an incident record matches the **Priority 1 resolution (8 hour) SLA Definition.**

**Procedure**

1. Navigate to **Process Automation > Flow Designer.**
2. Select **+ New > New Flow.**
3. On the form, fill in the fields.

**Flow Properties form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify your flow. The system computes the internal name of the flow from the name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope to create your flow in. Global is the default.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of your flow.</td>
</tr>
<tr>
<td>Protection</td>
<td>Selection to specify if the flow is read-only. You can only select a value when you create the flow in an application scope that you own.</td>
</tr>
</tbody>
</table>
| Run As     | Use this option to specify if the flow runs as system user or the user who initiates the session. Select the user who initiates the session option when updates should come from the user who triggered the flow. For example, when you want incident record comments to come from the current user, or approval emails to originate from the approver. Settings for the Run as option in a flow don’t apply to child subflows. The system runs flow actions as the user who initiates the flow. Verify that all users who can trigger a flow have the necessary security access to run its actions. The initiating user also determines user-specific settings such as date/time formats.  
  
  **Note:** Inbound email flows ignore this setting and always run as the user who initiates the session. To test access controls for an inbound email flow, impersonate a typical inbound email user and manually trigger the flow. |

4. Select **Submit.**
The system displays the Flow Designer page.

5. Select **Select to add a Trigger > Application > SLA Task**.

6. Add actions, subflows, and flow logic to the flow.
   Add **SLA Percentage Timer actions** to specify what to do when a task record attached to an SLA reaches specific percentages of completion.

7. Test the flow. Once behaving as desired, activate the flow.
   For more information, see **Test a flow and Activate a flow**.

8. **Create an SLA definition**

   a. In the **Flow** field, select the SLA Task flow you previously created.

   i. **Note:** The **Flow** field only displays flows with an SLA Task trigger.

   b. Click **Submit**.

**Results**
When the SLA Definition conditions are true, the system runs the specified SLA task flow.

**Create a flow with roles**
Create a flow or subflow that runs with assigned roles. Assigning roles enables you to create a user-initiated flow that runs with its own roles rather than the user's roles.

**Before you begin**
Role required: flow_designer or admin

**About this task**
Create a user-initiated flow that runs with its own roles and not the roles of the user. For more information about assigning roles to a flow, go to **Flow roles**.

**Procedure**

1. Navigate to **Process Automation > Flow Designer**.

2. Click **+ New > Flow** or **+ New > Subflow**.

3. On the Flow Properties form, define the Name, Protection, Application, and Description for the flow.
   For more information, see **Create a flow**.

4. In the **Run As** field, select **User who initiates session**.
   Role selection is not available if the **System User** option is selected in the **Run As** field.
5. In the **Run with role(s)** field, select the roles that you want the flow to execute with.

6. Click **Submit**.

   **Note:** If you have the Explicit Roles plugin (com.glide.explicit_roles) activated, add the snc_internal role to your flow.

**What to do next**

Continue to build and test your flow until you’re ready to activate it. You can modify your flow’s roles at any time by updating the Flow Properties form.

**Duplicate an action or subflow**

Duplicate an action or subflow within a flow.

**Before you begin**

Role required: admin or flow_designer

**Procedure**

1. Navigate to **Process Automation > Flow Designer**.

2. On the Flow Designer landing page, select the flow containing the action or subflow that you want to duplicate.

3. Under Actions, point to the action or subflow that you want to duplicate and then select the duplicate action icon (ไกล).

**Results**

Your selected action or subflow duplicates directly under itself. All configurations, including transform functions, are copied over to the duplicated action or subflow.

**Test a flow**

Before activating a flow so other users can access it, test to make certain it works the way you expect.

**Before you begin**

Role required: flow_designer or admin

**About this task**

Testing a flow bypasses the flow trigger conditions to run it with the test data you provide. For example, testing a flow with a record **Created** trigger causes the system to act as if the selected record was created. For a list of data pills available by trigger type, see **Flow trigger types**.
Because testing a flow creates or changes records on the instance, flow designers should always test flows on a non-production instance containing relevant demonstration data.

Procedure

1. Navigate to Process Automation > Flow Designer, then double-click the row for the flow you want to test.

2. Save the flow.

3. Select Test.
   The system displays the Test flow dialog. The contents of the Test flow dialog depend on the type of trigger.

4. If the flow has a record trigger, create or select a record to use for the test.
   To create a record, select the Create new record button.

5. If the flow has a record Updated or Created or Updated trigger, specify which fields and values changed in the update.
   To specify a field value change, select the Create new changed field button for each field whose value you want to change. Complete the changed field details for each changed field.

6. Select Run Test.

   Note: Select the Run test in background option to test a flow asynchronously in the background.

   The system tests the flow.

7. Select Your test has finished running. View the flow execution details.
Note: This link is created irrespective of your choice for the Run test in background option. If you have selected the Run test in background option, the execution details are displayed only after the execution is completed asynchronously in the background. Also, the execution details are associated with the flow only after execution is completed.

The system displays the flow execution details for the test.

What to do next
Review the Flow execution details.

Activate a flow
Activate a flow to make it available to other users.

Before you begin
Role required: flow_designer or admin

About this task
When you save a flow, you can test it, but no other users on the instance can see or run it. To make the flow available to other users, activate it.

Procedure
2. Locate the flow you want to activate from the list of saved flows and open it.
3. Click Activate.

Allow flow designers to dynamically set field values
Enable flow designers to dynamically set field values when adding the subflow or action to a flow. For example, allow flow designers to set the priority and short description of a Create Task action.

Before you begin
A dynamic field can only be created in a subflow action or action step that creates or updates a record, such as Create Catalog Task, Create Task, Create Record, and Update Record.

Role required: admin or action_designer

About this task
When creating or updating a record in a subflow action or action step, you can set static or dynamic values. A static value is the same every time a flow runs. A dynamic value allows a flow designer to change it every time a flow runs. For
example, setting the Urgency to the static value 1 - High generates an urgent catalog task every time the flow runs.

**Procedure**

1. Open an action in Action Designer or a subflow in Flow Designer that you want to create a dynamic value for.

2. Create an input.
   a. In the **Label** field, enter a label to help flow designers understand the purpose of the field. This is the label for the field when the flow designer adds the subflow or action to a flow. For example, enter **Select fields**.
   b. In the **Type** field, select Template Value. Select the table containing the record you will create or update. For example, if you are adding a Create Catalog Task action in a subflow, set the Type to Template Value. Requested Item [sc_req_item].

3. Add an action step or action that will use the template value.
   The action step or action must create or update a record. For example, add a Create Task action to a subflow that will create an incident task.

4. Drag the Template Value data pill into the **Field Values** or **Fields** field.

5. **Optional**: Add static values in addition to the dynamic field by selecting **Add Field Value**.

   ❗ **Note**: Avoid setting static values that you want flow designers to set from the dynamic field. The flow always uses the static value from the subflow or action step over a value entered from a dynamic field. You can use static values to enforce business policies that you do not want flow designers to change.

**Results**

When the subflow or action is added to a flow, a flow designer can set field values for the record being created or updated.

**Edit a flow**

Edit an existing flow.

**Before you begin**

Role required: flow_designer or admin
Procedure

1. If necessary, navigate to Process Automation > Flow Designer, then double-click the row for the flow you want to edit. The Flow Designer landing page appears.

2. Take the appropriate actions to edit the flow.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change the flow name, description, or roles</td>
<td>In the main header, click Properties, enter the values you want into the appropriate fields, then click Update.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot change the scope of an automationHub flow after you have saved it.</td>
</tr>
<tr>
<td>To edit the trigger</td>
<td>In your flow, click the trigger description, fill in the fields as desired, then click Done.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Modifying triggers can result in the deletion of referenced action configurations.</td>
</tr>
<tr>
<td>To edit an existing action</td>
<td>In your flow, click the action description, fill in the fields as desired, then click Done.</td>
</tr>
<tr>
<td>To add a new action</td>
<td>To add an action at the end of a flow, click the plus icon in the ACTION section. Proceed as you would for adding an action to a new flow.</td>
</tr>
<tr>
<td></td>
<td>To insert an action into an existing flow, point to the vertical line between the action icons where you want to insert the action. When the plus icon appears, click it. Add the action just as you would add it to a new flow.</td>
</tr>
</tbody>
</table>

3. To save your changes, click Save.

Delete a flow

Delete a flow that you no longer need.
Before you begin
Role required: flow_designer or admin

About this task
You can only delete records that are in the same application scope as the current session. If your instance uses domain separation, make sure that you are in the Global scope. For more information, see Domain separation and Flow Designer.

Procedure
1. If necessary, navigate to Process Automation > Flow Designer to display the Flow Designer landing page.
2. Check the selection box for the row corresponding to the flow you want to delete.
3. Click Actions on selected rows . . . , then click Delete.

View activated flows for a table
View flows with record-based triggers that run on a specific table.

Before you begin
Role required: flow_designer or admin

Procedure
1. Navigate to a table.
2. Right-click the form header and select Configure > Flow Designer Flows. The Flows table opens and displays all flows that have been activated to run on the specified table.

Supported Service Catalog types
Flow Designer supports several Service Catalog variable types for both single-row and multi-row variable sets.

Supported variable types

<table>
<thead>
<tr>
<th>Service Catalog variable type</th>
<th>Flow Designer variable type for single-row variable sets</th>
<th>Flow Designer variable type for multi-row variable sets</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check box</td>

### Flow trigger types

The trigger specifies the conditions that start running the flow. When the trigger conditions are met, the system starts running the flow.
**Record triggers**

Use record triggers to start a flow when a record is created or updated.

Follow these design considerations when creating record triggers.

**Add conditions to only start record flows when needed**

Use conditions to specify what record values start your flow. Starting a flow only when needed consumes fewer system resources than starting a flow, pausing it, and waiting to resume the flow until a specific record condition applies. Instead of creating a flow that starts with a Wait for condition action, redesign the flow to include the wait condition as part of the record trigger.

**Create unique conditions for record triggers on the same table**

To prevent flows from overwriting each other, create unique conditions for each flow running on the same table. If multiple flows on the same table have the same filter, there is no way to know the order in which the flows will run.

**Ignore records added or updated by import and update sets**

Record triggers ignore records added or updated by applying an update set or importing an XML file. These operations apply to the entire application or table rather than an individual record.

**Replace record triggers on Service Catalog tables with Service Catalog application triggers**

Flow Designer no longer displays Service Catalog tables as options for record triggers. Instead, create flows that use the Service Catalog application trigger type.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Starts a flow when a record is created in a specific table.</td>
</tr>
</tbody>
</table>
| Updated | Starts a flow when a record is updated in a specific table. Requires selecting when to run the flow.  
  
  - **For each unique change**: Triggers the flow for every unique update to a non-system field even if the flow is currently running.  
  
  **Note**: The system stores a history of every change to a record and determines whether the change is unique. For example, if an incident record’s State field changes from In Progress to On Hold, the flow will run. However, if the State field then changes back to In Progress, the flow will not run. |
<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> Flows that have a record trigger that runs <strong>For each unique change</strong> can produce recursions when run in a non-interactive session. When such flows make a change to the trigger record, the change meets the flow trigger conditions and causes a recursion.</td>
<td></td>
</tr>
<tr>
<td><strong>Once:</strong> Triggers the flow once for the life of the record.</td>
<td></td>
</tr>
<tr>
<td><strong>Only if not currently running:</strong> Triggers the flow for every unique change if the flow is not currently running. This behavior is the same as the <strong>Always</strong> option in previous releases.</td>
<td></td>
</tr>
<tr>
<td><strong>For every update:</strong> Triggers the flow every time the record is updated, regardless of whether there has already been or there currently are any running contexts for the flow.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Created or Updated</th>
<th>Starts a flow when a record is either created or updated in a specific table. Requires selecting when to run the flow.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>For each unique change:</strong> Triggers the flow for every unique update to a non-system field even if the flow is currently running.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** The system stores a history of every change to a record and determines whether the change is unique. For example, if an incident record’s **State** field changes from In Progress to On Hold, the flow will run. However, if the **State** field then changes back to In Progress, the flow will not run.

**Note:** Flows that have a record trigger that runs **For each unique change** can produce recursions when run in a non-interactive session. When such flows make a change to the trigger record, the change meets the flow trigger conditions and causes a recursion.

| **Once:** Triggers the flow once for the life of the record. |
| **Only if not currently running:** Triggers the flow for every unique change if the flow is not currently running. This behavior is the same as the **Always** option in previous releases. |
| **For every update:** Triggers the flow every time the record is updated, regardless of whether there has already been or there currently are any running contexts for the flow. |

**Note:** Flows including approval actions should only run the trigger once.
REST triggers

Use REST triggers to start a flow after a specific REST API request.

ℹ️ **Note:** This feature requires an IntegrationHub Enterprise subscription. For more information, see Request IntegrationHub.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REST API - Asynchronous</td>
<td>Start a flow from an inbound API call or webhook from an external system. Configure the trigger start conditions without having to write or maintain custom code. For more information, see REST API trigger.</td>
</tr>
</tbody>
</table>

Date triggers

Use date triggers to start a flow after a specific date and time or repeatedly at scheduled intervals.

ℹ️ **Note:** Because flows are processed asynchronously, a flow with a date trigger may not run at the exact scheduled time its trigger conditions were met. For example, if a scheduled flow is triggered during core business hours, the system may have to process other events in the queue before it can run the scheduled flow.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Daily</td>
<td>Starts a flow at a specific time every day.</td>
</tr>
<tr>
<td>Weekly</td>
<td>Starts a flow at a specific time every week.</td>
</tr>
<tr>
<td>Monthly</td>
<td>Starts a flow at a specific time every month.</td>
</tr>
<tr>
<td>Run Once</td>
<td>Starts a flow once at a specific time but does not repeat. If you select a past date or time, the system schedules the flow to run as soon as possible.</td>
</tr>
<tr>
<td>Repeat</td>
<td>Starts a flow at regular intervals you define.</td>
</tr>
</tbody>
</table>

Application triggers

Use application triggers to start a flow when application-specific conditions are met.
<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MetricBase</td>
<td>Starts a flow when a MetricBase trigger is met. Requires the MetricBase application. For more information, see Create a flow with a MetricBase trigger.</td>
</tr>
<tr>
<td>Service Catalog</td>
<td>Starts a flow from a Service Catalog item request. For more information, see Create a flow with a Service Catalog trigger. Note: Service Catalog records are created in the global scope. They are not part of the source control or application repository transfer, and they are not part of the default Flow Designer update set.</td>
</tr>
<tr>
<td>SLA Task</td>
<td>Starts a flow from an SLA Definition record. For more information, see Create a flow with an SLA Task trigger.</td>
</tr>
</tbody>
</table>

**Inbound email triggers**

Start a flow when your instance receives an email.

Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

With inbound email actions, you don’t have full control over email attachment handling or assigning the target record of an email. When you create a flow with an inbound email trigger, you can perform these actions with the Move Email Attachments to Record action and the Associate Record to Email action. For greater control over email attachments, you can also use the Look up email attachments action to access a specific attachment as a data pill.

Although you can process an inbound email with multiple inbound email actions, you can’t process an inbound email with multiple flows by default. Additional configuration is required. For information on how to stop processing in inbound email actions, see Specify the inbound email processing order.

For more information on running multiple flows on an inbound email, see Allow multiple triggers to process an inbound email.

The following diagram shows how inbound emails are processed by inbound email triggers. After the email has been classified as a reply, forward, or new email, the system tries to match the email to an active inbound email trigger. If the email meets the conditions of an inbound email trigger, the flow runs. If the flow issues stop processing, the email is finished being processed. If the flow does not issue stop processing, the system tries again to match the email to an active inbound email trigger. If at any point the email does not match an
active inbound email trigger, the system tries to match the email with an active inbound email action instead.

**Processing emails with inbound email triggers**

1. Email Classification
2. Start
   - Email matches conditions of an active inbound email trigger
     - Yes
     - Flow issues stop processing
       - Yes
       - Stop
     - No
   - Yes
   - There are more inbound email triggers to evaluate
     - Yes
     - Inbound Email Action Execution
     - No
     - No

**Note:** With other types of flows, you can choose to run as a system user or the user who initiates the session. However, inbound email flows always run as the sender of the inbound email. If the system does not recognize the sender, inbound email flows will run as the Guest user. The actions of inbound email flows are limited by user ACL restrictions. To test access controls for an inbound email flow, impersonate a typical inbound email user and manually trigger the flow.

**Advanced options**

Specify the user session requirements needed to start a flow with **Advanced Options**.

**When to run the flow**

Determine the type of session that can trigger the flow, whether to run the flow when triggered by certain users, and which tables can trigger the flow.
### Interactive session options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only Run for Non-Interactive Session</td>
<td>Flow that is only triggered in non-interactive sessions. See Non-interactive sessions.</td>
</tr>
<tr>
<td>Only Run for User Interactive Session</td>
<td>Flow that is only triggered in interactive sessions.</td>
</tr>
<tr>
<td>Run for Both Interactive and Non-Interactive Sessions</td>
<td>Flow that is triggered in all sessions.</td>
</tr>
</tbody>
</table>

### User options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not run if triggered by the following users</td>
<td>Flow that does not trigger for a selected list of users. Click the Add User icon (Ω) to add users to the list.</td>
</tr>
<tr>
<td>Only run if triggered by the following users</td>
<td>Flow that triggers only for a selected list of users. Click the Add User icon (Ω) to add users to the list.</td>
</tr>
<tr>
<td>Run for any user</td>
<td>Flow that runs for any user.</td>
</tr>
</tbody>
</table>

### Table options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run only on current table</td>
<td>Flow that is only triggered for the selected table.</td>
</tr>
<tr>
<td>Run on current and extended tables</td>
<td>Flow that is triggered for the selected table and any extended tables.</td>
</tr>
</tbody>
</table>

### Where to run the flow

Determine whether to run the flow in the background or in the current session.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run flow in background (default)</td>
<td>Flow that runs asynchronously in the background. Use this option for flows that do not require immediate updates and to allow other system processes to run at the same time.</td>
</tr>
<tr>
<td>Run flow in foreground</td>
<td>Flow that runs synchronously in the current session. Use this option to provide immediate updates to an end user. For example, if a flow opens a task after the previous task closes, use this option to open the next task immediately after a user closes one.</td>
</tr>
</tbody>
</table>

 đổ  Note: Running a flow in foreground may block the current session thread and prevent user input until the flow finishes. Avoid running flows in the foreground when they contain actions that cannot be interrupted, such as actions that run script. Actions or flow logic that pause a flow will not block a session.

**Data pills available by trigger type**

Flow designers have access to data pills from the trigger.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Data pills available</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td><strong>[Table Label] Record</strong></td>
</tr>
<tr>
<td></td>
<td>An object containing the triggering record.</td>
</tr>
<tr>
<td></td>
<td><strong>Changed Fields</strong></td>
</tr>
<tr>
<td></td>
<td>An array of objects containing the field values that changed. This data pill is only available for the Updated or Created or Updated trigger types.</td>
</tr>
</tbody>
</table>

Note: To process the Changed Fields array data pill, you will need to use For Each flow logic. For more information on working with array data pills, see Complex data.
<table>
<thead>
<tr>
<th>Trigger</th>
<th>Data pills available</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>[Table Label] Table</strong></td>
<td>The Sys ID of the table containing the trigger record.</td>
</tr>
<tr>
<td><strong>Run Start Time:</strong></td>
<td>The Date/Time value of when the flow started.</td>
</tr>
<tr>
<td>REST API - Asynchronous Path Parameters</td>
<td>An object containing path parameters in the inbound request.</td>
</tr>
<tr>
<td><strong>Query Parameters</strong></td>
<td>An object containing query parameters in the inbound request.</td>
</tr>
<tr>
<td><strong>Request Headers</strong></td>
<td>An object containing headers in the inbound request.</td>
</tr>
<tr>
<td><strong>Request Body</strong></td>
<td>Complex data object that defines the body structure of the inbound request. For more information on complex objects, see Complex data.</td>
</tr>
<tr>
<td><strong>Date</strong></td>
<td><strong>Run Start Time:</strong> The Date/Time value of when the flow started.</td>
</tr>
<tr>
<td><strong>SLA Task</strong></td>
<td><strong>Task SLA Record</strong> An object containing the triggering Task SLA record. <strong>sla_flow_inputs</strong> An Object containing Task SLA Definition values.</td>
</tr>
<tr>
<td><strong>Inbound Email</strong></td>
<td><strong>Email Record</strong> An object containing the triggering Email record. <strong>[Table Label] Table</strong> The Sys ID of the table associated with the target email. <strong>Body Text</strong></td>
</tr>
<tr>
<td>Trigger</td>
<td>Data pills available</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Trigger</td>
<td>A String containing the body of the email message.</td>
</tr>
<tr>
<td>Subject</td>
<td>A String containing the subject of the email message.</td>
</tr>
<tr>
<td>User Record</td>
<td>An object containing the user who sent the triggering email. If the sender does not have an associated User record, the data pill lists the object for the Guest user.</td>
</tr>
<tr>
<td>From address</td>
<td>A String containing the sender email address.</td>
</tr>
<tr>
<td>Metric Base</td>
<td><strong>MetricBase Trigger Definition Record</strong></td>
</tr>
<tr>
<td></td>
<td>An object containing the triggering MetricBase Trigger Definition Record.</td>
</tr>
<tr>
<td>Level</td>
<td>The Integer value of the MetricBase trigger level.</td>
</tr>
<tr>
<td>Time of Metric Event</td>
<td>The Date/Time value of when the metric event occurred.</td>
</tr>
<tr>
<td>Record</td>
<td>An object containing the record for which metric events have been collected.</td>
</tr>
<tr>
<td>Service Catalog</td>
<td><strong>Requested Item Record</strong></td>
</tr>
<tr>
<td></td>
<td>An object containing the triggering Requested Item record.</td>
</tr>
<tr>
<td>Run Start Time</td>
<td>The Date/Time value of when the flow started</td>
</tr>
<tr>
<td>Table Name</td>
<td>The table name containing the requested catalog item.</td>
</tr>
</tbody>
</table>
Flow roles
Create flows and subflows that run with specific roles. Assigning roles enables you to create user-initiated flows that run with their own roles rather than the user's roles.

Role selection
A flow runs as either the system user or as the user who initiates the session. You can only assign roles to flows that run as the user who initiates the session. When the flow runs as the system user, it runs with the system role, and individual role selection isn't available. For more information, see Create a flow.

You can assign multiple roles to a flow. Selecting new roles replaces the flow's original roles. If roles aren't selected, the flow runs with the roles of the user who initiates the session.

The roles you can select for a flow depend on the roles you have and the application scope of the flow. Assign any roles you that have access to in a particular scope, except high-security roles. You can't assign the following roles to a flow:

- admin
- security_admin
- application-specific admin roles, such as an application admin role for Human Resources.

Modified and copied flows
Other users can modify and copy your flow. To modify a flow, a user must have the same roles as the flow. Users missing any of the roles assigned to the flow, sees the flow as read-only.

When you copy a flow, the assigned roles are removed. The copied flow runs with either the system role or the roles of the user who initiated the session.

Missing roles
Sometimes a flow refers to a role that is not on the instance. The missing role may have been removed or may not exist on the instance. Either situation can occur when moving a flow between instances. When a role is unavailable, the Run with role(s) field displays the sys_id of the role instead of its name. While the role is missing, you cannot save changes to the flow. To save flow changes, either remove the role from the flow or add it to the instance.
Flow roles in execution details
You can see the "Run with" roles for a flow by viewing the flow execution details. Use the Run As field to determine which user ran the flow. Only flows that ran as the initiating user can have roles assigned. These flows have a Run with role(s) field that displays the roles assigned to the flow.

Subflow roles
Flows and subflows each run with their own roles. Subflows don’t inherit roles from a parent flow. When flow execution returns to a parent flow from a child flow, any special roles associated with the child flow are removed. The parent continues execution with its own roles.

Access control lists
Assigning a role to a flow doesn't guarantee that the flow can access a record or table. While roles are an important part of access control lists (ACLs), they are just one possible condition. If a flow cannot access the records you expect it to, review the record ACL rules for the table and fields. The ACL rules might require additional criteria to grant access. For more information, see access control list rules.

Actions
Actions can be added to any flow, enabling process analysts to automate Now Platform features without having to write code.

An action is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the Create Record action allows process analysts to generate records in a particular table with particular values when certain conditions occur. ServiceNow core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to preset configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

In Flow Designer, a process analyst adds actions to a flow and defines the configuration options.

ServiceNow Core actions
A ServiceNow core action is a ServiceNow-provided action available to any flow that cannot be viewed or edited from the Action Designer design environment. For example, the Ask for Approval action is a ServiceNow core action that allows process analysts to use Now Platform approvals.
provides a set of ServiceNow core actions to automate Now Platform processes. You can add application-specific ServiceNow core actions by activating the associated spoke.

**Custom actions**

Using a core action enables the process analyst to configure the desired behavior within the flow. To create an action with a pre-set configuration, or to define custom configuration options, a subject matter expert can create a custom action in Action Designer.

**Action limit**

By default, flows can have no more than 50 actions. To change the default behavior, increase the value of the `sn_flow_designer.max_actions` system property. However, consider the performance impact that a large flow may have on your instance.

**Missing actions**

If an administrator added your flow from an update set, you might have some missing actions in your flow. This normally happens when your instance doesn’t have the appropriate IntegrationHub spokes installed. For more information on how to install the spokes you need to get these actions to appear, see spokes.

**Add Worknote Link to Context action**

Add a journal field entry containing a link to the current flow context record. Use the link to view the flow execution details of the current flow. You can add a flow context link to any record that has a journal field.

**Roles and availability**

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record. For example, the Task table.</td>
</tr>
<tr>
<td>Record</td>
<td>The record to be updated. Drag a record data pill or use the data pill picker to select a record. For example, the trigger record.</td>
</tr>
</tbody>
</table>
### Ask for Approval action

Request approval for a record with an approval field. You can configure a rule set for an approval, rejection, or cancellation. If a due date is added to an approval, the approval is automatically approved, rejected, or canceled if the approvers have not responded by the designated time.

**Approvals** is a platform feature that enables users or groups to approve or reject a task.

### Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the `flow_designer` or `admin` role can add an action to a flow and define configuration details.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select a record under the data panel and drag the record pill into the Record field. If selecting a table with an approval field already configured, the Approval field is set to the correct field.</td>
</tr>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record.</td>
</tr>
<tr>
<td>Approval field</td>
<td>Select a field from the designated table to use for approval status.</td>
</tr>
<tr>
<td>Journal field</td>
<td>Select a field from the designated table to use for journal entries.</td>
</tr>
<tr>
<td>Rules</td>
<td>Define the approval and rejection rules. Approval rules determine which users can approve or reject requests, and what happens after approval or rejection. Approval or rejection rules include:</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
|         | • Anyone approves  
|         | • All users approve  
|         | • All responded and anyone approves  
|         | • % of users approve  
|         | • # of users approve |

In the field beside the approval rule, add the desired approvers. To add approvers:

• Select individual users or groups.  
• Drag or select a field from a record.  

• Select 🛡️ to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see Generate approvals using the approvers related list.

Define rejection rules by adding another OR rule set. When defining approvals, include rejection rules that run when there are no matching approvals. Such rejection rules prevent the flow from remaining in a waiting state. For example, if an approval can be approved by anyone, create a time-based rejection rule in case no one approves it.

ℹ️ **Note:** If you set an approval rule with no rejection rule (or vice versa) and the expected approval state is not met, the runtime value will be **canceled**.

**Due Date**

Define a due date to prevent the flow from remaining endlessly waiting for approval.

• None: The approval is not dependent on a specific date.  
• Approve: Automatically approve the step if an action is still pending by the specified date.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Reject: Automatically reject the step if an action is still pending by the specified date.</td>
<td></td>
</tr>
<tr>
<td>• Cancel: Automatically cancel the step if an action is still pending by the specified date.</td>
<td></td>
</tr>
</tbody>
</table>

ℹ️ **Note:** Relative dates always treat days as 24 hours regardless of the days schedule you select. For example, if you create a due date that expires in 1 relative day, the due date will occur in 24 hours based on the schedule you select. For an 8-5 weekdays excluding holidays schedule, a 24-hour duration is the equivalent of 2 complete business days and 6 hours into the third business day. When working with schedules where the business day is less than 24 hours, consider using relative hours instead of days.
Example

**TRIGGER**
[Incident] Created or Updated

**ACTION**

1. **Ask For Approval**
   - **Action**: Ask For Approval
   - **Record**: Trigger:Incident Record
   - **Table**: Incident [incident]
   - **Approval Field**: Approval
   - **Journal Field**: Approval history

   **Rules**
   - **Approve**
     - **When**: Anyone approves
     - **When**: Trigger:Incident Record = Assigned to:Manager

   - **Reject**
     - **When**: Anyone rejects
     - **When**: Trigger:Incident Record = Assigned to:Manager

   **Due Date**
   - **Approve**
     - **If pending by**: Relative date: 1
     - **Days**: From: Trigger:Incident Record = Assigned to:Created
     - **Days schedule**: 8.5 weekdays

**Output**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval State</td>
<td>State of the approval request</td>
<td>Choice</td>
</tr>
</tbody>
</table>

**Associate Record to Email action**

Associate a record with an Email [sys_email] record so that you can track which record is affected by the email.

**Roles and availability**

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Record</td>
<td>Email [sys_email] record that the Target Record associates with.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Record to associate to the email record</td>
</tr>
</tbody>
</table>

Output

- This action updates the **Target** field on the Email [sys_email] record.

Example

In the following example, a process owner adds the Associate Record to Email action under an inbound email trigger. The user has also added a Create Catalog Task action in the flow. In the **Email Record** field, the user selects to associate a record to the email that triggered the flow. In the **Target Record** field, the user selects to associate the Catalog Task [sc_task] record that is created in the Create Catalog Task action.

Create Catalog Task action

Creates a record in the Catalog Task [sc_task] table associated to a requested item in the Requested Items [sc_req_item] table. Adds the catalog task record as data to be used in the flow.
Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>The Catalog Task [sc_task] table where the catalog task is created. This value is read only.</td>
</tr>
<tr>
<td>Requested Item [Requested Item]</td>
<td>The requested item record from the Requested Items [sc_req_item] table that this catalog task fulfills.</td>
</tr>
<tr>
<td>Short Description</td>
<td>Short description for the catalog task.</td>
</tr>
<tr>
<td>Fields [Catalog Task]</td>
<td>To add the action to a flow, set fields in the catalog task record to the desired value. For example, to set the Urgency, select Urgency and set the desired value. If adding the action to a subflow, you can allow flow designers to dynamically set field values.</td>
</tr>
<tr>
<td>Wait</td>
<td>Pauses the flow until this task completes and is no longer active (active=false). Alternatively, you can add a wait condition by dragging-and-dropping a true/false field from the data panel into the Wait field. The flow only waits for the task to complete when this field is true.</td>
</tr>
<tr>
<td>Template Catalog Item [Catalog Item]</td>
<td>Select an item from the Catalog Items [sc_cat_item] table to populate the Catalog Variables slushbucket with the associated variables.</td>
</tr>
<tr>
<td>Catalog Variables</td>
<td>Select catalog variables to show on the catalog task form to provide more information or allow the fulfiller to modify the variables. You can define flow-specific variables that are displayed in the Available list. To define flow-specific variables, see Create flow Service Catalog variables.</td>
</tr>
</tbody>
</table>
Example

**Create Flow Data action**

Collect data from agents interacting with a Workspace playbook. Use this data to create reusable activities for process owners using Process Automation Designer.
Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Reference.Data Definition[sys_flow_data_definition]</td>
<td>Reference to the Data Definition record that defines the variables the system uses to collect data within the flow.</td>
</tr>
<tr>
<td>Assigned To</td>
<td>Reference.User[sys_user]</td>
<td>User responsible for completing the task associated with the Process Automation Designer activity.</td>
</tr>
<tr>
<td>Assignment Group</td>
<td>Reference.Group[sys_user_group]</td>
<td>User group responsible for completing the task associated with the Process Automation Designer activity.</td>
</tr>
<tr>
<td>Wait for user input</td>
<td>Choice</td>
<td>Option to prompt users in Process Automation Designer that determines if the activity pauses for input in a user-facing view of the process. Options include:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Yes - Pause the activity and prompt end users for input</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• No - Don't pause the activity for end user input</td>
</tr>
</tbody>
</table>
Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Reference.Flow Data[sys_flow_data]</td>
<td>Reference to the Flow Data record created from end user input in a user-facing view of the Process Automation Designer activity.</td>
</tr>
</tbody>
</table>

Create Record action

Creates a record on any table. You can dynamically add and configure fields for the record.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set the values of fields in the record to be created. For example, to set the short description to a certain value, select <strong>Short description</strong> and set the desired value. If adding the action to a subflow, you can allow flow designers to dynamically set field values.</td>
</tr>
</tbody>
</table>

Create or Update Record action

Create or update a record in a ServiceNow table using a single action. Update a record that exists, or create a record using the values provided.

Identification of existing records

The Create or Update Record action identifies existing records by searching for matching values in the fields that you select as unique identifiers. For example, you can specify that the short description and priority fields uniquely identify an
incident. When the action finds an incident with a matching short description and priority, it updates the matching record rather than creating a new record.

⚠️ Note:

- If no field is selected as a unique identifier, the action creates a record with the field values provided.
- If more than one record matches the value of the unique identifiers, the action doesn’t update any records and displays an error message in the flow execution details.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>Table in which a record is created or updated.</td>
</tr>
<tr>
<td>Fields</td>
<td>Values of fields in the record to be created or updated.</td>
</tr>
<tr>
<td></td>
<td>If adding the action to a subflow, you can Allow flow designers to dynamically set field values. Dynamically set field values can trigger server-side validation rules but cannot trigger UI policies.</td>
</tr>
<tr>
<td>Determines uniqueness</td>
<td>Option for selecting the field as a unique identifier. This field appears when the required table name and fields are selected.</td>
</tr>
</tbody>
</table>

Create Task action

Create a task on any ServiceNow task table. After you choose the task table, you can dynamically select the fields to configure the action. Defining the Parent field associates the task to a parent record.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
### Fields

<table>

<tr>
<td>• Ticket</td>
<td>[ticket]</td>
</tr>
</tbody>
</table>

Field Values
Set the values of fields in the task to be created. For example, to set the short description to a certain value, select **Short description** and set the desired value. To associate the task with a parent record, define the **Parent** field.

If adding the action to a subflow, you can **Allow flow designers to dynamically set field values**.

Wait
Waits to complete the action until the task completes and is no longer active (active=false).
Alternatively, you can add a wait condition by dragging-and-dropping a true/false field from the data panel into the **Wait** field. The flow only waits for the task to complete when the condition field is true.

**Copy Attachment action**
Copies an attachment from the Attachments [sys_attachment] table to a target record.

**Roles and availability**
- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Note:** Server-side validation rules, such as data policies, business rules, and dictionary-defined mandatory fields are enforced. UI policies do not apply.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Attachment Record</td>
<td>Select an attachment record from the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Select a record to attach the <strong>Source Attachment Record</strong> to, or drag a Record data pill from the data panel.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table from the list to select a Target Record.</td>
</tr>
</tbody>
</table>

Delete Attachment action

Removes one or all attachments associated with a record and deletes the attachment record from the Attachments [sys_attachment] table.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Record</td>
<td>Drag a Record data pill from the data panel to delete one or all attachment records from.</td>
</tr>
<tr>
<td>Table</td>
<td>Automatically populates with the <strong>Source Record</strong> table.</td>
</tr>
<tr>
<td>Attachment File Name</td>
<td>Enter the name of the attachment file to delete a single attachment associated with the selected record.</td>
</tr>
<tr>
<td></td>
<td>❯ <strong>Note:</strong> If a record has multiple attachments with same name, all matching attachments are deleted.</td>
</tr>
<tr>
<td>Delete All Attachments?</td>
<td>Select to delete all attachments associated with the selected record.</td>
</tr>
</tbody>
</table>

Delete Record action

Deletes a record on any table.
Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be deleted. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
</tbody>
</table>

Get Attachments on Record action

Access the list and count of the attachments associated with the provided source record as data pills in a flow. Use flow logic or scripting to process each attachment in the list of the attachments that the action returns.

Roles and availability

Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Name</td>
<td>Entire file name or part of the file name.</td>
</tr>
<tr>
<td>Source Record</td>
<td>Record as a data pill from the data panel or the record that the attachment is associated with.</td>
</tr>
</tbody>
</table>

Get Catalog Variables action

Select variables from multiple template catalog items and variable sets using the Get Catalog Variables action.

Roles and availability

Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
Submitted Request [Requested Item]  Submitted request from any ServiceNow table.

Template Catalog Items and Variable Sets [Catalog Items and Variable Sets]  Item from the Catalog Items [sc_cat_item] table and single row variable sets to populate the Catalog Variables list with the associated variables.

Catalog Variables  Catalog variables to be displayed in the data panel. Select variables, single-row variable sets, or multi-row variable sets.

**Note:** For optimal performance, avoid selecting Masked variables.

For a list of supported Service Catalog types, see Supported Service Catalog types.

You can define flow-specific variables that are displayed in the Available list. To define flow-specific variables, see Create flow Service Catalog variables.

**Note:** You can’t choose the same variable name from multiple Template Catalog Items and Variable Sets.

Get Email Header action
Access an email header value as a data pill in a flow.

Roles and availability
- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Record</td>
<td>Record from the Email [sys_email] table.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Target Header</td>
<td>Header from the email record. Upon completion of the action, the header value is added as a data pill in the flow.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If multiple headers have the same name, the action gets the value of the first header that appears.</td>
</tr>
</tbody>
</table>

**Example**

In the following example, a process owner adds the Get Email Header action under an inbound email trigger. In the **Email Record** field, the user selects to get an email header from the email that triggered the flow. In the **Target Header** field, the user selects to get the Subject header from the email.

**Get Latest Response Text From Email action**

Provide the most recent reply or forward message in an e-mail chain to other actions in your flow.

**Roles and availability**

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
Inputs
Provide a value for each input that your action needs. To add dynamic values, you can also drag and drop pills from the Data panel or select them from the pill picker.

<table>
<thead>
<tr>
<th>Input</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Record</td>
<td>Record</td>
<td>Email record whose most recent reply or forward message you want to provide to other actions in your flow. Select an Email [sys_email] record from the list, or add an Email [sys_email] record data pill from the Data panel.</td>
</tr>
</tbody>
</table>

Outputs
These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

<table>
<thead>
<tr>
<th>Output</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Latest Response Text</td>
<td>String</td>
<td>Body text for the most recent reply or forward message in the Email [sys_email] record that you selected for the action's input.</td>
</tr>
</tbody>
</table>

Note: If you select an Email [sys_email] record with a Type of New for this action's input, the Latest Response Text output will be the entire body text of the e-mail.
Log action
Logs a message in the Flow Designer log table.

Roles and availability
• Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log level</td>
<td>Level of importance of the log message.</td>
</tr>
<tr>
<td></td>
<td>• Error</td>
</tr>
<tr>
<td></td>
<td>• Warn</td>
</tr>
<tr>
<td></td>
<td>• Info</td>
</tr>
<tr>
<td>Log message</td>
<td>Message to display in the log. Enter text or drag data pills into the field.</td>
</tr>
</tbody>
</table>

Look up email attachments action
Look up files that are attached to an email so that you can perform an action on the files.

Roles and availability
• Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email record [Email]</td>
<td>Record from the Email [sys_email] table. For example, select the email record from the flow trigger. After you select an email record, the related Email Attachment [sys_email_attachment] record and its fields become available as data pills.</td>
</tr>
</tbody>
</table>
Output

- This action generates a list of Email Attachment [sys_email_attachment] records, which list the attachments that are associated with a given email record. To perform an action on an attachment, add flow logic that runs for each Attachment pill under the Email Attachment Record pill. For more information, see For each flow logic.

Example

In the following example, a process owner adds the Look up email attachments action under an inbound email trigger. In the Email record [Email] field, the user selects to look up files that are attached to the email that triggered the flow.

Look Up Record action

Look up a record from any table based on defined conditions.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions the returned record must meet.</td>
</tr>
<tr>
<td></td>
<td>When building a condition that looks up the value of a reference field, use</td>
</tr>
<tr>
<td></td>
<td>a data pill that explicitly provides</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>the Sys ID value. Ensure the condition has the format <code>[reference field][is][Reference type data pill-&gt;Sys ID]</code>. For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition <code>[Requested by][is][Trigger-&gt;incident record-&gt;Caller-&gt;Sys ID]</code>.</td>
<td></td>
</tr>
<tr>
<td>Order by</td>
<td>Determines how to sort results when more than one record matches the defined conditions. Select the field you want to use to sort results.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Select whether to sort alphabetically in ascending or descending order.</td>
</tr>
</tbody>
</table>
| If multiple records are found | Determines what information to return when more than one record matches the defined conditions.  
- Return only the first record  
- Fail the step |
| Don't fail on error | Determines whether to fail the flow when the lookup can't find a record. |
Look Up Records action

Look up multiple records on any table using defined conditions.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to search for in records.</td>
</tr>
</tbody>
</table>

When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format `[reference field] [is] [Reference type data pill->Sys ID]`. For example, both the Change and Incident tables contain a reference field to the
Input

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User table. To look up change records where the requester is the caller from an incident record, create the condition [Requested by][is][Trigger-&gt;incident record-&gt;Caller-&gt;Sys ID].</td>
</tr>
</tbody>
</table>

Order by

```
Lookup Attachment action
Looks up an attachment associated with a record and returns the Attachment Sys ID as a data pill.

Roles and availability
• Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Note: Server-side validation rules, such as data policies, business rules, and dictionary-defined mandatory fields are enforced. UI policies do not apply.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Name</td>
<td>Enter the name of the attachment to look up. If the record includes multiple attachments with the same file name, the system returns the first Sys ID encountered.</td>
</tr>
<tr>
<td>Source Record</td>
<td>Drag a Record data pill from the data panel, or select the record that the attachment is associated with.</td>
</tr>
</tbody>
</table>

Move Attachment action
Associates a record from the Attachment [sys_attachment] table with a target record. Removes the attachment from any other associated records.

Roles and availability
• Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Note: Server-side validation rules, such as data policies, business rules, and dictionary-defined mandatory fields are enforced. UI policies do not apply.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Attachment</td>
<td>Select an attachment record from the Attachments [sys_attachment] table.</td>
</tr>
</tbody>
</table>
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record [Attachment]</td>
<td>Drag a Record data pill from the data panel to attach the Source Attachment Record to.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Automatically populates with the Source Record table.</td>
</tr>
</tbody>
</table>

### Move Email Attachments to Record action

Move attachments from an email to a record so that the files are available to your users when they view the record.

### Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Record</td>
<td>Email [sys_email] record to move attachments from.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Record to move attachments to.</td>
</tr>
</tbody>
</table>

### Output

- This action updates the Email Attachment [sys_email_attachment] record. The Action field changes to Attached to Target Record.

### Example

In the following example, a process owner adds the Move Email Attachments to Record action under an inbound email trigger. The user has also added the Create Catalog Task action in the flow. In the Email Record field, the user selects to move attachments from the email that triggered the flow. In the Target Record field, the user selects to move email attachments to the Catalog Task [sc_task] record that is created in the Create Catalog Task action.
Record Producer action

Create a Task record from a Record Producer Catalog Item [sc_cat_item]. The Task record inherits values from the catalog item's variable values.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag and drop pills from the Data panel or select them from the pill picker.

<table>
<thead>
<tr>
<th>Input</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalog Item</td>
<td>Record</td>
<td>Reference to catalog item used to create a Task record.</td>
</tr>
<tr>
<td>Catalog Item Inputs</td>
<td>String</td>
<td>Catalog variables associated with the catalog item you choose. You can view associated catalog variables for Catalog Items from Service Catalog &gt; Catalog</td>
</tr>
<tr>
<td>Input</td>
<td>Data type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Don't fail on error</td>
<td>True/False</td>
<td>Catalog variable indicating whether to fail on error.</td>
</tr>
</tbody>
</table>

**Outputs**

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

<table>
<thead>
<tr>
<th>Output</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table Name</td>
<td>Table where Task record was created.</td>
</tr>
<tr>
<td>Record</td>
<td>Record</td>
<td>Reference to Task record created.</td>
</tr>
<tr>
<td>Error Message</td>
<td>String</td>
<td>Error message produced when the record operation fails.</td>
</tr>
<tr>
<td>Status</td>
<td>Choice</td>
<td>Completion status of the action. The flow execution details page displays one of these numeric values.</td>
</tr>
</tbody>
</table>

- Success [0]: The action succeeded.
- Error [1]: The action produced an error.

**Error messages**

If an error occurs with this action, the following error messages appear in the execution details page.

<table>
<thead>
<tr>
<th>Error message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record generation failed, check logs to get more information.</td>
<td>This error typically occurs when your flow or action contains logic to insert</td>
</tr>
</tbody>
</table>
Error message

<table>
<thead>
<tr>
<th>Error message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a record or records into other tables. When this logic exists, the Record Producer action aborts inserting the record into the table.</td>
<td></td>
</tr>
</tbody>
</table>

Send Email action

Send an email to specified users or groups as an action in a flow.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Record</td>
<td>Record that the email is associated to. When a user sends a reply to your email, the target record is updated with the reply email content.</td>
</tr>
<tr>
<td>Table</td>
<td>Table of the target record.</td>
</tr>
<tr>
<td>Include Watermark</td>
<td>Option to apply a watermark to the email that is sent. To include a watermark, you must set a target record.</td>
</tr>
<tr>
<td>To</td>
<td>The main recipients of the email. Enter a list of user email addresses separated by commas or white spaces. You can also drag data pills that contain email addresses into the field, such as a User record. For example, if you want to send an email to the group assigned to the incident, drag the [Assignment group] data pill from the data panel.</td>
</tr>
<tr>
<td>CC</td>
<td>Additional recipients copied on this email. Enter a list of user email addresses separated by commas or white spaces. You can also drag data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>BCC</td>
<td>Additional recipients of this email, who are visible only to the sender (blind copied). Enter a list of user email addresses separated by commas or white spaces. You can also drag data pills that contain email addresses into the field.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subject</td>
<td>Subject of the email. You can enter text or drag data pills into the field.</td>
</tr>
<tr>
<td>Body</td>
<td>The content of the message body. You can enter text or drag data pills into the field.</td>
</tr>
</tbody>
</table>

**Note:** Flow Designer does not support the `${URI}` parameter in the email message body. To create a link to a record, use data pills, or create a notification step instead.

### Testing the email action

To verify that the email was generated when testing the action, review the email record in the Email [sys_email] table. The **Headers** field indicates whether the email was successfully generated. For example:

- **X-ServiceNow-Source:** FlowDesigner-9ad2747b0b710300f4eb8bf637673a1e
- **Message-ID:** <193756824.0.15085345686438@[10.0.66.70]>
- **X-ServiceNow-Generated:** true

ACL restrictions apply to the Send Email action. If you configured your flow to run as the user who initiates the session, ensure that the user can access email. To test access controls for a Send Email action, impersonate a typical email sender and manually trigger the flow.

### Send Notification action

Send a notification as specified by a notification record. The notification record determines the notification formats and recipients.

### Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record that triggers the notification. The notification has access to the data from this record.</td>
</tr>
</tbody>
</table>
Table | The table containing the triggering record. The system automatically determines the table from the record you select.
---|---
Notification | The notification record you want to use to format the notification and generate its recipients.

### Send SMS action

Send an SMS text message to specified users or groups as an action in a flow.

### Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recipients</td>
<td>Recipients of the SMS text message. Specify a user or group by dragging a pill from the data panel.</td>
</tr>
<tr>
<td>Message</td>
<td>Content of the SMS text message. You can enter text directly or drag a pill from the data panel.</td>
</tr>
</tbody>
</table>

### SLA Percentage Timer action

Identify when a task SLA record reaches a specific percentage value and perform other actions or flow logic that is based on the SLA percentage. For example, send a notification when an SLA percentage timer completes.

### Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for percentage</td>
<td>The positive integer percentage of the total SLA duration used to compute an end time. For example, a 50% percentage results in the system computing an end date-time value that is 50% of the total duration.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>total SLA duration</td>
<td>If an SLA requires tasks to be completed within 24-hours, then 50% of that SLA would be 12 hours.</td>
</tr>
</tbody>
</table>

**Scheduled End Date/Time**
The **Scheduled End Date/Time** data pill lists when the SLA percentage timer action is expected to end.

- If the end date is in the future, the system creates a system event to continue running the action at that future date. While the system waits for the scheduled end date, it pauses the flow and action.
- If the end date is in the past, the system immediately sets the **Status** of the SLA Percentage Timer action.

**Status**
The **Status** data pill contains the result of the SLA percentage timer.

**SLA Percentage Timer status descriptions**

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Completed</td>
<td>The timer action reached its scheduled end date/time. Flow designers can build specific flow logic for this action status.</td>
</tr>
<tr>
<td>Paused</td>
<td>The timer was paused before its scheduled end date/time. If the timer resumes running, Flow Designer generates a new scheduled end date/time value. Flow designers can build specific flow logic for this action status.</td>
</tr>
<tr>
<td>Repair</td>
<td>The flow is running in repair mode, and the scheduled end date/time is in the past. Flow designers can build specific flow logic for this action status.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The timer did not run because the scheduled end date/time is in the past. Flow designers can build specific flow logic for this action status.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The timer is running and has yet to reach the scheduled end date/time.</td>
</tr>
</tbody>
</table>

Flow Designer sets the action status when the SLA state matches an **SLA condition** or when certain UI actions are selected.
**Action status set for SLA state**

<table>
<thead>
<tr>
<th>SLA state</th>
<th>Action status set</th>
<th>Flow run state</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLA attaches and the scheduled end date/time is in the future.</td>
<td>Set action status to <strong>Waiting</strong>.</td>
<td>The flow waits until the SLA timer completes, is cancelled, or is paused.</td>
</tr>
</tbody>
</table>
| SLA attaches and the scheduled end date/time is in the past. | • If the flow was started in Repair mode, set action status to **Repair**.  
• Otherwise, set action status to **Skipped**. | The flow runs the next action or flow logic in the flow sequence. |
| SLA Cancels. | Set action status to a null value. | The flow stops with a state of **Cancelled**. |
| SLA Pauses. | Set action status to **Paused**. | The flow waits until the SLA Task flow is cancelled or is resumed. |
| SLA reaches Scheduled End Date/Time. | Set action status to **Completed**. | The flow runs the next action or flow logic in the flow sequence. |
| SLA Resumes. | Set action status to **Waiting**. | The flow waits until the SLA timer completes, is cancelled, or is paused. |
| SLA Stops. | Set action status to a null value. | The flow stops with a state of **Cancelled**. |

**Total Duration**

The **Total Duration** data pill lists the total number of seconds that the action ran. The total duration is computed from the action start time and the time when the action reached the **Completed** status. Status values other than **Completed** produce a null value **Total Duration**.

**Design considerations**

Follow these design considerations when creating flows that contain SLA Percentage Timer actions.

**Add SLA Percentage Timer actions only to flows with an SLA Task trigger**
An SLA Percentage Timer action can only run when the flow starts from an SLA Task trigger. You cannot activate a subflow containing an SLA Percentage Timer action.

Create conditional flow logic for expected Status values
Use the value of the Status field as a condition for flow logic. Build flow logic for expected Status values such as Completed, Repair, and Skipped. For example, add an If flow logic block to send a notification when the SLA Percentage Timer has a status of Completed.

Assign each SLA Percentage Timer action a unique cumulative Wait for percentage value
Each SLA Percentage Timer action computes its own Scheduled End Date/Time using its Wait for percentage value. If you create multiple SLA Percentage Timer actions, give each action its own unique cumulative Wait for percentage value. For example, create three separate actions with different percentage complete values such as 25%, 50%, and 75% complete. Setting all three actions to the same percentage complete value such as 25% causes the timers to complete at the same time.

Copy existing flows to make customizations
Reduce development time by copying the default SLA flows and customizing the copies with your own logic. Select a customized flow to run from the SLA definition. See Create an SLA definition.

Submit Catalog Item Request action
Create a requested item [sc_req_item] on a Service Catalog Request [sc_req].

Roles and availability
• Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalog Item</td>
<td>Name of the requested catalog item. Extra inputs may be added dynamically, depending on which catalog item is selected. For example, when the requested</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>catalog item is a new email account, a field for <strong>Preferred Email address</strong> appears.</td>
</tr>
<tr>
<td>Quantity</td>
<td>Number of items requested.</td>
</tr>
<tr>
<td>Special Instructions</td>
<td>Text describing any special instructions about the item request.</td>
</tr>
<tr>
<td>Delivery Address</td>
<td>Location where the requested item should be delivered.</td>
</tr>
<tr>
<td>Requested for</td>
<td>User that the item is requested for.</td>
</tr>
<tr>
<td>Don’t fail on error</td>
<td>Option to determine whether to fail the flow if the action produces an error.</td>
</tr>
<tr>
<td>Wait for Completion</td>
<td>Option to force the flow to wait until the action has been completed before continuing.</td>
</tr>
<tr>
<td>Enable timeout</td>
<td>Option to limit the amount of time that the flow waits for the action to be completed before continuing.</td>
</tr>
<tr>
<td></td>
<td>This field appears only when the <strong>Wait for Completion</strong> option is selected.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that the flow waits before continuing when the <strong>Enable timeout</strong> option is selected. Enter the time to wait in hours, minutes, and seconds. If you leave this field empty, the flow does not wait.</td>
</tr>
<tr>
<td></td>
<td>This field appears only when the <strong>Wait for Completion</strong> option is selected.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Schedule used to compute the timeout duration when the <strong>Enable timeout</strong> option is selected. For example, waiting for 10 hours as part of an 8-5 weekdays schedule causes the flow to wait for one or more business days. If you leave this field empty, the timeout runs without a schedule.</td>
</tr>
<tr>
<td></td>
<td>This field appears only when the <strong>Wait for Completion</strong> option is selected.</td>
</tr>
</tbody>
</table>
Example

**OUTPUT**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error Message</td>
<td>Message that displays if the action produces an error.</td>
<td>String</td>
</tr>
<tr>
<td>Requested Item</td>
<td>Document ID for the requested item.</td>
<td>Document ID</td>
</tr>
<tr>
<td>Status</td>
<td>The completion status of the action as a numeric value.</td>
<td>Choice</td>
</tr>
</tbody>
</table>

Update Multiple Records action

Look up and update multiple records as a single action. Using this action removes the need to separately look up a list of records and then process the list with For Each flow logic. Set field values with a template or add and configure them using data pills.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table containing the records to look up and update.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Define the filter conditions used to look up records.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set the fields and field values you want to update. Set static or dynamic values for the fields in the records. For example, to set the short description to a certain value, select <strong>Short description</strong> and set the desired value. To add dynamic values, see <strong>Allow flow designers to dynamically set field values.</strong></td>
</tr>
<tr>
<td>Order by</td>
<td>Select the field you want to use to sort the records when more than one record matches the defined conditions.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Determine whether to sort the records alphabetically in ascending or descending order.</td>
</tr>
<tr>
<td>Don’t fail on error</td>
<td>Specify whether to continue running the flow when there is an error.</td>
</tr>
</tbody>
</table>
**Example**

**TRIGGER**

Problem Updated where (State is Closed)

**ACTIONS**

Update Multiple Incident Records

- **Action**: Update Multiple Records
- **Table**: Incident (incident)

**Conditions**

All of these conditions must be met

- Parent Number is Trigger + Problem Record + Number

**Fields**

- State
- Resolution code
- Resolution notes

**Order by**

- Number

**Sort Type**

- a to z

**Don't fail on error**

**Outputs**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Number of records updated. If no records are updated, the count is 0.</td>
<td>Integer</td>
</tr>
<tr>
<td>Error</td>
<td>Message that displays if the action produces an error.</td>
<td>String</td>
</tr>
<tr>
<td>Message</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Status</td>
<td>The completion status of the action as a numeric value.</td>
<td>Choice</td>
</tr>
<tr>
<td></td>
<td>• 0 (success)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 1 (error)</td>
<td></td>
</tr>
</tbody>
</table>

**Update Record action**

Update an existing record in a table. You can dynamically add and configure fields for the record.
Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>The table associated with the record. When you select a record, this field is automatically set to the table associated with the record.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set the values of fields in the record to be updated. For example, to set the short description to a certain value, select Short description and set the desired value. If adding the action to a subflow, you can Allow flow designers to dynamically set field values.</td>
</tr>
</tbody>
</table>

Wait For Condition action

Pause a flow until record values match a specific set of conditions.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag an input record or a record from a previous step.</td>
</tr>
<tr>
<td>Note:</td>
<td>If this record is deleted, the flow stops waiting and continues running.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record. Confirm that the system supports Wait for Condition for your selected table.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Conditions</td>
<td>Select the record values necessary to resume running the flow. For example, if the condition is [<strong>State</strong>][is][<strong>Closed</strong>], the flow pauses until the condition is met. Once met, the flow moves on to the next step or action. Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the <strong>Conditions</strong> field.</td>
</tr>
<tr>
<td>Enable timeout</td>
<td>Option to limit the amount of time that the flow waits for the action to be completed before continuing.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that the flow waits before continuing when the <strong>Enable timeout</strong> option is selected. Enter the time to wait in hours, minutes, and seconds. If you leave this field empty, the flow does not wait.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Schedule used to compute the timeout duration when the <strong>Enable timeout</strong> option is selected. For example, waiting for 10 hours as part of an 8-5 weekdays schedule causes the flow to wait for one or more business days. If you leave this field empty, the timeout runs without a schedule.</td>
</tr>
</tbody>
</table>

**Unsupported tables**

The system does not support Wait for Condition for the following tables.

<table>
<thead>
<tr>
<th>Table Category</th>
<th>Table Names</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audit</td>
<td>Sys Audit [sys_audit], Audit Deleted Record [sys_audit_delete], Audit Relationship Change [sys_audit_relation], Audit Roles [sys_audit_role], Audit Relationship Change [sys_audit_relation], Audit Deleted Record [sys_audit_delete]</td>

</tbody>
</table>
### Condition Evaluation

The Wait for Condition action only evaluates the wait condition when there are changes to the **Record** you select. A valid wait condition meets these criteria.

- Each condition evaluates a field from the table to which the record belongs.

  ℹ️ **Note:** Avoid conditions that dot-walk to another table or depend upon catalog item variables from a related record.

- Each condition specifies a field value change rather than a relative time period.

  ℹ️ **Note:** For conditions that depend on a specific duration, consider using **Wait for a duration flow logic** instead.
Valid wait condition

In this example, the wait condition is valid because the **State** field belongs to the Incident table and the condition is a field value change to **Closed**.

Invalid wait condition

In this example, the wait condition is invalid because it is a time relative to the **Created** date. Actions that have a condition that relies on a time interval will not be met, so the action is never performed.

Output

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>The completion status of the action as a numeric value.</td>
<td>Choice</td>
</tr>
</tbody>
</table>
Design considerations

Follow these design considerations when creating flows that wait for a condition.

**Use record triggers instead of wait conditions to start flows**

If you only want a flow to run when certain record conditions are met, create a flow with a record trigger instead of starting and pausing a flow. A waiting flow consumes more system resources than a flow trigger.

**Cancel flows whose resume conditions can never occur**

Prevent your flows from waiting indefinitely by specifying flow stop conditions with *End flow logic*. To free up system resources, you can also cancel any flow whose resume conditions can never be met. For example, cancel flows waiting for incident record updates where the related incident is closed.

**Restrict wait conditions to fields present on the current table**

The **Wait For Condition** action can only monitor changes to the fields of the table to which the record belongs. The action cannot detect changes to fields in related records or catalog variables. For example, if an action waits for changes to an Incident record, then it cannot detect changes to a related record such as a catalog item or change task record. Avoid building wait conditions that dot-walk to another record as these fields actually belong to the related record. Avoid building wait conditions that rely on catalog variables.

**Flow action numbering**

The action outline displays a whole number besides each action and flow logic block in a flow. You can update flows containing legacy action numbering from within Flow Designer.

**Current action numbering**

The current number sequence increments each item in the action outline by a whole value of one. For example, if a flow logic block is step 2 in the action...
outline, then the actions within the flow logic block are steps 3, 4, and 5. Inline scripts reference the whole number value of actions and flow logic.

**Legacy action numbering**
The legacy number sequence increments each item within a flow logic block by a decimal value of 0.1. For example, if a flow logic block is step 2 in the action outline, then the actions within the flow logic block are steps 2.1, 2.2, and 2.3. Inline scripts reference the decimal values of actions and flow logic.

**Important:** Inline scripts produce an error when they refer to actions using legacy action numbering. Update all inline script references to use the new action numbering.

**Automatic action numbering updates**
Flow Designer automatically updates the action numbering of all flows during upgrade. Whenever you open a flow that contains inline scripts, Flow Designer checks the script for references to legacy action numbering. If the script contains legacy references, it displays a prompt to update the action numbering.

**Prompt to automatically update action numbers in inline scripts**

Allow Flow Designer to update action numbering in your scripts?

There are scripts that use legacy action numbering on actions. More Info

- [ ] Do not show this again

The system attempts to match the actions referred to by the legacy action numbering to actions with the new numbering. Review the inline script changes to ensure that your inline scripts refer to the correct actions.

**Flow Designer stages**
Communicate the current stage of a request or flow with an end user.

When configuring stages in Flow Designer, you can:
• Create any number of stages.
• Change stage labels and names.
• Set the estimated duration for a stage.
• Import a copy of a pre-defined stage set from the Stage Sets table. To learn more about stage sets, see Workflow stage sets. Any changes made to the copy do not affect the original stage set record.

While stages can be added to a flow with a scheduled trigger, the stages are never displayed to an end user because there is no associated record for the stage field. Only use stages in flows with record and Service Catalog triggers. Stages are not supported on subflows.

View the stages of a flow in the flow execution details.

Displaying stages in a stage field

A stage field is a field of type Workflow that displays the stages of a flow to a user. The Service Catalog table uses a Stage field to indicate the progress of a request as it is processed.

Stage fields display:

• Stages from flows with record or Service Catalog triggers.
• Stages from the associated flow. If the associated flow calls another flow, stages set on the child flow do not display.
• Stages from flows that have started.

State icons in stage fields cannot be modified. Limit the number of stages and the length of each stage name to prevent wrapping text and icons onto multiple lines.

Note: Only add one stage field per table. If there is more than one stage field, the system only displays stages from the first stage field defined in the table dictionary entry.

Stage field and trigger types

Associating a flow to a stage field depends on the flow trigger type.

<table>
<thead>
<tr>
<th>Flow trigger type</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>For a stage field to report stages on a record-based flow, a stage field must be present on the same table as the triggering record. When a flow has</td>
</tr>
<tr>
<td>Flow trigger type</td>
<td>Requirements</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------</td>
</tr>
<tr>
<td></td>
<td>stages, Flow Designer communicates the status of each stage back to the triggering table and displays the current stage state as an icon. If more than one stage field exists on the table, only the first stage field defined in the table's dictionary definition is used.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Avoid creating stages for multiple flows that trigger from the same table. A stage field only displays the stages of the final flow to run. Add different conditions to each flow to ensure that the stages of one flow do not overwrite another flow.</td>
</tr>
<tr>
<td>Service Catalog</td>
<td>If using the Service Catalog trigger, the flow must be associated with the Service Catalog item through the <strong>Flow</strong> field. Remove any workflows associated with the item by clearing the <strong>Workflow</strong> and <strong>Execution Plan</strong> fields. The <strong>Stage</strong> field displays the current stage state on any list view of the Requested Items [sc_req_item] table.</td>
</tr>
</tbody>
</table>

### Stage states
During flow execution, each stage can be in one of five states.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pending</td>
<td>This stage has not yet started.</td>
</tr>
<tr>
<td>In progress</td>
<td>This stage is executing.</td>
</tr>
<tr>
<td>Skipped</td>
<td>This stage was skipped and did not run. Typically, this state is reached when a conditional flow logic block is not executed.</td>
</tr>
<tr>
<td>Complete</td>
<td>This stage is complete.</td>
</tr>
<tr>
<td>Error</td>
<td>This stage has reached an error condition. When designing a flow, you can manually set the flow to report an Error state. To set an Error state:</td>
</tr>
</tbody>
</table>
Each stage can have its own custom state labels. For example, suppose that you have a flow with two stages. Stage 1 could have the Pending state with the label Waiting, and Stage 2 could have a Pending state with a label of Not yet started. Flow Designer provides options to generate either the default states or approval states.

**Design considerations**

Follow these design considerations when creating flows with stages.

- **Avoid defining stages that depend on a For Each flow logic**

  Flow Designer prevents you from adding stages within a For Each block. You can only add stages before or after a For Each block.

- **Avoid having multiple flows with stages on the same table**

  A stage field always displays the stage information provided by the last flow to run on a table or record. If multiple flows run on the same records, then the stages defined in one flow can in theory overwrite the stages from another flow. To avoid multiple flows overwriting each other’s stages, define unique trigger conditions for each flow.

- **Avoid updating stage fields**

  If you manage stages with a flow, avoid directly updating stage fields with actions, business rules, script calls, or workflows. Manually updating the value of a stage field may produce unexpected or undesired results.

- **Ensure that each flow on a table has unique trigger conditions**

  Adding unique trigger conditions to each flow ensures the flows only run under those conditions and prevents the stages from one flow overwriting the stages of another flow. Specifying unique trigger conditions makes it easier to troubleshoot flows by limiting the number of flow executions that can produce record changes.

- **Use error stages to communicate with the user**

  The flow error state does not affect flow execution. A flow continues running even if it reaches an error stage. Use a conditional flow...
logic block to set the error stage and communicate to the user that the state of the current stage is Error. For example, if an approval is not approved within the required limit, you may want to communicate an error to the user.

**Use the error stage to stop processing a flow**

Use a conditional flow logic block to identify when a flow enters the error stage. Use the flow logic to stop processing the flow or take some kind of remediation action. For example, you may want to change the record state or assignment when a flow reaches an error state.

**Configure stages and add them to a flow**

Configure when stages display to a user, define stage state labels, and add stages to a flow within Flow Designer.

**Before you begin**

While stages can be added to a flow with a scheduled trigger, the stages are never displayed to an end user because there is no associated record for the stage field. Only use stages in flows with record and Service Catalog triggers.

Role required: flow_designer or admin

**Procedure**

1. **Optional:** If not already present, create a stage field on the table that triggers the flow. A stage field is a field of type Workflow that displays the stages of a flow to a user. The Service Catalog Requested Items [sc_req_item] table has a stage field by default.

   (Optional) For a stage field to report stages on a record-based flow, a stage field must be present on the same table as the triggering record.

   To add a field to a table, see Add and customize a field in a table.

2. **Optional:** If adding stages to a flow with a Service Catalog trigger, select the flow in the Flow field of the Service Catalog Item [sc_cat_item] table. If using the Service Catalog trigger, the flow must be associated with the Service Catalog item through the Flow field. Remove any workflows associated with the item by clearing the Workflow and Execution Plan fields. This enables a request for a catalog item to initiate a flow specific to that catalog item.

3. Open the flow in Flow Designer.

4. Create and configure stages.
a. Click 🔽 and select Stages. The Flow Stages menu opens.

b. Click New Stage to create and configure stage options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Display name for the stage. Must be unique.</td>
</tr>
<tr>
<td>Value</td>
<td>Internal name for the stage. Must be unique.</td>
</tr>
<tr>
<td>Duration</td>
<td>Estimated duration displayed to the user.</td>
</tr>
<tr>
<td>Always Show</td>
<td>If selected, the stage always displays in the stage field, even if the stage is set within a flow logic block that might not execute.</td>
</tr>
</tbody>
</table>

c. Optional: Select a stage set to import stages from the Stage Sets table. To learn more about stage sets, see Workflow stage sets. Any changes made to the copy do not affect the original stage set record.

d. Order stages from top to bottom in the order you want the stage field to display them. The stage at the top appears first in the stage field, and the stage at the bottom appears last in the stage field.

   Note: If you create stages inline, the Flow Stages menu displays them in the order they were created, not in the order they appear in the flow.

5. Add stages to the flow. Point to a location in the flow, click Add a Stage, and select an existing stage. Stages can be applied at the beginning of any Flow Designer action or flow logic block, or within an If block.

   Important: Stages are unavailable from within a For Each flow logic block. You can only add stages before and after a For Each flow logic block.
6. **Optional:** Create stages inline. Point to a location in the flow, click **Add a Stage**, and click + to create a new stage.

**Important:** When you create stages inline, stage fields display the stages in the order they were created, not in the order they appear in the flow. To configure or change the order of stages you create inline, open the More Actions menu.

7. **Optional:** Set a stage to the Error state within a conditional flow logic block.

   a. Point to a location and select **Set "Error" State**.

   To set a stage to the Error stage:
   - The flow must have at least one stage defined.
   - The Error can only be set within a stage. When an Error condition is reached, the current stage is set to Error.
   - The Error can only be set within a conditional flow logic block.

When the flow reaches the indicated point, the currently executing stage is set to Error in the stage field.

**Results**

When the flow runs, the stage details appear in any field of type Workflow. In a flow with a record-based trigger, the Workflow field of the triggering table displays the current stage state. In a flow with a Service Catalog trigger, the
Stage field of the Requested Items [sc_req_item] table displays the current stage state.

Flow execution details

View runtime information about an action or flow directly from the design environment such as the current state, actions or steps run, and values produced. Open related records from embedded Now Platform editors or in a new tab.

Each time you test a flow, the system generates information about the configuration and runtime values produced as flow execution details. Process analysts can view flow execution details from the Executions tab. Select a flow execution to open its associated execution details page.

Optionally, you can configure the system to generate execution details each time a flow is run, not just during testing. For more information, see Activate flow reporting.

Sample execution details of the VTB Sample Flow

<table>
<thead>
<tr>
<th>FLOW STATISTICS</th>
<th>ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>Look Up Record</td>
</tr>
<tr>
<td>3</td>
<td>Create VTB Card</td>
</tr>
</tbody>
</table>

Each execution details page displays:

- Calling source
- Flow state
- Related record options
- Flow Statistics

Calling source

The calling source lists what started a flow or subflow.
## Source

<table>
<thead>
<tr>
<th>Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow Designer Test</td>
<td>The flow started because a user selected the <strong>Test</strong> option from the Flow Designer interface. The flow trigger conditions were ignored.</td>
</tr>
<tr>
<td>CRUD Trigger</td>
<td>The flow started when the record-based trigger conditions were met.</td>
</tr>
<tr>
<td>Date Trigger</td>
<td>The flow started when the schedule-based trigger conditions were met.</td>
</tr>
<tr>
<td>Metric Trigger</td>
<td>The flow started when the MetricBase trigger conditions of a <strong>MetricBase</strong> were met.</td>
</tr>
<tr>
<td>Service Catalog Trigger</td>
<td>The flow started when a Service Catalog item was requested.</td>
</tr>
<tr>
<td>Script</td>
<td>The flow started from an API method call in a script, such as a business rule.</td>
</tr>
<tr>
<td>Background Script</td>
<td>The flow started from an API method call in the <strong>Scripts - Background</strong> module.</td>
</tr>
</tbody>
</table>

## Flow state

All active flows are in one of these states.

**Completed**

The flow successfully ran all actions. The flow statistics display configuration and run-time details for each action.

**Waiting**

The flow paused on an action that is waiting for some condition to be met before continuing. The flow statistics display configuration and run-time details for completed actions and configuration details for any actions waiting for a condition to be met. Flows in the Waiting state display a **Cancel Flow** UI action in the header.

**Error**

The flow stopped with an error. The flow statistics display configuration and run-time details for completed actions and configuration details for the action that produced the error. Flows in the Error state display a **Go to error** UI action in the header.

ℹ️ **Note:** When an action results in an error, the flow stops executing at that point and results in an error state.
Related record options
From the Execution details page, you can access records related to the current flow.

Refresh Flow Data
Use this option to update flow runtime data.

Open Flow
Use this option to make configuration changes and publish a new instance of the flow. Changing the flow configuration does not change any currently active flow.

Open Context Record
Use this option to view the flow state, run duration, and related log entries from a standard form view. This option opens the context record in a new tab.

Open Flow Logs
Use this link to view detailed log information about each action. This link opens the log entries list in a new tab.

Open Current Record
For flows that have a record-based trigger, use this link to view the triggering record in a pop-up window.

Open Action
Use this link to make configuration changes and publish a new instance of the action. Changing the action configuration does not change any currently active flow. This link is unavailable for ServiceNow-provided core actions.

Flow statistics
Use flow statistics to see configuration details and run-time values for each flow component. Clicking a trigger or action expands the row and displays configuration and run-time details about it.
The following types of execution details are available.

**Roles**

Use role information to identify whether the flow was **Run as the system** or the user who triggered the flow. If the flow ran with specific roles, the roles are listed after **Run with role(s).**

**Integration Metadata**

Use Integration Metadata to view transaction data such as connection and credential used, target host, and payload size. Integration Metadata only displays for integration steps and requires a separate IntegrationHub subscription. For more information, see Integration steps.

**Configuration Details**

Use the list of input variables to identify any configuration errors with the action. Each variable has its own row displaying its name, data type, configuration settings, and run-time value. The configuration settings display dynamic values as pills. The run-time values display generated records as a link.

**Output Data**

Use the list of output variables to identify any configuration errors with the action.
Logs

Use the log entries to identify potential processing or performance issues. Each log entry has its own row displaying the creation date, log level, and log message. If the action does not generate any logs, the statistics displays the string **No Logs**.

Steps

Use the list of steps to identify any configuration errors with the action. Each step has its own row displaying the variable name, data type, configuration settings, and run-time value. Core actions do not display steps because users cannot change their configuration.

Change the

```
com.snc.process_flow.reporting.serialized.val_size_limit
```

system property to truncate runtime values in the flow execution details step configuration. To learn more, see Flow Designer system properties.

Run duration

Use the run duration to identify potential processing or performance issues. Each action and step displays the duration in milliseconds. System quota rules prevent any action from running longer than a minute.

Embedded text viewer

Flow Designer displays large text-based configuration and runtime output records such as email output, XML payloads, or script steps using an embedded text viewer. The embedded text viewer can format text as HTML, plain text, or color-coded JavaScript. For script steps, the text viewer highlights code lines containing errors.
### Viewing results for each item in flow logic

Flow Designer displays a selector control to view the configuration and run-time results for each item processed by flow logic. Select a record number to see its configuration and run-time details.
Subflow execution details

Process analysts can view subflow execution details from multiple locations.

**Parent flow execution details**

A parent flow lists the flow execution details of each subflow it calls as inline elements. Expand the subflow step to see the subflow execution details.

**Subflow execution details**

The system generates flow execution details for each subflow run. View subflow execution details directly from the list of flow executions.

**Activate flow reporting**

Generate execution details anytime a flow, subflow, action, or step is run, not just during testing.

**Before you begin**

Role required: admin

**About this task**

**Important:** To avoid performance issues on your production instance, activate and configure reporting on the non-production instance that you use for testing.

You activate reporting for an individual flow, subflow, or action by creating a record on the Settings [sys_flow_execution_setting] table. You specify the flow, subflow, or action in the Settings record. Then, the system generates execution
details each time the flow, subflow, or action is run. You can create as many Settings records as you like.

**Note:** Setting records don’t affect actions and subflows running within a parent flow. These settings are only honored when an action or subflow is run using the action API or script API.

Alternatively, you can activate the system to generate execution details each time any of your flows, subflows, actions, or steps are run. To activate reporting globally, configure the `com.snc.process_flow.reporting.level` system property.

**Procedure**

Activate and configure reporting.

<table>
<thead>
<tr>
<th>Option</th>
<th>Procedure</th>
</tr>
</thead>
</table>
| **Activate reporting for an individual action** | a. Navigate to Process Automation > Settings and select New.  

b. In the Flow/SubFlow/Action field, select the lookup icon (🔍) to select an action.  

c. On the dialog box that appears, in the Table name field, select action Type.  

d. In the Document field, select the lookup icon (🔍) and then select an action.  

e. Select OK to close the dialog box.  

f. In the Reporting field, select Flows, Actions, and Steps.  

g. Select Submit. |

| **Activate reporting for an individual flow or subflow** | a. Navigate to Process Automation > Settings and select New.  

b. In the Flow/SubFlow/Action field, select the lookup icon (🔍) to select a flow or subflow.  

c. On the dialog box that appears, in the Table name field, select Flow. |

**Related reference**

Flow Designer system properties

**Flow execution details retention**

Due to the large amount of data consumed by flow execution details, your instance uses data retention policies to delete this data after a set time period.

**Scheduled table cleanup**

The time period used for scheduled table cleanup depends on the type of data stored. Once a record is older than its default retention period, it is deleted if it is in a completed state and the default skip_schedule_cleanup value is false.

### Flow reporting data tables

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Default retention period</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_flow_report_doc</td>
<td>Report table storing all Flow Designer execution details as of the New York release.</td>
<td>6 Months</td>
</tr>
<tr>
<td>sys_flow_context</td>
<td>Table storing all Flow Designer context records. Context records store the state and a reference to the process plan used to run a flow or action.</td>
<td>6 Months</td>
</tr>
<tr>
<td>sys_json_chunk</td>
<td>Table storing compiled process plans for future, running, and completed flows and actions.</td>
<td></td>
</tr>
<tr>
<td>sys_flow_flow_report</td>
<td>Legacy report table storing flow execution details. Replaced by the sys_flow_report_doc table as of the New York release.</td>
<td>6 Months</td>
</tr>
<tr>
<td>sys_flow_action_report</td>
<td>Legacy report table storing action execution details. Replaced by</td>
<td>6 Months</td>
</tr>
</tbody>
</table>
Flow reporting data tables (continued)

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Default retention period</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_flow_step_report</td>
<td>Legacy report table storing step execution details. Replaced by the sys_flow_report_doc table as of the New York release.</td>
<td>1 Week</td>
</tr>
</tbody>
</table>

Every month, the system deletes Flow Designer-related entries from the Variables [var_dictionary] table if they haven’t been used for over a year.

Unavailable flow data
A message displays at the top of the flow report to indicate that action reports are not available for a flow because of table cleanup. The **Show Action Details** link and Action states are not available in this case. A similar message is shown to indicate when reporting for a flow has been deactivated. In this case, a link to the report settings also displays.

Flow logic
Enable flows and subflows to specify conditional or repeated actions. Combine the elements of flow logic to create workflows in a graphical interface with little or no scripting.
The system provides these flow logic options.

<table>
<thead>
<tr>
<th>Flow logic option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If</td>
<td>Selectively apply one or more actions only when a list of conditions is met.</td>
</tr>
<tr>
<td>For each</td>
<td>Apply one or more actions to each record in a list of records.</td>
</tr>
<tr>
<td>Do the following until</td>
<td>Apply one or more actions repeatedly until an end condition is met. You can use the flow data to specify the end conditions.</td>
</tr>
<tr>
<td>Do the following in parallel</td>
<td>Run actions and subflows in separate paths within an isolated flow logic block.</td>
</tr>
<tr>
<td>Make a decision</td>
<td>You can use the decision table branching logic in situations where multiple conditional paths are required, as an alternative to nested If, Else If, or Else flow logic. For example, if you want to determine what kind of car insurance you need, you can add inputs such as your age, accident history, and car model to the decision table to determine a level of insurance coverage. This logic can save you time and present a more readable format than nested if conditions or switch case statements.</td>
</tr>
<tr>
<td>Wait for a duration of time</td>
<td>Use this flow logic to give your users time to act during automated processes or to wait for a specific date and time to complete actions</td>
</tr>
<tr>
<td>Call a Workflow</td>
<td>Run a published and active workflow from your flow. You can use the flow data as a workflow input. For example, you can specify the current record as a workflow input.</td>
</tr>
<tr>
<td>Flow logic option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>End</td>
<td>Use this flow logic to stop a flow within flow designer.</td>
</tr>
<tr>
<td>Dynamic Flow</td>
<td>Identify and run a flow or subflow dynamically by using runtime data. Build templates to provide expected inputs for dynamically called flows or subflows.</td>
</tr>
<tr>
<td>Get Flow Outputs</td>
<td>Use this flow logic to access flow contexts and derive the runtime values for dynamic flow outputs.</td>
</tr>
<tr>
<td>Set Flow Variables</td>
<td>Assign a value to one or more flow variables. Change or update a variable's value during a flow.</td>
</tr>
</tbody>
</table>

**Flow logic inputs**

Each flow logic option displays one or more fields that are used to determine its behavior. For example, the **Call Workflow** flow logic has an input where you are able to select a workflow to run. Use these inputs to define the behavior of the flow and enable optional functionality depending on your needs. See flow logic option documentation for a list of the available inputs and how they control the function of that element.

**Flow logic outputs**

Flow logic options may also have outputs. These represent information that is returned by the flow logic. For example, the **Make a decision** flow logic has an output that contains a decision answer record representing the decision reached by the flow. See the documentation for a flow logic option to see definitions for its outputs.

**If flow logic**

Selectively apply one or more actions only when a list of conditions is met.

Use this flow logic by specifying conditions that are based on the current record. Actions or subflows can be added to the flow within the if flow logic. The flow only applies the actions within this flow logic if the conditions evaluate to true. Conditions are based on data in records, such as a records state or urgency.
## Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition label</td>
<td>Descriptive label for the branch.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions under which the branch runs.</td>
</tr>
</tbody>
</table>

### Example: Perform an action on if an incident has a high urgency

In this example, the action is triggered when the incident record has a high urgency value.

![Example](image)

### Execution details

**Execution details for if flow logic**

1. The header shows the state, start time, and runtime for the flow logic.
2. The Configuration Details section shows the details about the variables that are used by the flow, including the type, configuration, and runtime values for each variable. Use the condition variable to see if the branch conditions were met.

**For Each flow logic**

Apply one or more actions to each record in a list of records.
The **For Each** flow logic applies one or more actions to a list of records. The flow applies the actions contained within the flow logic to each record in the list.

⚠ **Note:** Iterating over a large number of records can be resource intensive, especially when the For Each logic block includes complex actions for each iteration. To avoid performance issues, turn off reporting using the `com.snc.process_flow.reporting.level` system property. For more information, see Flow Designer system properties.

### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Items</td>
<td>List or Records data pill specifying the records to process in sequence.</td>
</tr>
<tr>
<td></td>
<td>• Array data pill</td>
</tr>
<tr>
<td></td>
<td>• List data pill</td>
</tr>
<tr>
<td></td>
<td>• Records data pill</td>
</tr>
<tr>
<td></td>
<td>For example, you could use the additional Assignee list for an incident record. For information on data pills, see Flow Designer data.</td>
</tr>
</tbody>
</table>

### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Table name] Record</td>
<td>Current record in the loop.</td>
</tr>
</tbody>
</table>

⚠ **Note:**

To optimize performance, avoid iterating over lists with more than 1000 records. To iterate over lists with more than 1000 records, divide the list into smaller sections and use multiple flows.

You can nest a **For Each** flow logic block inside of another flow logic block to repeat an action over a series of records. However, avoid nested For Each loops that process many records. Nested loops may cause the flow to run until it is stopped by the flow transaction quota rule, which prevents flows from running longer than an hour. For more information about transaction quotas, see Transaction quotas.
Note: By default, when viewing a flow's execution details, the last 50 iterations for a For Each flow logic's actions appear in the step details. To view more action iterations for a For Each flow logic in the execution details, change the value of the following property at Process Automation > Flow Administration > Properties:

• Number of recent iterations to report for Do Until and For Each loops. For example, if we have 100 iterations and the number is 5, we would report iterations 96-100. If the number is -1 we report all iterations. If the number is 0 we report 1 iteration.

Example: Send an email to each person assigned to a problem

This sample flow starts when a problem record is created. The flow uses For Each flow logic to send an email to each additional assignee listed in the trigger record. The Additional Assignee field of the triggering problem record contains the list of records you want to process.

When the loop is created, a new entry appears in the data panel on the right called 1 - For Each. In that entry, you see an Additional assignee list Record data pill that contains the user information for the users in that field.

The plus icon (+) below this email action is used to add additional actions, such as logging, to the loop.
The flow execution details tab provides runtime information on the flow logic.

1. The header shows the state, start time, and runtime for the flow logic.

2. This flow logic can run actions or subflows multiple times. Use the arrow keys to cycle through each of these instances to see their values.

3. The Configuration Details section shows which records the flow has evaluated.

4. After the For Each section are the actions taken within it. The values for these actions change as you cycle through the actions that are taken by this flow logic.

**Do the following until flow logic**

Apply one or more actions repeatedly until an end condition is met. You can use the flow data to specify the end conditions.

You can use **Do the following until** flow logic to create a loop that repeatedly applies actions. This flow logic requires a condition specifying when to stop the loop.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition label</td>
<td>Descriptive label for the loop.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions under which the loop terminates. You could, for example, end a loop when the state of an incident changes.</td>
</tr>
</tbody>
</table>
Example: Send a daily email until an incident is resolved

In this example, the flow sends a daily email about the incident, until the incident is in a closed or canceled state. Inside the Do the following branch, there is a step for looking up the incident record. This is necessary because the record that triggers the flow is only loaded when it is triggered. By adding this look up step, you can get the current state of the incident each time the loop runs.

Outputs
This flow logic produces no outputs.
1. The header shows the state, start time, and runtime for the flow logic.
2. This flow logic can run actions or subflows multiple times until its condition is met. Use the arrow icons to select an iteration and its values.
3. The Actions section shows details on the actions, flows, or subflows that are run during this loop iteration.

**Do the following in parallel flow logic**

Run actions and subflows in separate paths within an isolated flow logic block.

With this flow logic, you can run actions and subflows in separate paths. If any action within the Do the following in parallel flow logic block must wait, other actions run until all paths within the block finish processing.
Paths in a Do the following in parallel flow logic block

**Inputs**
Do the following in parallel flow logic does not have field inputs. Instead, it displays a plus (➕) icon that enables you to create a path with actions or subflows.

The actions and subflows in each path run until all tasks within the flow logic block have completed.

**Outputs**
This flow logic has no outputs, but actions and subflows in each path may have outputs. While the flow is running, outputs from a path are only accessible to other actions in the same path. After the Do the following in parallel flow logic completes, its final outputs are accessible to the rest of the flow.
Example: Create two tasks in parallel when a change request is created

In this example, a flow triggers when a new change request is created. Using Do the following in Parallel, two tasks are created in separate paths and are assigned to different groups. The flow uses the Number field data pill from the triggering change request to display the number in the short description for the task record.

Execution details

<table>
<thead>
<tr>
<th>Action</th>
<th>Table</th>
<th>Field Values</th>
<th>State</th>
<th>Start time</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Do the following in Parallel</td>
<td>Flow Logic</td>

<td>Completed</td>
<td>2018-09-05 15:20:44</td>
</tr>
<tr>
<td>1.2</td>
<td>Log</td>
<td>Core Action</td>
<td>Completed</td>
<td>2018-09-05 15:20:44</td>
</tr>
</tbody>
</table>
1. The header shows the state, start time, and runtime for the flow logic.

2. The Configuration Details section shows the state, start time, and runtime for each path in the flow logic block.

**Make a decision flow logic**

You can use the decision table branching logic in situations where multiple conditional paths are required, as an alternative to nested If, Else If, or Else flow logic. For example, if you want to determine what kind of car insurance you need, you can add inputs such as your age, accident history, and car model to the decision table to determine a level of insurance coverage. This logic can save you time and present a more readable format than nested if conditions or switch case statements.

The **Make a decision** flow logic requires that you create an external decision table for its branch paths. Each decision table answer produces a separate branch path within Flow Designer. Decision tables accept any number of inputs and support any number of decisions. You can configure the Make a decision flow logic to return a single or multiple answers and to display the answers as branch paths or record data pills. For more information on decision tables, see **Decision Tables**.

**Note:**

- When the **Use Branches** check box is cleared, the Make a decision data pills in other flow components is supported only if there are no branches.
- The Make a decision data pill can be used in the answer branches only when the **Use Branches** check box is selected.
- When the **Use Branches** check box is selected, don't use the Make a decision data pill in other flow components when there are branches.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decision Label</td>
<td>Descriptive label for the decision that you want to make. For example, you can create the <strong>Recommended Insurance Policy</strong> label if you want to determine the level of insurance coverage that you need. This value overrides the default action label.</td>
</tr>
<tr>
<td>Input</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Decision Table</td>
<td>Reference to a Decision Table [sys_decision] record. This record provides the decision input answers that are available to the flow.</td>
</tr>
<tr>
<td>Execution</td>
<td>Decision answers you want the flow to run.</td>
</tr>
<tr>
<td></td>
<td>• <strong>First decision that matches</strong>: Run only the first matching decision answer. This option produces these outputs.</td>
</tr>
<tr>
<td></td>
<td>◦ Answer record</td>
</tr>
<tr>
<td></td>
<td>◦ Answer table</td>
</tr>
<tr>
<td></td>
<td>• <strong>Run all decisions that match</strong>: Run all matching decision answers. This option produces these outputs.</td>
</tr>
<tr>
<td></td>
<td>◦ Answer table</td>
</tr>
<tr>
<td></td>
<td>◦ Ordered IDs</td>
</tr>
<tr>

<tr>
<td></td>
<td>◦ Count</td>
</tr>
<tr>
<td>Use Branches</td>
<td>Option to display each possible decision answer in its own branch flow logic block. Use the branch flow logic block to specify what Flow Designer content to run where the condition matches a specific decision table answer. Each branch flow logic block is equivalent to an If flow logic block for each answer. Disable branches when you want to return one or more answer records instead of branch flow logic blocks.</td>
</tr>
</tbody>
</table>

| Note: | Set the **Use Branches** option to specify how Flow Designer displays matching decision answers. |

© 2021 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
CAUTION: When you clear and confirm the Use Branches option, Flow Designer removes the flow logic blocks for each branch and removes the Include Otherwise check box. Reselecting the Use Branches check box does not restore any removed branch flow logic blocks.

Include Otherwise
Option to add the otherwise branch to the list of available answers. This option is only available when Use Branches is selected. You can use this branch to specify the actions and subflows to run when the decision table does not generate an answer. An Otherwise branch is equivalent to an Else flow logic block.

Note: If you specify a decision table default answer, this branch will never run because the decision table always selects an answer.

Decision table inputs
List of Decision Input [sys_decision_input] records that are associated with your decision table. Flow Designer displays a separate input for each record. For example, if you have decision inputs for Units Ordered and Location of Sale, an input displays for each record.

Outputs

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answer table</td>
<td>Table containing the answer records. Each Decision [sys_decision_question]</td>
<td>Table Name</td>
</tr>
</tbody>
</table>

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ordered IDs</td>
<td>List of matching answer record sys_id values generated by the decision table. Flow Designer only generates this output when the <strong>Use Branches</strong> option is false and the <strong>Execution</strong> option is <strong>Run all decisions that match</strong>. You can use this output as the input for a For Each flow logic block or a Look Up Record action. Flow Designer sorts the list by the Order value listed in the Decision [sys_decision_question] table.</td>
<td>List</td>
</tr>
<tr>
<td>Answer records</td>
<td>Answer records returned by the decision table. Returns a single record when <strong>Execution</strong> is <strong>First decision that matches</strong>. Returns a list of records when Execution is <strong>Run all decisions that match</strong>.</td>
<td>Record or Records</td>
</tr>
<tr>
<td>Count</td>
<td>The number of answer records returned by the decision table. Only displayed when Execution is <strong>Run all decisions that match</strong>.</td>
<td>Integer</td>
</tr>
</tbody>
</table>
Example: Use make a decision flow logic to determine insurance coverage

In this example, the flow uses a decision from the Insurance Coverage decision table, which an administrator had configured to determine the insurance coverage that was based on three inputs. The flow displays all the inputs that were used by the decision table in Flow Designer. These inputs can be entered manually, or by dragging data pills into the inputs from the data panel on the right side of the screen. Below this section, the branches for each answer are shown in the decision table.
The **Flow execution details** tab provides runtime information about the flow logic.
1. The header shows the state, start time, and runtime for the flow logic.
2. The action shows details about the decision table configuration and inputs.
3. Each possible answer for the decision table is represented as a branch. The state field indicates whether the branch was evaluated and the evaluation result. This section also displays details about the actions that are taken within a branch. Branches that evaluate to true are highlighted in green.

**Wait for a duration flow logic**

Use this flow logic to give your users time to act during automated processes or to wait for a specific date and time to complete actions.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration Type</td>
<td><strong>Explicit Duration</strong>: Wait for a specific time period, such as 5 minutes.</td>
</tr>
<tr>
<td></td>
<td><strong>Relative Duration</strong>: Wait for a specific time period from a selected Duration data pill or date/time value, such as 5 minutes after the flow start.</td>
</tr>
<tr>
<td></td>
<td><strong>Percentage Duration</strong>: Type to specify a certain percentage of time duration between the start of the flow logic and specified end time.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: The percentage value must be from 0 through 100 only.</td>
</tr>
<tr>
<td>Wait for</td>
<td>Set this value manually or select a Duration data pill from the data pill picker ( ).</td>
</tr>
<tr>
<td></td>
<td><strong>Explicit Duration</strong>: Wait duration in hours, minutes, and seconds.</td>
</tr>
<tr>
<td></td>
<td><strong>Relative Duration</strong>: Wait duration in hours, minutes, and seconds before or after a specific time. Select Relative Duration to specify a wait duration from a specific date.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Past dates don't affect the wait duration.</td>
</tr>
</tbody>
</table>

You can enter a wait value of up to 999 hours.
### Note:
The actual wait duration can vary due to the instance processing time. The flow always waits for the time that you specify for this field, but other work in the queue may add to the wait time.

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for Percentage</td>
<td>Wait duration as a percentage of the time period between the start of flow logic and specified end time. If you select a past date for the end time, the wait duration is set to 0. This field appears when <strong>Percentage Duration</strong> is selected from the Duration Type list.</td>
</tr>
<tr>
<td>During the following schedule</td>
<td>Select the schedule used to calculate the <strong>Scheduled End date/time</strong> value from the selected wait duration. For example, waiting for a 10-hour duration as part of an 8-5 weekdays schedule causes the flow to wait for one or more business days. If you leave this field blank, the timer runs without a schedule. For information on creating schedules, see <strong>Define a schedule</strong>.</td>
</tr>
</tbody>
</table>

### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration</td>
<td>Total time that the flow ran in milliseconds. You can drag this data pill into the duration fields.</td>
</tr>
<tr>
<td>Date/time</td>
<td>Date/time that the flow completed. You can drag this data pill into the date/time fields.</td>
</tr>
</tbody>
</table>

**Example:** Close an incident if it has been in the resolved state for 10 days

In this example, a flow starts when the incident state changes to Resolved.
Example: Wait 10 days after the last update to a record
In this example, the flows waits for 10 days after the incident record has been resolved.

Example: Update a record after 10 days
In this example, the flows closes the incident record 10 days after it was resolved.
Example: Wait for a duration of 50% of the time between the start of the flow logic and the due date

In this example, the flows send a notification email to the relevant manager when a critical problem is created and 50% of the time between the problem record creation and the problem due date has lapsed.

Relative Duration type

When the duration type is Relative Duration, the flow logic first evaluates the relative date and time, the schedule, and finally, the duration. Schedules, dates, and times set in the past don’t affect the wait duration. This table provides examples of how the flow processes the wait duration in these scenarios.
<table>
<thead>
<tr>
<th>Duration Setting</th>
<th>Relative Date/Time</th>
<th>Schedule</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set to 0.</td>
<td>None</td>
<td>None</td>
<td>Duration ends immediately.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Past date</td>
<td>None</td>
<td>Duration ends immediately.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Future date</td>
<td>None</td>
<td>Flow waits for the date/time, and then waits for the duration.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Past date</td>
<td>Future date</td>
<td>Flow waits for schedule, and then waits for the duration.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Future date</td>
<td>Past date</td>
<td>Flow waits for the date/time, and then waits for the duration.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Future date</td>
<td>Future date</td>
<td>Flow waits for the future date, then for the schedule, and then for the duration.</td>
</tr>
</tbody>
</table>

The timer waits for the next instance of a selected schedule. For example, if you set a schedule for Monday through Friday from 8 a.m. to 5 p.m., and the timer is initiated on Saturday, the timer waits until Monday at 8 a.m. before starting.

**Execution details**

1. The header shows the state, start time, and runtime for the flow logic.

   ![Note:](image) The runtime value in the header only includes the time that it takes to execute the flow logic and doesn’t include the wait duration that is specified in the flow.

2. The Configuration Details section shows details about the variables that are used by the flow, including the type, configuration, and runtime values for each variable.

### Call a workflow flow logic

Run a published and active workflow from your flow. You can use the flow data as a workflow input. For example, you can specify the current record as a workflow input.

### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
</table>
| Select a Workflow | Published and active workflow that you can select to run. The workflow that you select determines the records that are associated with it. If the workflow has inputs, Flow Designer displays them as additional flow inputs.  
   ![Note:](image) To prevent the workflow from running outside of Flow Designer, modify it to remove its start conditions. |
| Wait?         | Workflow that you set to true so that the flow waits for workflow completion before continuing. Only workflows that wait for completion can return certain output values to the flow. Set to false to continue running the flow separately from the workflow. |
### Input | Description
--- | ---
**Note:** If the workflow is canceled or its context record is deleted prior to the workflow finishing, the flow stops waiting and instead continues running.

Current | Current record that the workflow processes. Select a data pill that contains a record from the associated workflow table.

### Outputs
The flow execution details only display workflow output values that are generated while the flow is running. If you configure the flow to wait for the workflow to finish, the flow execution details can display all workflow output values. If the flow does not wait, the flow execution details only display the workflow output values that were generated before the **Call a Workflow** flow logic completes. If **Call a Workflow** completes before the workflow finishes, the workflow output values stop updating and only display the last known value.

| Output | Description |
--- | --- |
State | State of the workflow. This value comes from the workflow context record. The state will be **Complete** if the workflow executes successfully. If the workflow is canceled, the workflow state is set to **Canceled**. If the context record is deleted prior to the workflow finishing, the workflow state is set to **Invalid**. |
Context | Reference to the workflow context record. |
Result | String that contains the result from the workflow. This value comes from the workflow context record. |
Return value | String that contains the return_value from the workflow. This value comes from the workflow context record. |
Example: Calling the Routine Change workflow

In this example, the flow calls the **Routine Change** workflow. The **Wait?** option is checked, so the flow pauses until this workflow completes. The **Current** field is filled using a data pill representing the record that triggered this flow.

### ACTIONS

1. **Call a Workflow**

   - **Select a Workflow**: Routine Change
   - **Wait?**: 
   - **Current**: Trigger > Incident Record > Change Request

### Execution details

1. **Call Workflow execution details**

   - **Workflow Configuration**
     - **VARIABLE NAME**: wait, current, Workflow
     - **TYPE**: Trigger, False
     - **DOCUMENT ID**: Knowledge
     - **CONFIGURATION**: Trigger + Knowledge Record
     - **RUNTIME VALUE**: Knowledge - Instant Publish

   - **Workflow Output**
     - **RESULT**: finished
     - **STATE**: Knowledge - Instant Publish

### Note:

If you cancel the workflow or delete the context record prior to the workflow finishing, the flow logic state is set to **Complete**.
End flow logic

Use this flow logic to stop a flow within flow designer.

End flow logic can be contained within a conditional flow logic block, such as an If, Else If, or Else flow logic block. Use this flow logic to stop a flow when certain conditions are met. You cannot add actions or flow logic after you use the End flow logic. All branches of a flow are ended when a flow reaches the End flow logic, including the Wait for a duration logic. Any branches that run in parallel also stop their progress when you use the End flow logic.

Inputs

This flow logic has no inputs.

Execution Details

When a flow ends, the flow state becomes Complete.

Dynamic flows

Identify and run a flow or subflow dynamically by using runtime data. Build templates to provide expected inputs for dynamically called flows or subflows.

The Dynamic Flow flow logic calls a flow or subflow during runtime by using the data that you specify during the flow design. You can use Dynamic Flow to select which flow to run when multiple flows have similar names or purposes.

To use Dynamic Flow, the flow designer does the following:

1. Creates and publishes a flow or subflow to use as a template.
2. Adds Dynamic Flow to a parent flow.
4. Enters the flow name for Dynamic Flow.
5. Enters the required inputs specified by the flow template.

Dynamic flow templates

The template for Dynamic Flow can be a flow or a subflow. The template's inputs must match the inputs of any flow or subflow that you call dynamically. An input matches when it has the same Label and Name field values in each flow or subflow.

After you build a template, consider copying it to create similarly named and similarly performing flows or subflows. Make sure that you name each flow or subflow with a standard naming convention that can be generated by Dynamic Flow. For more information on creating a template for Dynamic Flow, see Getting started with Dynamic Flow and Get Flow Outputs.
## Inputs

The following inputs always appear when you add the Dynamic Flow flow logic to a flow.

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Flow Template</strong></td>
<td>Template whose inputs the dynamic flow copies and displays. The inputs for the template must match the inputs of the subflow that you want to run.</td>
</tr>
<tr>
<td><strong>Flow</strong></td>
<td>Name of the flow or subflow that you want to run. Generate a flow or subflow name dynamically by entering a string and concatenating it with data pill values.</td>
</tr>
</tbody>
</table>

**Note:** You can call a flow or subflow that is associated with another application scope by entering a scope-name.flow-name format. The user running the flow or subflow must have access to the application scopes that you specify. If you do not specify an application scope, the dynamic flow runs in the parent flow's scope.

**Note:** If the system can't find the flow or subflow, it skips the Dynamic Flow flow logic step and logs an error message.

| **Wait for completion** | Option to force the parent flow to wait until the dynamic flow finishes running before proceeding with the next action. |

**Note:** You see more inherited inputs after you select a **Flow Template**.

## Get flow outputs

Dynamic Flow outputs appear in the data panel as Record type data pills that are named as Context. You can use these flow contexts to derive the runtime
values for dynamic flow outputs with the Get Flow Outputs flow logic. To use Get Flow Outputs, the flow designer does the following:

1. Adds a Dynamic Flow to a flow.
2. Adds Get Flow Outputs after the dynamic flow.
3. Specifies the value for the Context input by clicking the data pill picker (şık) and selecting Dynamic Flow > Context.

For more information on using Get Flow Outputs, see Getting started with Dynamic Flow and Get Flow Outputs.

Design considerations

Consider using dynamic flows if you have multiple subflows with similar functionality

Dynamic flows let you compartmentalize your processes by applying a template to handle the inputs of multiple similar subflows. Compartmentalization lets you distinguish between subflows that perform similar functions, such as subflows for IntegrationHub spokes.

Ensure dynamically called subflow inputs match template flow inputs

If the inputs of the dynamic flow don't match the inputs of the flow template, the system throws an error and the main flow can’t run properly.

Use the correct context when getting flow outputs

If you are using Dynamic Flow more than once within a flow, make sure to drop in the correct context data pill from Get Flow Outputs.

Get started with Dynamic Flow and Get Flow Outputs

Create a sample flow that dynamically calls subflows for provisioning cloud services.

Before you begin
Role required: flow_designer or admin

About this task
To understand how to use the Dynamic Flow and Get Flow Outputs flow logic together, the flow that you create in this task dynamically runs subflows that are related to provisioning cloud services. This flow does the following:
1. Triggers when a Cloud Instance Provisioning Request record is created.
2. Calls the appropriate subflow to create a Cloud Instance record.
3. Gets an output from the dynamically called subflow and updates the Cloud Instance Provisioning Request record with the output’s value.

Procedure
1. Navigate to System Applications > Studio.
2. On the Select Application screen, click Create Application.
3. On the Guided App Creator welcome screen, click Let’s get started.
4. In the Name field, enter Cloud Instance Provisioning and then click Create.
5. In the Roles field, enter flow_designer or admin and then click Continue.
6. From the list of app formats, select Classic and then click Continue.
7. Select Create new table > Create table from scratch > Continue to create two new tables for your application.
   • Add the following fields for the first table and name the table Cloud Instance.

<table>
<thead>
<tr>
<th>Field label</th>
<th>Field type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Reference</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>Instance Type</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Instance URL</td>
<td>URL</td>
<td>None</td>
</tr>
<tr>
<td>Build Status</td>
<td>String</td>
<td>None</td>
</tr>
</tbody>
</table>

• Add the following fields for the second table and name the table Cloud Instance Provisioning Request.

<table>
<thead>
<tr>
<th>Field label</th>
<th>Field type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requested Instance Type</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Requested by</td>
<td>Reference</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>Approval Status</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Approved Instance</td>
<td>URL</td>
<td>None</td>
</tr>
</tbody>
</table>
8. After creating both tables, click **Done with tables**.

9. Select **Start > Create > Done with apps** to finish creating your application.

**Create a subflow template**

Create a sample subflow template for provisioning cloud services.

**Before you begin**

Role required: flow_designer or admin

**Procedure**

1. Under Business logic, process automation, and integrations, select **Go to Flow Designer**.

2. In the Flow Designer landing page main header, select **New > New Subflow**.

3. On the Subflow Properties screen, enter **TEMPLATE: Create Cloud Instance Record** in the **Name** field and then select **Submit**.

4. Under Inputs & Outputs, select the plus icon ( + ) to create two inputs for your subflow template.

<table>
<thead>
<tr>
<th>Label</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requested by</td>
<td>Reference.User</td>
</tr>
<tr>
<td>Requested Instance Type</td>
<td>String</td>
</tr>
</tbody>
</table>

5. Select the plus icon ( + ) to create one output for your subflow template.

<table>
<thead>
<tr>
<th>Label</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance URL</td>
<td>URL</td>
</tr>
</tbody>
</table>

6. Under your output, select **Done**.
7. Select the add action, flow logic, or subflow to end of flow icon ( ) and then select Action.

8. From the list of ServiceNow Core actions, select Log.

9. In the data panel, drag the data pills for the Requested by and Requested Instance Type inputs you created earlier, and drop both of the pills into the Message field.

10. In the Subflow header, select Save and then select Publish to publish your subflow template.

Create a subflow for Jira cloud instance provisioning requests
Create a sample subflow for provisioning cloud services from Jira.

Before you begin
Role required: flow_designer or admin

Procedure

1. In the Subflow header, select the more actions icon ( ) and select Copy subflow.

2. On the Copy Subflow screen, enter Create Cloud Instance Record - Jira in the New Subflow Name field, and then select Copy.

3. Under the Log action, add a Create Record action.

4. In the Table Name field, select Cloud Instance and then fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Select the data pill picker ( ) and select Subflow - Inputs &gt; Requested by.</td>
</tr>
<tr>
<td>Instance Type</td>
<td>Select the data pill picker ( ) and select Subflow - Inputs &gt; Requested Instance Type.</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>Instance URL</td>
<td>Enter <a href="https://mycompany-">https://mycompany-</a>. Then, select the data pill picker (-packages) and select Subflow - Inputs &gt; Requested by &gt; Name. Finally, enter .atlassian.net</td>
</tr>
<tr>
<td>Build Status</td>
<td>Enter In Progress.</td>
</tr>
</tbody>
</table>

5. Under the create record action, select Add an Action, Flow Logic, or Subflow > Flow Logic > Assign Subflow Outputs.
6. Select the plus icon to add an output.
7. For Name, select Instance URL.

8. For Data, select the data pill picker (-packages) and then 2 - Create Record - > Cloud Instance Record > Instance URL

9. In the Subflow header, select Save and then Publish to publish the subflow.

Create a subflow for Salesforce cloud instance provisioning requests
Create a sample subflow for provisioning cloud services from Salesforce.

Before you begin
Role required: flow_designer or admin

Procedure

1. In the Subflow header, select the more actions icon (more) and select Copy subflow.
2. On the Copy Subflow screen, enter Create Cloud Instance Record - Salesforce in the New Subflow Name field, and then select Copy.
3. Expand the Create Cloud Instance Record action and replace the .atlassian.net value for the Instance URL field with .salesforce.com
4. In the Subflow header, select Save, accept the data change warning message, and then Publish to publish the subflow.

Create a flow that runs your subflows dynamically
Create a sample flow to run your provisioning cloud services subflows.

Before you begin
Role required: flow_designer or admin

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Procedure

1. Under the Flow Designer header, select the **Create flow, subflow, or action** icon and select **Flow**.

2. On the Flow Properties screen, enter **Process Cloud Instance Provisioning Request** in the **Name** field, and then select **Submit**.

3. Under Trigger, select the plus icon (+) to add a trigger to your flow, and then fill out the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger</td>
<td>Select <strong>Created</strong>.</td>
</tr>
<tr>
<td>Table</td>
<td>Enter <strong>Cloud Instance Provisioning Request</strong> [x_cloud_instance_p_cloud_instance_provisioning_request]</td>
</tr>
</tbody>
</table>

4. Under Actions, select the plus icon (+) and then select **Flow Logic > Dynamic Flow**.

5. Fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow Template</td>
<td>Select <strong>TEMPLATE: Create Cloud Instance Record</strong></td>
</tr>
<tr>
<td>Flow</td>
<td>Enter <strong>Create Cloud Instance Record</strong> and then select the data pill picker (_picker) and select <strong>Trigger - Record Created &gt; Cloud Instance Provisioning Request Record &gt; Requested Instance Type</strong>.</td>
</tr>
<tr>
<td>Wait for completion</td>
<td>Enable this option to run your subflow dynamically first before other actions in your flow occur.</td>
</tr>
</tbody>
</table>
| Requested by   | Select the data pill picker (_picker) and select **Trigger - Record Created** > }
<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requested Instance Type</td>
<td>Select the data pill picker (.FILL) and select Trigger - Record Created &gt; Cloud Instance Provisioning Request Record &gt; Requested Instance Type.</td>
</tr>
</tbody>
</table>

6. Under your **Dynamic Flow** flow logic, add the Get Flow Outputs flow logic, and then fill in the following fields.

7. For **Flow Template**, select **TEMPLATE: Create Cloud Instance Record**

8. For **Context**, select the data pill picker (.FILL) and select 1 - Dynamic Flow - > Context.

9. Under your **Get Flow Outputs** flow logic, select the plus icon (.FILL) and then select Action > Update Record to add an Update Record action to your flow.

10. Fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select the data pill picker (.FILL) and select Trigger - Record Created &gt; Cloud Instance Provisioning Request Record.</td>
</tr>
<tr>
<td>Fields &gt; Approved Instance</td>
<td>Select the data pill picker (.FILL) and select 2 - Get Flow Outputs - &gt; Instance URL.</td>
</tr>
<tr>
<td>Fields &gt; Approval Status</td>
<td>Enter Approved.</td>
</tr>
</tbody>
</table>

11. Select **Save**.

**Test your flow**

Test your sample flow for provisioning cloud services.
Before you begin
Role required: flow_designer or admin

Procedure

1. In the Flow header, select Test to test your flow.

2. On the Test Flow screen, select the Create new record (+) icon to create a new record.

3. For Requested By, select the Lookup using list icon ( ) and select any user from the list.

4. For Requested Instance Type, enter either Jira or Salesforce. The value you enter determines which subflow runs dynamically at runtime. Entering Jira runs the Create Cloud Instance Record – Jira subflow, and entering Salesforce runs the Create Cloud Instance Record – Salesforce.

5. Select Submit.

6. Select Run Test, and when the flow finishes running, select Your test has finished running. View the flow execution details. Your flow runs successfully if the values in the State column for each step in your flow shows Completed and each step’s runtime value populates appropriately.

7. Select the tab for your Process Cloud Provisioning Requests flow and close the Test Flow modal.

8. In the Flow header, select Activate to make your flow accessible within the Cloud Instance Provisioning application scope.

Results
When a user in your instance creates a new record in the Cloud Provisioning Request table, your Process Cloud Provisioning Requests flow runs automatically. This flow dynamically creates the proper Cloud Instance record that is based on the requested instance type. It also generates a cloud instance URL, which populates in the Cloud Instance Provisioning Request record.

Set Flow Variables flow logic
Assign a value to one or more flow variables. Change or update a variable’s value during a flow.

This flow logic sets values for flow variables that have already been created. For instructions on creating flow variables, see Create a flow variable.
### Inputs

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the variable. Select from the list of variables available for the flow.</td>
</tr>
<tr>
<td>Data</td>
<td>Value for the variable. Enter a specific value, input a script, or use a data pill. To assign a blank value, leave this field empty.</td>
</tr>
</tbody>
</table>

### Outputs

This flow logic produces no outputs.

**Example: Use Set flow variables flow logic to store a record number**

In this example, the flow asks for approval for an incident record. If the record is approved, a flow variable is used to store the approved record number.
Execution details

Set flow variables flow logic execution details

1. The header shows how the flow was run, the state, the start time, and the runtime.

2. The Configuration Details section shows the variables that were assigned values with the flow logic. It displays the variable name, type, configuration, and runtime value for each flow variable.

3. Actions that use a flow variable display the variable’s type, configuration, and runtime value.

Subflows

Define a sequence of reusable actions that can be started from a flow, subflow, or script. Define inputs and outputs to pass data to and from the subflow.

Unlike flows, subflows lack a trigger. Use a subflow when:

- You only want to start a flow by calling it from another flow or script.
- You want to create a set of reusable operations for use in multiple flows.
- You want to specify the inputs available to the subflow when it starts.
- You want to specify the outputs available to the parent flow after the subflow ends.

All subflows consist of properties, one or more inputs, one or more outputs, a sequence of actions, and the data collected or created.

Subflow properties

The subflow properties specify the subflow name, application, category, description, in-flow annotation, roles, and status. Flow designers can update the
subflow name, category, description, in-flow annotation, and roles at any time, but can only set the application during subflow creation. The subflow status is set when you save or publish a subflow.

**Subflow inputs**

Subflow inputs specify the data available to the subflow when it starts. Each input you define for a subflow becomes a configuration option in the Flow Designer interface. To use the subflow in a flow, flow designers must define a value for each mandatory input. The more inputs a subflow has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the subflow effectively.

Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring a subflow to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

**Subflow outputs**

Subflow outputs specify the data available to the parent flow after the subflow completes. Subflow outputs are defined as variables with a name and data type. Subflow designers assign values to an output using the Assign Subflow Output flow logic. Output values can be based on the subflow logic conditions, action results, or a manually set value. For example, an output may have one value when a condition is met and another value when a condition is not met. During runtime, the value of the output is determined by the condition that is met.

Consider the following example of a subflow with two conditions that both result in a value for a single output variable. The value of the variable depends on which condition is met during runtime.

**Outputs**

[Manager ID] [String]

**Actions**

- 1 Look Up [User] Record where (Created on Today)
- 2 If ([1->User Record->Title] contains Manager) then
  - 2.1 Assign Subflow Outputs [Manager ID] to [1->User Record->User ID]
• 3 Else
  ◦ 3.1 Assign Subflow Outputs [Manager ID] to [1->User Record->Manager->User ID]

In this case, if the user's title contains "Manager" then the user ID is assigned as output. Otherwise, the subflow looks up the user's manager and assigns the user ID of the manager as output.

Flow Designer allows you to define a value for the same variable multiple times. However, if a variable is given two or more possible values without conditional logic, only the last value defined in the subflow is applied to the output at runtime.

**Outputs**

[Manager ID] [String]

**Actions**

• 1 Look Up [User] Record where (Created on Today)
• 2 Assign Subflow Outputs [Manager ID] to [1->User Record->User ID]
• 3 Assign Subflow Outputs [Manager ID] to [1->User Record->Manager->User ID]

In this example, action three overwrites the value of action two and [1->User Record->Manager->User ID] is applied to the [Manager ID] output at runtime because it was the last value defined. Typically, subflows should only include multiple values for one variable if conditional flow logic is used.

**Subflow execution details**

Process analysts can view subflow execution details from multiple locations.

**Parent flow execution details**

Flow Designer displays subflow execution details within the parent flow execution details. The parent flow execution details list each subflow as inline elements. You can expand a subflow step to see its execution details.

**Subflow execution details**

The system generates flow execution details for each subflow run. View subflow execution details directly from the list of flow executions.
**Actions**

Within **Actions**, flow designers can add actions, flow logic, flows, or other subflows.

An action is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the **Create Record** action allows process analysts to generate records in a particular table with particular values when certain conditions occur. ServiceNow core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to pre-set configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

**Flow logic**

Subflows can contain flow logic to specify conditional or repeated actions, or to assign output variables to subflow data. The system provides these flow logic options.

### Available flow logic

<table>
<thead>
<tr>
<th>Flow logic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>For Each</td>
<td>Applies actions to each record in a list of records. Flow designers must specify the list of records from the subflow data.</td>
</tr>
<tr>
<td><strong>Note:</strong> You can nest a For Each flow logic block inside of another flow logic block to repeat an action over a series of records. However, avoid nested For Each loops that process many records. Nested loops may cause the flow to run until it is stopped by the flow transaction quota rule, which prevents flows from running longer than an hour. For more information about transaction quotas, see Transaction quotas.</td>
<td></td>
</tr>
<tr>
<td>If</td>
<td>Applies actions when a list of conditions is met. Flow designers can specify the conditions with subflow data. Once an If condition is added, you can add an Else or Else If flow logic option to define behavior when conditions are not met.</td>
</tr>
<tr>
<td>Assign Subflow Outputs</td>
<td>Assigns an output variable to subflow data. Only outputs defined in Inputs &amp; Outputs can be assigned a value. Assigning outputs enables you to assign a different output variable for each logical path in the subflow.</td>
</tr>
</tbody>
</table>
More Actions

Click the More Actions (⋮) button to access additional options for the subflow.

**Copy action**
Create a copy of the open subflow in an application you specify.

**Configurations**
Enable or disable the Show draft actions, Show triggered flows, Show store spokes, and Show inline script toggle options.

**Code Snippet**
Generate a code snippet for the action.

**Manage security**
Enable or disable the Callable by Client API option.

**Manage natural language title**
Create or edit a subflow title with styled or dynamic text. For more information, see Manage natural language titles.

**Testing subflows**
You can test a subflow alone, or when added to a flow. When testing a subflow alone, you must define the inputs that the subflow uses in its actions. Because a subflow does not have a trigger, testing a subflow runs the actions using the defined input values.

ℹ️ Note: Because testing a subflow creates or changes records on the instance, flow designers should always test subflows on a non-production instance containing relevant demonstration data.

**Roles**
To access subflows, a user must have the flow_designer or admin role.

**Create a subflow**
Create a reusable sequence of actions that can be added to multiple flows.

**Before you begin**
- Role required: flow_designer or admin
- Set up an application in Guided Application Creator to store Flow Designer content.
About this task
Users with the flow_designer or admin role should know the application table structure and be aware of any existing business logic associated with the target tables of a flow or subflow. Be sure to disable any conflicting business rules or workflows before creating a flow or subflow.

Creating a custom application to contain your Flow Designer content allows you to deploy it using the application repository or the ServiceNow Store.

Procedure
2. Click New > Subflow.
   The Subflow properties screen displays.
3. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the subflow.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope to create the subflow in.</td>
</tr>
<tr>
<td>Category</td>
<td>Logical group for subflow.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the subflow is read-only. You can only select a value when you create the subflow in an application scope you own. The default value is None.</td>
</tr>
<tr>
<td>In-flow annotation</td>
<td>Help text that appears under the subflow title in Flow Designer to help flow designers understand what the subflow does when used in a flow.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the subflow.</td>
</tr>
<tr>
<td>Run as</td>
<td>Use this option to specify if the flow runs as system user or the user who initiates the session. Select the user who initiates the session option when updates should come from the user who triggered the flow. For example, when you want incident record comments to come from the current user, or approval emails to originate from the approver. Settings for the Run as option in a flow don't apply to child subflows. Running as the initiating user also ensures the actions taken during flow execution are limited by the user's ACL restrictions. Flows run by the initiating user will also respect user-specific settings like date/time format.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Note</td>
<td>When choosing the option to run as the user who initiates the session, ensure that your security restrictions do not prevent your users from making any changes the flow executes.</td>
</tr>
</tbody>
</table>

Run with roles
Select the roles the flow runs with. This option is only available when Run as is set to user who initiates the session.

4. Create subflow inputs to specify the data available to the subflow when it starts running.
Each input you define for a subflow becomes a configuration option in the Flow Designer interface. To use the subflow in a flow, flow designers must define a value for each mandatory input. The more inputs a subflow has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the subflow effectively.

a. Click + to open the Inputs & Outputs pane.

b. Click + to add a new input.

c. Define the name and type for the input.

Note: Subflow input names can’t include any of the following reserved system names:

- `sys_id`
- `sys_created_by`
- `sys_created_on`
- `sys_updated_on`
- `sys_updated_by`
- `sys_mod_count`

d. To make the input a mandatory configuration option, select the Mandatory flag.

e. Click ‾‾‾ to view the advanced options and define values.
Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced
options to guide flow designers through adding and configuring a subflow to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

5. Create subflow outputs by defining the names and data types.
Subflow outputs specify the data available to the parent flow after the subflow completes.

a. Click + to add a new output.

b. Define the name and the data type.
Output values are assigned in later steps.

Note: Subflow output names can't include any of the following reserved system names:
- sys_id
- sys_created_by
- sys_created_on
- sys_updated_on
- sys_updated_by
- sys_mod_count

6. To add actions, flows, subflows, or flow logic, click Select to add an Action, Flow Logic, or Subflow.
a. Select an option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Select the desired action. Flow Designer includes a set of Actions available to flows and subflows. Alternatively, a user with the action_designer role can create additional actions to add to flows. The IntegrationHub and spoke plugins install additional actions. To add draft actions from the More Actions menu, set <strong>Show draft actions to true</strong>. To view spokes available in the ServiceNow Store, set <strong>Show store spokes to true</strong> from the More Actions menu. <strong>Note:</strong> Under <strong>Not Installed Spokes</strong>, the system displays spokes available in the ServiceNow Store based on compatibility with the ServiceNow version and application dependency on Flow Designer.</td>
</tr>
<tr>
<td>Flow Logic</td>
<td>Select an option to specify conditional or repeated operations.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Select a published subflow and define input values. In addition to adding a subflow as a flow action, you can enable the <strong>Show triggered flows</strong> option from the More Actions menu to select an activated flow and define the required inputs. Running a triggered flow ignores its trigger conditions and runs all actions.</td>
</tr>
</tbody>
</table>

To change the order of an action in a flow, drag the handle on the left side of the action to the desired location.

The system displays a set of fields depending on the option selected.

b. To configure the action, flow logic, or subflow, fill in the fields.

c. Click **Done**.

d. Repeat adding actions until complete.

7. Assign subflow outputs to a value.
   - You can assign a subflow output to multiple values, enabling you to create conditional outputs based on flow logic.
a. Under Actions, click + and select Flow Logic.

b. Click Assign Subflow Outputs.

c. In the Name field, select an output you created in the Inputs & Outputs section. You can only assign values to outputs that have already been given a name and data type.

d. In the Data field, enter a value or select a data pill from the data panel.

e. Click Done.

What to do next
Test the subflow, and publish it when it is ready to be added to a flow or called from a script.

⚠ Note: You can only test or publish subflows that contain at least one action.

Test a subflow
You can test a subflow alone, or when added to a flow. When testing a subflow alone, you must define the inputs that the subflow uses in its actions. Because a subflow does not have a trigger, testing a subflow runs the actions using the defined input values. Unless updated, subsequent tests use the same inputs defined in the initial test run.

Before you begin
Role required: flow_designer or admin
Create a subflow that contains at least one action and save it. Flow Designer only tests saved subflows that contain at least one action.

About this task
Because testing a subflow creates or changes records on the instance, flow designers should always test subflows on a non-production instance containing relevant demonstration data.

Procedure
2. Click the subflows tab and open a saved subflow.
3. Click Test.
   The Test Subflow dialog opens.
4. Define input values for the subflow to use in its actions. The values defined are remembered on future test runs.
5. Click Run Test.
Note: Select the Run test in background option to test a subflow asynchronously in the background.

If you select the Run test in background option, the execution details are displayed only after the execution is completed asynchronously in the background. Also, the execution details are associated with the subflow only after execution is completed.

6. After the flow executes, click Subflow has been executed. To view the subflow, click here.
   The Execution Details open.

What to do next
Review the Flow execution details.

Once the subflow behaves as desired, you can publish the subflow and add it to a flow.

Publish a subflow
Publish a subflow to make it available to other users and to add it to activated flows.

Before you begin
Role required: flow_designer or admin
Create a subflow, test the subflow, and verify that it is working as expected.

About this task
When you make changes to a published subflow, the changes remain in the draft state until you publish the subflow again. You must publish a changed subflow to make the changes available to activated flows.

Procedure
2. Click the subflows tab and open a tested subflow.
3. Click Publish.

Results
The subflow can be added to activated flows. If you update the subflow after it is published, you must click Publish again to see the changes when the parent flow is run. After publishing changes, all parent flows that use the subflow are automatically updated to use the current version.
Complex data

Use a graphical interface to work with collections of complex structured data. Help design users understand the organization of structured data, and add, remove, or configure its individual elements.

Complex data allows you to encode and store structured data in a machine-readable format such as JavaScript Object Notation (JSON) or eXtensible Markup Language (XML). You can use the Flow Designer interface to view and understand the organization of structured data as well as create data structures. For example, you can create a contact data structure consisting of information you look up from a user record such as first name, last name, and email address.

You can create complex data from these Flow Designer interfaces.

Complex data usage examples

<table>
<thead>
<tr>
<th>Flow Designer interface</th>
<th>Example usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action inputs and outputs</td>
<td>Create an action that generates an object from record data. Populate the object using record data the action looks up. See Create a custom action to generate an object from a record</td>
</tr>
<tr>
<td>Script step input and output variables</td>
<td>Write a script to create an array of objects from a list of records. See Create a custom action to generate an array of objects from a list of records. Write a script to parse a JSON document into an output of type Object.</td>
</tr>
<tr>
<td>Subflow inputs and outputs</td>
<td>Create a subflow that accepts an object as an input and uses it to call an external service.</td>
</tr>
<tr>
<td>XML parser step Target field configurations</td>
<td>Parse an XML payload into a complex data object using the XML parser step.</td>
</tr>
<tr>
<td>REST API Trigger Body field</td>
<td>Parse an inbound REST API request into a complex data object and use the values in a flow. See REST API trigger.</td>
</tr>
</tbody>
</table>

Benefits

Complex data offers these benefits.
• Parse and format data without having to write code. For example, create data variables to parse a response message or format a request message.

• Create arbitrary data structures. For example, create an issue data structure that combines information from existing interaction and incident records, or create a data structure to support a custom integration.

• View the organization of data structures. For example, an issue data structure might consist of a user object to describe who to contact about the issue and a history object to describe the work done to resolve it. You could configure a notification action with the path to the email address listed in the user object, and call an escalate issue subflow with the path to the status or reassign count from the history object.

• Allow access to data structure from API calls. For example, call an action or subflow from a script and use the predefined data structure as input values.

• Save and reuse data structures as templates. For example, save the user object as a template data structure for reuse in other actions and flows.

Data structure
A data structure is a collection of related data elements organized into a hierarchy. Each element in a data structure has its own data type and its own unique position in the hierarchy.

The Editor pane displays data structure hierarchy with indentation. The indentation level identifies whether an element is a parent, child, or sibling in the hierarchy. Parent elements have children indented underneath them, and siblings have the same indentation level.

⚠️ Note: The Flow Designer interface allows you to create hierarchies with an unlimited number of child levels, but you may have to scroll horizontally to see them.

For example, this data structure consists of an Employee parent element with four child elements for ID Number, Name, Start Date, and Contact Email. The Contact Email element is also a parent element with one child.
The data panel displays data structure hierarchy as a tree of collapsible and expandable data pills just like it does with record variables. Parent elements have an arrow icon to collapse or expand the hierarchy.

For example, here is the Employee data structure as seen from the data panel.

You can use the data panel or Data picker to select specific values from a data structure. Data structures are similar to data pills for records in that you can dot-walk or navigate to specific elements within the structure. When you select a data element, Flow Designer displays the path to it as a data pill just like any other data element selection. For example, if you select the Start Date data element, the path is [Input->Employee->Start Date].

You can use an element data path the same way you can an XPath or JPath. Sometimes you may even convert the data pill path into one of these path notations.
Complex data types

You build data structures using one or more Array or Object variables. Only these variable data types support child variables.

An Array variable contains values for one type of item. The parent variable is always of an Array data type, and there is always only one child variable, which is one instance of the data type supported by the array. Create Array variables when an input or output accepts multiple values of the same data type.

For example, you could create a Contact Email array to list all the email addresses associated with a given person.

Sample data structure for the Contact Email array

<table>
<thead>
<tr>
<th>Component label</th>
<th>Data Type</th>
<th>Sample Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact Email</td>
<td>Array.String</td>
<td><a href="mailto:beth.anglin@example.com">beth.anglin@example.com</a> and <a href="mailto:beth@anglin.com">beth@anglin.com</a></td>
</tr>
<tr>
<td>Contact Email_child0</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>

An Object variable contains any number and arrangement of child variables that each have their own data type and values. Nesting Object variables allows you to create complex data structures similar to a table schema where one table has related records in another table. Create Object variables when an input or output accepts one or more related properties.

For example, you can create an Employee object to define information about the people who work at a company.

Sample data structure for the Employee object

<table>
<thead>
<tr>
<th>Component label</th>
<th>Data Type</th>
<th>Sample Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employee</td>
<td>Object</td>
<td></td>
</tr>
<tr>
<td>ID Number</td>
<td>Integer</td>
<td>20190304000101</td>
</tr>
<tr>
<td>Name</td>
<td>String</td>
<td>Beth Anglin</td>
</tr>
<tr>
<td>Start Date</td>
<td>Date/Time</td>
<td>March 4, 2019</td>
</tr>
<tr>
<td>Contact Email</td>
<td>Array.String</td>
<td><a href="mailto:beth.anglin@example.com">beth.anglin@example.com</a> and <a href="mailto:beth@anglin.com">beth@anglin.com</a></td>
</tr>
</tbody>
</table>

Only these variable data types can be parents.
## Parent data types

<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Array</td>
<td>A container for arrays. Adds a read-only child item of type Array.</td>
</tr>
<tr>
<td>Array.True/False</td>
<td>A container for true/false values. Adds a read-only child item of type True/False.</td>
</tr>
<tr>
<td>Array.Choice</td>
<td>A container for choice values. Adds a read-only child item of type Choice.</td>
</tr>
<tr>
<td>Array.Date/Time</td>
<td>A container for date/time values. Adds a read-only child item of type Date/Time.</td>
</tr>
<tr>
<td>Array.Integer</td>
<td>A container for integer values. Adds a read-only child item of type Integer.</td>
</tr>
<tr>
<td>Array.Object</td>
<td>A container for objects. Adds a read-only child item of type Object, which displays the Add Child Item option.</td>
</tr>
<tr>
<td>Array.String</td>
<td>A container for string values. Adds a read-only child item of type String.</td>
</tr>
<tr>
<td>Object</td>
<td>A container for other data elements. Displays the Add Child Item option.</td>
</tr>
</tbody>
</table>

Array and Object variables only support these child data types.
- Array
- True/False
- Choice
- Date/Time
- Integer
- Object
- String

**Note:** The data types in array and object variables are not Glide elements. There may not be complete compatibility between these items and Now platform types.
Advanced options

Object variables have advanced options to save and load data structures. These options allow you to reuse a data structure defined in one location in another. For details on advanced options see action variable data types.

Data structure templates

Data structure templates allow you to reuse Object variables in multiple actions or subflows. For example, you can create a data structure to parse a response and then later reuse that same data structure to format a request. A template stores the list of child variables and their structure within an object. Each Object variable has an Advanced Option to save it as a template.

When you apply a template, you are creating a copy of the original structure. Any changes you make after applying a template do not affect the template, nor do they affect other actions that use the template.

Array data pills

Objects that contain array data may require For Each flow logic to process. For example, a user object that contains an array of email addresses would require a For Each flow logic loop to send a notification to each email address.

Object data pills

You can design actions that accept object data pills as input values. For example, you might create a notification action that accepts a user object as an input. If the user object consists of values for first name, last name, and addresses, then the notification action has access to all these values. To configure an action input with an object data pill, you must create an object earlier in the flow.

Sample action that accepts an object data pill
You can use an object data pill or any of its child elements to configure an input. When you configure an input value with an object data pill, Flow Designer makes any child elements of the object read-only, and the action uses the values provided by the object. For example, you can create a flow where one action generates a user object and another action sends a notification to the user specified in the object.

Sample action configured to use an object data pill

<table>
<thead>
<tr>
<th>Action</th>
<th>Complex data action</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Label</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>A = User object X</td>
</tr>
<tr>
<td></td>
<td>First name</td>
</tr>
<tr>
<td></td>
<td>Last name</td>
</tr>
<tr>
<td>Addresses</td>
<td>Drag and drop array data pill here</td>
</tr>
<tr>
<td>Address 1</td>
<td>Drag and drop array data pill here</td>
</tr>
</tbody>
</table>

When you configure the child elements of an object, you must manually provide data pills for each child element of the object. For example, you can manually configure the user object with record values from an earlier action.

**Script support**

Create and reference complex data from a script. Use a script when your source data comes from a data stream, a REST step response, or a Look Up Records step. See [Script support for complex data](#) for more information about scripting with complex data.

**Design considerations**

Follow these design guidelines to create reusable and maintainable data structures.

**Minimize the number of child levels in the hierarchy**

The more child levels a data structure has, the more difficult it is to view and select any specific data variable from the hierarchy. While you can build data structures with any number of child levels, it becomes difficult to navigate and understand data structures with more than seven child levels. For the best user experience, avoid creating data structures that have so many child levels you must scroll horizontally to see and populate them.
Create a separate object for each type of record data

Most Flow Designer data is record data whether it is from an instance or an external system. This design method ensures that you know what the object contains and where the data came from.

Recreate record data structures

When building objects that receive or transmit record data, review the database dictionary entries for these records and create matching object data structures. For example, suppose that you want an object to contain data from incident and configuration item records. You might create a string element for the incident short description field and an array of strings element for the configuration item class field.

Create objects to combine different types of records

If you need information from multiple types of records, create an object that contains all the information you need. You can then use the object to format or parse data in Flow Designer.

Create data structure

Organize multiple data variables into a structure to process them as a unit and identify the individual items within it.

Before you begin

- Role required: action_designer, flow_designer, or admin
- Set up an application in Guided Application Creator to store Flow Designer content.
- Create an action or Create a subflow

About this task

A data structure is a collection of related data elements organized into a hierarchy. Each element in a data structure has its own data type and its own unique position in the hierarchy.

Procedure

1. Create a data variable.

<table>
<thead>
<tr>
<th>Action or subflow input</th>
<th>Click Create Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action or subflow output</td>
<td>Click Create Output</td>
</tr>
</tbody>
</table>
XML parser step

2. Set **Type** to **Object**.
The top level of a data structure hierarchy must be an Object variable.

3. Click the **Add Child Item** icon.
Flow Designer adds a child data variable to the bottom of the object list.

   **Note:** You can insert a child item variable between existing variables by hovering your mouse pointer between two variables, and click the insert item icon (⁺) that appears.

   **Note:** When hovering your mouse pointer between a child and sibling variable, you will see a add child icon (⁺⁺). Click the left side of the icon to add a new sibling variable to the child's parent, or the right side to add another child variable under the current variable.

4. Set the child variable **Label** and **Type**.
To add another branch to the data structure hierarchy, set the Type to Object.

5. Repeat steps 3-4 for each data variable in the hierarchy.

**What to do next**
Use the data structure to populate action, step, or subflow inputs. If you can reuse the data structure, save it as a template.

**Save data structure**
Save the data structure of child variables within an Object variable for later reuse.

**Before you begin**
• Role required: action_designer, flow_designer, or admin
• Set up an application in Guided Application Creator to store Flow Designer content.
• Create an action or Create a subflow

**Procedure**
1. **Create data structure.**
2. Expand the Advanced options for the Object variable you want to save.
3. Click **Save as Template**.
   Flow Designer displays a pop-up dialog.
4. Enter the template name.

5. Click **Save**.
   
   If the template name already exists, Flow Designer displays a confirmation dialog to overwrite the existing template.

**What to do next**

Load the data structure in another action or subflow. Make updates to the data structure and save them.

**Load data structure**

Load a data structure of child variables within an Object variable.

**Before you begin**

- Role required: action_designer, flow_designer, or admin
- Set up an application in Guided Application Creator to store Flow Designer content.
- Create an action or Create a subflow

**Procedure**

1. Create a data variable.

2. From **Type**, select **Object**.

3. Expand the Advanced options for the Object variable whose data structure you want to replace.

4. From **Structure**, select **Start from Template**.
   
   Flow Designer displays the **Template** field.

5. From **Template**, select the template containing the template you want to load.
   
   If the Object variable has no existing data structure, Flow Designer loads the data structure into it. If the Object variable has an existing data structure, Flow Designer displays a confirmation dialog to replace the existing structure.

**Create a custom action to generate an object from a record**

Generate an object from a User record. Learn how to use an Action output to create an object from record values.

**Before you begin**

Role required: admin
About this task
Use this example to see demonstrations of these operations and steps.

• Create action inputs for the User record fields First name, Last name, and Email.
• Lookup a User record matching the action input values.
• Create an action output for a contact object.
• Save the contact object as a template.
• Map contact object values to User record field values.
• Test the action with a sample user.

Procedure
1. Create an application to store your work.
   Use the Guided Application Creator.

   Example
   For example, create My Application.

   The system displays the Flow Designer landing page.

3. Select New > Action
   The system displays the Action Properties dialog.

4. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Contact Object From User</td>
</tr>
<tr>
<td>Application</td>
<td>My Application</td>
</tr>
<tr>
<td>Accessible From</td>
<td>All application scopes</td>
</tr>
</tbody>
</table>

5. Select Submit.
   The system displays the Action Designer interface.

6. From the Action Outline, select Inputs > Create Input
   The system displays a new action input.

7. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>First name</td>
</tr>
</tbody>
</table>
8. From the Action Outline, select **Inputs > Create Input**
   The system displays a new action input.

9. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

10. From the Action Outline, select **Inputs > Create Input**
    The system displays a new action input.

11. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Last name</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

12. From Action Outline, select **Outputs > Create Output**.
    The system displays a new action output.

13. Configure the output variable with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contact</td>
<td>contact</td>
<td>Object</td>
<td>False</td>
</tr>
</tbody>
</table>

14. From the row for the contact Object, select **Add Child Item**.

15. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>first_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>
16. From the row for the contact Object, select **Add Child Item**.
17. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last name</td>
<td>last_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

18. From the row for the contact Object, select **Add Child Item**.
19. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email address</td>
<td>email_address</td>
<td>String</td>
<td>False</td>
</tr>
</tbody>
</table>

20. From the row for the contact Object, select **Toggle Advanced Inputs**.
21. From the Advanced Options, select **Save As Template**.
   The system displays the Save As Template dialog.
22. For **Enter a Name**, enter `contact`.
23. Click **Save**.
24. Select **Exit Edit Mode**.
   The System displays the output fields you created.
25. Configure the outputs with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>[step-&gt;Look Up Record step-&gt;Record-&gt;First name]</td>
</tr>
<tr>
<td>Last name</td>
<td>[step-&gt;Look Up Record step-&gt;Record-&gt;Last name]</td>
</tr>
<tr>
<td>Email Address</td>
<td>[step-&gt;Look Up Record step-&gt;Record-&gt;Email]</td>
</tr>
</tbody>
</table>

*Note:* You can select data pills from the data panel or from the Data Pill Picker button.

26. Select **Save**.
27. Select **Test**.
   The system displays the Test Action dialog.
28. Enter these test values.
29. Select **Run Test**.
The system runs the action with the test values provided.

30. Select **Action has executed. To view the action, click here**.
The system displays the action execution details.

31. Review the runtime value for the action **Output data**.
The system displays output data in JSON format.

**Example**
For example, sample contact object JSON for the user Abel Tuter.

```json
{
    "contact": {
        "email_address": "abel.tuter@example.com",
        "last_name": "Tuter",
        "first_name": "Abel"
    }
}
```

**Results**
You have a custom action that looks up a User record and converts it into a contact object.

**What to do next**
Customize the action to use your own logic.

**Create a custom flow to generate an object for each record in a list**
Generate an object for each User record in a list. Learn how to use flow logic to iterate through a list of records.

**Before you begin**
- Role required: admin
- **Create a custom action to generate an object from a record**

**About this task**
Use this example to see demonstrations of these operations and steps.
• Create a flow that runs on a daily schedule.
• Look up User records filtered by the Department provided as an input.
• Add flow logic that runs for each User record you looked up previously.
• Create a contact object for each User record using the custom action you created previously.
• Create a log message for each User record.

Procedure

1. Navigate to **Process Automation > Flow Designer**.
   The system displays the Flow Designer landing page.
2. Select **New > Flow**
   The system displays the Flow Properties dialog.
3. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Contact Objects From Users</td>
</tr>
<tr>
<td>Application</td>
<td>My Application</td>
</tr>
<tr>
<td>Run As</td>
<td>User who initiates session</td>
</tr>
</tbody>
</table>

4. Select **Submit**.
   The system displays the Flow Designer interface.
5. Select **Click to add a Trigger > Date > Daily**.
6. Select **Done** to close the trigger.
7. Select **Click to add an Action, Flow Logic, or Subflow > Action > ServiceNow Core > Look Up Records**.
   The system adds the action to the flow.
8. For **Table**, select **User [sys_user]**.
9. For **Conditions**, add these values.
   • `[Department][is][Development] [AND]
   • `[Email][is not empty]`
10. Configure these field values.
11. Select **Done** to close the action.

12. Select **Click to add an Action, Flow Logic, or Subflow > Flow Logic > For Each.** The system adds the flow logic to the flow.

13. For **Items**, select [1->User Records].

   ![Note:](Note) You can select the Action 1 **User Records** data pill from the data panel or from the Data Pill Picker button.

14. Select **Done** to close the flow logic.

15. Select the plus icon to add a child item to the For Each flow logic.

16. Select **Action > My Application > Create Contact Object.**

17. For **userRecord [User]**, select [2->User Record].

   ![Note:](Note) You can select the Action 2 **User Record** data pill from the data panel or from the Data Pill Picker button.

18. Select **Done** to close the flow logic action.

19. Select the plus icon to add a child item to the For Each flow logic.

20. Select **Action > ServiceNow Core > Log.**

21. For **Message**, select [2.1->contact].

   ![Note:](Note) You can select the Action 2.1 **contact** data pill from the data panel or from the Data Pill Picker button.

22. Select **Done** to close the flow logic action.

23. Select **Save**.

**Script support for complex data**

Create and reference complex data from a script. Use a script when your source data comes from a data stream, a REST step response, or a Look Up Records step.

Use script to create complex data when data comes from these sources.
## Data sources requiring script

<table>
<thead>
<tr>
<th>Data source</th>
<th>Create/map complex data from</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Stream action response stream</td>
<td>Script Parser step</td>
</tr>
<tr>
<td>REST step response</td>
<td>Script step</td>
</tr>
<tr>
<td>Look Up Records step</td>
<td></td>
</tr>
</tbody>
</table>

### Data Stream action response stream

Data Stream actions use a parser script to map stream item values to complex object values. When writing a parser script, use JavaScript methods appropriate to the data stream format. For example, use the JSON - Scoped class to parse or encode a JSON data stream.

Parser scripts have access to the data stream input and output objects as well as a targetObject property. See Data Stream actions for more information about parsing a response stream to create complex data.

### REST step response

You can convert a REST step response into one or more complex objects by parsing it with a Script step. To access a response from a Script step, you must create an input script variable and map it to the response payload from the prior REST step. See Script step for more information about creating script input variables.

Write a script that maps REST response values to complex object values. When writing REST response script, use JavaScript methods appropriate to the response format such as the JSON parse() method.

**Note:** When you use complex data as the source of a string input, Flow Designer automatically converts it into a JSON string.

You do not need to use a Script step to create a REST request from complex data. You can generate complex data in a prior action or step and then map it to a string input of the REST step. At run time, the action or flow converts the complex data into a JSON representation.

### Look Up Records step

While flows can use **For each** flow logic to process a list of records, actions require a Script step. The Script step replaces the **For each** flow logic with JavaScript such as a **For** or **While** loop.
To access record data from a Script step, you must create an input script variable and map it to the record data from the prior look up step. See Script step for more information about creating script input variables.

See Create a custom action to generate an array of objects from a list of records for an example action that converts a list of user records into an array of contact objects.

⚠️ Note: The Look Up Records action does not require a Script step to convert record data into complex data. You can create a custom action to convert a record into an object and apply For each flow logic to the custom action. See Create a custom action to generate an object from a record and Create a custom flow to generate an object for each record in a list for an example of creating a complex object without using script.

**Dot-walking object structures**

You can reference elements from the structure of an object by dot-walking the path of the structure. All complex data paths start with the name of the data source, which is either the global object for inputs, the global object for outputs, or the name of the array or object you created in script.

Next in the path are the names of each structural element referenced separated by period characters (also known as dots). Listing the names of structural elements is identical to dot-walking a reference field where you list the table structure to a particular reference field.

⚠️ Note: A dot-walk path always lists the name of a structural element rather than its label.

For example, suppose that you define a contact object as an Output variable. The object has the following structure.
Sample Contact object

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact</td>
<td>contact</td>
<td>Object</td>
<td></td>
</tr>
<tr>
<td>First name</td>
<td>first_name</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Last name</td>
<td>last_name</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Email Addresses</td>
<td>email_addresses</td>
<td>Array.Object</td>
<td></td>
</tr>
<tr>
<td>Email Address</td>
<td>email_address</td>
<td>Object</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>type</td>
<td>Choice</td>
<td></td>
</tr>
<tr>
<td>Email</td>
<td>email</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Telephone Numbers</td>
<td>telephone_numbers</td>
<td>Array.Object</td>
<td></td>
</tr>
<tr>
<td>Mailing Addresses</td>
<td>mailing_addresses</td>
<td>Array.Object</td>
<td></td>
</tr>
</tbody>
</table>

The dot-walk path to the **First name** structural element would be `outputs.contact.first_name` while the path to the **Email** structural element would be `outputs.contact.email_addresses[0].email` since you must specify an individual element of the array by its JavaScript index value.
Note: A dot-walk path omits the name of the repeated element within the array. For example, an array of objects does not have to specify the object element name. However, since objects are containers for other elements, you can specify a child element of the object within a dot-walk path.

Design considerations

Keep these design considerations in mind when scripting with complex data.

Use string inputs to convert complex data into a JSON string

When you map complex data to a string input, Flow Designer automatically converts it into a JSON string. Instead of writing a script, you can add a string input to a REST step and map it to complex data from a prior action or step.

Save your objects as templates

Save your objects as templates so you can reuse them in other actions, flows, and Script steps.

Create script input variables to access prior data

Create a script input variable for any data you want to access from the action input or a prior step. Map the script input variable to the input or step data pill. For example, map the script input variable to a list of user records you looked up in a prior step.

Create a script output variable to store complex data

Create a script output variable to store any complex data your script creates. The script output variable data structure, data types, and names must match the values defined in the script. For example, create a contacts array of objects to store multiple contact objects. Save the contact object as a template so you can reuse it.

Map the action output to the script output variable

When you want a custom action to output complex data, add an action output and map it to the data pill for your Script step output variable. For example, create a contacts array and load the contact object template you saved earlier. Map the action output to the contacts array produced by your Script step.

Create a custom action to generate an array of objects from a list of records

Generate an array of objects from a list of User records. Learn how to use a Script step to iterate through a list of records.
Before you begin
Role required: admin

About this task
Use this example to see demonstrations of these operations and steps.

• Create an action input for a Department record.
• Look up a maximum of three User records for the Department action input.
• Configure a Script step to process a list of User records.
• Create a script input variable containing the list of User records.
• Write script that creates an empty contacts array.
• Write script that iterates through the list of User records.
• Write script that creates a contact object and maps User record field values to the contact object.
• Write script that populates the contacts array with the current contact object.
• Create script output variables for the contacts array and child contact object.
• Save the contact object as a template.
• Output the generated contacts array of objects as a data pill.
• Test the action with a sample department.

Procedure

1. Create an application to store your work.
   Use the Guided Application Creator.

   Example
   For example, create My Application.

   The system displays the Flow Designer landing page.

3. Select New > Action
   The system displays the Action Properties dialog.

4. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Contacts Array Of Objects</td>
</tr>
<tr>
<td>Application</td>
<td>My Application</td>
</tr>
<tr>
<td>Accessible From</td>
<td>All application scopes</td>
</tr>
</tbody>
</table>
5. Select **Submit**.
   The system displays the Action Designer interface.

6. From the Action Outline, select **Inputs > Create Input**
   The system displays a new action input.

7. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Department</td>
</tr>
<tr>
<td>Type</td>
<td>Record.Department [Reference.cmn_department]</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

8. From the Action Outline, select **Add a new step**.
   The system displays a list of available steps.

9. Select **Look Up Records**

10. Configure the step with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>Conditions</td>
<td>[Department][is][action-&gt;Department]</td>
</tr>
<tr>
<td>Order by</td>
<td>Name</td>
</tr>
<tr>
<td>Sort Type</td>
<td>a to z</td>
</tr>
<tr>
<td>Max Results</td>
<td>3</td>
</tr>
</tbody>
</table>

**Note:** This example limits the **Max Results** setting to three records just for demonstration purposes.

11. From the Action Outline, select **Add a new step**.
   The system displays a list of available steps.

12. Select **Script**.

13. For **Required Runtime**, select **Instance**.

14. From the Input Variables section, select **Create Variable**.

15. Configure the input variable with these values.
### Step 16. For Script, enter the following text.

```javascript
(function execute(inputs, outputs) {
  // Create an empty array
  var contactsArray = [];
  var i = 0;
  // Iterate through the list of User records
  while (inputs.userRecords.next()) {
    // Create an empty object for each iteration
    var contactObject = {};
    // Query User records to assign object values
    contactObject.first_name = inputs.userRecords.getValue('first_name');
    contactObject.last_name = inputs.userRecords.getValue('last_name');
    contactObject.email = inputs.userRecords.getValue('email');
    // Add current object to array
    contactsArray[i] = contactObject;
    i += 1;
  }
  outputs.contacts = contactsArray;
}) (inputs, outputs);
```

### Step 17. From Output Variables, select Create Variable.

### Step 18. Configure the output variable with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contacts</td>
<td>contacts</td>
<td>Array.Object</td>
<td>True</td>
</tr>
</tbody>
</table>

### Step 19. Expand the contacts Array.Object, and rename the child item as contact.

### Step 20. From the row for the contact Object, select Add Child Item.

### Step 21. Configure the child item with these values.
<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>first name</td>
<td>first_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

22. From the row for the contact Object, select **Add Child Item**.
23. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>last name</td>
<td>last_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

24. From the row for the contact Object, select **Add Child Item**.
25. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>email address</td>
<td>email_address</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

26. From the row for the contact Object, select **Toggle Advanced Inputs**.
27. From the Advanced Options, select **Save As Template**.
   The system displays the Save As Template dialog.
28. For **Enter a Name**, enter **contact**.
29. Click **Save**.
30. From the Action Outline, select **Outputs > Create Output**.
31. Configure the Action Output with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contacts</td>
<td>contacts</td>
<td>Array.Object</td>
<td>True</td>
</tr>
</tbody>
</table>

32. Expand the contacts Array.Object.
33. From the row for the contact Object, select **Toggle Advanced Inputs**.
34. From the Advanced Options, select **Structure > Start from Template**.
   The system displays **Template**.
35. For **Template**, select the template you previously saved.
   **Example**
   For example, select **My application: contact**.
36. Select **Exit Edit Mode**.
The System displays the output fields you created.

37. For **contacts**, select **[step->Script step->contacts]**.

   **Note:** You can select the Script step **contacts** data pill from the data panel or from the Data Pill Picker button.

38. Click **Save**.

39. Select **Test**.
   The system displays the Test Action dialog.

40. Enter the following test value:

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Department</td>
<td>Development</td>
</tr>
</tbody>
</table>

41. Select **Run Test**.
   The system runs the action with the test values provided.

42. Select **Action has executed. To view the action, click here.**
   The system displays the action execution details.

43. Review the runtime value for the action **Output data**.
   The system displays output data in JSON format.

**Example**
For this example, the contacts object contains an array of contact objects with first name, last name, and email information for three users in the Development department.

```json
{
    "contacts":
        "contact": [
            {
                "email_address": "allyson.gillispie@example.com",
                "first_name": "Allyson",
                "last_name": "Gillispie"
            },
            {
                "email_address": "alva.pennigton@example.com",
                "first_name": "Alva",
                "last_name": "Pennigton"
            },
            {
                "email_address": "andrew.och@example.com",
                "first_name": "Andrew",
            }
        ]
}
```
Results
You have a custom action that looks up the Users for a given department and converts those users into an array of contact objects.

What to do next
Customize this action to use your own logic.

Flow variables
Similar to Workflow scratchpad variables, create variables that you can use and modify directly in your flow. Access flow variables as data pills directly in the Data panel.

Use flow variables to set and retrieve values throughout a flow. Flow variables are similar to subflow inputs and outputs. Both define data available to a flow or subflow. The main difference between them is when they are accessible. Flow variables are accessible throughout a flow. Inputs are only accessible at the start of a subflow, and outputs are only accessible when a subflow completes.

Creating flow variables
Create variables with the Flow Variables option on the More Actions menu. You can create several variables at a time by choosing a name and data type for each one. Flow variables appear as data pills in the Flow Variables section of the Data panel.

Assigning values to flow variables
Assign values to variables with the Set Flow Variables flow logic. Set Flow Variables has the following inputs:

• The name of the variable.
• The data value for the variable.

You can assign values to all of your variables with a single use of Set Flow Variables. Unlike other data pills, the values assigned to flow variables are mutable and can be changed at any time. Using Set Flow Variables overrides the current value of the variable. If no value is assigned to a variable, the default value is null.
Flow execution details

A summary of the Set Flow Variables flow logic appears in the execution details. The details show the name, type, configuration, and runtime values for all the variables set with the action. Execution details also provide information about the variables when they're used in actions or flow logic. In that case, it shows the type, configuration, and runtime values.

Supported data types

Flow Designer supports the following data types for flow variables:

- Integer
- JSON
- Reference
- String
- True/False

Create a flow variable

Create a flow variable to store and retrieve a value throughout a flow.

Before you begin

Role required: flow_designer or admin

Procedure

2. Click New > Flow.
3. On the Flow Properties form, fill in the fields. For more information, see Create a flow.
4. Click Submit.
5. Click the more actions icon (⋯) and select Flow Variables.
6. In the upper-right side of the Flow Variables form, click the plus icon (+) to create a variable.
7. On the form, fill in the fields.

Flow Variables form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label for the variable. It can consist of any text. The label is visible to the user.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Name</td>
<td>Unique name for the variable. Displays the name used to identify the variable in script calls. The name can only consist of alphanumeric and underscore characters. The system automatically converts the label into a valid name by removing or replacing any special characters. The name is not visible to the user, it's what the system uses behind-the-scenes.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type for the variable.</td>
</tr>
</tbody>
</table>

8. Click **Save**.

**Results**
The Data panel displays the variable in the Flow Variables section. It appears as a data pill, with its name and type.

**What to do next**
To assign a value to the variable, use the **Set Flow Variables flow logic**. If you don’t assign a value, the default value is null.

**Flow error handler**
Enable flows to catch errors. Run a sequence of actions and subflows to identify and correct issues. For example, have flows log output values, send notifications, and run corrective subflows when they produce an error.

**Benefits**
Enable a flow error handler to gain these benefits.

- Automate the identification of flow errors as they happen. Capture and push flow error information rather than manually search for issues caused by flow errors.
- Automate the resolution of flow errors. Run actions and subflows to update records rather than manually updating records affected by flow errors.
- Build your own action error handling logic. Specify when actions return an error rather than always return an error.
Flow error handling consists of these components.

1. **Error Handler switch**
   Option to enable or disable flow error handling. When enabled, the flow displays the Error Handler section.

2. **Error Handler section**
   Section of flow that runs when the flow catches an error. Use this section to automate the identification and resolution of flow errors. You can add up to 10 items in this section.

   Note: The 10-item limit includes any combination of actions, flow logic, or subflows.

3. **Error Status**
   Object data pill containing details about the error caught by the flow.
4. Error Status > Code

Integer data pill indicating whether the flow produced an error. By default, a value of 1 indicates that the flow produced an error. A value of 0 indicates that the flow ran successfully. You can define your own error codes when you create a custom action.

5. Error Status > Message

String data pill containing the error message produced by the action, step, or system operation.

Available error states

Enabling the Error Handler changes the states reported in the flow execution details. The Error Handler can produce these flow states.

Completed (error caught)

State generated when the flow caught an error and successfully ran the items in the Event Handler section. The flow generates this state even when the Event Handler section is empty. This state is only available when you enable a flow Error Handler. This state is only visible from a flow execution details page. Flow context records instead display the state as **Complete**.

Completed (error skipped)

State generated when a custom action continues running after a step failure. When an action generates this state, it passes it to the parent flow. This state is only available when you enable a flow Error Handler. This state is only visible from a flow execution details page. Flow context records instead display the state as **Complete**.

Error

State generated when an error remains uncaught.

- An error occurs in the flow while the Error Handler is disabled
- An error occurs in the Error Handler section

Design considerations

Follow these guidelines to achieve the benefits offered by flow error handling.

Avoid adding error handling items to the main section of the flow

A flow normally stops running when an action or subflow returns an error in the main section. A stopped flow cannot run any actions or subflows past the point where it returned an error. Adding error handling actions and subflows to the Error Handler section ensures they run when there is an error.
Capture Error Status information

The Error Status object contains information about the action that produced an error. You can use this information to identify the cause of the error as well as record data that may need correction.

Suppress subflow error messages

You can enable the Error Handler for a subflow to prevent its errors from cascading to a parent flow. Leaving the subflow Error Handler section empty ensures that it always generates the Completed (error caught) state.

Use subflows to avoid the 10-item limit

Rather than force your error-handling-process to fit within a 10-item limit, call subflows, which can contain many more items. You can also use the subflow outputs to trigger automation in other flows.

Use subflows to take corrective actions

Rather than recreate the same sequence of actions in multiple flows, create reusable subflows to correct errors to your record data. When a flow error leaves your record data in an undesired state, use subflows to correct these records. You can use the error handler to identify such record data as a subflow output.

Add an error handler to a flow

Run a sequence of actions and subflows when your flow catches an error.

Before you begin

Role required: flow_designer or admin

About this task

A flow error handler allows your flow to catch an error and run a set of actions, flow logic, and subflows. Enable a flow error handler when you want to identify and correct issues caused by flow errors.

Important: A flow error handler cannot resume or restart a flow that produces an error.

Procedure

2. Create a flow or open an existing flow.
3. Enable the ERROR HANDLER switch.
   Flow Designer adds an Error Handler section to the flow and the Data pane.
4. Add actions, flow logic, or subflows to the Error Handler section.
You can add up to 10 actions, flow logic, or subflows to this section. Consider calling a subflow to capture error information or correct issues with record data.

The **Error Status** object contains information about the flow error. You can also use the **Action Status** object returned by each action to build conditional logic.

5. Add a custom action to the main body of the flow that throws an error. See **Create a custom action to throw an error** for an example action.

6. **Test your flow** to ensure that the error handler works as expected.

7. When your flow error handling is working as expected, remove the custom action that throws an error from your flow.

**Results**

Your flow runs the actions, flow logic, and subflows you specify when the flow produces an error. The flow execution details display the state **Completed (error caught)** for both the flow and the action that returned an error.

**Create a custom action to throw an error**

Create an action that intentionally throws an error to test flow error handling.

**Before you begin**

Role required: flow_designer, action_designer, or admin

**About this task**

This custom action throws an error when the action input value is set to 1. Any other input value allows the action to run without throwing an error. You can add this custom action to a flow to test flow error handling.

**Procedure**

1. **Navigate to Process Automation > Flow Designer.**
   The system displays the Flow Designer landing page.

2. **Select New > Action**
   The system displays the Action Properties dialog.

3. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Throw an error</td>
</tr>
<tr>
<td>Application</td>
<td>Global</td>
</tr>
</tbody>
</table>
4. Select **Submit**.
The system displays the Action Designer interface.

5. From the Action Outline, select **Inputs > Create Input**
The system displays a new action input.

6. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accessible From</td>
<td>All application scopes</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Error Code</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

7. From the Action Outline, select **Add a new step**.
The system displays a list of available steps.

8. Select **Script step**.

9. From the **Input Variables** section, select **Create Variable**.

10. Configure the variable with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>code</td>
</tr>
<tr>
<td>Value</td>
<td>Select the data pill [action-&gt;Error Code]</td>
</tr>
</tbody>
</table>

11. In **Script**, enter this JavaScript code.

```javascript
(function execute(inputs, outputs) {
  if (inputs.code == 1) {
    throw 'My custom error message'
  }
})(inputs, outputs);
```

12. Click **Save**.
13. Select **Test**.
   The system displays the Test Action dialog.

14. Enter the following test value:

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error Code</td>
<td>1</td>
</tr>
</tbody>
</table>

15. Select **Run Test**.
   The system runs the action with the test values provided.

16. Select **Your test has finished running. View the action execution details**.
   The system displays the action execution details.

17. Verify that the action ran the Script step and threw your custom error message.
   The **Action Status** object should list an error on line 3 and display the text of your custom error message.
18. Close the action execution details.

19. Select **Cancel** to stop testing the action.

20. Select **Publish** to make your custom action available to your flows.

**Results**

You have a custom action that throws an error when you set the action input **Error Code** to 1.

**What to do next**

Add this action to a flow to test the contents of the Error Handler section.

**Inline scripts**

Enable users with coding experience to write inline scripts that set and modify input values during the configuration of an action or flow. Use inline scripts to modify input values that require small format conversions, data transformations, or math operations.

Flow Designer displays a Script button when you configure these components.

- Action instance inputs when you configure the action for a flow
- Action instance outputs when you configure the action for a flow
- Flow logic inputs when you configure the flow logic for a flow
• Flow logic outputs when you configure the flow logic for a flow.
• Step inputs when you configure the step for an action.
• Subflow inputs when you configure the subflow for a flow.
• Subflow outputs when you configure the subflow for a flow.

Inline scripts must return values in the same data type as the input expects. For example, an inline script for a Record input must return a GlideRecord object and an inline script for a Date input must return a date-time value. Always test actions and flows containing inline scripts, and verify that there are no runtime errors in the flow execution details.

Script writers should be familiar with Now Platform table structures and field types. In addition, they should know how to work with record and system data using the ServiceNow API.

**Benefits**

Inline scripts offer these benefits.

• Enable simple data conversion or transformation without having to create custom actions or flows.
• Identify which input data a script affects.
• Restricted access to scripting features to users or groups who are knowledgeable with the available ServiceNow APIs.

**Access to inline script**

You can grant users access to online scripting by either granting them the flow_designer_scripting role or the Allow Scripting delegated development permission. Both the role and the developer permission display a script button field for each Flow Designer input.

**Script button**

When you enable a user to create inline scripts, Flow Designer displays a script button next to flow and step inputs.
Clicking the **Script** button opens the Script editor, which replaces the standard input interface. Enter a script to compute the input value. Script writers can use the `fd_data` object to access data from previous actions and steps. Ensure your script includes a `return` statement with the results of your script. For example, `return shortDesc;` returns the value of the `shortDesc` variable.

Clicking the **Collapse Script** button hides the Script editor and displays a read-only version of the input. Clicking the **Expand Script** button displays the Script editor and allows you to edit the script.
Design considerations

Follow these design guidelines to create reusable and maintainable inline scripts.

Write inline script for small non-reusable logic

Use inline script to format or modify the data for specific inputs and use cases. For reusable logic, create an action or subflow instead.

Create custom actions or subflows for reusable code rather than inline script

Create custom actions or subflows for reusable or complex data logic such as changing the data type of source data. You may also want to provide custom actions or subflows for flow designers who are not comfortable with code.

Avoid duplicating action and flow functionality

Avoid writing inline script that duplicates action and flow functionality. For example, rather than write inline script to perform record operations, use the create and update record baseline actions.

Avoid data type changes

Avoid runtime errors by verifying that your inline script provides information in the same data type as the input or output expects.

Create variables by declaring them with the var keyword

Use the var keyword to declare variables so that they remain within the proper JavaScript scope. When you create a variable by assigning it a value, JavaScript may attach it to the global object, which can result in variable values persisting outside of the local scope and causing errors.

Process records outputs with For Each flow logic and the flow data object

Inline script can only access the records output of a Look Up Records action from For Each flow logic. Add a Look Up Records action to the flow to generate the records output. Add a For Each flow logic to the flow to process each record in the records output. Create an inline script reference to the For Each flow logic using the fd_data and item objects. For example, this reference assumes the For Each flow logic is the second item in your flow outline fd_data._2__for_each.item.

Use type ahead suggestions to generate references to flow and action data.

Create references to flow and action data using the fd_data object. The script editor displays type ahead suggestions for existing
flow and action data when you type \texttt{fd\_data}. Select a suggestion to build references to flow and action data.

\textbf{Note:} Refer to record data in a For Each flow logic using the \texttt{item} object.

\section*{Licensing considerations}

Inline scripts that call integration APIs are subject to IntegrationHub licensing.

\section*{Code editor}

The code editor provides text editor support for inline scripts.

The code editor has these features for the supported language services and scripts.

- Syntax coloring, indentation, line numbers, and automatic creation of closing braces and quotes
- Auto-suggestions and auto-completions

\section*{Editing tips}

- To insert a fixed space anywhere in your code, press Tab.
- To indent a single line of code, click in the leading white space of the line and then press Tab.
- To indent one or more lines of code, select the code and then press Tab. To decrease the indentation, press Shift+Tab.
- To remove one tab from the start of a line of code, click in the line and press Shift+Tab.
- To declare variables, use the \texttt{var} keyword so that they remain within the proper JavaScript scope.
Action Designer

Automate a task with a sequence of related steps such as lookup a record, create a record, and log details about the record creation. Actions separate complexity from the Flow Designer environment, enabling flow designers to add actions to multiple flows with minimal configuration.

Using Action Designer, you can:

• Create application-specific actions with pre-set configuration details, enabling process analysts to easily add actions to a flow with little configuration.
• Create scripted actions that appear code-less when added to a flow.
• Build integrations using IntegrationHub.

Core actions

Core actions that come with your instance cannot be viewed or edited from the Action Designer interface. Some applications include spokes which include application-specific actions. Spoke actions are typically read-only but can be copied and customized.

Custom actions

Unlike core actions where flow designers must manually configure flow logic, custom actions always use the same configuration when added to a flow. If your flow designers often use an action with the same configuration, you might create a reusable action.

A reusable action includes these components.

Inputs

Inputs are data variables used in your action. For example, if an action step creates a record in the incident table, your input might be a reference to the incident table. Once added as an input, the table and its fields are available to steps and outputs in the flow.

Each input you define for an action becomes a configuration option in the Flow Designer interface. To use the action in a flow, flow designers must define a value for each mandatory input. The more inputs an action has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the action effectively.

Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring an action to a flow. For example, create
a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

**Action steps**

An action step or step is a single reusable operation within an action. For example, the **Create Record** step allows action designers to specify the table and field values to use during record creation. Action steps require subject matter expertise with application tables, fields, and business logic. Application developers or IT generalists add action steps to actions from the Action Designer design environment. Flow Designer provides a set of ServiceNow core action steps to automate Now Platform processes. You can add application-specific action steps by activating the associated spoke.

**Outputs**

Outputs are data variables that represent the results of the action. These results are available to other actions in a flow.

**Action Designer design environment**

Create and edit actions by defining inputs and adding action steps. Test actions to verify if they complete successfully and review the runtime values they generate. Copy actions to use existing actions as templates. Publish actions to activate them, which makes them available to activated flows and to preserve their current action steps, variables, and sequence as a snapshot separate from further configuration changes.

**More Actions**

Click the More actions icon (⋯) to access additional options for the action.

**Copy action**

Create a copy of the open action in an application you specify.

**Configurations**

Enable or disable the **Show inline script toggle** option.
Code Snippet
Generate a code snippet for the action.

Manage security
Enable or disable the Callable by Client API option.

Manage natural language title
Create or edit an action title with styled or dynamic text. For more information, see Manage natural language titles.

Testing actions
After adding inputs and action steps, users with the action_designer or admin role can test an action. To test an action, provide the required inputs. Action designers should always test actions on non-production instances containing relevant demonstration data because testing an action can make significant changes to records on your instance.

Roles
To create custom actions, you must have the action_designer or admin role.

Getting started with actions
Transform the Ask for Approval action into a reusable action that always requires manager approval.

Before you begin
Role required: admin

Note: While Action Designer is designed to use the action_designer and delegated_developer roles in most scenarios, this tutorial uses the admin role to illustrate functionality without requiring additional roles to set up records and approve requests.

Complete the steps in Getting started with flows. This tutorial replaces the Ask for Approval action in the Expense Approval flow.

About this task
Actions are made up of:
• Inputs: Data variables used in your action.
• Steps: Operations on the inputs or results from a prior step that generate data that can be used in later steps.
• Outputs: Data variables that represent the results of the action. These results are available to other actions in a flow.

Unlike the core Ask for Approval action where flow designers must manually configure the approval rules, this custom action always uses the same approval rules when added to a flow. You might create a reusable action if your flow designers often use an action with the same configuration. For example, if your flow designers always use the request manager approval and due date options, this action automatically uses them and therefore requires less flow configuration.

Demonstrates creating actions within a flow in the Flow Designer, and testing a flow.

Procedure

2. Create an action.
   a. Click Create Application File.
   b. Under Flow Designer, select Action and click Create.
   c. In the Name field, enter Ask for Manager Approval.
   d. In the Description field, enter Approve or reject a request based on manager approval or rejection. Allow manual approvers to be added.
   e. Click Submit.
   An Ask for Manager Approval action is created in the Expenses Getting Started scope.

3. Define the inputs in the Ask for Manager Approval action.
a. Select + Create Input and add the following values.

- Name: **Request**
- Type: **Reference**
- Reference Table: **Expenses [x_expenses_getting_expenses]**

This input enables you to reference any field or record from the Expenses table. Use the data pills on the right-hand side to add the record or its fields to action steps.

4. Add an Ask for Approval step.

   a. Click the + underneath Inputs in the Action Outline.

   b. Select Ask for Approval.

   c. Complete the fields in the Ask for Approval step.

      - Record: Under the Input Variables category, drag the [Request] data pill from the right-hand pane.
      - Table: Set to Expenses [x_expenses_getting_expenses].
      - Approval Field: Set to Approval.
      - Journal Field: Set to Approval history.
d. Define rules in the Ask for Approval step. You can use the data pill picker, or drag the data pills from the right-hand pane to select the data you need.

- **[Approve]** when **[Anyone approves]** from the field **[action->Requested for->Manager]**. [OR]
- **[Anyone approves]** from the field **[Manual User(s)]**.

Select **Add another OR rule set** to define rejection rules:

- **[Reject]** when **[Anyone rejects]** from the field **[action->Requested for->Manager]**. [OR]
- **[Anyone rejects]** from the field **[Manual User(s)]**.

![Rules diagram]

e. Define a due date in the Ask for Approval step.

- **[Approve]** if pending by **[Relative date] [1][Days]** from **[action->Created]**.
- Days schedule **[8-5 weekdays excluding holidays]**.

This due date automatically approves all requests that have not been approved or denied within one day from when the request was created.

![Due Date diagram]

5. Define the outputs in the Ask for Manager Approval action. Adding an output makes data available to a flow. For example, this action outputs the approval state of the record.
a. Select + Create Outputs and add the following values.

- **Name:** Approval state
- **Value:** In the right-hand pane, expand the **Ask for Approval step** category and drag the [Approval State] data pill.

b. Click **Save**.

6. Add a custom icon for your application that displays in Flow Designer. All actions in the application scope use the custom icon.

a. In Studio, navigate to **File > Settings**. The application settings open.

b. In the **Logo** field, select **Click to add**....

c. Upload an icon to use with your reusable actions.

7. Test the reusable action within your flow.

a. Return to the Expense Approval flow.

b. Remove the 2.1 Ask for Approval action from the flow. This action will be replaced by the reusable Ask for Manager Approval action.

c. Set **Show draft actions** to true.

d. Add the Ask for Manager Approval action to your flow.

e. In the right-hand pane, expand the **Trigger - Record Created** category and drag the [Expenses Record] data pill into the **Request [Expenses]** field.
8. Click **Save**.

9. Test the flow using a record with an amount below the designated limit.

   a. From the flow, click **Test**.
      
      The Test flow modal appears.

   b. In the **Record** field, select a record you created in earlier steps that has value in the **Amount** field under the 100.00 limit. Verify that you have not already run tests using this record.

   c. Select **Run Test**.

   d. After the flow executes, click **Flow has been executed. To view the flow, click here**.
      
      The Execution Details open.

      Because the amount is less than 100.00, the first condition is met and the request is approved. The Else condition is not evaluated.
10. Test a record with an amount over the designated limit. Verify that you have not already run a test on the test record. Because the amount is over the designated limit, the second condition is evaluated.

11. Approve the request.

   a. Navigate to the test record and change the value of the State field in the Approvers related list to Approved.

   b. Navigate back to the flow execution details and refresh the browser.
Because the request is approved, the flow completes.

12. Navigate to the Ask for Manager Approval action and click Publish. Publishing an action enables you to activate any flow that uses it.

13. Navigate to the flow and set Show draft actions to false.

14. Click Activate. Activating a flow sets it to run every time the trigger conditions are met.

Results
The Expense Approval flow runs every time a record is created in the Expenses table. Now that the flow is activated and working as expected, you can publish it to the application repository and deploy it to other instances.

Create an action
Create a reusable component to automate one or more steps of a process.

Before you begin
- Set up an application in Guided Application Creator to store Flow Designer content.
- Role required: flow_designer, action_designer or admin

About this task
Action designers should know the application table structure and be aware of any existing business logic associated with the target tables of an action. Be sure to disable any conflicting business rules or workflows before creating an action.

Creating a custom application to contain your Flow Designer content enables you to deploy it using the application repository or the ServiceNow Store.
Procedure

1. Navigate to **Process Automation > Flow Designer**.
2. Click the **Actions** tab and select **New Action**.
3. Fill in the Action Properties and click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for your action.</td>
</tr>
<tr>
<td>Accessible From</td>
<td>Accessible from all application scoped or only within the specified application scope.</td>
</tr>
<tr>
<td>Category</td>
<td>Defined category within the application scope for an action.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the action is read-only. You can only select a value when you create the action in an application scope you own. The default value is None.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the action.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the action.</td>
</tr>
<tr>
<td>In-Flow Annotation</td>
<td>Help text that appears under the action title in Flow Designer to help flow designers understand what the action does when used in a flow.</td>
</tr>
</tbody>
</table>

An empty action opens.

4. Define action inputs to make data available to the action steps and outputs.

   **a. Select + Create Input** and complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the input. This value is used as the name of the data pill in the right-hand pane.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Action input names can't include any of the following reserved system names:</td>
</tr>
<tr>
<td></td>
<td>• sys_id&lt;br&gt;• sys_created_by&lt;br&gt;• sys_created_on&lt;br&gt;• sys_updated_on&lt;br&gt;• sys_updated_by&lt;br&gt;• sys_mod_count</td>
</tr>
<tr>
<td>Type</td>
<td>Data type of the input. For supported data types, see Action input and output data types.</td>
</tr>
<tr>
<td>Reference Table</td>
<td>Reference table for the data type. Only required for the following data types:&lt;br&gt;• Records&lt;br&gt;• Reference</td>
</tr>
<tr>
<td>Advanced options</td>
<td>Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring an action to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.</td>
</tr>
<tr>
<td></td>
<td>Click to view the advanced options and define values.</td>
</tr>
</tbody>
</table>

Inputs are represented as data pills in the right-hand pane. You can add inputs to steps and outputs in the flow by dragging and dropping data pills.

5. **Add an action step to perform an operation on the action inputs.**
   a. Click the + underneath Inputs in the Action Outline.
   b. Select the step you would like to perform.
   c. Complete the fields in the step.

6. **For If this step fails**, select the action error evaluation behavior you want the step to take.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stop the action and go to error evaluation</td>
<td>Stop running the action at the current step and go to error evaluation. The Step Status object contains the error information returned by the step.</td>
</tr>
<tr>
<td>Don’t stop the action and go to the next step</td>
<td>Ignore the failure and continue running the action from the next step. The Step Status object contains the error information returned by the step. Action error evaluation runs regardless of whether the action continues running.</td>
</tr>
</tbody>
</table>

7. Add action outputs to make data available to a flow.

a. Select + Create Outputs and complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the output. This value is the name of the data pill in the right-hand pane when the action is added to a flow.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Action output names can’t include any of the following reserved system names:</td>
</tr>
<tr>
<td></td>
<td>• sys_id</td>
</tr>
<tr>
<td></td>
<td>• sys_created_by</td>
</tr>
<tr>
<td></td>
<td>• sys_created_on</td>
</tr>
<tr>
<td></td>
<td>• sys_updated_on</td>
</tr>
<tr>
<td></td>
<td>• sys_updated_by</td>
</tr>
<tr>
<td></td>
<td>• sys_mod_count</td>
</tr>
<tr>
<td>Value</td>
<td>Data used previously in the action either in a step or input. Adding a variable to the output makes the value available to the flow.</td>
</tr>
</tbody>
</table>

8. Click Save.
Action Designer saves a draft of the action.
What to do next
Test the action until it is ready to be published.

ℹ️ Note: By default, the system only runs published actions.

Test an action
Test an action before publishing it for other users.

Before you begin
• Create an action and save it.
• Role required: flow_designer, flow_operator, action_designer, or admin.

About this task
A user with the flow_designer role should always test actions on non-production instances containing relevant demonstration data because testing an action creates or changes records on the instance.

Procedure
2. Click the Actions tab and select the action that you want to test.
3. Click Test.
   The system displays the Test Action dialog box.
4. Fill in the fields for the action.
   ℹ️ Note: Complete all mandatory fields in the Test Action dialog box.
5. Click Run Test.
   ℹ️ Note: Select the Run test in background option to test an action asynchronously in the background.
   If you select the Run test in background option, the execution details are displayed only after the execution is completed asynchronously in the background.

What to do next
Click Action has been executed. To view the action, click here to view the action execution details. See Flow execution details for information about the executions.

ℹ️ Note: Users must have the flow_operator or admin role to view the executions.
Action input and output data types

The inputs and outputs of an action are variables. Each variable has a data type that determines what data it stores and its advanced configuration options.

Data variables available in Action Designer

Inputs are displayed as data pills in the Input Variables section of the Data pane. Outputs are listed as data pills in the Output Variables section of the Data pane.

Sample Action Designer data panel

Each data pill consists of a label and a data type description. For example, the Incident input uses the Record data type to store an incident Sys ID. The Problem output uses the Record data type to store a problem Sys ID. You can expand data pills to see the contents and hierarchy of any child elements.

Data variables available in Flow Designer

Only action outputs are displayed as data pills in the Data pane. Output data pills are associated with the action that created them.

Supported variable data types

Flow Designer supports variable data types for Now Platform record data and complex data. Variables that store record data must have a data type matching the Now Platform field type of the record. Variables for complex data must match the type of complex data stored, either an array or an object.

Approval rules data type

Store the conditions for approving or rejecting an approval requests.
Basic options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Displays the label used to identify the data variable in the Flow Designer interface. The label can consist of any text.</td>
</tr>
<tr>
<td>Name</td>
<td>Displays the name used to identify the data variable in script calls. The name can only consist of alphanumeric and underscore characters. The system automatically converts the label into a valid name by removing or replacing any special characters.</td>
</tr>
<tr>
<td>Type</td>
<td>Indicates the type of data stored by the data variable.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Indicates whether the data variable must contain a value when configured in an action.</td>
</tr>
</tbody>
</table>

Advanced options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint</td>
<td>Provides guidance to flow or action designers on how to configure the data.</td>
</tr>
<tr>
<td>Default value</td>
<td>Specifies the value used when a flow or action designer does not provide a value.</td>
</tr>
</tbody>
</table>

Design considerations

Provide a default value

Create or select an approval rule as a default value.

Array. Boolean data type

Store a sequence of true or false values in an array.

Basic options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Displays the label used to identify the data variable in the Flow Designer interface. The label can consist of any text.</td>
</tr>
<tr>
<td>Name</td>
<td>Displays the name used to identify the data variable in script calls. The name can only consist of alphanumeric and underscore characters.</td>
</tr>
</tbody>
</table>
### Advanced options for Array variables

<table>

<tr>
<td>Name</td>
<td>Displays the name used to identify the data variable in script calls. The name can only consist of alphanumeric and underscore characters. The system automatically converts the label into a valid name by removing or replacing any special characters.</td>
</tr>
</tbody>
</table>
Option | Description
--- | ---
Type | Indicates the type of data stored by the data variable.
Mandatory | Indicates whether the data variable must contain a value when configured in an action.

### Advanced options for Array variables

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint</td>
<td>Provides guidance to flow or action designers on how to configure the data.</td>
</tr>
<tr>
<td>Max rows</td>
<td>Specifies the maximum number of entries to display in the Flow Designer interface. The array can store more values than it displays.</td>
</tr>
</tbody>
</table>

### Advanced options for Choice variables

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Displays the name used to identify the data variable in script calls.</td>
</tr>
<tr>
<td>Max length</td>
<td>Specifies the maximum length a user can enter for a choice value. Use this option to restrict the length of input values stored during action design.</td>
</tr>
<tr>
<td>Hint</td>
<td>Provides guidance to flow or action designers on how to configure the data.</td>
</tr>
</tbody>
</table>
| Choice | Specifies whether the choice list has a value for no selection. Options include:  
  • Dropdown with --None--  
  • Dropdown without --None--  
  
  **Note:** The *Dropdown with --None--* option requires selecting a default choice. |
| Default | Specifies the choice used when a flow or action designer does not select a choice. |
| Choices | Specify the choices available to select. Use the add button (⁺) to create a choice. Each choice must have a **Name**, **Value**, and **Order**. See [Choice list field type](#) for more information about choice lists. |
Array.Datetime data type
Store a sequence of date-time values in an array.

Basic options

<td>Displays the name used to identify the data variable in script calls. The name can only consist of alphanumeric and underscore characters. The system automatically converts the label into a valid name by removing or replacing any special characters.</td>
</tr>
<tr>
<td>Type</td>
<td>Indicates the type of data stored by the data variable.</td>
</tr>
</tbody>
</table>
Option | Description
--- | ---
Mandatory | Indicates whether the data variable must contain a value when configured in an action.

Advanced options

| Option | Description |
--- | --- |
| Hint | Provides guidance to flow or action designers on how to configure the data. |
| Default value | Specifies the value used when a flow or action designer does not provide a value. |

List.[Table] data type
Stores a list of record Sys IDs associated to a specific table. This variable is intended to store the contents of a Now Platform List field.

Basic options

| Option | Description |
--- | --- |
| Label | Displays the label used to identify the data variable in the Flow Designer interface. The label can consist of any text. |
| Name | Displays the name used to identify the data variable in script calls. The name can only consist of alphanumeric and underscore characters. The system automatically converts the label into a valid name by removing or replacing any special characters. |
| Type | Indicates the type of data stored by the data variable. |
| Mandatory | Indicates whether the data variable must contain a value when configured in an action. |

Advanced options for List variables

| Option | Description |
--- | --- |
<p>| Hint | Provides guidance to flow or action designers on how to configure the data. |</p>
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default value</td>
<td>Specifies the value used when a flow or action designer does not provide a value.</td>
</tr>
<tr>
<td>Add [Record Label]</td>
<td>Select one or more records to include as default values for the list. If you filter the list with a reference qualifier, you can only select records that match the reference qualifier conditions.</td>
</tr>
<tr>
<td>Reference qualifier conditions</td>
<td>Select the filter conditions applied to the list of records. Flow designers can only select records that match the reference qualifier conditions.</td>
</tr>
</tbody>
</table>

**Design considerations**

**Add a reference qualifier to filter list records**

Filter the records the list variable displays as valid options by adding a reference qualifier. The reference qualifier acts as a mandatory list filter and causes the list variable to only display records that match the reference qualifier conditions. For example, to only displays active incident records add the reference qualifier condition `[Active][is][true]`.

**Avoid selecting default records for actions intended for ServiceNow Store**

Avoid selecting default records for a list unless you know all instances will have access to the selected records. Spoke developers typically do not have access to the data of the customers who install their custom action. You may need to provide any default records as demo data if you intend to publish a custom action on the ServiceNow Store.

**Use List variables in For Each flow logic**

You can use a List variable to specify the records to process within For Each flow logic. The For Each flow logic ignores any non record Sys ID present in the data. For example, if the List variable contains an email address, the flow logic ignores it.

**Object data type**

Store a JavaScript object.
Basic options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Displays the label used to identify the data variable in the Flow Designer interface. The label can consist of any text.</td>

</tr>
</tbody>
</table>

### Advanced options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint</td>
<td>Provides guidance to flow or action designers on how to configure the data.</td>
</tr>
<tr>
<td>Default value</td>
<td>Specifies the value used when a flow or action designer does not provide a value.</td>
</tr>
</tbody>
</table>

### Design considerations

Follow these guidelines when designing flows containing Password (2 Way Encrypted) data.

**Assign values using existing Password (2 Way Encrypted) data pills.**

You can only assign a value to a password2 variable by selecting an existing password2 data pill. Selecting values from other field types is not supported. Flow Designer presents a warning message when invalid data pill types are selected.

![Image](image_url)

**Note:** You cannot manually enter Password (2 Way Encrypted) values.

**Use Password (2 Way Encrypted) variables only for valid field types**

Flow Designer prevents selecting Password2 data pills as the value for invalid field types. The system presents a warning message when the field is incompatible type.
Flow Designer only allows Password2 data pills to be dragged into the following field types.

- Email body fields
- HTML fields
- Password 2 Fields
- PowerShell Input Variables
- REST fields
  - Variables
  - REST payload body
  - Query parameters
  - Headers
  - REST multi-part form values
  - Form URL-encoded values
- SOAP fields
  - Headers
  - Envelope

**Note:** you cannot use Password (2 Way Encrypted) variables as conditions

Flow Designer performs a validation check when a user saves, publishes, or tests actions and flows. This check shows an alert for any data pills dropped in restricted field types and prevents the action or flow from executing. Update the action or flow to remove the invalid data pill and then retry the action.

**Set up encryption contexts to allow decryption**

Only users with a valid encryption context can decrypt and view the contents of password2 variables. To specify the encryption algorithm and the roles allowed to access encrypted data, see [Setup encryption contexts](#).
**Records.[Table] data type**

Stores one or more Sys ID references to records in a specific table.

**Basic options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Displays the label used to identify the data variable in the Flow Designer interface. The label can consist of any text.</td>
</tr>
<tr>

<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint</td>
<td>Provides guidance to flow or action designers on how to configure the data.</td>
</tr>
<tr>
<td>Default value</td>
<td>Specifies the value used when a flow or action designer does not provide a value.</td>
</tr>
</tbody>
</table>

**Dynamic inputs**

Build dynamic choice and template inputs for an action. Dynamically display and assign values to the inputs during flow design.

ℹ️ **Note:** Dynamic inputs are not available in the base system. To use dynamic inputs in Flow Designer, you must request an IntegrationHub Enterprise Pack subscription.

During flow design, dynamic inputs retrieve values and display them as inputs within an action dynamically. Dynamic input types include:

- Dynamic choice
- Dynamic template
A dynamic input must point to a data gathering action that collects the displayed data. For example, a data gathering action can retrieve values from a third-party system and populate a dynamic choice for an action that runs in an IntegrationHub spoke. To use a dynamic input in Flow Designer:

1. An action designer creates a data gathering action.
2. An action designer creates a parent action with a dynamic input that points to the child data gathering action.
3. A flow designer adds the parent action to a flow.

**Data gathering actions**

A data gathering action collects data, typically from a third-party system via a REST call, and dynamically builds its output based on the returned payload. A data gathering action must:

- Have a script step that contains an output variable of type JSON.
- Have an action output named `output` of type JSON whose value is derived from the script step's JSON output variable.

**Note:** The action can have multiple outputs but can only have one of type JSON.

- Format the payload in the script step so that `output` has a property named `data`.
- Wait for up to 300 seconds (5 minutes) to gather data before it times out.

**Note:** To change the timeout period for a data gathering action, modify the value of the `sn_flow_designer.sync_action_execution_timeout_in_seconds` system property.

**Dynamic choice**

A dynamic choice displays gathered data as a list of choice values during flow design. For more information on building a dynamic choice, see Create a data gathering action for a dynamic choice.

**Dynamic template**

A dynamic template displays a gathered list of fields whose associated values can be specified during flow design. Because this list populates dynamically, you don’t have to change the flow if new fields are added to or removed from the table that is accessed in the data gathering action. For more information on building a dynamic template, see Create a data gathering action for a dynamic template.
Design considerations

Consider dynamic inputs for third-party integrations

Dynamic inputs let you create flows that fetch data dynamically from external sources. In third-party integrations, dynamic inputs can provide data values that pertain to a particular endpoint. For more information on setting up third-party integrations with Flow Designer, see IntegrationHub.

Be aware of the time required to retrieve large amounts of data

By default, dynamic inputs have up to 300 seconds to gather data before they time out. If your data gathering action needs more time to gather data, set the `sn_flow_designer.sync_action_execution_timeout_in_seconds` system property to a higher value. However, don't use long timeout values for interactive flows where an end user must enter or select a value.

Be aware of scripting errors

Because all data gathering actions use a script step, potential errors could occur from scripting. When using scripts to output JSON variables for your dynamic inputs, you may encounter errors which prevent inputs from receiving the JSON values they need. When a dynamic input scripting error occurs, the following warning message may appear.

Message displayed for scripting error

![Warning: A dynamic action error occurred.](image)

Get started with dynamic inputs

Create a sample action that builds a dynamic choice and dynamic template for use in a flow.

Before you begin

Role required: action_designer or admin

About this task

In this task, you create a custom action that dynamically generates a list of tables and associated fields in your instance. To accomplish this, you create two data gathering actions: one that collects a list of tables in your instance, and another that collects a list of fields for the selected table. Each data gathering action consists of the following:
• A REST step to gather table and field data from your instance
• A script step to construct the payload from the REST step’s Response Body
• An output variable named `output` of type JSON

You then use these data gathering actions to build a dynamic choice and a dynamic template. Finally, you will create a custom action that calls the data gathering action during flow design.

ℹ️ **Note:** This task recreates the demo actions that are installed when you request a ServiceNow IntegrationHub Enterprise Pack subscription for your instance.

**Procedure**
1. Navigate to **Process Automation > Flow Designer**.
2. Click **New** and select **New Action**.
   a. On the Action Properties screen, in the **Name** field, enter `Get ServiceNow Tables (Dynamic)`.
   b. Click **Submit**.
3. In the Action Outline, click the Add a new step icon (∇) under **Inputs** and select the **REST** step. Enter the following information.
4. Under the REST step header, fill in the following fields.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave <strong>Use Connection Alias</strong> selected.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Click the Create new record icon (+) to create a new HTTP(s) connection, or use an existing connection for your instance. The <strong>Credential</strong> for the HTTP(s) connection must use basic auth. Additionally, the <strong>Connection URL</strong> must be the base URL for your instance, including the forward slash at the end. For more information on connections and credentials, see Getting started with</td>
</tr>
</tbody>
</table>

Input | Value
--- | ---
connections and Getting started with credentials.
Build Request | Leave the Manually option selected
Resource Path | Enter api/now/doc/table/schema
HTTP Method | Enter GET

5. In the Action Outline, click the Add a new step icon (➕) under your REST step and select the **Script** step.

a. In the Input Variables section, click **Create Variable**.

b. In the **Name** field, enter **payload**.

c. Next to the **Value** field, click the data pill picker (🔍) and select **REST Step > Response Body**.

d. In the **Script** field, enter the following code.

```javascript
(function execute(inputs, outputs) {
    var payload = JSON.parse(inputs.payload);
    var tables = payload.result
        .filter(function(table) { return table.value.indexOf('_') < 0; }) // Filter the tables we want
        .map(function(table) {
            return { label: table.label, name: table.value };
        });
    outputs.tables = { data: tables }; // Final, properly formatted output
})(inputs, outputs);
```

e. In the Output Variables section, click **Create Variable**.

f. In the **Label** and **Name** fields, enter **tables**.

g. In the **Type** field, select **JSON**.

6. In the Action Outline, click **Outputs**.

a. Click **Create Output**.

b. In the **Label** and **Name** fields, enter **output**.
c. In the **Type** field, select **JSON**.

d. Click **Exit Edit Mode**.

e. Next to the **Value**, click the data pill picker (🔍) and select **Script Step > tables**.

7. In the Action header, click **Save** and then click **Test** to test the action.

a. Click **Run Test**.

b. Check the action's execution details. Your data gathering action runs successfully if the runtime value for `tables` is a complex object containing an array of key-value pairs for `label` and `name` as shown in the following abbreviated example.

```
{
    "data": [  
        {
            "name": "sla",
            "label": "Agreement"
        },
        {
            "name": "announcement",
            "label": "Announcement"
        },
        {
            "name": "cmdb",
            "label": "Base Configuration Item"
        },
        {
            "name": "checklist",
            "label": "Checklist"
        }, ...
    ]
}
```

8. In the Action header, click **Publish** to make the **Get ServiceNow Tables (Dynamic)** action available to other flows and actions within the Global scope.

**Create the Get ServiceNow Fields (Dynamic) action**

Create a sample action that generates a list of fields for a dynamically selected table.

**Before you begin**

Role required: action_designer or admin
Procedure

1. In the main header, click the Create flow, subflow, or action icon (+) and select Action.
   a. On the Action Properties screen, in the Name field, enter Get ServiceNow Fields (Dynamic).
   b. Click Submit.

2. In the Action Outline, select Inputs.
   a. In the Action Input header, click Create Input.
   b. In the Label and Name fields, enter Table.
   c. In the Type field, select String.
   d. To make the input required, toggle the Mandatory slider so that it is active.

3. In the Action Outline, click the Add a new step icon (+) under Inputs and select the REST step. Enter the following information.

4. Under the REST step header, fill in the following fields.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave Use Connection Alias selected.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Click the Create new record icon (+) to create a new HTTP(s) connection, or use an existing connection for your instance. The Credential for the HTTP(s) connection must use basic auth. Additionally, the Connection URL must be the base URL for your instance, including the forward slash at the end.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave Manually selected.</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter api/now/table/ and then click the data pill picker ( ), Select Inputs &gt; Table.</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter GET</td>
</tr>
</tbody>
</table>
5. In the Action Outline, under the REST step, click the Add a new step icon (.addButton) and select the **Script** step.

a. In the Input Variables section, click **Create Variable**.

b. In the **Name** field, enter `payload`.

c. Next to the **Value**, click the data pill picker (pill) and select **REST Step > Response Body**.

d. In the **Script** field, enter the following code.

   ```javascript
   (function execute(inputs, outputs) {
     var payload = JSON.parse(inputs.payload);
     var fields = Object.keys(payload.result[0]).map(function(property) {
       return {
         label: property.charAt(0).toUpperCase() + property.slice(1).replace(/_/g, ' ')
           ,
         name: property,
         value: '' // value is always empty
           ,
       };
     });
     outputs.fields = { data: fields }; // final properly formatted output
   })(inputs, outputs);
   
   e. In the Output Variables section, click **Create Variable**.

f. In the **Label** and **Name** fields, enter `fields`.

g. In the **Type** field, select **JSON**.

6. In the Action Outline, click **Outputs**.

a. On the Action Output header, click **Create Output**.

b. In the **Label** and **Name** fields, enter `output`.

c. In the **Type** field, select **JSON**.

d. Click **Exit Edit Mode**.

e. Next to the **Value** field, click the data pill picker (pill) and then select **Script Step > fields**.
7. In the Action header, click **Save** and then click **Test** to test the action.

   a. On the Test Action screen, in the **Table** field, enter **incident**.

   b. Click **Run Test**.

   c. Check the action’s execution details.

       Your data gathering action runs successfully if the runtime value for **fields** is a complex object containing an array of key-value pairs for **label**, **name**, and **value** as shown in the following abbreviated example.

       ```json
       {
         "data": [
           {
             "name": "Parent",
             "label": "parent",
             "value": ""
           },
           {
             "name": "Made sla",
             "label": "made_sla",
             "value": ""
           },
           {
             "name": "Caused by",
             "label": "caused_by",
             "value": ""
           },
           {
             "name": "Watch list",
             "label": "watch_list",
             "value": ""
           }, ...
       ]
       ```

8. In the Action header, click **Publish** to make the Get ServiceNow Fields (Dynamic) action available to other actions within the Global scope.

Create the Create ServiceNow Record (Dynamic) action

Create a sample action to generate a record in a dynamically chosen table.

**Before you begin**

Role required: action_designer or admin
Procedure

1. Click the Create flow, subflow, or action icon (+) and then select Action.
   a. On the Action Properties screen, in the Name field, enter Create ServiceNow Record (Dynamic).
   b. Click Submit.
2. In the Action Outline, click Inputs.
   a. Click Create Input.
   b. In the Label and Name fields, enter Table.
   c. In the Type field, select Dynamic Choice.
   d. To make the input required, toggle the Mandatory slider so that it is active.
   e. Click the Toggle advanced inputs icon ( ) to display the advanced options for the Table input.
   f. Under Dynamic Options, in the Action field, select Get ServiceNow Tables (Dynamic).
   g. Click Create Input to create another action input.
   h. In the Label and Name fields, enter Fields.
   i. In the Type field, select Dynamic Template.
   j. To make the input required, toggle the Mandatory slider so that it is active.
   k. Click the Toggle advanced inputs icon ( ) to display the advanced options for the Table input.
   l. Under Dynamic Options, in the Action field, select Get ServiceNow Fields (Dynamic).
   m. Toggle the Depends-On Another Input slider to make it active.
   n. In the Table field, select Table.
3. In the Action Outline, under Inputs, click the Add a new step icon (+) and then select the Script step.
   a. In the Input Variables section, click Create Variable.
   b. In the Name field, enter table.
   c. Next to the Value field, click the data pill picker ( ) and select Inputs > Table.
d. Click **Create Variable** to create another input variable.

e. In the **Name** field, enter *fields*.

f. In the **Type** field, select **String**.

g. Next to the **Value** field, click the data pill picker (🔍) and select **Inputs > Fields**.

h. In the **Script** field, enter the following code.

```
(function execute(inputs, outputs) {
  var now_GR = new GlideRecord(inputs.table);
  gr.applyEncodedQuery(inputs.fields);
  gr.insert();
})(inputs, outputs);
```

4. In the Action header, click **Save** and then click **Test** to test the action.

a. On the Test Action screen, in the **Table** input, select any dynamically-generated choice value.

b. Click **Add Field Value** and then select any field and enter any value.

c. Click **Run Test**.

d. Check the action’s execution details. Your action runs successfully if the runtime values for **Table** and **Field** match the values you entered for the test.

5. In the Action header, click **Publish** to make the *Create ServiceNow Record (Dynamic)* action available to flows within the Global scope.

**Results**

You can now add the *Create ServiceNow Record (Dynamic)* action to a flow in Flow Designer. This sample action dynamically generates a list of tables and
Create a data gathering action for a dynamic choice

Create an action to collect input values to pass to a parent action as a dynamic choice.

**Before you begin**
Role required: action_designer or admin

**Procedure**

2. Click New > New Action.
3. In the Name field, enter a name for your action, choose the proper Application scope, and then click Submit.
4. In the Action Outline, click the add a new step icon (+) under Inputs and select the REST step.
   Configure your REST step to get data from the proper Base URL and Resource Path with any applicable Query Parameters for the HTTP Method GET. For more information on using the REST step in IntegrationHub, see REST step and REST in IntegrationHub.
5. In the Action Outline, click the add a new step icon (+) under your REST step and select the Script step.
   This script step must transform the REST step's Response Body into a format that can be used as a dynamic choice for a parent action. Format the JSON output variable so that it contains a property named data with a structure similar to the following example.
6. In the Action Outline, click **Outputs** and create an output named `output` of type JSON.

7. Use the data pill picker (🔍) to assign the data pill for the JSON output variable from your script step to the action output's **Value**.

   ⚠ **Note:** The action can have multiple outputs, but there can only be one of type JSON.

8. Click **Save** and **test the action**.
   In the execution details, your data gathering action runs successfully if the runtime value for `output` contains the `data` property in the proper format.

9. Click **Publish** to make the action available to other flows and actions within the same application scope.
Results
You can now use your data gathering action to populate the options that appear for a dynamic choice input in a parent action.

Create a data gathering action for a dynamic template
Create an action to collect input values to pass to a parent action as a dynamic template.

Before you begin
Role required: action_designer or admin

Procedure
2. Click New > New Action.
3. In the Name field, enter a name for your action, choose the proper Application scope, and then click Submit.
4. In the Action Outline, click the add a new step icon (➕) under Inputs and select the REST step. Configure your REST step to get data from the proper Base URL and Resource Path with any applicable Query Parameters for the HTTP Method GET. For more information on using the REST step in IntegrationHub, see REST step and REST in IntegrationHub.
5. In the Action Outline, click the add a new step icon (➕) under your REST step and select the Script step. This script step must transform the REST step's Response Body into a format that can be used as a dynamic choice for a parent action. Format the JSON
output variable so that it contains a property named `data` with a structure similar to the following example:

```json
{
  data: [
    {
      label: "Template Option 1",
      name: "template_option_1",
      value: ""
    },
    {
      label: "Template Option 2",
      name: "template_option_2"
    },
    {
      label: "Template Option 3",
      name: "template_option_3",
      value: ""
    }
  ]
}
```

**Note:** The JSON output structure for a dynamic template can include the optional properties `type` and `choices`.

- **type:** Specify a valid field type to render the appropriate UI control for the dynamic template.
- **choices:** If specifying `choice` for the `type` property, you can then specify an array of choice options that will render in a list for the dynamic template.

6. In the Action Outline, click **Outputs** and create an output named `output` of type JSON.

7. Use the data pill picker (📅) to assign the data pill for the JSON output variable from your script step to the action output's **Value**.

**Note:** The action can have multiple outputs, but there can only be one of type JSON.
8. Click **Save** and test the action.
   In the execution details, your data gathering action runs successfully if the runtime value for **output** contains the **data** property in the proper format.

9. Click **Publish** to make the action available to other flows or actions within the same application scope.

**Results**

You can now use your data gathering action to populate the options that appear for a dynamic template input in a parent action.

**Dynamic input configuration options**

Use these options to configure your dynamic inputs for a parent action.

**Dynamic input configuration**

**Dynamic input options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter a label that appears for the action input when the action is added to a flow.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the dynamic choice or template.</td>
</tr>
<tr>
<td>Max length</td>
<td>Enter the maximum character length for one choice or template field value.</td>
</tr>
<tr>
<td>Hint</td>
<td>Enter a hint to display for the dynamic input.</td>
</tr>
<tr>
<td>Choice</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• Dropdown with --None--</td>
</tr>
<tr>
<td></td>
<td>• Dropdown without --None--</td>
</tr>
</tbody>
</table>
Dynamic input options (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Enter a string value to use as a default for the dynamic input.</td>
</tr>
<tr>
<td>Action</td>
<td>Select a data gathering action that generates values as JSON output.</td>
</tr>
<tr>
<td>Depends-on Another Input</td>
<td>Enable this option to require an input value from the parent action to be passed as an input to the data gathering action. If enabled, select a dependent input from the parent action.</td>
</tr>
</tbody>
</table>

Dynamic outputs

Access action and subflow outputs as dynamically generated data pills during flow design. You can also build data gathering actions to generate complex objects from Now Platform and IntegrationHub outputs.

⚠️ Note: Dynamic outputs are not available in the base system. To use dynamic outputs in Flow Designer, you must request an IntegrationHub Enterprise Pack subscription.

During the flow design, a dynamic output retrieves the complex object’s schema values and displays them as data pills in the data panel.

A dynamic output must point to a data gathering action that collects the displayed data. For example, a data gathering action can retrieve values from a third-party system as part of an IntegrationHub spoke. To use a dynamic output in Flow Designer:

1. An action designer creates a data gathering action.
2. An action designer creates a parent action with a dynamic output that points to the child data gathering action.
3. A flow designer adds the parent action to a flow.

Data gathering actions

A data gathering action collects data, typically from a third-party system via a REST call, and dynamically builds its output based on the returned payload. A data gathering action must:

- Have a script step that contains an output variable of type JSON.
- Have an action output named output of type JSON whose value is derived from the script step’s JSON output variable.
Note: The action can have multiple outputs but can only have one of type JSON.

- Format the payload in the script step so that `output` has a property named `data`.
- Wait for up to 300 seconds (5 minutes) to gather data before it times out.

Note: To change the timeout period for a data gathering action, modify the value of the `sn_flow_designer.sync_action_execution_timeout_in_seconds` system property.

Dynamic object

A dynamic object is either a complex object or an array of complex objects. Action designers build the object structure dynamically with a data gathering action rather than hard-coding it. For more information on building a dynamic object, see Create a data gathering action for a dynamic object.

Design considerations

Consider dynamic outputs for third-party integrations

Use dynamic outputs to introspect and fetch data from external systems during the flow design. For example, you can specify service endpoints or call actions that interact with specific endpoint APIs. For more information on setting up third-party integrations with Flow Designer, see IntegrationHub.

Be aware of the time that is required to retrieve large amounts of data

By default, dynamic outputs have up to 300 seconds to gather data before the system stops them. If your data gathering action needs more time to gather data, set the `sn_flow_designer.sync_action_execution_timeout_in_seconds` system property to a greater value. Avoid long timeout values for interactive flows where an end user is expecting to enter or select a value.

Be aware of scripting errors

Because all data gathering actions use a script step, be aware of any potential errors that could arise from scripting. Review any scripts that are used to output JSON variables because script errors may prevent the outputs from receiving the JSON values that they need. When a dynamic output scripting error occurs, the following warning message may appear.
Get started with dynamic outputs
Create a sample action that builds dynamic objects for use in a flow.

Before you begin
Role required: action_designer or admin

About this task
In this task, you create two data gathering actions: one that collects the schema for a record on your instance, and another that collects the schema for multiple records in the same table on your instance. The goal is to create both a complex object and a complex object array to use as dynamic outputs. Each data gathering action will consist of the following:

- A REST step to gather table schema data from your instance.
- A script step to construct the payload from the REST step's Response Body.
- An output variable named `output` of type JSON.

You use these data gathering actions to build two dynamic objects. Then, you create a custom action that calls the data gathering actions during the flow design.

ℹ️ Note: This task re-creates the demo actions that are installed when you request an IntegrationHub Enterprise Pack subscription for your instance.

Procedure
2. Click New and select New Action.
   a. On the Action Properties screen, in the Name field, enter `Get ServiceNow Object Schema (Dynamic)`.
   b. Click Submit.
3. In the Action Outline, click Inputs.
   a. In the Action Input header, click Create Input.
   b. In the Label and Name fields, enter Table.
c. In the **Type** field, select **String**.

d. To make this input required, toggle the **Mandatory** slider so that it is active.

4. In the Action Outline, click the add a new step icon (➕) under Inputs and select **REST Step**.

5. Under the REST step header, fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave the <strong>Use Connection Alias</strong> option selected.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Click the create new record icon (➕) to create a new <strong>HTTP(s)</strong> connection, or use an existing connection for your instance. The <strong>Credential</strong> for the <strong>HTTP(s)</strong> connection must use <strong>basic auth</strong>. Additionally, the <strong>Connection URL</strong> must be the base URL for your instance, including the forward slash at the end. For more information on connections and credentials, see Getting started with connections and Getting started with credentials.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave the <strong>Manually</strong> option selected.</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter <code>api/now/processflow/table/</code> and then click the data pill picker (🔍). Select <strong>Inputs &gt; Table</strong>. Next, enter <code>/schema</code>.</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter <strong>GET</strong></td>
</tr>
<tr>
<td>Query Parameters</td>
<td>Click the plus icon (➕) to add a new query parameter. Then, in the <strong>Name</strong> field, enter <code>get_choices</code> and <code>true</code> in the <strong>Value</strong> field.</td>
</tr>
</tbody>
</table>

6. In the Action Outline, click the add a new step icon (➕) under your REST step and select the **Script** step.
a. In the Input Variables section, click Create Variable.

b. In the Name field, enter `payload`.

c. Next to the Value field, click the data pill picker (🔍) and select REST Step > Response Body.

d. In the Script field, enter the following code.

```javascript
(function execute(inputs, outputs) {
  var payload = JSON.parse(inputs.payload);

  var columns = payload.result.data.columns;
  var schema = columns.map(function(column) {
    var value = {
      label: column.label,
      name: column.name,
      type: getCOType(column.definition.base_type),
    };
    if (column.definition.type === 'choice') {
      value.type = 'choice';
      value.choices = column.definition.choices;
    }
    if (column.definition.base_type === 'GUID') {
      value.children = [
        { label: 'Link', name: 'link', type: 'string' },
        { label: 'Value', name: 'value', type: 'string' },
      ];
    }
    return value;
  });
  outputs.schema = {
    data: {
      type: 'object',
      children: schema,
    },
  };

  function getCOType(type) {
    if (type === 'GUID') return 'reference';
    return type;
}
```
e. In the Output Variables section, click **Create Variable**.

f. In the **Label** and **Name** fields, enter `schema`.

g. In the **Type** field, select **JSON**.

7. In the Action Outline, click **Outputs**.

   a. In the Action Output header, click **Create Output**.
   
   b. In the **Label** and **Name** fields, enter `output`.
   
   c. In the **Type** field, select **JSON**.
   
   d. In the Action Output header, click **Exit Edit Mode**.

   e. Next to the **Value** field, click the data pill picker (.Optional) and select **Script Step > schema**.

8. In the Action header, click **Save** and then click **Test** to test the action.

   a. On the Test Action screen, enter `incident` for the **Table** input.

   b. Click **Run Test**.

   c. Check the action’s execution details.

Your data gathering action runs successfully if the runtime value for `fields` is a complex object in a format that is similar to the following abbreviated example.

```json
{
    "data": {
        "type": "object",
        "children": [
            {
                "name": "active",
                "label": "Active",
                "type": "boolean"
            },
            {
                "name": "activity_due",
                "label": "Activity due",
```
9. In the Action header, click **Publish** to make the **Get ServiceNow Object Schema (Dynamic)** action available to other flows and actions within the Global scope.

**Create the Get ServiceNow Array.Object Schema (Dynamic) action**

Create a sample data gathering action to generate an array of objects.

**Before you begin**

Role required: action_designer or admin

**Procedure**

1. In the main header, click the create flow, subflow, or action icon (➕) and select **Action**.
   
   a. On the Action Properties screen, in the **Name** field, enter **Get ServiceNow Array.Object Schema (Dynamic)**.
   
   b. Click **Submit**.

2. In the Action Outline, click **Inputs**.
   
   a. In the Action Input header, click **Create Input**.
   
   b. In the **Label** and **Name** fields, enter **Table**.
   
   c. In the **Type** field, select **String**.
   
   d. To make the input required, toggle the **Mandatory** slider so that it is active.

3. In the Action Outline, click the add a new step icon (➕) under Inputs and select the **REST** step.

4. Under the REST step header, fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave <strong>Use Connection Alias</strong> selected.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Click the create new record icon (➕) to create a new <strong>HTTP(s)</strong> connection, or use an existing connection for your instance. The <strong>Credential</strong> for the <strong>HTTP(s)</strong> connection must use <strong>basic auth</strong>. Additionally, the</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection URL</td>
<td><strong>Connection URL</strong> must be the base URL for your instance, including the forward slash at the end.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave <strong>Manually</strong> selected.</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter <code>api/now/processflow/table/</code> and then click the data pill picker (🔍). Select <strong>Inputs &gt; Table</strong>. Finally, enter <code>/schema</code></td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter <strong>GET</strong></td>
</tr>
<tr>
<td>Query Parameters</td>
<td>Click the plus icon (+) to add a new query parameter. Then, in the <strong>Name</strong> field, enter <code>get_choices</code> and <code>true</code> in the <strong>Value</strong> field.</td>
</tr>
</tbody>
</table>

5. In the Action Outline, click the **Add a new step** (➕) icon under your REST step and select the **Script** step.

a. In the Input Variables section, click **Create Variable**.

b. In the **Name** field, enter `payload`.

c. Next to the **Value** field, click the data pill picker (🔍) and select **REST Step > Response Body**.

d. In the **Script** field, enter the following code.

```javascript
(function execute(inputs, outputs) {
    var payload = JSON.parse(inputs.payload);

    var columns = payload.result.data.columns;
    var schema = columns.map(function(column) {
        var value = {
            label: column.label,
            name: column.name,
            type: getCOType(column.definition.base_type),
        };
        if (column.definition.type === 'choice') {
            value.type = 'choice';
        }
    });
}
```
value.choices = column.definition.choices;
}
return value;
});
outputs.schema = {
data: {
type: 'array.object',
attributes: {
child_type: 'object',
},
children: schema,
},
};

function getCOType(type) {
if (type === 'GUID') return 'string';
return type;
}
})(inputs, outputs);

e. In the Output Variables section, click Create Variable.

f. In the Label and Name fields, enter schema.

g. In the Type field, select JSON.

6. In the Action Outline, click Outputs.

a. On the Action Output header, click Create Output.

b. Enter output in the Label field and Name field.

c. Select JSON for the Type field.

d. Click Exit Edit Mode.

e. Next to the Value field, click the data pill picker (-script-step) and select Script Step > schema.

7. In the Action header, click Save and then click Test to test the action.

a. On the Test Action screen, in the Table field, enter incident.

b. Click Run Test.

c. Check the action's execution details.
Your data gathering action runs successfully if the runtime value for fields output is a complex object that contains an array of key-value pairs for label, name, and value as shown in the following abbreviated example.

```json
{
  "data": {
    "type": "array.object",
    "children": [
      {
        "name": "active",
        "label": "Active",
        "type": "boolean"
      },
      {
        "name": "activity_due",
        "label": "Activity due",
        "type": "datetime"
      }, ...
    ]
  }
}
```

8. In the Action header, click Publish to make the Get ServiceNow Array.Object Schema (Dynamic) action available to other actions within the Global scope.

Create the Get ServiceNow Records (dynamic) action

Create a sample action to dynamically generate two action outputs, Record and Records which refresh dynamically when the value for the Table input changes.

Before you begin
Role required: action_designer or admin

Procedure

1. In the main header, click the create flow, subflow, or action icon (➕) and select Action.
   a. In the Action Properties modal, in the Name field, enter Get ServiceNow Records (Dynamic).
   b. Click Submit.

2. In the Action Outline, click Inputs.
   a. In the Action Input header, click Create Input.
   b. In the Label and Name fields, enter Table.
   c. In the Type field, select Dynamic Choice.
   d. To make the input required, toggle the Mandatory slider so that it is active.
e. Click the Toggle advanced inputs icon (✓) to display the advanced options for the Table input.

f. In the Default value field, enter incident.

g. Under Dynamic Options, in the Action field, select Get ServiceNow Tables - Dynamic.

h. Click Create Input to create another action input.

i. In the Label and Name fields, enter NumberOfRecords.

j. In the Type field, select Integer.

k. To make the input required, toggle the Mandatory slider so that it is active.

l. Click the Toggle advanced inputs icon (✓) to display the advanced options for the Table input.

m. In the Default value field, enter 3.

3. In the Action Outline, click the add a new step icon (➕) under Inputs and select the REST step.

4. Under the REST step header, fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave Use Connection Alias selected.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Click the create new record icon (➕) to create a new HTTP(s) connection, or use an existing connection for your instance. The Credential for the HTTP(s) connection must use basic auth. Additionally, the Connection URL must be the base URL for your instance, including the forward slash at the end.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave Manually selected</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter api/now/table/ and then click the data pill picker ( ExecutionContext). Select Inputs &gt; Table.</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter GET</td>
</tr>
</tbody>
</table>
5. In the Action Outline, click the add a new step icon (➕) under Inputs and select the **Script** step.

a. In the Input Variables section, click **Create Variable**.

b. In the **Name** field, enter `payload`.

c. Next to the **Value** field, click the data pill picker (🔍) and select **REST Step > Response Body**.

d. In the **Script** field, enter the following code.

   ```javascript
   (function execute(inputs, outputs) {
   var response = JSON.parse(inputs.payload);
   var records = response.result;
   outputs.record = records[0];
   outputs.records = JSON.stringify(records);
   })(inputs, outputs);
   ```

e. In the Output Variables section, click **Create Variable**.

f. In the **Label** and **Name** fields, enter `record`.

g. Select **JSON** for the **Type** field.

h. Toggle the **Mandatory** slider so that it is active.

i. Click **Create Variable** to create another output variable for the script step.

j. In the **Label** and **Name** fields, enter `records`.
In the **Type** field, select **JSON**.

To make the input required, toggle the **Mandatory** slider so that it is active.

6. In the Action Outline, click **Outputs**.
   
a. In the Action Output header, click **Create Output**.
   
b. In the **Label** and **Name** fields, enter **Records**.
   
c. In the **Type** field, select **Dynamic Object**.
   
d. Click the Toggle advanced inputs icon ( ▼ ) to display the advanced options for the **Records** output.
   
e. Under Dynamic Options, select **Get ServiceNow Array.Object Schema (Dynamic)** as the **Action**.
   
f. To make the Table input dependent on another input, toggle the **Depends-On Another Input** slider to make it active.
   
g. In the **Table** field, select **Table**.
   
h. In the Action Output header, click **Exit Edit Mode**.
   
i. Next to the **Value** field, click the data pill picker ( △ ) and select **Script Step > records**.
   
j. In the Action Output header, click **Edit Outputs > Create Output** to create another action output.
   
k. In the **Label** and **Name** fields, enter **Record**.
   
l. In the **Type** field, select **Dynamic Object**.
   
m. Click the Toggle advanced inputs icon ( ▼ ) to display the advanced options for the **Record** output.
   
n. Under Dynamic Options, in the **Action** field, select **Get ServiceNow Object Schema (Dynamic)**.
   
o. To make the Table input dependent on another input, toggle the **Depends-On Another Input** slider to make it active.
   
p. In the **Table** field, select **Table**.
   
q. In the Action Output header, click **Exit Edit Mode**.
   
r. For the **Value**, click the data pill picker ( △ ) and select **Script Step > record**.
   
7. In the Action header, click **Save** and then click **Test** to test the action.
a. On the Test Action screen, select any dynamically generated choice value for the Table input.

b. Click Run Test.

c. Check the action's execution details. Your action runs successfully if the runtime value for Record is a properly formatted complex object and the runtime value for Records is a properly formatted complex object array.

8. In the Action header, click Publish to make the Get ServiceNow Records (Dynamic) action available to flows within the Global scope.

Results
You can now add the Get ServiceNow Records (Dynamic) action to a flow in Flow Designer. This sample action dynamically generates two action outputs, Record and Records, which can be accessed as data pills in the data panel. The data pills refresh dynamically when the value for the Table input changes.

Create a data gathering action for a dynamic object
Create an action to collect output values. Then, pass the values to a parent action as a dynamic object.

Before you begin
Role required: action_designer or admin

Procedure
3. In the Name field, enter a name for your action, choose the proper Application scope, and then click Submit.

4. In the Action Outline, click the add a new step icon (➕) under Inputs and select the REST step. Configure your REST step to get data from the proper Base URL and Resource Path with any applicable Query Parameters for the HTTP Method GET. For more information on using the REST step in IntegrationHub, see REST step and REST in IntegrationHub.

5. In the Action Outline, click the add a new step icon (➕) under your REST step and select the Script step. This script step must transform the response from the REST step's Response Body into a format that defines the schema of a dynamic object output for a parent action. Your script step must:

- Have a single JSON output variable. The script step can have other output variables, but only one must be of type JSON.
- Format the JSON output variable so that it contains a property named data. For a complex object output, your data property must have a format similar to the following example:

```json
{
    data: {
        type: "object",
        //Required
        children: [
            //Required - This is a collection of field definitions
            {
                name: "Name 1",
                //Required - Unique name
                label: "Label 1",
                //Required - Display name
                type: "string"
                //Required - Supported field type (See the Note below)
            },
            {
                name: "Name 2",
                label: "Label 2",
            }
        ]
    }
}
```
For a complex object array output, your `data` property must have a format similar to the following example:

```json
{
  data: {
    type: "object",
    //Required

    attributes: { child_type: "object" }  
    //Required - Indicates that the array's children are of type object

    children: [  
      //Required - This is a collection of field definitions

      {
        name: "Name 1",
        //Required - Unique name

        label: "Label 1",
        //Required - Display name

        type: "string"
        //Required - Supported field type (See the Note below)
      },

      {
        name: "Name 2",
        label: "Label 2",
        type: "string"
      }
    ]
  }
}
```
6. In the Action Outline, click **Outputs**. Create an output named `output` of type JSON. Then, use the data pill picker (تظ) to assign the data pill for the JSON output variable from your script step to the action output's **Value** field.

   **Note:** The action can have multiple outputs, but there can only be one of type JSON.

7. Click **Save** and **test the action**. In the execution details, your data gathering action runs successfully if the runtime value for `output` contains the `data` property in the proper format.
8. Click **Publish** to make the action available to other flows or actions within the same application scope. You can now use your data gathering action to populate the schema values for a dynamic object in a parent action.

### Dynamic output configuration options

Use these options to configure your dynamic outputs for a parent action.

#### Dynamic output configuration

##### Dynamic output options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Label</strong></td>
<td>Enter a label that appears within the output data pill for the action.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Enter a descriptive name for the dynamic object.</td>
</tr>
<tr>
<td><strong>Action</strong></td>
<td>Select a data gathering action that generates values as JSON output.</td>
</tr>
<tr>
<td><strong>Depends-On Another Input</strong></td>
<td>Enable this option to require an input value from the parent action to be passed as an input to the data gathering action. If enabled, select a dependent input from the parent action.</td>
</tr>
</tbody>
</table>

##### Action error evaluation

Enable actions to catch step failures and continue running. Identify when specific error conditions occur and return your own action status code, status message, and error state.

#### Benefits

Enable action error evaluation to gain these benefits.
• Catch step failures and allow an action to continue running. Specify the failure behavior of each step you add to an action.

• Create your own error conditions. Specify when an action returns an error state as well as the status codes and messages they return.

• Provide more error handling information and options to flow designers. Use your own action status codes and messages to identify issues and provide details for corrective actions.

**Action error evaluation step components**

Each step offers these error evaluation components.

1. **If this step fails option**

   Option to continue running the next step or go to error evaluation. This option has no effect on the Step Status.

2. **Step Status**

   Object data pill containing runtime details about the step. Each step in an action returns a Step Status.

3. **Step Status > Code**

   Integer data pill indicating whether the step produced an error. By default, a value of 1 indicates that the step produced an error. A value of 0 indicates that the step ran successfully. You cannot customize these codes.

4. **Step Status > Message**
String data pill containing the error message produced by the step or system operation. You cannot customize this message.

Action error evaluation configuration components

Action error evaluation consists of these configuration components.

Error evaluation configuration components

5. Error Evaluation section

Section containing possible error conditions. When an action runs, it evaluates the available error conditions from top to bottom looking for a possible match. An action returns the Action Status specified by the first matching error condition. If there is no matching error condition, the Action status is set to the Step Status of the last step run.

6. Add error condition option

Option to add an error condition. Each error condition is equivalent to an else if flow logic block. Only one error condition can be true at a time.

7. Error condition configuration

Options available to configure an error condition.

- Label you want to use to identify this error condition
- Conditions that must be met to match this error condition
- Error state you want the action to return to flow
• Action Status Code you want the action to return to flow
• Action Status Message you want the action to return to flow

8. Action Status
   Object data pill containing runtime details about the action. An action always returns an Action Status.

9. Action Status > Code
   Integer data pill containing the code returned by the first matching error condition or the last step run. You can return your own code when you create a custom error condition.

10. Action Status > Message
    String data pill containing the message produced by a matching error condition or the last step run. You can return your own message when you create a custom error condition.

Design considerations
Follow these guidelines to achieve the benefits offered by action error evaluation.

Allow only independent steps to continue running
   Allow a step to continue running if it does not return data required by a later step. If a step provides data necessary for later steps, then you know that the later steps cannot run successfully.

Avoid more than 10 error conditions
   While there is no limit to the number of error conditions you can create, each error condition requires evaluation. The more error conditions your action has to evaluate, the potentially slower your action can run.

Identify specific step failures
   You can use the Step Status to identify when a specific step fails. Identifying a specific step can be useful when your action contains multiple instances of the same type of step. You may also want to identify a specific step so that a flow error handler can take specific corrective actions for the failure.

Put specific error conditions before general error conditions
   Error evaluation stops as soon as the action finds a matching error condition. Putting general error conditions first may prevent the action from ever matching specific error conditions.
Use descriptive error condition labels

By default, you can only see error condition conditions when you edit them. A descriptive label allows you to identify an error condition without having to edit it.

Add error condition

Enable an action to return custom status information when specific conditions are met. Specify whether a flow considers your custom action status as an error or a successful run.

Before you begin

- Role required: flow_designer, action_designer, or admin
- Create an action

About this task

An action always returns an Action Status object. When an action runs, it evaluates the available error conditions from top to bottom looking for a possible match. An action returns the Action Status specified by the first matching error condition. If there is no matching error condition, the Action status is set to the Step Status of the last step run.

Procedure

2. Select the Actions tab and select the custom action you want to edit.
3. From the Action Outline, select Error Evaluation.
4. Select Add error condition for each error condition you want to define. Action Designer adds an If block for configuration.
5. Configure each error condition.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If</td>
<td>Description of your error condition. You can use this label to identify the error condition when the condition builder is not visible. Each error condition is equivalent to an else if flow logic block. Only one error condition can be true at a time.</td>
</tr>
<tr>
<td>Condition N</td>
<td>Condition builder to specify the matching criteria for the error condition. You can add conditions or condition sets to define the matching criteria.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Don’t treat as error</td>
<td>Option to report the Action Status as an error or a success when returned to a flow.</td>
</tr>
<tr>
<td>Action Status Code</td>
<td>Integer value you want the action to return as part of the Action Status object. You can use this integer value as part of a Flow error handler.</td>
</tr>
<tr>
<td>Action Status Message</td>
<td>String value you want the action to return as part of the Action Status object. You can use this string value as part of a Flow error handler.</td>
</tr>
</tbody>
</table>

6. Order error conditions from top to bottom in the order you want the action to evaluate them.

7. Select Save.

### Results

Your custom action evaluates each error condition for matching conditions. The action returns the Action Status Code and Action Status Message for the first matching error condition. If there is no matching error condition, the Action status is set to the Step Status of the last step run.

### Retry policy

Automatically retry failed requests when a step encounters an intermittent issue such as a network failure or request rate limit. Set a retry policy to prevent having to manually trigger the step again.

### Features

Retry policies can be:

- Created to support connection timeouts or failed requests based on header, status, response body, error, and HTTP method.
- Applied to all actions that use a given connection alias.
- Applied directly to an action step.

Use retry policies to define:
• The conditions that must be met to retry a step.
• The time interval to wait before retrying a step.
• The maximum number of retry attempts the step makes before stopping.

Associate a default retry policy to a Connection & Credentials alias and apply the retry policy to all HTTP connections.

⚠️ Note: You can only create retry policies for REST and SOAP steps.

Create a retry policy

Automatically retry failed requests when a step encounters an intermittent issue such as a network failure or request rate limit. Set a retry policy to prevent having to manually trigger the step again.

Before you begin
Role required: flow_designer or admin

Procedure
1. Navigate to IntegrationHub > Retry Policy > Create New.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the retry policy.</td>
</tr>
<tr>
<td>Connection Type</td>
<td>HTTP</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions that must be met to trigger the retry policy.</td>
</tr>
<tr>
<td></td>
<td>Conditions that trigger a retry policy include the is, is not, contains, and contains not operators.</td>
</tr>
<tr>
<td>Retry Strategy</td>
<td>• Exponential Backoff: Option to exponentially increase the time interval for the subsequent retry attempts. The multiplier is 2.</td>
</tr>
<tr>
<td></td>
<td>• Fixed Interval: Option to specify a fixed time interval after which a retry attempt should be made.</td>
</tr>
<tr>
<td>Interval (seconds)</td>
<td>Time interval in seconds after which a retry attempt should be made.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If <strong>Retry Strategy</strong> is <strong>Exponential Backoff</strong>, the time interval exponentially increases after every retry attempt till the maximum numbers of attempts is reached.</td>
</tr>
</tbody>
</table>

### Count
- Maximum number of retry attempts. If no value is specified, the maximum number of retry attempts is based on the value provided in the `glide.fdih.retry.max_count` system property. Default value of the `glide.fdih.retry.max_count` system property is 0. For more information about system properties, see Available system properties.

3. Click **Submit**.

**Example:Retry policy with Retry Strategy as Exponential Backoff**

**Sample retry policy**

<table>
<thead>
<tr>
<th>Name</th>
<th>HTTP Retry Policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Type</td>
<td>HTTP</td>
</tr>
<tr>
<td>Conditions</td>
<td>Add Filter Condition Add &quot;OR&quot; Clause</td>
</tr>
</tbody>
</table>

*All of these conditions must be met*

- **HTTP Method** is **GET**
- **Error** is **Connection Timeout**

*OR all of these conditions must be met*

- **HTTP Method** is **GET**
- **Status Code** is **429**

**Retry Strategy**

- **Retry Strategy**: **Exponential Backoff**
- **Interval (seconds)**: 10
- **Count**: 3

In this example, the policy is defined to attempt retry when one of these conditions is met:

- **HTTP Method** is **GET** and **Error** is **Connection Timeout**
- **HTTP Method** is **GET** and **Status Code** is **429**

When the condition is met, retry attempts are made for a maximum number of three times. The time interval between the retry attempts is exponentially increased. The time intervals in this example are 10 seconds, 20 seconds, and 40 seconds.
What to do next

- **Create Connection & Credential alias**, if you do not have the required alias.
- Assign the retry policy as **Default Retry Policy** to the required Connection & Credential alias.

  🔴 **Note:** A default retry policy is provided and is selected as **Default Retry Policy**. If you have created retry policies, you can select the required policy as **Default Retry Policy**.

- Create an HTTP(s) Connection in the Connections related list for the Connection & Credential alias. For more information, see credentials, connections, and aliases.
- Verify and view the details of the retry attempts by navigating to **System Logs > Outbound HTTP Requests**.

Ask for Approval step

Request approval for a record with an approval field. You can configure a rule set for an approval, rejection, or cancellation. If a due date is added to an approval, the approval is automatically approved, rejected, or canceled if the approvers have not responded by the designated time.

**Approvals** is a platform feature that enables users or groups to approve or reject a task.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select a record under the data panel and drag the record pill into the Record field. If selecting a table with an approval field already configured, the <strong>Approval field</strong> is set to the correct field.</td>
</tr>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record.</td>
</tr>
<tr>
<td>Approval field</td>
<td>Select a field from the designated table to use for approval status.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Journal field</td>
<td>Select a field from the designated table to use for journal entries.</td>
</tr>
<tr>
<td>Rules</td>
<td>Define the approval and rejection rules. Approval rules determine which users can approve or reject requests, and what happens after approval or rejection. Approval or rejection rules include:</td>
</tr>
<tr>
<td></td>
<td>• Anyone approves</td>
</tr>
<tr>
<td></td>
<td>• All users approve</td>
</tr>
<tr>
<td></td>
<td>• All responded and anyone approves</td>
</tr>
<tr>
<td></td>
<td>• % of users approve</td>
</tr>
<tr>
<td></td>
<td>• # of users approve</td>
</tr>
<tr>
<td></td>
<td>In the field beside the approval rule, add the desired approvers. To add approvers:</td>
</tr>
<tr>
<td></td>
<td>• Select individual users or groups.</td>
</tr>
<tr>
<td></td>
<td>• Drag or select a field from a record.</td>
</tr>
<tr>
<td></td>
<td>• Select to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see Generate approvals using the approvers related list.</td>
</tr>
<tr>
<td></td>
<td>Define rejection rules by adding another OR rule set. When defining approvals, include rejection rules that run when there are no matching approvals. Such rejection rules prevent the flow from remaining in a waiting state. For example, if an approval can be approved by anyone, create a time-based rejection rule in case no one approves it.</td>
</tr>
</tbody>
</table>

**Note:** If you set an approval rule with no rejection rule (or vice versa) and the expected approval state is not met, the runtime value will be canceled.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Due Date</td>
<td>Define a due date to prevent the flow from remaining endlessly waiting for approval.</td>
</tr>
<tr>
<td></td>
<td>• None: The approval is not dependent on a specific date.</td>
</tr>
<tr>
<td></td>
<td>• Approve: Automatically approve the step if an action is still pending by the specified date.</td>
</tr>
<tr>
<td></td>
<td>• Reject: Automatically reject the step if an action is still pending by the specified date.</td>
</tr>
<tr>
<td></td>
<td>• Cancel: Automatically cancel the step if an action is still pending by the specified date.</td>
</tr>
</tbody>
</table>

**Note:** Relative dates always treat days as 24 hours regardless of the days schedule you select. For example, if you create a due date that expires in 1 relative day, the due date will occur in 24 hours based on the schedule you select. For an 8-5 weekdays excluding holidays schedule, a 24-hour duration is the equivalent of 2 complete business days and 6 hours into the third business day. When working with schedules where the business day is less than 24 hours, consider using relative hours instead of days.

### Example

**1. Ask for Approval step**

#### Approval Request Definition

- **Record**: `incident`  
- **Table**: `incident`  

**Rules**

- **Approve**:  
  - **Anyone approves**:  
  - **When**: `action = incident = Assigned to = Manager`  

- **Reject**:  
  - **Anyone rejects**:  
  - **When**: `action = incident = Assigned to = Manager`  

**Due Date**

- **Approve**: If pending by `Relative date` 1 Days from `action = incident = Created`  
- **Days schedule**: 8-5 weekdays excluding holidays
Output

<table>
<thead>
<tr>

<td>State of the approval request</td>
<td>Choice</td>
</tr>
</tbody>
</table>

Create Record step
Create a record on any table. You can dynamically add and configure fields for the record.

Roles and availability
- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select <strong>Short description</strong> and set the desired value. To add dynamic values, see Allow flow designers to dynamically set field values.</td>
</tr>
</tbody>
</table>

Create or Update Record step
Create or update a record in a ServiceNow table by determining if it already exists. Add records that do not exist, and update existing ones. Identify existing records by selecting unique fields. Set field values dynamically and enforce server-side validation rules (data policy, business rules, dictionary-defined mandatory fields). UI policy does not apply.

Roles and availability
Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
Create Task step

Create a task on any ServiceNow task table. After you choose the task table, you can dynamically select the fields to configure the action. Defining the Parent field associates the task to a parent record.

Roles and availability

• Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>Table in which a record is created or updated.</td>
</tr>
<tr>
<td>Fields</td>
<td>Values of fields in the record to be created or updated.</td>
</tr>
<tr>
<td></td>
<td>If adding the action to a subflow, you can <strong>Allow flow designers to dynamically set field values</strong>. Dynamically set field values can trigger server-side validation rules but cannot trigger UI policies.</td>
</tr>
<tr>
<td>Determines uniqueness</td>
<td>Option for selecting the field as a unique identifier. This field appears when the required table name and fields are selected.</td>
</tr>
</tbody>
</table>

• Standard Change Proposal [std_change_proposal]  
• Ticket [ticket] |

Field Values: Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select **Short description** and set the desired value.
To add dynamic values, see Allow flow designers to dynamically set field values.

To associate the task with a parent record, define the **Parent** field.

**Wait**

Waits to complete the step until the task completes and is no longer active (active=false).

Alternatively, you can add a wait condition by dragging-and-dropping a true/false field from the data panel into the **Wait** field. The flow only waits for the task to complete when the condition field is true.

### Delete Multiple Records step

Look up and delete multiple existing records as a single action. Using this action removes the need to separately look up a list of records and then delete the list with **For Each** flow logic.

### Roles and availability

Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table containing the records to delete.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Define the filter condition used to look up records.</td>
</tr>
<tr>
<td>Order by</td>
<td>Select the field that you want to use to sort the records when more than one record matches the defined conditions.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Determine whether to sort the records alphabetically in ascending or descending order.</td>
</tr>
<tr>
<td>Run Business Rules and Workflow</td>
<td>Determine whether to call any business rules and workflows associated with the table.</td>
</tr>
<tr>
<td>Don't fail on error</td>
<td>Specify whether to continue running the flow when there is an error.</td>
</tr>
</tbody>
</table>
Example

1. Delete Multiple Records step

<table>
<thead>
<tr>
<th>Table</th>
<th>Catalog Item (sc_cat_item)</th>
</tr>
</thead>
</table>

**Conditions**

All of these conditions must be met

- **tags** have **discontinued**

*OR*

- **New Criteria**

**Order by** Name  
**Sort Type** a to z

**Run Business Rules and WorkFlow**

**Don’t Fail on Error**

**Data**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Count</strong></td>
<td>Number of records deleted. If no records are deleted, the count is 0.</td>
<td>Integer</td>
</tr>
<tr>
<td><strong>Error Message</strong></td>
<td>Message that is displayed if the step produces an error.</td>
<td>String</td>
</tr>
</tbody>
</table>
| **Status**  | The completion status of the step as a numeric value.  
  • 0 (success)  
  • 1 (error) | Choice    |

**Note:** The example is for illustration purposes only.

**Outputs**

**Delete Record step**

Deletes a record on any table.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be deleted. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
</tbody>
</table>

Get Connection Info step

Provide the connection and credential details from another step, such as a REST step, to other steps in your action.

**Note:**
- The Get Connection Info step is not available in the base system and requires the subscription to IntegrationHub Starter Pack Installer (com.glide.hub.integrations) or later. For more information about the ServiceNow® IntegrationHub subscription packages, see IntegrationHub usage and subscription. After the required plugin is activated, the step is visible under Integrations.

Roles and availability

After setting up your IntegrationHub Starter subscription, the Get Connection Info step is available as an Action Designer action step. Users with the action_designer role can create a custom action with the Get Connection Info step.

Inputs

Provide a value for each input that your step needs. To add dynamic values, you can also drag and drop pills from the Data panel or select them from the pill picker.

<table>
<thead>
<tr>
<th>Input</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Choice</td>
<td>Choose from:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Connection Alias - Associates to connection information required to connect to the remote system.</td>
</tr>
<tr>
<td>Input</td>
<td>Data type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>• Credential Alias</td>
<td></td>
<td>- Associates to credential data required to connect to the remote system. Depending on which option you choose, the following input requires that you choose the appropriate Connection Alias or Credential Alias.</td>
</tr>
</tbody>
</table>

**Outputs**

These outputs appear in the Data panel. You can use them as inputs elsewhere in your action.

<table>
<thead>
<tr>
<th>Output</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Runtime Alias ID</td>
<td>String</td>
<td>Sys ID of the Connection Alias or Credential Alias record used to connect to the remote system.</td>
</tr>
<tr>
<td>Connection ID</td>
<td>String</td>
<td>Sys ID of the Connection record used to connect to the remote system.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>String</td>
<td>URL used to connect to the remote system.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>String</td>
<td>Sys ID of the Credential record used to connect to the remote system.</td>
</tr>
<tr>
<td>Credential Value</td>
<td>Password (2 Way Encrypted)</td>
<td>2-way encrypted password used to authenticate when connecting to the remote system.</td>
</tr>
</tbody>
</table>
JDBC step

Create a reusable action to send SQL commands to a relational database.

Note:

- The JDBC step is not available in the base system and requires the subscription to IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later. For more information about the ServiceNow® IntegrationHub subscription packages, see IntegrationHub usage and subscription. After the required plugin is activated, the step is visible under Integrations.

- The JDBC step runs only on a ServiceNow® MID Server with JDBC step capabilities. Activate the plugin, IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later to use the JDBC capability for the MID Server.

Roles and availability

The JDBC step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Sanitizing inputs

Escape all user inputs to eliminate the possibility of a malicious user from executing malicious SQL statements that can result in SQL injection on your target database. When you use data pills in JDBC step SQL statements, sanitize them first using Sanitize SQL transform functions. This transform function category automatically appears when a data pill is dropped into the SQL Statement input.

SQL operations inclusion list

By default, you can run the following SQL operations.

- SELECT
- INSERT
- UPDATE
- DELETE
- SHOW
- DESCRIBE

To enable only some of these SQL operations that the JDBC step can perform, create a MID Server property, mid.property.jdbc_operations and enter the SQL
operations, separated by comma. To learn more about MID Server properties, see **MID Server properties**.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Connection Details</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Connection</strong></td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td></td>
<td><strong>Define Connection Inline</strong>: Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td><strong>Use Connection Alias</strong>: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see <strong>credentials, connections, and aliases</strong>.</td>
</tr>
<tr>
<td><strong>Connection Alias</strong></td>
<td>Connection &amp; Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see <strong>credentials, connections, and aliases</strong>. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel. This field is available when <strong>Use Connection Alias</strong> is selected from the Connection list.</td>
</tr>
<tr>
<td><strong>Credential Alias</strong></td>
<td>Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action.</td>
</tr>
<tr>

<td>When <strong>Define Connection Inline</strong> is selected from the Connection list.</td>
<td></td>
</tr>
<tr>
<td>JDBC Configuration</td>
<td>SQL statement that the step executes.</td>
</tr>
<tr>
<td><strong>Note:</strong> When you use data pills in step SQL statements, sanitize them first using a preprocessing Script step. For more information, see <strong>Sanitizing inputs using the escape functions</strong>.</td>
<td></td>
</tr>
<tr>
<td>Maximum Rows</td>
<td>Maximum number of rows to be returned from the SQL statement. The default value is <strong>1000</strong>.</td>
</tr>
<tr>
<td>Maximum Payload Size (KB)</td>
<td>Maximum allowable payload size, in KB, to be returned from the SQL statement. The default payload size is <strong>5120 KB</strong>. The maximum payload size is <strong>5 MB</strong>.</td>
</tr>
</tbody>
</table>

**Retry Policy**

| Enable Retry Policy           | Option to enable the retry policy. For more information, see **Retry policy**. |
| Override Default Policy for Alias | Option to override the default retry policy. This option is not applicable when **Define Connection Inline** is selected from the Connection list. |
| Retry Policy                  | Default retry policy associated with **Connection Alias**. If **Override Default Policy for Alias** is selected, you can override the default retry policy and select another existing retry policy based on your requirement. |

**Test JDBC step**

Test the JDBC step before testing or publishing an action that contains the JDBC step.

**About this task**

It is mandatory that you test the JDBC step before testing the action. Testing ensures that the relevant complex object output schema is created from table columns, which can be used as data pills in subsequent steps.

**Procedure**

1. Navigate to **Process Automation > Flow Designer**.
2. Create an action with a JDBC step.
3. Click **Test JDBC Step**.
   The **Test JDBC Step** pop-up window is displayed.

4. If the JDBC step takes an action input or output of the previous step as its input, provide required input values in the **Step input pills** field to test the JDBC step.

   Note: Input values in the **Step input pills** fields are not needed when records are updated, inserted, or deleted.

5. Click **Run Test**.
   - When a SELECT query is executed, **Sample Result** is displayed in the **Test JDBC Step** pop-up window. **Sample Result** includes column names, columns types, and the values of the first row.
   - When an UPDATE, INSERT, or DELETE query is executed, a message is displayed mentioning the number of rows affected.

6. To use the sample result as the JDBC step output, click **Use Result**.

   Note: **Use Result** is not displayed when records are updated, inserted, or deleted.

7. To retrieve schema of a different table when a SELECT query is executed in the JDBC step, enter the required value in the **Step input pills** field and click **Run Test**.

**Results**
When a SELECT query is executed in the JDBC step, **ResultSet** is displayed under **Outputs**. The relevant complex object output is populated. To learn more about complex objects, see **Complex data**.

**What to do next**
Test and publish the action.

**Get Latest Response Text From Email step**
Provide the most recent reply or forward message in an e-mail chain to other steps in your action.

**Roles and availability**
- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
**Inputs**

Provide a value for each input that your step needs. To add dynamic values, you can also drag and drop pills from the Data panel or select them from the pill picker.

<table>
<thead>
<tr>
<th>Input</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Record</td>
<td>Record</td>
<td>Email record whose most recent reply or forward message you want to provide to other steps in your action. Select an Email [sys_email] record from the list, or add an Email [sys_email] record data pill from the Data panel.</td>
</tr>
</tbody>
</table>

**Outputs**

These outputs appear in the Data panel. You can use them as inputs elsewhere in your action.

<table>
<thead>
<tr>
<th>Output</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Latest Response Text</td>
<td>String</td>
<td>Body text for the most recent reply or forward message in the Email [sys_email] record that you selected for the step’s input.</td>
</tr>
</tbody>
</table>

**Note:** If you select an Email [sys_email] record with a Type of New for this step’s input, the Latest Response Text output will be the entire body text of the e-mail.
Log step
Logs a message in the Flow Designer log table.

Roles and availability
• Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log level</td>
<td>Level of importance of the log message.</td>
</tr>
<tr>
<td></td>
<td>• Error</td>
</tr>
<tr>
<td></td>
<td>• Warn</td>
</tr>
<tr>
<td></td>
<td>• Info</td>
</tr>
<tr>
<td>Log message</td>
<td>Message to display in the log. Enter text or drag data pills into the field.</td>
</tr>
</tbody>
</table>

Look Up Record step
Look up a record from any table based on defined conditions.

Roles and availability
• Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>

</tr>
</tbody>
</table>

**Example**

1. **Look Up Records step**

   Table: Incident [incident]
   Conditions: All of these conditions must be met
     - Assigned to: is Bow Ruggieri
     - State: is New
   Order by: Short description
   Sort Type: a to z
   Max Results: 1000
**Notification step**

Trigger a notification as a step within an action by selecting a record (such as an incident, change request, problem, or user record) to trigger a notification and defining the associated notification.

**Notifications** is a platform feature. Before triggering a notification as an action step in Flow Designer, ensure that the notification is set up for use in the platform.

- When you **create or update the notification**, set the **Send when** field in the **When to send** tab of the Notification form to Triggered.
- Verify that your users have an active primary email channel and that all their notifications are active.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step. This is the record that will trigger a notification.</td>
</tr>
<tr>
<td>Note:</td>
<td>Some notifications are not associated with a specific record or table, such as the <strong>Passwords Require Updating</strong> notification. If configuring such a notification, leave this field blank.</td>
</tr>
<tr>
<td>Table name</td>
<td>Read-only. Set to the table of the triggering record.</td>
</tr>
<tr>
<td>Notification</td>
<td>Select the notification to be triggered. The notifications that can be selected are associated with the table of the specified record. If no record was selected, you can select a notification that does not have an associated record or table. To create notifications, see Create an email notification.</td>
</tr>
</tbody>
</table>

**Example**

1. **Notification step**

   ![Notification step example](image-url)
## Payload Builder step

Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.

### Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name Value Pairs</td>
<td>The name-value pairs to include in the payload. Click the plus icon to add name-value pairs. Drag data pills into either field to produce dynamic payloads.</td>
</tr>
<tr>
<td></td>
<td>The <strong>Name</strong> becomes a key in JSON and an element in XML. For example, suppose you create this name-value pair.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Name</strong>: short_description</td>
</tr>
<tr>
<td></td>
<td>- <strong>Value</strong>: [action]-&gt;[short_description]</td>
</tr>
<tr>
<td></td>
<td>When the system formats the name-value pair as JSON:</td>
</tr>
<tr>
<td></td>
<td>&quot;short_description&quot;: &quot;[action]-&gt;[short_description]&quot;</td>
</tr>
<tr>
<td></td>
<td>When the system formats the name-value pair as XML:</td>
</tr>
</tbody>
</table>

| Omit if empty           | The option to exclude a name-value pair if the value is empty or null.                                                                       |
|                        | **Note**: This field is only visible after clicking the down arrow to display advanced options.                                              |

| Output Format           | The payload file format.                                                                                                                      |
|                        |   - **JSON**: Select to format the payload as a JSON document.                                                                               |
|                        |   - **XML**: Select to format the payload as an XML document.                                                                               |

<p>| Namespace               | The XML namespace to apply to each element. For example, when the namespace is set to incident:                                              |</p>
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note: This field is only visible when the <strong>Output Format</strong> is set to <strong>XML</strong>.</td>
<td></td>
</tr>
</tbody>
</table>
| Include Outer Structure| The option to include or exclude a top level container appropriate to the output format. When the **Output Format** is JSON, curly braces contain the name-value pairs. When the **Output Format** is XML, a specified XML element contains the name-value pairs. For example, when the system formats the name-value pair as JSON:  
   ```json
   {
     "short_description": "[action]->[short_description]
   }
   ```
   When the system formats the name-value pair as XML:  
   ```xml
   <xml>
   </xml>
   ```
| Send Empty Structure   | The option to send valid JSON or XML structures when the payload is empty. Enable this option to include JSON or XML structural text in the payload. For example, when the system formats an empty structure as JSON:  
   ```json
   {}
   ```
   When the system formats an empty structure as XML:  
   ```xml
   </xml>
   ```
   Disable this option to produce an empty payload. Empty payloads can occur when you select the **Omit if empty** option for every name-value pair, and all name-value pairs in the payload produce empty values. |
| Parent Node            | The name of the XML element that contains the name-value pairs. The default parent node element is `xml`.  
   **Note:** This field is only visible when the **Output Format** is set to **XML** and the option to **Include Outer Structure** is enabled. |
| Preview                | The read-only payload the step produces. |
PowerShell step

Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server.

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. ServiceNow supports PowerShell 3.0 to 5.1. PowerShell 3.0 does not support Windows 2003 Server.

Note: PowerShell step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td></td>
<td>• Define Connection Inline: Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td>• Use Connection Alias: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see credentials, connections, and aliases.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection &amp; Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Credential Alias | Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don’t need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel.  
<p>| Note: This field is available when <strong>Use Connection Alias</strong> is selected from the Connection list.                                                                                                                                                                                                                                             |
| Host            | Specify the fully-qualified domain name of the target host where the system runs the action step. For example, host.domain.com.                                                                                                                                                                                                                                                                       |
| Port            | Specify the communications port on which the target host listens for connections. For example, 5985. Leave blank to use the default port.                                                                                                                                                                                                                                                                   |
| MID Selection   | Option to select MID Server as required. This field is available when <strong>Define Connection Inline</strong> is selected from the Source Connection list.                                                                                                                                                                                                                                                                  |
| MID Application | Specify the application the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected application. If                                                                                                                                                                                                                                                                  |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>you use a data pill for this field, the pill must reference the MID Application’s name, not the MID Application record. This field is available when Define Connection Inline is selected from the Connection list and Auto-Select MID Server is selected from the MID Selection list.</td>
<td></td>
</tr>
<tr>
<td>Capabilities</td>
<td>Capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities. This field is available when Define Connection Inline is selected from the Connection list and Auto-Select MID Server is selected from the MID Selection list.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Data pill of the required MID Server. This field is available when Define Connection Inline is selected from the Connection list and Specific MID Server is selected from the MID Selection list.</td>
</tr>
<tr>
<td>Remoting Type</td>
<td>The location where the PowerShell script runs such as the MID or a remote server.</td>
</tr>
<tr>
<td>▪ Explicit Remoting (Most Common): Establish a connection with and run the script on a remote server.</td>
<td></td>
</tr>
<tr>
<td>▪ Implicit Remoting (Advanced): Run a script on a MID Server while importing necessary modules from a remote server. If selected, define the Remote name prefix and Modules to import fields. For optimal performance, only import modules necessary to the step. If blank, all available modules are imported from the server.</td>
<td></td>
</tr>
<tr>
<td>▪ Run on a MID Server or have your script establish a remote session: Run a script directly on a MID Server, or define remoting specifications within the script. This value is the default.</td>
<td></td>
</tr>
</tbody>
</table>

⚠️ Note: To invoke a function in a PowerShell script command or PowerShell script file, the command must define the function param block if the function has input parameters. This requirement applies to explicit and implicit remoting. For additional information on param block, see Microsoft’s documentation on Windows Powershell parameters at https://technet.microsoft.com/.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote name prefix</td>
<td>The file path, excluding file names, to the modules to load from the remote server.</td>
</tr>
<tr>
<td><strong>Note</strong>: This field is only visible when the Remoting Type is Implicit Remoting (Advanced).</td>
<td></td>
</tr>
<tr>
<td>Modules to import</td>
<td>The comma-separated list of modules to import from the remote server at the defined file path.</td>
</tr>
<tr>
<td><strong>Note</strong>: This field is only visible when the Remoting Type is Explicit Remoting (Most Common) or Implicit Remoting (Advanced).</td>
<td></td>
</tr>
<tr>
<td>Script type</td>
<td>The type of script to run on the PowerShell host.</td>
</tr>
<tr>
<td>• Inline script: Enter the script to run in the Command field of the step.</td>
<td></td>
</tr>
<tr>
<td>• MID Server Script File: Select the PowerShell script to run from the MID Server Script Files [ecc_agent_script_file] table. This is the default value and separates scripting logic from the action, enabling you to update the script without having to modify and redeploy the action.</td>
<td></td>
</tr>
<tr>
<td>MID Server Script</td>
<td>Pre-defined PowerShell script from the MID Server Script Files table [ecc_agent_script_file].</td>
</tr>
<tr>
<td><strong>Note</strong>: This field is only available if the Script type is MID Server Script File.</td>
<td></td>
</tr>
<tr>
<td>Script path</td>
<td>Read-only path to the selected MID Server script.</td>
</tr>
<tr>
<td><strong>Note</strong>: This field is only visible when the Script type is MID Server Script File.</td>
<td></td>
</tr>
<tr>
<td>Input variables</td>
<td>The optional name-value pairs that represent the values of PowerShell script variables. You can use action inputs and data from other steps within the PowerShell script. Define the following fields for each variable:</td>
</tr>
</tbody>
</table>
| • Name: The name of the script variable to pass a value to. The name cannot match a reserved or prohibited PowerShell variable. Some variable names are reserved for internal processing and should not be used as input variables. See Reserved variables in PowerShell scripting variables.
### Field | Description
--- | ---
• **Type**: The type of PowerShell variable. Select plain text, encrypted, or boolean. If encrypted is selected, the value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.
• **Value**: The value to map to the variable. Manually enter a value, or drag a data pill into the field.

### Command
The inline PowerShell script to run on the target host.

**Note**: This field is only visible when the **Script type** is **Inline script**.

---

**PowerShell scripting variables**

To access input variables from the **Command** field, you must call them using special syntax. The syntax you use depends on the value of a system property. If the **Remoting Type** is **Run on a MID Server or have your script establish a remote session**, some reserved variables are available in addition to input variables.

#### Input variable syntax

By default, prefix variable names with a $ character. For example, if an input variable is named `message`, use `$message` to access the variable in script.

If the `mid.powershell.command.script.parameter_passing` parameter is set to false, prefix the variable name with `$env:SNC_`. For example, if an input variable is named `message`, use `$env:SNC_message` to access the variable in script. To learn more about the `mid.powershell.command.script.parameter_passing` parameter, see **MID Server parameters**.

#### Reserved variables

When the **Remoting Type** is **Run on a MID Server or have your script establish a remote session**, the following variables are available for use in script. Reserved variables cannot be used as custom input variable names.

<table>
<thead>
<tr>
<th>Reserved variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>$computer</code></td>
<td>Host IP address defined in the Connection alias record.</td>
</tr>
<tr>
<td><code>$cred</code></td>
<td>Credential object that contains the credentials defined in the connection record. Use this</td>
</tr>
</tbody>
</table>
### Reserved variable

<table>
<thead>
<tr>
<th>Reserved variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>variable</code></td>
<td>variable with any PowerShell cmdlet that supports the credential parameter. For example, <code>New-PSSession -credential $cred</code>.</td>
</tr>
<tr>
<td><code>$log_info</code></td>
<td>If the <code>mid.property.powershell.log_info</code> property is set to true, adds logging information to a PowerShell script.</td>
</tr>
</tbody>
</table>

The following variable names are reserved for internal processing and should not be used as input variables.

- `script`
- `useCred`
- `isMid`
- `isDiscovery`
- `debug`
- `user`
- `password`
- `executingScriptDirectory`
- `midScriptDirectory`
- `hresult`

### REST step

Send an outbound REST web service request to an external system.

**Note:** REST step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

Outbound REST web service is a platform feature that enables you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.

### Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Define Connection Inline</strong>: Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Use Connection Alias</strong>: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see <a href="#">credentials, connections, and aliases</a>.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection &amp; Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see <a href="#">credentials, connections, and aliases</a>. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel.</td>
</tr>
<tr>
<td></td>
<td>️ <strong>Note:</strong> This field is available when <strong>Use Connection Alias</strong> is selected from the Connection list.</td>
</tr>
<tr>
<td>Credential Alias</td>
<td>Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see <a href="#">credentials, connections, and aliases</a>.</td>
</tr>
<tr>
<td>Field</td>

<td>credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when Define Connection Inline is selected from the Connection list.</td>
</tr>
<tr>
<td>Use MID</td>
<td>Option to use a ServiceNow® MID Server to run the REST step. Select this check box to display the MID Application and Capabilities fields.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The system doesn't log REST request, response, and parameter runtime data sent via a MID server in the same way that outbound web services logging occurs. Instead, you can view this data in the flow execution details.</td>
</tr>
<tr>
<td>Base URL</td>
<td>Base URL for the REST request. If Use Connection Alias is selected, this field is read-only and displays the base URL associated with alias. If Define Connection Inline is selected, enter a base URL for the connection.</td>
</tr>
<tr>
<td>Connection Timeout</td>
<td>Number of milliseconds the system waits for a successful host connection. If the step does not make a successful connection during this time, the connection request times out. If Define Connection Inline is selected, enter a timeout value for the connection. Leave this field empty to use the system default connection timeout value.</td>
</tr>
<tr>
<td>MID Selection</td>
<td>Option to select MID Server as required. This field is available when Define Connection Inline is selected from the Source Connection list.</td>
</tr>
<tr>
<td>MID Application</td>
<td>Capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities. This field is available when Define Connection Inline is selected from the Connection list, Use MID check box is enabled, and Auto-Select MID Server is selected from the MID Selection list.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>

<tr>
<td>PATCH</td>
<td></td>
</tr>
<tr>
<td>DELETE</td>
<td></td>
</tr>
</tbody>
</table>

**Query Parameters**

Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value.

Support REST step requests that contain duplicate query parameter names. If you create a REST request that contains duplicate query parameter names, Flow Designer adds the query parameters to the request in the same order as you defined them.

**Note:** When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. Remove one of the headers depending on the content type you want to receive in the response.

<p>| Headers        | Headers to send with the request. You can create headers manually, or drag input variables into the parameter fields, and then assign a value. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>Note: When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. Remove one of the headers depending on the content type you want to receive in the response.</td>
<td></td>
</tr>
<tr>
<td>Request Type</td>
<td>Format of the request. Options include.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Text</strong>: A request in JSON, XML, or other text format.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Binary</strong>: A request in a binary file format.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Multipart</strong>: A request consisting of multiple content types.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Form URL-Encoded</strong>: A request in a URL-encoded query.</td>
</tr>
<tr>
<td>Note: This field is editable when the HTTP Method is POST, PUT, PATCH, or DELETE.</td>
<td></td>
</tr>
<tr>
<td>Request Body [Text]</td>
<td>Body of the request in JSON or XML format. The flow execution details display the response body as either a link to the embedded text viewer or the sys_id of the attachment record containing the response.</td>
</tr>
<tr>
<td>Note: This field is editable if you select <strong>Text</strong> from the Request Type list.</td>
<td></td>
</tr>
<tr>
<td>Attachment</td>
<td>Attachment record containing the request. You can look up or create this record in a prior step and define it as an input variable. Create it using the <strong>JSONStreamingBuilder</strong> and <strong>XMLStreamingBuilder</strong> APIs in the Script step.</td>
</tr>
<tr>
<td>Note: This field is available when you select <strong>Binary</strong> from the Request Type list.</td>
<td></td>
</tr>
<tr>
<td>Name, Type, Value</td>
<td>Content of a multiple part request. For each request part, specify its name, content type, and value. The name can be any valid string and the type can be</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name, Value</td>
<td>Content of a form URL-encoded request. Specify each part of the URL-encoded request with a name-value pair.</td>
</tr>
<tr>
<td>Enable Retry Policy</td>
<td>Option to enable the retry policy. For more information, see Retry policy.</td>
</tr>
<tr>
<td>Override Default Policy for Alias</td>
<td>Option to override the default retry policy. This check box is not applicable when Define Connection Inline is selected from the Connection list.</td>
</tr>
<tr>
<td>Retry Policy</td>
<td>Default retry policy associated with Connection Alias. If Override Default Policy for Alias is selected, you can override the default retry policy and select another existing retry policy based on your requirement.</td>
</tr>
<tr>
<td>Save As Attachment</td>
<td>Option to specify whether to save the response as a record in the Attachment [sys_attachment] table.</td>
</tr>
<tr>
<td>Attachment File Name</td>
<td>Name of the attachment created by the REST response. For example, rest-response.txt.</td>
</tr>
<tr>
<td>Attachment File Record</td>
<td>Target record to which the attachment is associated. The target record must be a data pill of type Record. For example, a specific incident record. You can look</td>
</tr>
</tbody>
</table>
REST response size limits

By default, the system limits the size of REST responses that are not saved as attachments to 5 MB. Direct REST responses that exceed this limit generate an error. To support larger response sizes, either save the response as an attachment or increase the response size limit with the `glide.pf.rest.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

Script step

Add custom JavaScript to execute within a reusable action. While most core actions and steps fit common use cases, you can build a Script step to execute behavior not satisfied by the core steps.

Roles and availability

- Available as an Action Designer action step. Users with the `action_designer` role can create a custom action with one or more action steps.
- The Script step is available by default to run JavaScript on a local instance.

Note: An IntegrationHub subscription is required to enable integration features such as running a Script step on a MID Server. See Request IntegrationHub for information about IntegrationHub usage and subscriptions.

Fields

The Script step includes separate input and output variables that enable you to map JavaScript data to Flow Designer data. By defining input and output variables within the step, you can define what Flow Designer data is available within your script, and which scripting variables are available to other steps in your action.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Required Runtime         | The runtime environment required to support the script. Choices include:  
  • **Instance**: The action step runs the script from instance. Select this option when the script needs access to the ServiceNow API or instance data. This is the default value.  
  • **MID**: The action step runs the script from the MID Server. Select this option when the script needs access to MID Server script files and APIs. Selecting this option displays the **Select MID Server Using** field.  
  • **Vanilla (Core JavaScript)**: The action step runs the script from either the instance or MID Server. Select this option when the script only needs the core JavaScript APIs and not the ServiceNow API or instance data.  
  The runtime you select determines the JavaScript objects and methods displayed in the Context-sensitive help.  
  **Note**: This field is only visible when IntegrationHub is activated. |
| Select MID Server Using  | Specify the MID Server selection process to use. Choices include:  
  • **Any MID**: The system runs the action step from any available MID Server.  
  • **Use Connection Alias**: The system runs the action using the connection alias you specify. Selecting this option displays the **Connection Alias** field.  
  • **Use Inline Selection**: The system runs the action using the connection details you specify in the action. Selecting this option displays the **Host**, **MID Application**, and **Capabilities** fields.  
  **Note**: This field is only visible when IntegrationHub is activated, and you select **MID** from **Required Runtime**. |
<p>| Connection Alias         | Connection &amp; Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated |</p>
<table>

<tr>
<td></td>
<td>By default, Flow Designer run scripts on the instance. To run script from a MID Server requires an IntegrationHub subscription.</td>
</tr>
<tr>
<td></td>
<td>Flow Designer runs script from the domain from which it is triggered or initiated. See Domain separation and Flow Designer.</td>
</tr>
<tr>
<td></td>
<td>For available classes and methods, see the JavaScript API context-sensitive help or the JavaScript API reference.</td>
</tr>
<tr>
<td>Output variables</td>
<td>Map JavaScript output to Flow Designer data pills. Define output variables when you want other steps in the action to use the script output.</td>
</tr>
</tbody>
</table>

**Example**

This example builds a JSON payload that can be easily updated or changed and added to a subsequent REST step.

**Note:** REST step is not available in the base system and requires the ServiceNow® IntegrationHub subscription.
By creating an output variable that represents the payload, you can drag the [Payload] data pill into the REST step **Body** field.

### Send Email step
Send an email to specified users or groups as an action in a flow.

### Roles and availability
- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Record</td>
<td>Record that the email is associated to. When a user sends a reply to your email, the target record is updated with the reply email content.</td>
</tr>
<tr>
<td>Table</td>
<td>Table of the target record.</td>
</tr>
<tr>
<td>Include Watermark</td>
<td>Option to apply a watermark to the email that is sent. To include a watermark, you must set a target record.</td>
</tr>
<tr>
<td>To</td>
<td>The main recipients of the email. Enter a list of user email addresses separated by commas or white spaces. You can also drag data pills that contain email addresses into the field, such as a User record. For example, if you want to send an email to</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
| the group assigned to the incident, drag the **[Assignment group]** data pill from the data panel.  
CC | Additional recipients copied on this email. Enter a list of user email addresses separated by commas or white spaces. You can also drag data pills that contain email addresses into the field.  
BCC | Additional recipients of this email, who are visible only to the sender (blind copied). Enter a list of user email addresses separated by commas or white spaces. You can also drag data pills that contain email addresses into the field.  
Subject | Subject of the email. You can enter text or drag data pills into the field.  
Body | The content of the message body. You can enter text or drag data pills into the field.  

**Note:** Flow Designer does not support the `${URI}` parameter in the email message body. To create a link to a record, use data pills, or create a notification step instead.

### Testing the email step
To verify that the email was generated when testing the action, review the email record in the Email `[sys_email]` table. The **Headers** field indicates whether the email was successfully generated. For example:

```
X-ServiceNow-Source:FlowDesigner-9ad2747b0b710300f4eb8bf637673a1e
Message-ID:<193756824.0.1508534586438@[10.0.66.70]>
X-ServiceNow-Generated:true
```

ACL restrictions apply to the Send Email action. If you configured your flow to run as the user who initiates the session, ensure that the user can access email. To test access controls for a Send Email action, impersonate a typical email sender and manually trigger the flow.

### SFTP step
Create a reusable action to manage files and directories on an SFTP server and to move files from one SFTP server to another.
Note:

• The SFTP step is not available in the base system and requires the subscription to IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional). For more information about the ServiceNow® IntegrationHub subscription packages, see IntegrationHub usage and subscription. After the required plugin is activated, the step is visible under Integrations.

• The SFTP step runs only on a ServiceNow® MID Server with SSH capabilities. Activate the plugin, IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional) to use the JDBC capability for the MID Server.

Roles and availability
The SFTP step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Prerequisite
Activate the Managed File Transfer Extensions for the SFTP Step (com.glide.hub.action_step.sftp_mft) plugin.

SFTP commands
• Copy File
• Copy Directory
• Create Directory
• Get File List
• Remove File
• Remove Files
• Delete Directory
• Rename File or Directory
• Set File Attributes
• Copy Attachments To SFTP Server
• Copy Files To This Instance

Note: The SFTP commands can be performed on a maximum of 10,000 files at a time.

Copy File
Copies a file from the source SFTP server to target SFTP server.
# Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Connections**            | Type of connection to use to connect to the source SFTP server.  
• **Define Connection Inline**: Define connection information within the action step.  
• **Use Connection Alias**: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don’t need to update your custom action.  
To learn more about connections and credentials, see credentials, connections, and aliases. |
| **Source Connection**      | Connection & Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don’t need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel. This field is available when Use Connection Alias is selected from the Source Connection list. |
| **Target Connection**      | Type of connection to use to connect to the target SFTP server.  
• **Define Connection Inline**: Define connection information within the action step.  
• **Use Connection Alias**: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don’t need to update your custom action. |

<td></td>
</tr>
<tr>
<td>Enable Retry Policy</td>
<td>Option to enable the retry policy. For more information, see Retry policy.</td>
</tr>
<tr>
<td>Override Default Policy for Alias</td>
<td>Option to override the default retry policy. This option is not applicable when Define Connection Inline is selected from the Connection list.</td>
</tr>
</tbody>
</table>

#### Retry Policy

| Retry Policy | Default retry policy associated with Connection Alias. If Override Default Policy for Alias is selected, you can override the default retry policy and select another existing retry policy based on your requirement. |

### Remove File

Removes a file on an SFTP server, including subfolders, when configured.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connections</td>
<td>Type of connection to use to connect to the source SFTP server.</td>
</tr>
<tr>
<td>Source Connection</td>
<td></td>
</tr>
</tbody>
</table>
- **Define Connection Inline**: Define connection information within the action step.

- **Use Connection Alias**: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don’t need to update your custom action.

To learn more about connections and credentials, see credentials, connections, and aliases.

</table>

**Command Details**

- **Source Path**: Path of the directory that contains the files you wish to remove.
- **Apply Remove Conditions**: Option to specify conditions to remove files.

**Include Files**: List of target files to remove. This is a comma separated list that accepts wild cards, such as *.txt.*

<details>
<summary>Note:</summary>

- If no value is provided, subfolders in the specified directory are deleted.
- If a value is provided, subfolders are not deleted even if they are empty.

</details>

**Exclude Files**: List of target files that should not be removed. This is a comma separated list that accepts wild cards, such as *.txt.*
### Field Description

####  Note:
- If no value is provided, subfolders in the specified directory are deleted.
- If a value is provided, subfolders are not deleted even if they are empty.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>

</tbody>
</table>
**Field** | **Description**
--- | ---
Connection list and **Auto-Select MID Server** is selected from the MID Selection list.

**MID Server** | Data pill of the required MID Server. This field is available when **Define Connection Inline** is selected from the Source Connection list and **Specific MID Server** is selected from the MID Selection list.

**Command Details**

**Source Path** | Path of the directory you wish to remove.

**Include Subfolders** | Option to specify if the subfolders should be deleted.

*Note:* If this option is selected, all subfolders are deleted. Else, only empty subfolders are deleted.

**Retry Policy** | Option to enable the retry policy. For more information, see **Retry policy**.

**Override Default Policy for Alias** | Option to override the default retry policy. This option is not applicable when **Define Connection Inline** is selected from the Connection list.

**Retry Policy** | Default retry policy associated with **Connection Alias**. If **Override Default Policy for Alias** is selected, you can override the default retry policy and select another existing retry policy based on your requirement.

---

**Rename File or Directory**

Renames a file or directory on an SFTP server.

</tr>
</tbody>
</table>

**Set File Attributes**

Sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.

A good practice is to use the Get File List command to return a list of files and their attributes first. Then, after you have moved the files from a source host to a
target host, use the Set File Attributes command to set the source file attributes on the target file.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</tbody>
</table>
**SSH step**

The SSH step executes SSH commands on an external *nix system through a ServiceNow® MID Server. The step also stores scripts and commands for the *nix systems.

⚠️ **Note:**

- The SSH step is not available in the base system. The step requires the subscription to ServiceNow® IntegrationHub and activation of IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional) or later. For more information about the IntegrationHub subscription packages, see IntegrationHub usage and subscription. After you activate the required plugin, the step is visible under Integrations.
- IntegrationHub supports ServiceNow SSH only.

**Roles and availability**

The SSH step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Sanitizing inputs**

Escape all user inputs to eliminate the possibility of a malicious user executing arbitrary commands on your target server. Escape and validate data pills before the command field uses them by sanitizing arguments using Sanitize shell arguments transform functions. This transform function category automatically appears when a data pill is dropped into the Command input.

</table>
### Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSH Configuration</td>
<td>Optional target directory on the target host where the command is run.</td>
</tr>
<tr>
<td>Working Directory</td>
<td>Command that runs on the target directory. The command can also include MID Serverscripts. See Advanced SSH script options for more information.</td>
</tr>
<tr>
<td>Command</td>
<td>Option to disable the SSH connection timeout for commands that might take longer than the default time of 120 seconds to run. When selected, the engine detaches from the execution thread until completion.</td>
</tr>
<tr>
<td>Long Running</td>
<td>Option to elevate privileges to execute the script.</td>
</tr>
</tbody>
</table>

**Note:** Escape and validate data pills before the command field uses them by sanitizing arguments using a preprocessing Script step. For more information, see Sanitizing arguments using the escape class and function.

For more information, see SSH credentials.

### Advanced SSH Script Options

To run a MID Server script on the target host, specify the script type and pass the name of the script into the `syncFile()` parameter. The system uses this parameter to locate the named script in the MID Server Script File [ecc_agent_script_file] table and run it on the target host. For example, a bash script can be expressed as:

```
bash syncFile("<MID script name>") argument1 argument2 argument3
```

A base script (main_script.bash) can reference another script (my_include.bash) as well as a separate file (.my_profile) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the `syncFile()` parameter, to execute properly.
A Python example with inline comments might look like this:

```python
set $LIB_DIR=/usr/bin;.
# Sync a file that is referenced inside myF5CreateLBPool.py
cp ${syncFile("specialFunctions.py")} ~/specialFunctions.py
# set up environment variables
source ${syncFile(".python_profile")}
# call script that sets up dependencies on the box from remote package repos
python ${syncFile("setupPythonDependencies.py")} pycontrol
# call a script that requires functions from the package as well as a function from
# myIncludedFile
python ${syncFile("myF5CreateLBPool.py")} snow_pool myActualValue
# user is responsible for their own cleanup
rm ~/specialFunctions.py
```

To see the list of available MID Server scripts, navigate to **MID Server > Script Files**.

**SOAP step**

Enable action designers to send outbound SOAP web service requests to external systems.

⚠️ **Note:** SOAP step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

- Action designers need the web_service_admin role to perform these web services tasks.
  - Select WSDL
  - Load new WSDL
  - Select a WS-Security policy

- The ServiceNow® MID Server doesn't support WS-Security policies
## Fields

<td>Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don’t need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel. Note: This field is available when Define Connection Inline is selected from the Connection list.</td>
</tr>
<tr>
<td>Connection Timeout</td>
<td>Number of milliseconds the system waits for a successful host connection. If the step does not make a successful connection during this time, the connection request times out. If Define Connection Inline is selected, enter a timeout value for the connection. Leave this field empty to use the system default connection timeout value.</td>
</tr>
<tr>
<td>Use MID</td>
<td>Option to use a MID Server to run the SOAP step. Select this check box</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>Endpoint</td>
<td>The URL endpoint for the SOAP request. If Use Connection Alias is selected, this field is read-only and displays the endpoint URL associated with alias. If Define Connection Inline is selected, enter an endpoint URL for the connection.</td>
</tr>
<tr>
<td>Request Details</td>
<td></td>
</tr>
<tr>
<td>Build Envelope</td>
<td>The method to use when building the SOAP envelope.</td>
</tr>
<tr>
<td></td>
<td>• From WSDL: Select this option to display the Select a WSDL and Operation fields.</td>
</tr>
<tr>
<td></td>
<td>• Manually: Select this option to manually enter or paste WSDL text.</td>
</tr>
<tr>
<td>Select a WSDL</td>
<td>The WSDL to use to build the SOAP envelope. Select an existing WSDL record or click Load New WSDL to download or manually enter a WSDL file. The selected WSDL populates the values of the Operation, SOAP action, and SOAP Envelope fields.</td>
</tr>
<tr>
<td>Load New WSDL</td>
<td>Option to download or manually enter a WSDL file.</td>
</tr>
<tr>
<td>Operation</td>
<td>The operation to run from the selected WSDL. Each WSDL has its own list of available operations.</td>
</tr>
<tr>
<td>SOAP Action</td>
<td>The URL to run the SOAP action. If Build Envelope is set to From WSDL, this field is read-only and displays the URL to run SOAP action. If Build Envelope is set to</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Manually, enter a URL to run the SOAP action. | **Request Type**  
Format of the request. Options include.  
- **Text**: A request in JSON, XML, or other text format.  
- **Binary**: A request in a binary file format. |   |
| SOAP Envelope       | The XML text sent to the endpoint. If **Build Envelope** is set to From WSDL, the system adds the necessary XML for the **Operation** that you select. If **Build Envelope** is set to Manually, enter the XML text that you want to use. Enter record values in the appropriate SOAP envelope elements. For example, enter an incident short description in the `<short_description>` element.  
**Note**: This field is available when the **Request Type** is Text. |
| Attachment          | Attachment record containing the request. You can look up or create this record in a prior step and define it as an input variable. Create it using the JSONStreamingBuilder and XMLStreamingBuilder APIs in the Script step.  
**Note**: This field is available when the **Request Type** is Binary. |
| Reset Envelope      | Option to discard all manual changes that you made to the SOAP envelope. Select this check box to revert the SOAP envelope to its original state.  
**Note**: This field is available when you select From WSDL from the Build Envelope list. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New WSDL</td>
<td></td>

<td>Override Default Policy for Alias</td>
<td>Option to override the default retry policy. This check box is not applicable when <strong>Define Connection Inline</strong> is selected from the Connection list.</td>
</tr>
<tr>
<td>Retry Policy</td>
<td>Default retry policy associated with <strong>Connection Alias</strong>. If <strong>Override Default Policy for Alias</strong> is selected, you can override the default retry policy and select another existing retry policy based on your requirement.</td>
</tr>
<tr>
<td>Advanced Options</td>
<td>The name-value pairs to include in the SOAP message as HTTP headers. Click the plus icon + to add headers. Add a <strong>Name</strong> and <strong>Value</strong> for each HTTP header.</td>
</tr>
<tr>
<td>Omit if empty</td>
<td>Option to exclude a name-value pair if the value is empty or null.</td>
</tr>
</tbody>
</table>
SOAP response size limit

The system limits the size of SOAP responses to 5 MB. Direct SOAP responses that exceed this limit generate an error. To support larger response sizes, increase the response size limit with the `glide.pf.soap.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

Update Multiple Records step

Look up and update multiple records as a single step. Using this step removes the need to separately look up a list of records and then process the list with a Script step. Set field values with a template or add and configure them using data pills.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table containing the records to look up and update.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Define the filter conditions used to look up records.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set the fields and field values that you want to update. Set static or dynamic values for the fields in the records. For example, to set the short description to a certain value, select <strong>Short description</strong> and enter the desired value. To add dynamic values, see <strong>Allow flow designers to dynamically set field values</strong>.</td>
</tr>
<tr>
<td>Order by</td>
<td>Select the field that you want to use to sort the records when more than one record matches the defined conditions.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Determine whether to sort the records alphabetically in ascending or descending order.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Run Business Rules and Workflow</td>
<td>Determine whether to call any business rules and workflows associated with the table.</td>
</tr>
<tr>
<td>Update System Fields</td>
<td>Select if you want to automatically update system fields such as Updated by.</td>
</tr>
<tr>
<td>Don't fail on error</td>
<td>Specify whether to continue running the flow when there is an error.</td>
</tr>
</tbody>
</table>

### Example

![Action Outline](image)

### Outputs

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Number of records updated. If no records are updated, the count is 0.</td>
<td>Integer</td>
</tr>
<tr>
<td>Error Message</td>
<td>Message that is displayed if the step produces an error.</td>
<td>String</td>
</tr>
</tbody>
</table>
| Status | The completion status of the step as a numeric value.  
- 0 (success)  
- 1 (error) | Choice |
Update Record step

Update an existing record in a table. You can dynamically add and configure fields for the record, or use a template to set field values.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>The table associated with the record. When you select a record, this field is automatically set to the table associated with the record.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select Short description and set the desired value. To add dynamic values, see Allow flow designers to dynamically set field values.</td>
</tr>
</tbody>
</table>

Wait For Condition step

Pause a flow until record values match a specific set of conditions.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag an input record or a record from a previous step.</td>
</tr>
</tbody>
</table>

Note: If this record is deleted, the flow stops waiting and continues running.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record. Confirm that the system supports Wait for Condition for your selected table.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Select the record values necessary to resume running the flow. For example, if the condition is <code>[State][is][Closed]</code>, the flow pauses until the condition is met. Once met, the flow moves on to the next step or action. Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field.</td>
</tr>
<tr>
<td>Enable timeout</td>
<td>Option to limit the amount of time that the flow waits for the action to be completed before continuing.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that the flow waits before continuing when the Enable timeout option is selected. Enter the time to wait in hours, minutes, and seconds. If you leave this field empty, the flow does not wait.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Schedule used to compute the timeout duration when the Enable timeout option is selected. For example, waiting for 10 hours as part of an 8-5 weekdays schedule causes the flow to wait for one or more business days. If you leave this field empty, the timeout runs without a schedule.</td>
</tr>
</tbody>
</table>

**Unsupported tables**

The system does not support Wait for Condition for the following tables.

<table>
<thead>
<tr>

<th>Data Type</th>
</tr>
</thead>
</table>
| State | The completion status of the action as a numeric value.  
• 0 (success)  
• 1 (error) | Choice |
Transform functions

Transform data pill values without the need to write a script. Use transform functions to reformat text, perform mathematical calculations, sanitize potentially unsafe SQL statements, and serialize complex objects to raw XML.

Available transform function categories include date and time, string, utilities, simple math, sanitize shell arguments, sanitize SQL, and complex data. Some examples of transform function uses include:

- Trimming white space from a string before integrating it into the CMDB.
- Adding days, hours, minutes, and seconds to a date or time to localize for a specific time zone.
- Sanitizing SQL values to prevent injection as part of a JDBC step for an IntegrationHub spoke.
- Retrieving an appropriate value from a map of priorities that have equivalent values in a third-party database.
- Transforming a complex object into raw XML as part of a REST step Request Body field.

ℹ️ **Note:** Custom transform functions are not currently supported. For information on creating custom functions to transform Flow Designer data, see Inline scripts.

**Applying a transform function**

You can apply a transform function to a data pill when you are designing or creating a flow. To apply a transform function, point or tab to a data pill and select the \( f(x) \) icon that appears. Selecting the icon displays the Available Transforms list. Select the transform function that you want to apply to your data pill, enter information into any required fields, and select **Apply.** Your selected transform function appears in the Applied Transforms list.

![Image of a data pill with transform icon](image-url)
Applying multiple transform functions

You can apply multiple transform functions to the same data pill. The system applies transform functions sequentially from top to bottom as listed in the Applied Transforms list. For example, you can apply a String to Date transform function followed by the Add Time transform function.

Viewing applied transform functions

You can find out which transform functions are applied to a data pill by looking at the Applied Transforms list. When you are designing or creating a flow or action, point to or tab into the data pill and select the $f(x)$ icon. You can also view applied transform functions in the flow execution details.

Note: The output values for applied transform functions are field values, not display values.

When a data pill is dropped into certain types of inputs, the system automatically suggests a transform function category that is related to the input. For example, the system suggests transform functions to escape special characters in SQL statements, prevent script injection in shell scripts, and validate API or operation requests. Currently, the system suggests transform function categories for these inputs:

- For data pills dropped in the JDBC step's SQL Statement input, the sanitize SQL transform function category is displayed automatically.
- For data pills dropped in the SSH step's Command input, the sanitize shell arguments transform function category is displayed automatically.

Design considerations

Apply transform functions to valid input data pill types

Be sure to check the input data pill type before applying a transform function. Applying a transform function to an invalid data pill type results in the system skipping the transform. An error also occurs if transform functions produce results that the system cannot parse. For example, when transforming a string into a date, the system throws an error if the transform does not produce a valid date.

Confirm applied transform functions for multiple inputs with the same data pill

Transform functions only affect the runtime value of a data pill for one specific input. The actual field value that is associated with a data pill remains unchanged. To apply a transform function to the
same data pill across multiple actions or steps, you must apply the transform function to the data pill in each input separately.

**View final transformed values in the flow execution details**

Only the final transformed value, and not the value for each applied transform, appears in the flow execution details.

**Test transform functions to verify they produce expected results**

Verify that your transform functions produce the expected data pill runtime values. For more information on confirming the runtime values for data pills with applied transform functions, see Test a flow and Test an action.

**Date and time transform functions**

Use date and time transform functions to recalculate or reformat data pills for Date/Time values.

Date and time transform functions require a Date/Time or String input data pill. Make sure to use the correct input data pill type when applying date and time transform functions. If a date and time transform function is applied to an improper data pill type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

⚠️ Note: Runtime Date/Time values are not localized and appear in the UTC (Coordinated Universal Time) time zone. For more information, see time zones and time zone representation.

### Add Time

Adds days, hours, minutes, or seconds to the input Date/Time, Date, or Due Date.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date/Time, Date, or Due Date</td>
<td>Duration - Amount of time to add in days, hours, minutes, and seconds</td>
<td>Date/Time - Transformed Date/Time value after adding the specified Duration</td>
</tr>
</tbody>
</table>

⚠️ Note: If the input is a Date or Due Date, the transform creates a full Date/Time value using time values of hour 0, minute 0, and second 0.
Example

- **Input:** 2019-09-12 11:00:00
- **Duration:** 3 hours
- **Output:** 2019-09-12 13:00:00

In this example, the flow retrieves a CMDB Configuration Item record from a remote instance. The Subtract Time transform function then localizes the value of the **Created** field by subtracting three hours from the input Date/Time.

**Subtract Time**

Subtracts days, hours, minutes, and/or seconds from the input Date/Time, Date, or Due Date. Enter a **Duration** of time to subtract from the input Date/Time.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date/Time, Date, or Due Date</td>
<td><strong>Duration</strong> - Enter an amount of time to subtract in days, hours, minutes, and seconds</td>
<td>Date/Time - Transformed Date/Time value after subtracting the specified Duration</td>
</tr>
</tbody>
</table>

**Note:** If the input is a Date or Due Date, the transform creates a full Date/Time value using time values of hour 0, minute 0, and second 0.

Example

- **Input:** 2019-09-12 11:00:00
- **Duration:** 2 days, 1 hours, 5 minutes, 10 seconds
- **Output:** 2019-09-10 09:54:50
**String to Date**

Converts the input String to a Date/Time.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
</table>
| String formatted as specified in the **Input Date Format** | - **Input Date Format** - Date/Time or date format of the input String  
- **Custom Format** - Valid Date/Time or date format represented as a String. Required only if Custom Format is selected as the **Input Date Format**. | Date/Time |

**Note:**

- If the Date/Time value for the **Custom Format** input is incomplete, the transform creates a full Date/Time value using default dates and times. In such a case, the transform defaults to the current year, the current month, day 1 of a month, hour 0, minute 0, and second 0. For example, an input data pill value of **Oct 2019** and a custom date format of **MMM yyyy** produces an output of **2019-10-01 00:00:00**.

- If you use an incorrect data pill type or invalid **Custom Format**, the flow cancels during runtime.

**Example**

- Input: `'1995-11-20'`
- **Input Date Format**: ISO Date `(2004-06-28)`
- Output: `1995-11-20 00:00:00`

---

**Date to String**

Converts the input Date/Time, Date, or Due Date to a String. Select a **Date Format** for the input Date/Time. Alternatively, enter a **Custom Format** for the input Date/Time.
### Input data pill

<table>
<thead>
<tr>
<th>Date/Time, Date, or Due Date</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Output Date Format</strong> - Date/Time or date format of the output String</td>
</tr>
<tr>
<td><strong>Custom Format</strong> - Valid Date/Time or date format represented as a String. Required only if selecting Custom Format as the Date Format.</td>
</tr>
</tbody>
</table>

#### Note:
If you use an incorrect input data pill type or invalid Custom Format, the flow cancels during runtime.

#### Example
- **Input**: 1969-12-31 14:23:57
- **Output Date Format**: Custom (enter below)
- **Custom Format**: 'On' MMM dd, yyyy 'at' hh:mm a
- **Output**: 'On Dec 31, 1969 at 2:23 PM'

In this example, the flow retrieves a User [sys_user] record from a third-party database. The Date to String transform function converts the format of the Created field and then logs the date, time, and name that is associated with the record.

### Custom date formats
You can specify a custom date format with a sequence of specific date and time pattern strings. A pattern string consists of one or more uppercase and lowercase letters from A to Z. Any text within quotation marks is ignored and is instead copied into the date output.
<table>
<thead>
<tr>
<th>String</th>
<th>Description</th>
<th>Output Format</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>G</td>
<td>Era designator</td>
<td>Text</td>
<td>AD</td>

</tr>
<tr>
<td>Z</td>
<td>Time zone in RFC 822 format</td>
<td>Time zone in RFC 822 format</td>
<td>-0800</td>
</tr>
</tbody>
</table>
String transform functions

Use string transform functions to reformat or perform calculations on String data pills.

String transform functions require a String input data pill. Make sure to use the correct input data pill type when applying string transform functions. If a string transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

Contains?

Returns true when the input string contains a given sequence of characters.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Characters to search for.</td>
<td>Boolean indicating whether a sequence of characters exists in the input string</td>
</tr>
</tbody>
</table>

Example

- Input: Cheese Pizza
- Parameter: Cheese
- Output: true

Does not Contain?

Returns true when the input string does not contain a given sequence of characters.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Characters to search for.</td>
<td>Boolean indicating whether a sequence of characters does not exist in the input string</td>
</tr>
</tbody>
</table>

Example
- Input: Cheese Pizza
- Parameter: Joey
- Output: true

**Ends With?**
Returns **true** when the input string ends with a given sequence of characters.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Characters to search for.</td>
<td>Boolean indicating whether the input string ends with the given sequence of characters</td>
</tr>
</tbody>
</table>

Example
- Input: Cheese Pizza
- Parameter: Pizza
- Output: true

**First Character**
Returns the first character of the input String.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String - Transformed String as the first character of the input String</td>
</tr>
</tbody>
</table>
Example

- **Input:** Madrid
- **Output:** m

In this example, the flow triggers when a User [sys_user] record is created. The flow then updates the City field for the User [sys_user] record with a code that is represented as the first character of the city's name.

Last Character

Returns the last character of the input String.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String - Transformed String as the last character of the input String</td>
</tr>
</tbody>
</table>

Example

- **Input:** Madrid
- **Output:** d

Replace String

Returns a replaced string from the input string based on the provided regex and replacement string.
### String

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
</table>
| String         | • Regex - Regular expression to be matched for replacement  
                 • Replace String - Replacement string | Resulting string after replacement with given parameters |

**Example**

- **Input**: Pepperoni Pizza
- **Parameters**:
  - Regex: Pepperoni
  - Replacement string: Cheese
- **Output**: Cheese Pizza

### Size

Returns the total number of characters in the input String.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Integer</td>
</tr>
</tbody>
</table>

**Example**

- **Input**: Example input string
- **Output**: 21

### Split

Returns an Array.String based on a provided **Separator** that splits the input String. If the **Separator** field is left blank, the transformation is ignored and the system returns the input String. If entering any data type other than a String as the **Separator**, the system converts the provided value to a String.
<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td><strong>Separator</strong> - Enter a delimiter that specifies where the input String should be split. If left blank, the input String is not transformed at runtime.</td>
<td>Array.String - An array of substrings from the input String</td>
</tr>
</tbody>
</table>

**Example**
- **Input:** Example, input, string.
- **Separator:** ,
- **Output:** ["Example", "input", "string."]

**Starts With?**
Returns **true** when the input string starts with a given sequence of characters.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Characters to search for.</td>
<td>Boolean indicating whether the input string starts with the given sequence of characters</td>
</tr>
</tbody>
</table>

**Example**
- **Input:** Cheese Pizza
- **Parameter:** Chees
- **Output:** true

**Substring**
Returns a substring from the input String that is based on the provided **Start Index** and **End Index**. Input String index starts at 0.
### Parameters

- **Start Index** - Index of the first character to include in the returned substring
- **End Index** - Index of the last character to include in the returned substring

### Output data pill

String - Transformed String as a substring of the input String

### Example

- **Input**: Example input string
- **Start Index**: 3
- **End Index**: 6
- **Output**: mple

### To Lower Case

Converts the input String to all lowercase characters.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String in all lowercase characters</td>
</tr>
</tbody>
</table>

**Example**

- **Input**: Example input string
- **Output**: example input string

### To Proper Case

Changes the case of words in the input string. Capitalizes the first letter of each word and makes the remaining letters in the word lower case. A word is considered any string separated by a space, hyphen, backslash, or forward slash character. The transform function always evaluates words from left-to-right to determine the first letter.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String in proper case</td>
</tr>
</tbody>
</table>
Example

- **Input**: exAMPle-input string/TEXT
- **Output**: Example-Input String/Text

**To Upper Case**

Converts the input String to all uppercase characters.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String in all uppercase characters</td>
</tr>
</tbody>
</table>

**Example**

- **Input**: ExamPle inpuT stRing
- **Output**: EXAMPLE INPUT STRING

**Trim**

Removes white space from the beginning and end of the input String. Does not remove white space within the input String.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String - Transformed String with trimmed white space</td>
</tr>
</tbody>
</table>
Example

- **Input:** SQL Server APAC 1
- **Output:** SQL Server APAC 1

In this example, the action makes a REST call to a third-party system and GETs a response body containing data about a server. Then, the Trim transform function removes any unwanted white space before adding the server’s name to a new record in the Server [cmdb_ci_server] table.

Utilities transform functions

Use utilities transform functions to return a Complex Object from an Array, or a value associated with a specific key.

Utilities transform functions require an Array, Name-Value Pair, String, Integer, or Choice input data pill. Make sure to use the correct input data pill when applying utilities transform functions. If a utilities transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

Get First Item from Array

Returns the first item from the input array as a complex object.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td><strong>Complex Object</strong> - First item found in the input array</td>
</tr>
</tbody>
</table>
Get Item from Array

Returns a Complex Object from the input Array. Enter a value for the Nth Item in
the input Array that you want to return. The Nth Item represents the Array index,
starting at 0.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Nth Item - Enter the index of the target object in the input Array. The Array index starts at 0.</td>
<td>Complex Object</td>
</tr>
</tbody>
</table>

Get Item from Name/Values

Returns a value that is associated with a matching key from a map of Name-
Value Pairs.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name-Value Pairs</td>
<td>• Key - Name of the key that is used to look up its corresponding value • Default - The value returned when there is no matching key</td>
<td>String associated with the matching key</td>
</tr>
</tbody>
</table>

Note: When applying the Get Item from Name/Values transform function, consider that the runtime value might be the system value, not the display value. For example, if mapping the Priority field in the Incident table to a similar field in a remote table, the returned runtime value might be 2, not 2 - High.
Example

• Input: "username":"abel.tuter"
• Key: username
• Default: example.username
• Output: abel.tuter

In this example, an action makes a REST call to a third-party system and GETs ticket data as a map of Name-Value Pairs. A Ticket ID is provided as an output for this action. The Get Item from Name/Values transform function returns either the value that is associated with the ticket_id key or Ticket ID not found.

Get Last Item from Array
Returns the last item from the input array as a complex object.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Complex Object - Last item found in the input array</td>
</tr>
</tbody>
</table>

Is Blank?
Returns true when the input is blank. A string input is blank when it is an empty string. An integer input is blank when it is zero. A Boolean input is blank when it is false.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Returns true or false</td>
</tr>
</tbody>
</table>
Example

- Input: an integer data pill with 0
- Output: true

Is False?

Returns true when the input is false. A string is false when it is an empty string. An integer is false when it is zero. A Boolean input is false when it is false.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Returns true or false</td>
</tr>
</tbody>
</table>

Example

- Input: an integer data pill with 13
- Output: false

Is Not Blank?

Returns true when the input is not blank. A string is not blank when it is not an empty string. An integer is not blank when it is anything but zero. A Boolean input is not blank when it is true.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Returns true or false</td>
</tr>
</tbody>
</table>

Example

- Input: an integer data pill with 13
- Output: true

Is Null?

Returns true when the input value is null. An input is null if it is not initialized, or if it is a null object or reference.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Returns true or false</td>
</tr>
</tbody>
</table>
Example

- Input: an integer data pill with 725
- Output: false

Is True?

Returns true when the input is true. A string is true when it is not an empty string. An integer is true when it is anything but zero. A Boolean input is true when it is true.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Returns true or false</td>
</tr>
</tbody>
</table>

Example

- Input: an integer data pill with 13
- Output: true

Key Value Map

Returns a value associated with a matching key, or a default value if there is not a match.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
</table>
| String or Integer
| • Name - The key that is used to find the corresponding value
| • Value - The value matched to a specific key
| • Default - The value returned when there is no matching name |
| String associated with the matching key |
Example

In this example, a log action stores a record’s priority as a message. In the Name-Values section, each priority is mapped to a corresponding string value. When the flow runs, the record’s priority number is transformed to a string, and the string is logged to a message.

Simple math transform functions

Use simple math transform functions to perform basic mathematical calculations on Number data pills.

Simple math transform functions require an Array.Number, Array.Integer, or Array.Decimal input data pill. Make sure to use the correct input data pill type when applying simple math transform functions. If a simple math transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

Absolute Value

A mathematical function that returns the distance from zero for any real number. An absolute value is always a positive or zero value.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number, Integer, or Decimal</td>
<td>Number as the absolute value of the input number</td>
</tr>
</tbody>
</table>

Example

• Input: -3
• Output: 3
Add

Adds the given value to the input.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number, Integer, or Decimal</td>
<td>Number to be added.</td>
<td>Number as the addition of the input value by the parameter.</td>
</tr>
</tbody>
</table>

Example

- Input: 12
- Parameter: 4
- Output: 16

Average

Returns the average value of the elements in the input array.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Number, Array.Integer, or Array.Decimal</td>
<td>Number as the average value of the input array.</td>
</tr>
</tbody>
</table>

Example

- Input: [10, 30, 20]
- Output: 20

Count

Returns the number of elements in the input array.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Number, Array.Integer, Array.Decimal, Array.Object, Array.String, or Array.Boolean</td>
<td>Number of elements in the input array</td>
</tr>
</tbody>
</table>

Example

- Input: [2, 10, 30]
- Output: 3
Divide
Divides the input value by a given value.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number, Integer, or Decimal</td>
<td>Number to divide the input value by.</td>
<td>Number as the division of the input value by the parameter.</td>
</tr>
</tbody>
</table>

**Example**
- Input: 12
- Parameter: 4
- Output: 3

Max
Returns the highest value found in the input Array.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Number, Array.Integer, or Array.Decimal</td>
<td>Number as the highest value in the input Array</td>
</tr>
</tbody>
</table>

**Example**
- Input: [1, -5, 20, 6]
- Output: 20

Median
Returns the median value of elements in the input array.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Number, Array.Integer, or Array.Decimal</td>
<td>Number as the median value of the input array.</td>
</tr>
</tbody>
</table>

**Example**
- Input: [10, 30, 15]
- Output: 15
Min

Returns the lowest value found in the input Array.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Number, Array.Integer, or Array.Decimal</td>
<td>Number as the lowest value in the input Array</td>
</tr>
</tbody>
</table>

Example
- Input: [1, -5, 20, 6]
- Output: -5

Multiply

Multiplies the input value by a given value.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number, Integer, or Decimal</td>
<td>Number to be multiplied.</td>
<td>Number as multiplication of the input value by the parameter.</td>
</tr>
</tbody>
</table>

Example
- Input: 12
- Parameter: 4
- Output: 48

Power

Returns the value of the input value raised to the power of a given value.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number, Integer, or Decimal</td>
<td>Number as the exponent of the power.</td>
<td>Number as the power of input value to the parameter.</td>
</tr>
</tbody>
</table>
Example

- Input: 2
- Parameter: 3
- Output: 8

Round
A mathematical function that approximates a numeric value based on rounding rules and a digit position. The function rounds up by adding one to the digit to be rounded and then replacing all digits to its right with zeroes.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number, Integer, or Decimal</td>
<td><strong>Number of Digits</strong> - A positive integer specifying the position of the digit to be rounded starting on the left</td>
<td>Number as the rounded value of the input number</td>
</tr>
</tbody>
</table>

Example

- Input: 194
- Parameter: 2
- Output: 190

Note: The function uses the digit to the right of the parameter digit to round up or down. If the digit to the right has a value from zero through four, the function rounds down. If the digit to the right has a value from five through nine, then the function rounds up. If there is no digit to the right, then the function rounds down.

Square Root
A mathematical function that computes a positive number that when multiplied by itself produces the input value. The input value must be a positive real number.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number, Integer, or Decimal</td>
<td>Number as the square root of the input number</td>
</tr>
</tbody>
</table>

Example

- Input: 16
- Output: 4
**Subtract**

Subtracts the given value from the input.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number, Integer, or Decimal</td>
<td>Number to subtract from the input value.</td>
<td>Number as the subtraction of the input value by the parameter.</td>
</tr>
</tbody>
</table>

**Example**

- Input: 12
- Parameter: 4
- Output: 8

**Sum**

Returns the sum of all values in the input Array.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Number, Array.Integer, or Array.Decimal</td>
<td>Number as a sum of all values in the input Array</td>
</tr>
</tbody>
</table>

**Example**

- Input: [1, -5, 20, 6]
- Output: 22

**Sanitize shell arguments transform functions**

Use sanitize shell arguments transform functions to remove any potentially unsafe command injections in String data pills to be used for Bash shell scripting.

Sanitize shell arguments transform functions require a String input data pill. Make sure to use the correct input data pill type when applying sanitize shell arguments transform functions. If a sanitize shell arguments transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

**Note:** When a data pill is dropped into the Command input for an SSH step, the sanitize shell arguments transform function category automatically appears.
**Sanitize Bash shell arguments**

Returns a String free of any unsafe command injections in your Bash shell script. Wraps the input String with single quotes and escapes any existing single quotes so that you can pass the String directly to a shell function as a safe argument.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String - String with Bash shell arguments properly escaped</td>
</tr>
</tbody>
</table>

**Sanitize SQL transform functions**

Use sanitize SQL transform functions to escape special characters and prevent injection in String data pills to be used for SQL statements.

Sanitize SQL transform functions require a String input data pill. Make sure to use the correct input data pill type when applying sanitize SQL transform functions. If a sanitize SQL transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see [Test a flow](#).

ℹ️ **Note:** When a data pill is dropped into the **SQL Statement** input for a JDBC step, the sanitize SQL transform function category automatically appears.

**Sanitize SQL Identifier**

Returns a String with escaped special characters/injected values for SQL identifiers (such as table, view, and column names). Wraps the input String in database-specific quotes.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>• <strong>Database</strong> - The database-specific context in which characters are escaped. Choices include MySQL, Oracle, PostgreSQL, and Microsoft SQL Server.</td>
<td>String - String with SQL identifiers that are properly escaped based on the selected database</td>
</tr>
</tbody>
</table>
Example

- Input: `simple_column`
- Database: `MySQL`
- Output: `simple_column`
Complex data transform functions

Use complex data transform functions to serialize Complex Object data pills into an XML format.

Complex data functions require a Complex Object input data pill. Make sure to use the correct input data pill type when applying complex data transform functions. If a complex data transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

To XML

Serializes the input Complex Object to XML.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complex Object</td>
<td>XML - XML document formatted as a String</td>
</tr>
</tbody>
</table>

**Example**

- **Input:** { "article_id": KB3843202, "article_description": "How do I reset my Active Directory password?" }
- **Output:**
  ```xml
  <article_id>KB3843202</article_id>
  <article_description>How do I reset my Active Directory password?</article_description>
  ``

In this example, an action makes a REST call to a third-party knowledge base and retrieves KB article IDs and descriptions. The To XML transform function changes the response body's JSON text into XML format before it is integrated into the system's knowledge base.
Domain separation and Flow Designer

Domain separation is supported in Flow Designer. Flow Designer supports domain separation of business logic, which lets each tenant domain have its own flows, actions, and subflows. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard*

- Includes Basic level
- Business logic: Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application.

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another.

How domain separation works in Flow Designer

The system domain separates Flow Designer content according to these rules.

**Flow Designer content inherits the domain of the user who creates them**

Flows, actions, and subflows belong to the domain of the user who creates them. For example, when a service provider (SP) administrator in the TOP domain creates a flow, it belongs to the TOP domain.

*Note:* The domain selected from the domain picker overrides the domain the user belongs to. For example, when an SP administrator in the TOP domain selects the ACME domain from the domain picker, any content created belongs to the ACME domain.

**Flow Designer content runs from the domain from which it is triggered or initiated**

Flows, actions, and subflows run from the domain of the record or user who initiates them. For example, when a user from the child domain ACME triggers a flow belonging to the parent domain TOP, the flow runs in the context of the child domain ACME.
### Domain assignment by trigger type

<table>
<thead>
<tr>
<th>Trigger type</th>
<th>Domain assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>API call</td>
<td>Domain of the user making API call</td>
</tr>
<tr>
<td>Email trigger</td>
<td>Domain of the email sender</td>
</tr>
<tr>
<td>Record trigger</td>
<td>Domain of the triggering record</td>
</tr>
<tr>
<td>Scheduled trigger</td>
<td>Domain of the flow</td>
</tr>
<tr>
<td>Service Catalog trigger</td>
<td>Domain of the requested item record</td>
</tr>
</tbody>
</table>

**Flow Designer only runs content accessible from the current domain context**

The system can only run content to which the current domain context allows access. See [Understanding domain separation](#) to understand data separation and the domain hierarchy. For example, a user in the child domain ACME can trigger flows belonging to the parent domain TOP, but cannot trigger flows belonging to a sibling domain such as INITECH.

Flow Designer runs record operations from the current user domain context. A read operation such as the Lookup Records action returns records based on the currently selected domain and its children. For example, if the currently selected domain is the TOP domain, you will see records from the TOP domain and all its children such as the ACME and INITECH domains. If the currently selected domain is the ACME domain, you will see records from the ACME domain and its children, but you will not see records from the parent TOP domain.

**Note:** Record operations use the data or process separation rules applied to the table the record belongs to. For example, suppose you have process-separated the Business Rule table. If you add a business rule to the TOP domain, the business rule will be accessible to record operations in child domains such as the ACME domain because process separation allows access to records from parent domains.

Flows that call another application such as a decision table or workflow also run from the current user domain context.

**Flow Designer runs all flows whose trigger conditions are met**

A flow in one domain cannot override or prevent a flow from another domain from running. Flow Designer runs any flow that
is visible to the current user and whose trigger conditions have been met. For example, a flow belonging to the TOP domain that is triggered by the creation of an incident record runs anytime an incident is created, regardless of whether the incident is created in the ACME or INITECH child domains.

**Design considerations**

Follow these design considerations when using domain separation with Flow Designer.

**Have a service provider (SP) administrator in the TOP domain author and manage tenant flows, actions, and subflows**

Since tenants cannot override Flow Designer content, an SP administrator from the TOP domain must author and manage them to ensure they run properly for all domains. While you can create domain-specific flows, be aware that users working from domains higher in the hierarchy may trigger multiple child domain flows. For example, a user working in the TOP domain can trigger flows in child domains such as ACME and INITECH.

ℹ️ **Note:** Flow authors can see only Flow Designer content available from their current domain and any parent domains in the hierarchy. Flow Designer does not display content visible from Contains domains.

**Provide a unique name for each flow, action, and subflow**

Since all domains share the same Flow Designer content, have an SP administrator in the TOP domain uniquely name each flow, action, and subflow to ensure that a flow intended for one domain does not duplicate the name of a flow in another domain. For example, add the domain to the flow name such as `Validate incidents - TOP`, `Validate incidents - ACME`, and `Validate incidents - INITECH`.

**Ensure flows and actions only contain artifacts available from the current or parent domains**

Flow Designer prevents the activation of any flow containing artifacts unavailable to the current or parent domains. For example, if you create a domain-specific flow that belongs to the ACME domain, it cannot contain actions or subflows belonging to the sibling domain INITECH.

**Edit Flow Designer content in the domain to which it belongs**
While users in a parent domain can see flows, actions, and subflows in a child domain, they must edit them in the domain they belong to. For example, an administrator in the TOP domain can see flows from the ACME domain but must switch to the ACME domain to edit it.

Related information
Domain separation for service providers

Generate group approvals for domain separated requests

Configure Flow Designer to generate approvals for all members of a group or to restrict approvals to only group members who are visible from the domain of the request.

Before you begin
Role required: admin

About this task
By default, Flow Designer generates approvals for all group members who can access the parent request regardless of domain visibility. This configuration allows requests from members of a child domain to generate approvals for members of a parent domain who are not otherwise visible from lower in the domain hierarchy. You can use this procedure to restrict the generation of approvals to only those group members who are visible from the domain of the parent request. For information about domain hierarchies, see Understanding domain separation. For more information about visibility and contains domains, see Visibility domains and contains domains.

Procedure
1. Add a system property.
2. For the system property name, enter `com.glide.hub.flow.approval.group_member.use_query_no_domain`.
3. For the system property type, select `true` or `false`.
4. For the system property value, enter one of these values.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>Generate approvals for all members of the group who have access to the domain of the parent request. Select this option to exclude domain visibility from the approval generation query.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>For example, generate approvals for users who belong to domains higher in the domain hierarchy. This is the default value.</td>
<td></td>
</tr>
<tr>
<td>Generate approvals only for group members who are visible from the domain of the parent request. Select this option to include domain visibility in the approval generation query. For example, do not generate approvals for users who belong to domains higher in the domain hierarchy.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Flow Designer only generates approvals for users who can access the domain of the request.

**Results**

Flow Designer only generates approvals for group members who belong to the same domain or child domains of the parent request.

**User access to Flow Designer**

Administrators can grant users access to Flow Designer by assigning delegated development permissions or directly assigning a user role. Administrators can also specify which features and content a user can access based on user roles. Application developers can access Flow Designer functionality through APIs for flows, subflows, and actions.

**Flow Designer user roles**

Administrators can grant access to Flow Designer by directly assigning users the flow_designer user role, which includes the role to view flow execution details.

**Warning:** Directly granting a user the flow_designer role is equivalent to giving the user the admin role, because Flow Designer can run flows as the System user, which has access to all tables and all database operations.

Administrators can also grant users one or more Flow Designer roles to enable them to create flows and subflows, view flow execution details, and create actions.
### Flow Designer roles

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>flow_designer</td>
<td>Enables a user to launch the Flow Designer design environment to create and edit flows and subflows.</td>
<td>flow_operator</td>
</tr>
<tr>
<td>flow_designer_scripting</td>
<td>Enables a user with the flow_designer or action_designer role to set and modify input values by writing inline scripts. For information, see Inline scripts.</td>
<td>none</td>
</tr>
<tr>
<td>flow_operator</td>
<td>Enables a user to view flow execution details, dashboards, and logs. Administrators can grant this role to users that want to be able to view flow results but not create, change, or test them.</td>
<td>none</td>
</tr>
<tr>
<td>action_designer</td>
<td>Enables a user to launch the Action Designer design environment to create and edit actions.</td>
<td>none</td>
</tr>
<tr>
<td>action_category_creator</td>
<td>Enables a user with the action_designer role to create action categories for actions and subflows.</td>
<td>none</td>
</tr>
</tbody>
</table>

### API access

Application developers can access Flow Designer functionality through APIs for flows, subflows, and actions. Flow designers can enable individual flows, subflows, and actions to be client callable during design. For more information, see API access to Flow Designer.

### Delegated development access

Administrators can grant users access to Flow Designer by creating an application and assigning users as developers with the Flow Designer delegated development permission. Delegated development allows administrators to control whether flow designers can access features normally restricted to admin users such as assigning user roles, creating access controls, or creating scripts. For more information, see Developer permissions.
Feature access and content filtering by user role
Administrators can specify which features and content a user can access based on their role.

Feature access
Specifies the user roles necessary to access the UI elements of Flow Designer. For example, the buttons to save, test, or activate a flow or the option to copy a code snippet. Manage feature access directly through the Feature Access List. For more information, see Manage access to Flow Designer features.

Content filtering
Specifies the user roles necessary to access Flow Designer content. For example, flows, flow triggers, actions, and subflows. Manage content filtering by creating content definitions and content filtering rules. For more information, see Content filtering for Flow Designer.

Note: Users must have the flow_designer role to create and edit flows. Administrators can specify the additional roles that a user must have to access particular features or content.

API access to Flow Designer
Application developers can access Flow Designer functionality through APIs for flows, subflows, and actions. Flow designers can enable individual flows, subflows, and actions to be client callable during design.

Available Flow Designer APIs
Trigger flows, subflows, and actions using these APIs from server or client scripts.

Server side
FlowAPI: Trigger a flow, subflow, or action using synchronous or asynchronous methods, with or without execution details.

Client side
GlideFlow: Perform client-side interactions with actions, flows, and subflows. Flow designers must enable a flow, subflow, and action to be called from the client.

FlowAPI quick methods
Use quick methods in the FlowAPI class to run an action, flow, or subflow from a server-side script without creating execution details or other related records. Use these methods to increase the speed of high-volume processing in a production environment, and to improve performance by eliminating record-keeping overhead. Methods include:
• `executeActionQuick()`, `executeFlowQuick()`, `executeSubflowQuick()`: Run an action, flow, or subflow from a server-side script synchronously from the current user session.

• `startActionQuick()`, `startFlowQuick()`, `startSubflowQuick()`: Run an action, flow, or subflow from a server-side script asynchronously.

**XML and JSON streaming APIs**

Build a large streaming or non-streaming JSON or XML payload to use in a REST or SOAP request to send bulk data to a third-party API. For example, you can use these APIs to create a JSON payload in the ServiceNow® Flow Designer Script step and pass the returned value to the REST step to send the request to a third-party service. For more information, see `JSONStreamingBuilder` and `XMLStreamingBuilder`.

**Client callable APIs**

By default, the flows, subflows, and actions can only be called by the FlowAPI within a server script. Flow and action designers can make individual flows, subflows, or actions available to client calls by enabling the **Client callable** option during design.

**Run as support**

Flows and subflows can run as either the system user or the user who initiates the session. Set this behavior from the flow properties. All API quick methods ignore the run as property, and always run as the system user.

Actions always run as the user who initiates the session.

**Code snippets**

Application developers can generate a JavaScript function that calls a specific flow, subflow, or action with the **Code Snippet** option. Use the code snippet in scripts such as business rules or the **Scripts - Background** module to call specific Flow Designer elements. The system only generates code snippets for published flows, subflows, and actions. Flow Designer elements in the draft or modified status do not generate code snippets.

**Create code snippets for flows, sub-flows, and actions**

Generate a code snippet to call a specific flow, subflow or action.
Before you begin

- Role required: flow_designer or admin
- Activate the flow or subflow you want to call.
- Publish the action you want to call.

Procedure

2. Open a flow, subflow, or action.
3. Click the More Actions icon in the upper right corner of the flow designer.
5. A modal window appears containing the code snippet. The text of the snippet is selected by default. To copy the code, manually copy the code from the pop-up modal, or click the Copy Code Snippet Clipboard button.

Create a client callable flow, subflow, or action

Enable a client script to trigger a flow, subflow, or action.

Before you begin

- Role required: security_admin
- Consider the implications of making a flow, subflow, or action client callable, such as whether it exposes protected data or bypasses validation logic.

About this task

By default, the flows, subflows, and actions can only be called by the FlowAPI within a server script. Flow and action designers can make individual flows, subflows, or actions available to client calls by enabling the Client callable option during design.

Procedure

1. Elevate privileges to security_admin.
3. Click New.
4. Create an access control.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>client_callable_flow_object</td>
</tr>
</tbody>
</table>
### Manage access to Flow Designer features

Specify which features a user can access based on the user's role.

#### Before you begin

Create any custom roles that you want to use for feature access. When you specify which roles are required to access a feature, you select from a list of existing roles.

**Role required:** admin

#### About this task

Features are elements of the Flow Designer UI. When feature filtering is turned off, users with the flow_designer role have access to all Flow Designer features. When feature filtering is turned on, administrators can specify which roles a user must have to access individual features.

**Note:** Users must have the flow_designer role to create and edit flows. Administrators can specify the additional roles that a user must have to access particular features or content.

---

#### Table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operation</td>
<td>create</td>
</tr>
<tr>
<td>Admin overrides</td>
<td>Selected</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a name for the ACL.</td>
</tr>
<tr>
<td>Requires role</td>
<td>Create a role to provide access to the APIs. For example, create a flow_api_access role.</td>
</tr>
</tbody>
</table>
Procedure

2. For each feature on the list, click the edit icon (📝) next to the feature.

3. Enter the role or roles required to access the feature.

   Note: Add the flow_designer role to each feature on the Feature Access List. Users must have the flow_designer role to access Flow Designer features.

4. Continue until you have added roles to each feature on the list.

5. Click OK.

6. To turn on feature access, select the Enable feature access filtering? option. Once enabled, users must have the required roles to access the features. If a user doesn't have the required roles for a feature, the feature will not render for that user.

What to do next

Assign users the roles necessary to access your features.

Content filtering for Flow Designer

Specify which content a user can access based on the user's role.

Display only content that is relevant for a particular user, hiding content that is unnecessary or sensitive. Specify the Flow Designer content that you want to control access to and the role that a user must have to access it. For example, if a user with the hr_manager role in human resources is creating a flow, show only the set of actions and subflows that are relevant to HR cases.

Content filtering uses:

• Content definitions to specify types of content.

• Content filtering rules to determine who can access the content.

Flow Designer includes several default definitions and filtering rules. Set up content filtering by modifying pre-existing rules or creating your own.

Content definitions

Content definitions specify a type of Flow Designer resource. Resources are the key components of Flow Designer, such as triggers, actions, and subflows. Create definitions to include an entire resource, or refine your definitions through conditions. For example, you can create a definition that includes all flow
triggers, or you can use conditions to include only triggers with a category of date.

You can further refine content definitions through tagging. Add tags to items in a resource list, then design your content definition to only include resources with that tag.

**Content filtering rules**

Content filtering rules specify the role that a user must have to access the content in a particular definition. Each rule associates a single user role with a single content definition. When a user accesses Flow Designer, content filtering rules determine what content the user may access based on the user's role.

**Feature access**

You can also filter access to Flow Designer features. Features are UI elements and sections. Access to both elements and sections can be managed by configuring content definitions and filtering rules. However, access to UI elements can also be managed through a simplified UI. For more information, see Manage access to Flow Designer features.

**Read-only flows**

Users may be able to view a flow, subflow, or action containing content that they can't normally access. For example, a flow that's visible to a user might include an action the user wouldn't usually be able to view. When a flow contains restricted content, the entire flow becomes read-only. Users can run the flow but can't modify or copy it.

The creation of read-only flows doesn't apply to feature filtering. If a user doesn't have access to a feature, the feature doesn't render for that user. It doesn't affect the ability to copy or modify a flow. If a user doesn't have access to transform functions and uses a flow that already has a transform function applied, the transform function is read-only. The rest of the flow can still be copied and modified.
## Access summary

<table>
<thead>
<tr>
<th>Resource filtered</th>
<th>User has role</th>
<th>User does not have role</th>
</tr>

</tbody>
</table>
configure content filtering definitions

Specify which content a user can access by creating content definitions.

Before you begin
Content filtering requires some familiarity with user roles and Flow Designer tables and records.

Role required: flow_designer, action_designer, or admin

About this task
Filter Flow Designer content based on user role. Filtering content requires you to set up:

1. Content definitions to describe the content that you want to filter. Content definitions specify types of Flow Designer resources, such as actions and subflows.

2. Content filtering rules to state the role a user must have to access the resource in a particular definition.

Flow Designer includes several content definitions and filtering rules by default. Get started with content filtering by modifying the preexisting definitions and rules or creating your own.
Procedure

1. To modify or create a content definition, navigate to Process Automation > Flow Administration > Content Definitions.
2. Select the definition that you want to modify or click New to create one.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the content definition.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the definition. This field is automatically set to the currently selected application scope. If no application scope is selected, the field is set to Global.</td>
</tr>
<tr>
<td>Table</td>
<td>Table containing the resource type that you’re defining. For example, the Flow [sys_hub_flow] table includes all the flows and subflows available on your instance.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions used to filter the records in the table. For example, creating a condition where [Flow Type] [is] [SubFlow] returns only the subflows from the Flow table.</td>
</tr>
<tr>
<td>Resource Tags</td>
<td>Tags used to filter the resources in the table.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Configure content filtering rules

Use content filtering rules to specify the role a user must have to access content.

Before you begin
Role required: flow_designer, action_designer, or admin

Content filtering requires some familiarity with user roles and Flow Designer tables and records.

Role required: flow_designer, action_designer, or admin

About this task
Filter Flow Designer content based on user role. Filtering content requires you to set up:
1. Content definitions to describe the content that you want to filter. Content definitions specify types of Flow Designer resources, such as actions and subflows.

2. Content filtering rules to state the role a user must have to access the resource in a particular definition.

Flow Designer includes several content definitions and filtering rules by default. Get started with content filtering by modifying the pre-existing definitions and rules or creating your own.

**Procedure**

1. To modify or create a content filtering rule, navigate to Process Automation > Flow Administration > Content Filtering Rules.

2. Select the rule that you want to modify or click New to create one.

3. On the form, fill in the fields.

**Flow Designer Resource Filter Rule form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the content filtering rule.</td>
</tr>
<tr>
<td>User Role</td>
<td>The role a user must have to access the content in the Resource Definition field.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to enable the rule.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the rule. This field is automatically set to the currently selected application scope. If no application scope is selected, the field is set to Global.</td>
</tr>
<tr>
<td>Resource Definition</td>
<td>The name of the content definition that specifies the resource to filter.</td>
</tr>
</tbody>
</table>

4. Click Submit.

**Spokes**

Add application-specific content to Flow Designer by installing spokes.

A spoke is a scoped application containing Flow Designer content dedicated to a particular application or record type. For example, the **ITSM Spoke** contains actions for managing Task records such as the **Create Task** action. Spokes are activated when their parent application is activated. For example, the **ITSM Spoke** is activated when the Incident, Problem, and Change applications are...
activated. Creating a spoke requires familiarity with application development as developers must add Flow Designer content to a scoped application.

### Default spokes available

<table>
<thead>
<tr>
<th>Spoke</th>
<th>Description</th>
<th>Plugin</th>
<th>Included with</th>
</tr>
</thead>
<tbody>
<tr>
<td>Benchmarks Spoke</td>
<td>Provides read-only actions for the read-only Benchmark Recommendation Evaluator flow.</td>
<td>[com.sn_bm_client.spoke]</td>
<td>Now Platform</td>
</tr>
<tr>
<td>Connect spoke</td>
<td>Provides actions to automate the creation of conversations, to add users to a conversation, and to send messages to a conversation. These actions work with Connect API version 3 and later.</td>
<td>[com.glide.connect.client.spoke]</td>
<td>Now Platform</td>
</tr>
<tr>
<td>External Related Files Spoke</td>
<td>The External Related Files spoke stores information about files in third-party systems and helps you manage the information.</td>
<td>[com.sn.external.files]</td>
<td>Now Platform</td>
</tr>
</tbody>
</table>
### Default spokes available (continued)

<table>
<thead>
<tr>
<th>Spoke</th>
<th>Description</th>
<th>Plugin</th>
<th>Included with</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Service Spoke</td>
<td>Provides actions for flow designers to use when creating Field Service Management business processes.</td>
<td>[com.snc.field_service.spoke]</td>
<td>Field Service Management application</td>
</tr>
<tr>
<td>ITSM spoke</td>
<td>Provides flow and actions associated with ITSM. Requires the ITSM application suite.</td>
<td>[com.snc.itsm.spoke]</td>
<td>ITSM application</td>
</tr>
<tr>
<td>Predictive Intelligence for Flow Designer</td>
<td>Provides actions to make predictions from trained Predictive Intelligence solutions.</td>
<td>[com.snc.ml_flowdesigner]</td>
<td>Predictive Intelligence</td>
</tr>
<tr>
<td>Visual Task Board (VTB) Spoke</td>
<td>Provides VTB actions for flow designers to manage the boards, lanes, cards, board members, and assignees.</td>
<td>[com.glide.ui.vtb.ah]</td>
<td>Now Platform</td>
</tr>
</tbody>
</table>

Additional spokes are available with an IntegrationHub subscription. To see a list of IntegrationHub spokes, see IntegrationHub available spokes. For more
information about requesting an IntegrationHub subscription, see Request IntegrationHub.

**Benchmarks Spoke**

Provides read-only actions for the read-only Benchmark Recommendation Evaluator flow.

The Benchmarks Spoke is designed for the Recommendations feature of the Benchmarks application.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Recommendation Activity Records</td>
<td>Create or update recommendation activity records.</td>
<td>• Recommendation</td>
<td>N/A</td>
</tr>
<tr>
<td>Delete Recommendation Evaluations</td>
<td>Delete recommendation evaluations for the specified month.</td>
<td>• Activity record</td>
<td>N/A</td>
</tr>
<tr>
<td>Evaluate Recommendation Condition</td>
<td>Evaluate the conditions and script specified for the recommendation.</td>
<td>• Record count</td>
<td>• Result</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Threshold</td>
<td>• Score</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Direction</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Recommendation</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Activity record</td>
<td></td>
</tr>
</tbody>
</table>

**Connect spoke**

Provides actions to automate the creation of conversations, to add users to a conversation, and to send messages to a conversation. These actions work with Connect API version 3 and later.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Group Users to Task Conversation</td>
<td>Create a task conversation, and add all users of a group to it.</td>
</tr>
<tr>
<td>Add User to Task Conversation</td>
<td>Create a task conversation, and add a user to it.</td>
</tr>
<tr>
<td>Send Message to Task Conversation</td>
<td>Send a message to all users of a task conversation.</td>
</tr>
</tbody>
</table>
Customer Service Spoke

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Case</td>
<td>Retrieve a case record using the case number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Case</td>
<td>Create a case using one or more attributes. This action mimics the structure of the Case table (sn_customerservice_case) and exposes the fields present on the Case table.</td>
</tr>
<tr>
<td>Create Quick Case</td>
<td>Create a case using the customer, description, channel, priority, and category attributes.</td>
</tr>
<tr>
<td>Create Task on Case</td>
<td>Create a case task and optionally associate it with a case.</td>
</tr>
<tr>
<td>Update Case</td>
<td>Update a case by providing the case reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Assign Case</td>
<td>Assign a case using matching rules. To use this action, you must first define the matching rules that match cases with resources (assignment groups, agents).</td>
</tr>
<tr>
<td>Escalate Case</td>
<td>Request case escalation. This action does not automatically approve escalation. Approval is based on the selected escalation template.</td>
</tr>
<tr>
<td>Escalate Account</td>
<td>Request account escalation. This action does not automatically approve escalation. Approval is based on the selected escalation template.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Add Work Note to Task</td>
<td>Add a work note to a task or to task extended objects (for example, a case or case task).</td>
</tr>
<tr>
<td>Add Comment to Task</td>
<td>Add a comment to a task or to task extended objects (for example, a case or case task).</td>
</tr>
</tbody>
</table>

**External Related Files spoke**

The External Related Files spoke stores information about files in third-party systems and helps you manage the information.

**External Related Files spoke tables**

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>External Provider</td>
<td>Stores information about the external provider. For example, Box or DocuSign services.</td>
</tr>
<tr>
<td>[sn_ext_files_spoke_provider]</td>
<td></td>
</tr>
<tr>
<td>External Related Files</td>
<td>Stores metadata information about the files in third-party systems. This table is extensible.</td>
</tr>
<tr>
<td>[sn_external_related_files]</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** If you extend the table, ensure that you perform the data separation for the scoped applications

- To store metadata information of files in a specific third-party system, create a table with a column that contains a reference field to the External Related Files table. For more information about reference fields, see reference field type.
- To establish a relationship between a specific ServiceNow table and External Related Files table, create defined related lists.
### External Related Files spoke actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create External File Record</td>
<td>Creates a record in the External Related Files table.</td>
</tr>
<tr>
<td>Update External File Record</td>
<td>Updates a record in the External Related Files table.</td>
</tr>
<tr>
<td>Delete External File Record</td>
<td>Deletes a record in the External Related Files table.</td>
</tr>
</tbody>
</table>

### External Related Files spoke user roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_ext_files_spoke.doc_reader</td>
<td>Read records in the External Related Files and External Provider tables.</td>
</tr>
<tr>
<td>sn_ext_files_spoke.file_admin</td>
<td>• Read, update, and delete records in the External Related Files table.</td>
</tr>
<tr>
<td></td>
<td>• Read records in the External Provider table.</td>
</tr>
<tr>
<td>sn_ext_files_spoke.provider_admin</td>
<td>Read, update, and delete records in the External Provider table.</td>
</tr>
</tbody>
</table>

### Field Service Spoke

Provides actions for flow designers to use when creating Field Service Management business processes.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Work Order</td>
<td>Retrieve a work order record using the work order number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Work Order</td>
<td>Create a work order and optionally associate it with a case.</td>
</tr>
<tr>
<td>Update Work Order</td>
<td>Update a work order by providing the work order reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Get Work Order Task</td>
<td>Retrieve a work order task record using the work order task number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Work Order Task</td>
<td>Create a work order task and optionally associate it with a work order.</td>
</tr>
<tr>
<td>Update Work Order Task</td>
<td>Update a work order task by providing the work order task reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Add Work Note to Task</td>
<td>Add a work note to a task or to task extended objects (for example, a work order or work order task).</td>
</tr>
</tbody>
</table>

**ITSM spoke**

Provides flow and actions associated with ITSM. Requires the ITSM application suite.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Comment</td>
<td>Adds a comment to a task record.</td>
</tr>
<tr>
<td>Add Worknote</td>
<td>Adds a work note to a task record.</td>
</tr>
<tr>
<td>Apply Change Approval Policy</td>
<td>Controls the approval process for a change request by creating user and group approvals according to a change approval policy record. Multiple actions can be used in a flow, where each action references the same or different Change Approval Policies.</td>
</tr>
<tr>
<td>Assign Incident to CI Support Group</td>
<td>Updates an incident record to assign it to the CI Support Group.</td>
</tr>
<tr>
<td>Cancel Change Tasks from Flow</td>
<td>Cancels all related pending and open change tasks that are created from Flow.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Check Change for User Approval</td>
<td>Checks if the specified user has already approved the change request.</td>
</tr>
<tr>
<td>Create Catalog Task on Request</td>
<td>Creates a Catalog Task record from a Request record.</td>
</tr>
<tr>
<td>Create Catalog Task on Request Item</td>
<td>Creates a Catalog Task record from a Request Item record.</td>
</tr>
<tr>
<td>Create Change Task on Change Request</td>
<td>Creates a Change Task record from a Change Request record.</td>
</tr>
<tr>
<td>Create Emergency Change Request</td>
<td>Creates a Change Request record of type Emergency.</td>
</tr>
<tr>
<td>Create Emergency Request from Incident</td>
<td>Creates a Change Request record of type Emergency from an Incident record.</td>
</tr>
<tr>
<td>Create Incident</td>
<td>Creates an Incident record.</td>
</tr>
<tr>
<td>Create Incident Task on Incident</td>
<td>Creates an Incident Task record from an Incident record.</td>
</tr>
<tr>
<td>Create Normal Change Request from Incident</td>
<td>Creates a Change Request record of type Normal from an Incident record.</td>
</tr>
<tr>
<td>Create Outage</td>
<td>Creates a cmdb_ci outage record for a configuration item. The Task field is populated only if the source is a task record. If the source is non-task record such as an alert record, the Task field is empty.</td>
</tr>
<tr>
<td>Create Problem from Incident</td>
<td>Creates a Problem record from an Incident record.</td>
</tr>
<tr>
<td>Create Request</td>
<td>Creates a Request record.</td>
</tr>
<tr>
<td>Create Standard Change Request</td>
<td>Creates a Change Request record of type Standard.</td>
</tr>
<tr>
<td>Create Task</td>
<td>Creates a child task record for a Task table record. For example, creates an Incident Task record for an Incident record.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>Create Task Outage Relationship</td>
<td>Creates a Task Outage Relationship record where cmdb_ci outage record and task record are inputs to the action.</td>
</tr>
<tr>
<td>Create Standard Change Request from Incident</td>
<td>Creates a Change Request record of type Standard from an Incident record.</td>
</tr>
<tr>
<td>Disregard Change Approvals</td>
<td>Sets all related pending approvals to no longer required.</td>
</tr>
<tr>
<td>Update Assignee</td>
<td>Updates the Assigned to field of a Task table record.</td>
</tr>
<tr>
<td>Update Assignment Group</td>
<td>Updates the Assignment Group field of a Task table record.</td>
</tr>
</tbody>
</table>

**Predictive Intelligence for Flow Designer**

Provides actions to make predictions from trained Predictive Intelligence solutions.

**Predictive Intelligence subscription**

This spoke requires a subscription to Predictive Intelligence. For more information, see Activate Predictive Intelligence.

**Key features**

Predictive Intelligence for Flow Designer provides four frameworks that you can use to create machine-learning solutions in your instance. Each framework delivers a different solution type for training the system to predict, recommend, and organize data outcomes.

- Classification framework
- Similarity framework
- Clustering framework
- Regression framework

**Spoke requirements**

- A sharedservice.worker user to train solutions
- A pre-trained solution for your Predictive Intelligence framework
Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Predictive Intelligence (com.glide.platform_ml) plugin
- Predictive Intelligence Reporting (com.glide.platform_ml_pa) plugin

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
Predictive Intelligence for Flow Designer provides actions to make predictions using existing models without having to write or maintain script. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification</td>
<td>Obtain a predicted value from an active classification solution definition using multiple input records.</td>
</tr>
<tr>
<td>Batch Prediction</td>
<td></td>
</tr>
<tr>
<td>Classification Prediction</td>
<td>Obtain a predicted value from an active classification solution definition using a single input record.</td>
</tr>
<tr>
<td>Pi Confidence Check</td>
<td>Compare an output value (number) from Predictive intelligence with a number specified by the user. For example: Compare the confidence value of a prediction with a specified value.</td>
</tr>
<tr>
<td>Regression</td>
<td>Obtain a predicted value from an active regression solution definition using multiple input records.</td>
</tr>
<tr>
<td>Batch Prediction</td>
<td></td>
</tr>
<tr>
<td>Regression</td>
<td>Obtain a predicted value from an active regression solution definition using a single input record.</td>
</tr>
<tr>
<td>Prediction</td>
<td></td>
</tr>
<tr>
<td>Similarity Prediction</td>
<td>Obtain similar records that exist in the table specified by the user in their similarity solution definition.</td>
</tr>
</tbody>
</table>

Spoke user roles
Predictive Intelligence for Flow Designer provides these user roles to control access to data:

<table>
<thead>
<tr>
<th>User role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ml_admin</td>
<td>Grants access to all Predictive Intelligence features</td>
</tr>
</tbody>
</table>
**Related information**

# Visual Task Board (VTB) Spoke

Provides VTB actions for flow designers to manage the boards, lanes, cards, board members, and assignees.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
</table>
| Create Freeform VTB Action | Creates a Freeform VTB for any task type. The default lanes are: Todo, Doing, and Done. These lanes can be modified with actions: Add Lane, Rename Lane, Reorder Lane, and Delete Lane | • Name  
• Board Owner  
• Default view  
• Label visibility  
• Picker visibility  
• Background color | • Board record |
| Create Flexible VTB Action | Creates a Flexible VTB bound to a single Task table. The default lanes are: Todo, Doing, and Done. These lanes can be modified with actions: Add Lane, Rename Lane, Reorder Lane, and Delete Lane | • Name  
• Task table  
• Filter  
• Board Owner  
• Default view  
• Label visibility  
• Picker visibility  
• Background color | • Board record |
| Create Guided VTB Action | Creates a data-driven VTB bound to a single Task table along with the fields the lanes are derived.                                                                                                          | • Name  
• Task table  
• Land field  
• Filter  
• Board Owner  
• Default view  
• Label visibility | • Board record |
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
</table>
| Add VTB Member Action       | Add a user to a VTB. Only members of the VTB can access the board. Any VTB member can add other members. | • Board record  
• User record                                      | N/A            |
| Remove VTB Member Action    | Remove a user from a VTB. Only members of a VTB can access the board. Any VTB member can remove other members. | • Board record  
• User record                                      | N/A            |

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Steps</th>
<th>State</th>
</tr>
</thead>
</table>
| Add VTB lane                | Add a lane to a Freeform or Flexible VTB. This action does not apply to Guided boards, which are constrained to fixed lanes based on fields configured. | • Board record  
• Lane name                                              | • VTB lane record                                           |
| Rename VTB Lane             | Rename an existing lane on a Freeform or Flexible VTB.                       | • Lane record  
• New lane name                                              | N/A            |
| Reorder VTB Lane            | Reorder lanes on any VTB.                                                   | • Lane record  
• New lane name                                              | N/A            |
| Delete VTB Lane             | Delete an existing lane from a Freeform or Flexible VTB.                     | • Lane record                                              | N/A            |
## Card Management Actions

<table>
<thead>
<tr>
<th>Flow/Action</th>
<th>Description</th>
<th>Action Steps</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create VTB Card</td>
<td>Create a VTB card on a Freeform board for a task.</td>
<td>• Lane record</td>
<td>• Card</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Task record</td>
<td>record</td>
</tr>
<tr>
<td>Assign VTB Card</td>
<td>Assign a user to a VTB card.</td>
<td>• Card record</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• User record</td>
<td></td>
</tr>
<tr>
<td>Move VTB Card</td>
<td>Move a VTB card from one lane to another lane.</td>
<td>• Card record</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Lane record</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For Flexible boards, use the Update Record action to change the state of the underlying task. For Guided boards, this action changes the field on the task associated with that card.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Remove Assignee from VTB Card</td>
<td>Remove an assignee from a card.</td>
<td>• Card record</td>
<td>N/A</td>
</tr>
</tbody>
</table>

## Change a flow or action’s default title

Change the default title for a flow, subflow, or action by adding styled and dynamic text.

### Before you begin

Role required: admin, flow_designer, or action_designer

### Procedure

2. On the Flow Designer landing page, click New and then select Flow, Subflow, or Action from the list.
3. In the Flow Designer main header, click the more actions icon ( ...).

4. Click **Change default title**.

5. On the Change default title screen, enter a title.

   a. Use any combination of the following options to create a styled title:

<table>
<thead>
<tr>
<th>Text style</th>
<th>Example input for new title</th>
<th>Example output in Flow Designer environment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bold</td>
<td>A <em>bold</em> title</td>
<td><img src="image" alt="A bold title" /></td>
</tr>
<tr>
<td>Italic</td>
<td>An <em>italic</em> title</td>
<td><img src="image" alt="An italic title" /></td>
</tr>
<tr>
<td>Underline</td>
<td>An <del>underlined</del> title</td>
<td><img src="image" alt="An underlined title" /></td>
</tr>
<tr>
<td>Strikethrough</td>
<td>A <del>strikethrough</del> title</td>
<td><img src="image" alt="A strikethrough title" /></td>
</tr>
<tr>
<td>Title (bold and colored)</td>
<td>A #titled# title</td>
<td><img src="image" alt="A titled title" /></td>
</tr>
</tbody>
</table>
b. Add dynamically generated text for your title from an input, output, action, or action step by clicking the data pill picker (дается) and selecting the input, output, action, or action step that you want to include in your title.

Note: The value that is associated with the Label field for an input or output appears in the title.

6. Click Submit.

Results
When you change your action or subflow's default title, the new title appears in the Flow Designer environment.

Instance Scan
Use ServiceNow® Instance Scan to interrogate your instance for configurations that indicate health issues and identify opportunities to address best practices. Instance Scan checks your existing configurations and helps you avoid creating future configuration issues. Instance Scan is a tool that can be used as a part of your development operations, release management as well as pre- and post-upgrades.

<table>

Getting started with Instance Scan

If you are new to Instance Scan, read this overview to learn what the tool can do. Follow the tutorial to create checks and execute scans that uses most basics of Instance Scan features.

ℹ️ **Note:** Instance Scan doesn’t fully support domain separation. Findings are visibly domain separated based on the domain of the source record. For more information see Domain separation.

### Instance Scan record and components

#### Checks

Checks are singular focused rules that detect anomalies or opportunities in an instance. These checks can run against tables, records, or metadata. Checks are defined to identify security, upgrade best practices, manageability, user experience and performance vulnerabilities. See Getting started with checks for more information.

#### Results

A Instance Scan result reports the status and type of the scan. See Results for more information.

#### Findings

A finding is a reference to a record that has violated a rule from a check on the instance. See Findings for more information.

#### Dashboard

The Instance Scan dashboard is a system-wide visual representation of the health of your instance. The dashboard helps you manage and analyze the full scan results against your instance. See Instance Scan dashboard for more information.

#### Quota rule

A quota rule determines the execution threshold of a scan. Quota rule prevents the instance from running long scans. For example, any scan running longer than the threshold set by the quota rule will result in a failure. See Quota rules for more information.

### Scan types

Instance Scan deals with the following types of scans.

- **Full scan**
Execute a scan for the entire instance by clicking **Execute Full Scan**. Implementing a full scan runs all the active checks present in your instance.

**Point scan**

Execute all applicable checks against a single record, update set, or an application by selecting **Run Point Scan**. For example, if you execute a point scan against a business rule, only the checks that are applicable to the business rule table run, and only that single target record is scanned. If you execute an update set scan or an application scan, all records related to that update set or application are scanned. See **Execute an app scan** and **Execute an update set scan** for more information.

**Test scan**

Execute a test scan to verify if the check works as expected. The test scan enables you to test a single check instead of a full scan by selecting a single check and clicking **Test Check** on the Check form.

**Roles**

Instance Scan has the following roles.

- **scan_user**
  
  The scan_user role can run different types of scans and view the findings and results.

- **scan_admin**

  The scan_admin role has access to everything in the Instance Scan instance. It can also create and modify checks except the default ones.

**Getting started with checks**

Checks are singular focused rules that detect anomalies or opportunities in an instance. These checks can run against tables, records, or metadata. Checks are defined to identify security, upgrade best practices, manageability, user experience and performance vulnerabilities.

**Check types**

You can create your check by selecting one of these types.

- **Table Check**
Create a check by selecting Create a new Table Check if you know which specific table and conditions you want to test. This check type is applied on only one table at a time. You can also include your own script for more complex capabilities by selecting the Advanced option on the form.

Column Type Check
Retrieve all records containing a specific column field type from all tables in an instance by selecting Create a new Column Type Check. The Column Type Check type implements the rule you created to iterate all records matching the target column field type.

Script Only Check
Create a check without specifying a table or a column type by selecting Create a new Script Only Check. You can verify meta data, configurations, and execute complex checks by writing your own script.

Linter Check
Create a linter check to identify any issues in a script. When a linter check is run on a record, an abstract syntax tree for its code is generated. You can use the abstract syntax tree to analyze issues with the code.

Create a check
Create your own checks by implementing the following procedure.

Before you begin
Role required: scan_admin

Procedure
1. Navigate to Instance Scan > Checks.
2. Select New from the Checks context menu. The Check Interceptor list appears.
3. Select one of the available types of checks. See Check types, for more information.

Note: If you want to update an existing check, the Version field increments itself. The new version provides you a change history. You can also know which particular version of the check ran with a given scan.
Create a table type check

Create a check by selecting **Create a new Table Check** if you know which specific table and conditions you want to test. This check type is applied on only one table at a time. You can also include your own script for more complex capabilities by selecting the **Advanced** option on the form.

**Before you begin**

Role required: scan_admin

Before performing this task you must complete **Create a check**.

**Procedure**

1. Select **Create a new Table Check**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Fields</th>

<td>The script that executes against each record that matches the condition in the defined table.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field shows up only if the Advanced check box is selected.</td>
</tr>
</tbody>
</table>

Create a column type check

Retrieve all records containing a specific column field type from all tables in an instance by selecting **Create a new Column Type Check**. The **Column Type Check** type implements the rule you created to iterate all records matching the target column field type.

**Before you begin**
Role required: scan_admin
Before performing this task you must complete Create a check.

Procedure
1. Select Create a new Column Type Check.
   A New record form appears.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the check record.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that has the check record.</td>
</tr>
<tr>
<td>Category</td>
<td>Category of the check record.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority at which the findings should be resolved.</td>
</tr>
<tr>
<td>Version</td>
<td>Current version of the check record.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate this check record.</td>

<tr>
<td>Short Description</td>
<td>Mandatory description about the check records.</td>
</tr>
<tr>
<td>Description</td>
<td>Additional information about the check records.</td>
</tr>
<tr>
<td>Resolution Details</td>
<td>Guideline to avoid check to go off against one or more tables.</td>
</tr>
<tr>
<td>Column Type</td>
<td>Column type queried for this check.</td>
</tr>
<tr>
<td>Documentation URL</td>
<td>Documentation link for the check details.</td>
</tr>
</tbody>
</table>

Note: If you want to update an already existing check, the Version field increments itself.

Note: A scan_user can't edit the Documentation URL field.
### Create a script only check

Create a check without specifying a table or a column type by selecting **Create a new Script Only Check**. You can verify meta data, configurations, and execute complex checks by writing your own script.

**Before you begin**

Role required: scan_admin

Before performing this task you must complete Create a check.

**About this task**

The script only check runs only during a full scan and executes only once during a scan.

**Procedure**

1. Select **Create a new Script Only Check** from the Check Interceptor list.
2. On this form, fill in the fields.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the check record.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that has the check record.</td>
</tr>
<tr>
<td>Category</td>
<td>Category of the check record.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority at which the findings should be resolved.</td>
</tr>
<tr>
<td>Version</td>
<td>Current version of the check record.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate this check record.</td>
</tr>
</tbody>
</table>

**Note:** If you want to update an already existing check, the **Version** field increments itself.
### Fields

---

## Create a linter check

Create a linter check to identify any issues in a script. When a linter check is run on a record, an abstract syntax tree for its code is generated. You can use the abstract syntax tree to analyze issues with the code.

### Before you begin

**Role required:** scan_admin

Before performing this task you must complete Create a check.

### Procedure

1. Select **Create a new Linter Check**.
2. On the form, fill in the fields.

### Linter Check form

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the check record.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that has the check record.</td>
</tr>
<tr>
<td>Fields</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Category</td>
<td>Category of the check record.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority at which the findings should be resolved.</td>
</tr>
<tr>
<td>Version</td>
<td>Current version of the check record.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: If you want to update an already existing check, the Version field increments itself.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate this check record.</td>
</tr>
<tr>
<td>Short Description</td>
<td>Mandatory description about the check records.</td>
</tr>
<tr>
<td>Description</td>
<td>Additional information about the check records.</td>
</tr>
<tr>
<td>Resolution Details</td>
<td>Guideline to avoid check to go off against one or more tables.</td>
</tr>
<tr>
<td>Documentation URL</td>
<td>Documentation link for the check details.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: A scan_user can't edit the Documentation URL field.</td>
</tr>
<tr>
<td>Run Condition</td>
<td>Boolean field that determines if the check should be run.</td>
</tr>
<tr>
<td>Script</td>
<td>The script that executes against each record that matches the condition. By default, this field has an engine object to use. This engine object contains other objects like engine.finding which you can call engine.finding.increment() to manually increment the Count field on that specific finding. Another object is engine.current which is the</td>
</tr>
<tr>
<td>Fields</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>current GlideRecord that the check would be viewing when running.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** This is new to Quebec release, where previously you would call `finding` and `current` directly.

### Advanced linter check scripts

Linter check scripts helps you in writing checks that look for issues in scripts. When a linter check is run on a record, it provides an abstract syntax tree for its code. You can use this abstract syntax tree to analyze issues with the code such as too many nested if statements or usages of slow API in a while loop.

### Linter check usage

Linter checks have a unique object to use called `rootNode`. This is the root node of the parsed abstract syntax tree (AST) for the script of the current record. This object has many functions, but the `visit` function is the most important. The `visit` function takes a callback function as a parameter which gets called on every node of the tree. The callback function then takes a node as a parameter which represents the current node during its iteration. You can return false from the callback function to stop iterating the tree early, otherwise it keeps visiting every subnode in the tree of the node you called `visit` on.

For example, if you want to scan for a deprecated API called `badFunction()`. You can write a Linter Check with a script in the following example:

```javascript
(function(engine) {
  engine.rootNode.visit(function(node) {
    if (node.getTypeName() === "NAME" &&
        node.getNameIdentifier() === "badFunction" &&
        node.getParent().getTypeName() === "CALL") {
      engine.finding.incrementWithNode(node);
    }
  });
})(engine);
```

When you run a scan with this Linter Check, it checks every record in the scan with a script field. For example, if a record in that scan has a script that looks like the following, the scan picks up a finding for this record.

```javascript
/*
badFunction()
*/
```
Node functions
The following is a list of available functions to call on the node object.

- `getRootNode()`: Get the root node of the tree for this node
- `getParent()`: Get the parent of this node
- `getLineNo()`: Get the line number location for this node
- `getColumnNo()`: Get the column number location for this node
- `toSource()`: Get the source for this node. The source is based on this node and its children
- `getTypeName()`: Get the node type name of this node. For example, a function call in source is tokenized as a node with the type name of "CALL"
- `getNameIdentifier()`: If the node type of this node is "NAME", then return the identifier, which is the string value of the name itself. A "NAME" node represents a simple name that is not a keyword, like a function name or a variable name.

ℹ️ Note: If this node is not a NAME node, then the result is null.
- `getAbsolutePosition()`: Get the absolute position of this node. The absolute position is the number of characters from the start of the script to this node
- `compareTo(other)`: Compare this node with another node. The node with a greater absolute position and length will be the larger in comparison. `other` is a node to compare with this node
- `visit(callbackFunction)`: Visit each node in the subtree starting from this node and execute the given callback function on each node. `callbackFunction` is a function that will be executed on each node in the subtree of this node. This
callback function takes a LinterCheckAstNode as a parameter which is will be the node being visited

- `debugPrint()`: Returns a string representation of the abstract syntax tree, starting from this node. Each line contains information about a node, and the indentation represents the hierarchy relationship between the nodes. The information in each line is arranged as follows
  1. Absolute position
  2. Node type name
  3. Position relative to parent
  4. Length
  5. Name identifier (if a NAME node)

For more information, see LinterCheckAstNode API - Scoped, Global.

**Suites management**

A suite is a collection of individual checks and suites that can be used for a scan. Suites can be created for specific business needs. All child suites are executed when a parent suite is used in a scan.

Navigate to **Instance Scan > Suites**. Select one of the suites from the list. Click **Execute Suite Scan** to run a suite scan. See **Execute a suite scan** for more information.
Note: Some ServiceNow provided suites are protected suites and the checks in the suite are not modifiable. For example, if you have a suite from the app store, the suite is unmodifiable.

Note: You can't add a child suite to the unmodifiable suite. But you can add a parent suite because it doesn't affect the suite.

Create a check suite
Create a check suite to bundle a group of checks into a suite and execute it.

Before you begin
Role required: admin

Procedure
1. Navigate to Instance Scan > Suites. A list of suites shows up.
2. Click New to create a new suite.
3. Fill up the details on the new suite record.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the suite</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the suite</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate this suite</td>
</tr>
<tr>
<td>Description</td>
<td>Information about the suite</td>
</tr>
</tbody>
</table>

4. Click Submit to create a new check suite.

Note: The suites that you create are completely modifiable. You can modify the checks in the suite and can also add child and parent suites.

Execution and scheduling of scans
Execute the different kinds of scans that Instance Scan offers to keep a check on the health of your instance. You can also schedule a full scan so you can ensure the health of your instance even without an active session.

Note: Instance Scan scans only customized records, but point scan scans all records including the default records.
**Execute a point scan**

Execute all applicable checks against a single record, update set or an application by selecting **Run Point Scan**.

**Before you begin**
Role required: admin

**About this task**
For example, if you execute a point scan against a business rule, only the checks that are applicable to the business rule table run, and only that single target record is scanned. If an update set scan or an application scan is executed, all records related to that update set or application are scanned.

**Procedure**

1. Navigate to **Instance Scan > Checks**.
2. Navigate to the record in a table applicable for point scan.
   - **Note:** The **Run Point Scan** related link appears in the UI only for applicable records.
3. Scroll down to the **Related Links** section.
4. Click the **Run Point Scan** related links.
   - **Note:** The **Run Point Scan** related link is available only if all the following conditions are true.
     - Available checks that are applicable to the record
     - The user has read access to the record
     - The record is on a table that extends sys_metadata
     - The role of the user must be scan_user
     - The system property `glide.scan.enable_point_scan_ui_action` must not be false

   The progress tracker appears showing the status of the scan.

5. Click **Go to Result**.
   The Scan Result record appears.
6. Click **Checks** related list to look at the findings.
   If you want to review the failure reasons, click **Failures** related list.

**Results**
A scan of all applicable checks against only a single record is executed.
Execute an update set scan

Use update set scan to execute applicable checks against records that are affected by the update set.

Before you begin
Role required: admin

Procedure
1. Navigate to System Update Sets > Local Update Sets.
2. Select the desired update set from the list.
3. Click Scan Update Set from the Related Links list.

Execute an app scan

Scan the installed files of an application as well as the application record itself with applicable checks by executing an application scan.

Before you begin
Role required: admin

About this task
For example, if the application installs a business rule, checks that are relevant to sys_script table are executed against that business rule. To trigger an application scan, go to the record of the application you desire to scan and select Scan Application form link UI action.

Procedure
1. Navigate to System Application > All Available Applications > All.
   A list of all available applications and plugins appears.
2. Click the menu icon of the desired application.
3. Select Go to application option from the menu icon.
   
   Note: The Go to application option appears only if the selected application is not a plugin.
4. Click Scan Application to run app scan.

Execute a test scan

Execute a test scan to verify if the check works as expected. The test scan enables you to test a single check instead of a full scan by selecting a single check and clicking Test Check on the Check form.
**Before you begin**  
Role required: admin

**Procedure**

1. Navigate to **Instance Scan > Checks**.  
   A list of checks appears.

2. Open the check record you want to test from the list.

3. To start the test, click **Test Check**.  
The status of the scan appears in the progress tracker. The **Findings** module in the application navigator shows the number of records found from running the check test.

**Execute a full scan**

Execute a scan for the entire instance by clicking **Execute Full Scan**. Implementing a full scan runs all the active checks present in your instance.

**Before you begin**  
Role required: admin

**Procedure**

1. Navigate to **Instance Scan > Checks**.

2. To run all the active checks in your instance, click **Execute Full Scan**. The progress tracker shows the status of the scan.

![Execute Full Scan](image)

**Note:** Running of multiple full scans simultaneously is not allowed. If two or more checks overlap during full scan execution, only the first check succeeds. The first check keeps running while the other overlapping checks fail immediately.

3. To find the **Result Number** and the number of checks that ran as part of the full scan, click **Go to Result**.
4. Optional: From the related list click **Checks** to view the list of all the checks that ran as a part of the full scan.

5. Optional: From the related list click **Errors** to review the errors encountered during the full scan.

**Results**
A scan of the whole instance is executed.

**Schedule a full scan**
Create a schedule to regularly trigger a full scan even when you don’t have an active session. A schedule creates an established baseline for the health of the instance and provides a comparison to configuration and instance health over time.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to **Instance Scan > Checks**.
2. Click **Schedule Full Scan**.
3. On the Trigger full scan form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the check record.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to execute the scan at a scheduled time.</td>
</tr>
<tr>
<td>Application</td>
<td>Application where the job belongs.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Option to select conditions under which the scan runs.</td>
</tr>
<tr>
<td>Run</td>
<td>List used to select the scheduling of full scan.</td>
</tr>
<tr>
<td>Run this script</td>
<td>Selection to run the default script.</td>
</tr>
<tr>
<td>Update</td>
<td>The script that is updated for full scan.</td>
</tr>
<tr>
<td>Execute Now</td>
<td>The default script that is executed for full scan.</td>
</tr>
</tbody>
</table>
4. To run the full scan click **Execute Now**.
   A list of findings is displayed.

5. From the application navigator, select **Results**.
   The status of the execution is displayed along with the **Result Number**.

6. To display the list of findings, select the **Result Number**.

7. **Optional:** From the application navigator, select **Dashboard** to display data about the findings.

**Results**
A schedule to trigger a full scan regularly even without an active session is created.

**Execute a suite scan**
Execute suites of available checks against a specific target to have targeted scan results by clicking **Execute Suite Scan**.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to **Instance Scan > Suites**.
   A list of all suites displays.

2. Select one of the suites from the list.
   The form for the selected suite displays.

3. Click **Execute Suite Scan**.
   The **Scan Suites Now** modal displays.

4. Select a target for the scan.
• **Full Instance**: Scans all the available records in the instance.
• **Scoped App**: Scans selected scoped apps. You can select multiple scoped apps.
• **Update Set**: Scans multiple update sets.

5. Click **Execute Scan**.

⚠ **Note**: If a record is inactive, the checks don’t generate any findings for that record.

**Schedule a suite scan**

Create a schedule to regularly trigger a suite scan even when you don’t have an active session.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to **Instance Scan > Suites**.
   A list of suites displays.
2. Select a suite from the list to schedule a suite scan.
3. Click **Schedule related list**.
   A list of scheduled scans displays.
4. Click **New** to create a schedule for the suite scan. The **Schedule Suite Scan** modal displays.

5. Select a target for the scan.
   - **Full Instance**: Scans all the available records in the instance.
   - **Scoped App**: Scans selected scoped apps. You can select multiple scoped apps.
   - **Update Set**: Scans multiple update sets.

6. Click **Schedule**

   ![Schedule Suite Scan modal](image)

   ![Scheduled Scan form](image)

   **Note**: If a record is inactive, the checks don’t generate any findings for that record.

   The **Scheduled Scan** form displays.

7. On the form, fill in the fields.

   **Linter Check form**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the scheduled scan.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that has the record.</td>
</tr>
<tr>
<td>Fields</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>Combo</td>
<td>References a record which has a list of sources and a list of targets to run the scan against.</td>
</tr>
</tbody>
</table>
| Run | Frequency at which the scan should be scheduled to run.  
  • Daily: Scan is scheduled to run daily.  
  ◦ Time: The time at which the scan is scheduled to start daily.  
  • Weekly: Scan is scheduled to run weekly.  
  ◦ Day: The day in the week on which the scan is scheduled to start weekly.  
  ◦ Time: The time at which the scan is scheduled to start.  
  • Monthly: Scan is scheduled to run monthly.  
  ◦ Day: The day in the month on which the scan is scheduled to start monthly.  
  ◦ Time: The time at which the scan is scheduled to start.  
  • Periodically: Scan is scheduled to run periodically.  
  ◦ Starting: Date and time at which the scan is scheduled to start.  
  ◦ Repeat interval: Date and time at which the scan has been scheduled to repeat.  
  • Once: Date and time at which the scan is scheduled to start.  
  • On Demand: Scan is not scheduled to run and runs only manually when **On Demand** option is chosen for the **Run** field. |
### Fields | Description
---|---
Business Calendar | Business calendar time of the user to schedule the scan run either at the beginning of that period or at the end, depending on their selection.
Active | Option to activate the record.
Conditional | Option to write your own script condition, which is always verified before scheduled scan runs.
Run as | User role used to run the scan.
Run as tz | Timezone used to run the scan.

8. Click **Submit**. The scan that has been scheduled displays under Schedule related list.

### Progress status of a scan
You can check the progress status of a scan by checking the progress tracker.

**Before you begin**
Role required: admin

**Procedure**

1. Navigate to Instance Scan > Checks. A list of checks appears.
2. Run the required scan. The progress tracker displays the status of the scan run. You can close the progress tracker and view it later without having to stay in the modal for the execution to complete. To see the status later, go to **Results** in the application navigator. Select the required scan results record to review its status.
3. To see the status of the scan, click **Go to Result**. If the scan completes, a list of findings is displayed. You can also find all the checks that ran as a part of the scan by clicking the Checks related list. If any of the checks fails, click Failures related list to review them. If the full scan takes some time to complete, you can check the status by selecting **Results** from the application navigator.
Execute a reactive scan

Execute a reactive scan to set up a scan that runs automatically on an execution tracker failure.

Before you begin
Role required: admin

About this task
For many failed processes on your instance, you can find a corresponding record on the execution tracker. The progress window shows the status of the test. If a process fails on an execution tracker, Instance Scan can watch for that failure on the progress status and run a scan automatically.
The **Trigger Type** in the Scan Trigger form should match the **Source Table** field on the sys_execution_tracker record of the failed process to enable the connection between the two. For example, if the failed test is in the Update Sets list, you can set up the **Trigger Type** as sys_update_set. This enables Instance Scan to be connected to the execution tracker test failure.

Procedure

1. Enter scan_trigger_list.do in the left navigation window.
   A list of scan triggers shows up.
2. Select the required trigger from the list to update it.

   Note: The **Trigger Type** is based out of table names. You can also create a custom trigger type in your codes.

![Scan Trigger](image)

The reactive scan is now set up to automatically scan the execution tracker of the failed process which appears on the scan results table.
Reviewing of scans

After the scans have been executed, you can review them with the findings and results components.

- **Results**: An Instance Scan result reports the status and type of scan. You can also see all the checks that ran as part of the scan and all other information related to the scan such as errors and scan logs. Use Scan Results dashboard to get detailed information about an executed scan.

- **Findings**: A finding is a reference to a record that has violated a check which was used in a scan. You can also mute a finding if you don’t want a finding to be reported in the next scan.

**Results**

An Instance Scan result reports the status and type of scan. You can also see all the checks that ran as part of the scan and all other information related to the scan such as errors and scan logs.

On clicking Go to Result from the progress tracker of a scan, the Scan Result is identified by a Result Number. Click Results Dashboard to view the scan results.

The Scan Type field states the type of scan that was executed. The Status field shows the status of the scan which can either be In progress, Complete or Failed. The Execution Time field shows the duration of the scan in milliseconds.

There are the following related lists in the Scan Result form.

- **Scan Findings**: The Scan Findings related list shows up all the findings encountered during the execution of the checks.

- **Suites**: The Suites related list shows up all the suites that ran as part of the scan.

- **Checks**: The Check related list shows all the checks that ran as part of the scan.

- **Failures**: The Failures related list shows all the checks that failed during the execution of the scan. It also shows up the reason of its failure in the form of an error message.

- **Scan Log**
The Scan Log related list shows up messages encountered during the entire scan.

**Scan Statistics**

The Scan Statistics related list shows up

**Target**

The Target related list shows all the targets against which the checks have executed.

**Scan results**

Scan Results dashboard helps you with an overview of all details of an executed scan.

Navigate to **Instance Scan > Results**. Select a scan result from the Scan Results list. Click Results Dashboard link on the Scan Result form.
Click **Rescan** to execute the same scan again. If you want to see all the findings grouped by checks, click **Findings** at the top right corner.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Previous Scan</td>
<td>Details about the previous scan.</td>
</tr>
<tr>
<td>Fields</td>
<td>Description</td>

<tr>
<td></td>
<td><strong>Note:</strong> Only the top 5 user names appear on the list. Click <strong>View All</strong> to view all the findings grouped by users.</td>
</tr>
</tbody>
</table>

If a scan is in progress and at least one of the checks fails, the following warning message shows up.

⚠️ You are viewing the results of a failed scan. Click **here** to review the details.

**Findings**

A finding is a reference to a record that has violated a rule from a check on the instance. You can find the source record and the number of times the record triggered rules of a given check.
Each finding is specific to a result and each result is specific to a scan that has been executed.

**Note:** When you run a scan, you definitely get a result of the scan but might not get any findings. There might be no findings encountered during the execution of the checks.

**Note:** If a record is inactive, the checks don't generate any findings for that record.

The Scan Finding gives information about the check that has been violated by a record. The **Source Table** and **Source** fields point to the record that has violated a rule from a check during the execution. You can find more information about the record by clicking the information icon. The **Count** field shows the number of times the record has violated the check rules. The finding also shows the version of the check that generated the finding. The **Product Family** field shows you the product family for each check. The **Task** field helps you to assign a task to an individual or a group. See [Creating scan tasks](#) for more information. If you want to avoid a finding from being generated from any future scans, use the **Mute Rule**.

**Note:** If you use the **Mute Rule**, you must also select a reason for muting the finding.

**Mute a finding**

Mute a finding on the Scan Finding form to avoid the finding from being reported in the later scan results.

**Before you begin**
Role required: admin

**Procedure**

1. Navigate to **Instance Scan > Results**. A list of Scan Results shows up.
2. Select the scan result you ran from the list. The Scan Result form for the scan shows up.
3. Select the Scan Findings related list. A list of findings for the scan shows up.
4. Use the information icon to open the finding you want to mute.
5. Click **Mute** to avoid the finding from being reported in the next scan.
Note: The Select Mute Reason modal shows up only if you click Mute on the Scan Finding form.

6. Select the reason for muting the finding and then click Mute on the modal.

Note: Click Unmute if you want the finding to be reported in the later scans. The Unmute button is visible only when you have muted a finding.

Creating scan tasks
Create a scan task to facilitate task assignments from the finding of a record.

Before you begin
Role required: scan_user

Procedure
1. In the navigation filter, enter scan_task_list.do.
2. Click New to create a new scan task.
   The Scan Task form appears.
3. Fill in the following fields in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Auto-generated task number</td>
</tr>
<tr>
<td>Assigned to</td>
<td>Person responsible to work on the task</td>
</tr>
<tr>
<td>Assignment group</td>
<td>Group responsible to work on the task</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate task</td>
</tr>
<tr>
<td>State</td>
<td>State of the task.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• New</td>
<td></td>
</tr>
<tr>
<td>• In Progress</td>
<td></td>
</tr>
<tr>
<td>• On Hold</td>
<td></td>
</tr>
<tr>
<td>• Resolved</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Short description</th>
<th>Brief description about the task</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Description</th>
<th>Additional information about the task</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Work notes</th>
<th>Additional notes</th>
</tr>
</thead>
</table>

**Note:** The scan_user can assign the task only to a non-scan_user. The user to which the task has been assigned also gets the same privilege as the scan_user.

### Instance Scan dashboard

The Instance Scan dashboard is a system wide visual representation of the health of your instance. The dashboard helps you to manage and analyze the results of full scan against your instance.

The dashboard offers several options to filter your search results to find the exact check finding that might be causing some issues. The **Instance Scan Category** is the filter picker that shows all the categories of all the checks that were scanned. You can select the type of scan category that you want the dashboard to display as a part of the scan results. **Instance Scan Priority** helps you to select the priority level of the results to decide which scan results must be addressed first. This priority level is often referred to as the rating level of the scans.
Note: The dashboard is only applicable for full scans. The **Instance Scan Category** is only available if you have data or a finding in the result set that are applicable to the categories.

For example, you can use the dashboard to compare the results of the check findings. If you see a sudden change in the number of check findings, select the particular scan result from the Scan Results List.

You can review all the findings for the scan that generated an unexpected number of findings. This list displays all the findings that are related to one or more of all the scans.
You can also directly select the column with the required findings to display the related list for a particular scan.

The list also indicates the source from which the finding has been retrieved. You can export the list view data to an external source such as a .csv file or an .xlsx file for further performance comparison and analysis.

**Implement the Instance Scan dashboard**

Compare and analyze the results of the scans in your instance by representing it on the premium Performance Analytics (PA) dashboard.

**Before you begin**
You’ve created some checks to execute the full scan. See Create a check and Execute a full scan for more information.

Role required: admin.

**Procedure**

1. Navigate to **Instance Scan > Dashboard**.
2. Select an option from the **Instance Scan Category** or **Instance Scan Priority** list.

   **Note:** The dashboard is applicable only for full scans. The **Instance Scan Category** appears only if you have data or a finding in the result set that are applicable to the categories.

3. Select the scan result from the Scan Results list that generates an unexpected number of check findings.
   A related list of findings related to only that scan is expanded.
4. Optional: Select the scan column directly from the dashboard to display the related list of checks.
The related list of checks appears. The list also indicates the source that the finding has been retrieved from.

**Results**

A dashboard showing the results of scans is created.

**Instance Scan table cleanup policies**

Instance Scan offers table cleanup policies to erase previous scan results. The cleanup policies are based on the time that the scans are created. The timer starts when you run a scan. **Table Cleanup** is run against the Auto Flushes [sys_auto_flush] table and cleans up the previous scan results.

- If the result records are older than 90 days (**7,776,000** seconds), the first policy clears all scan result records and related records.
- If the following conditions are true, the second policy deletes all scan result records and related records.
  - The **Scan type** is **Test Scan**.
  - The records are older than 14 days, and **Age in seconds** is equal to or greater than **1,209,600** seconds.
You can also modify these policies by entering any customized time period. See Customize table cleanup policies, for more information.

**Customize table cleanup policies**

Clean up previous scan results at a regular interval by customizing the table cleanup time period.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **Instance Scan > Table Cleanup**.
2. Select one of the cleanup policies from the Auto Flushes list.
3. Customize the **Age in seconds** field as required.
4. To save the customized table cleanup policy, click **Update**.

**Timeout threshold**

A timeout determines the execution threshold of a scan from running long scans. For example, any scan running longer than the set time period results in a failure. If the scan or the check takes longer than the set time period set by the quota rule, an error message appears.

ℹ️ **Note:** By default the scans are limited to three hours and individual checks are limited to 10 minutes.

To learn how to configure these thresholds, see Implement a scan timeout threshold and Implement a check timeout threshold.

**Implement a scan timeout threshold**

Set the execution time of a single scan by implementing **Transaction Quota Rules**. Setting of a quota rule prevents your instance from running a long scan.
Before you begin
Role required: admin

Procedure
2. To set a definite execution time, select Scan timeout.
3. Enter the definite execution time in the Maximum Duration (seconds) field and click Update.

⚠️ Note: The minimum allowed timeout threshold is 5 seconds. If you set the timeout to anything less than 5 seconds, the system still considers it to be 5 seconds. By default, it has been set to 10,800 seconds.

The scan fails if the execution time exceeds the set timeout. For more information on the type of scan you want to run, see Execution and scheduling of scans for more information on the type of scan you want to run.

Implement a check timeout threshold
Set the execution time of an individual check by implementing timeout system property. Setting of a timeout threshold prevents your instance from running a long check.

Before you begin
Role required: admin

Procedure
1. In the navigation filter, enter sys_properties.list.
2. From the System Properties list, select glide.scan.process_check.time_out.

⚠️ Note: If glide.scan.process_check.time_out is not present in the list, see Create a new check timeout system property for more information.
3. In the Value field, set the execution time for the check in seconds.

⚠️ Note: The minimum allowed timeout threshold is 5 seconds. If you set the timeout to anything less than 5 seconds, the system still considers it to be 5 seconds. By default, it has been set to 10,800 seconds.

Results
A timeout threshold for a check is set by the user. Individual checks will be cancelled after the set time threshold exceeds.
Create a new check timeout system property

Create a new timeout threshold property for a check if the `glide.scan.process_check.time_out` system property is not present. Setting of a timeout threshold prevents your instance from running a long check.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. Click **New** to create a new timeout system property.
3. In the **Name** field, enter `glide.scan.process_check.time_out`.
4. In the **Value** field, enter the check execution time in seconds.

   ✪ **Note:** The minimum allowed timeout threshold is 5 seconds. If you set the timeout to anything less than 5 seconds, the system still considers it to be 5 seconds. By default, it has been set to 10,800 seconds.

HTTP Response Headers

A response header is a simple name-value pair used in an HTTP response to provide additional information about page content or how the client should process it.

You can configure HTTP response headers for all, or specific types of pages, which include Service Portal, UI Page, or UX applications. The ability to configure and pass response headers enables special handling of the page content by a client, most typically a browser.

To learn more about what an HTTP header is, and about configuring the name-value pair for specific HTTP response headers, see:

- Configure HTTP response headers

When configuring response headers, you must look at the definition for the HTTP header to determine how the client would handle the page content.
• For example, you configure an HTTP header for a specific page or all the pages with a Content-Security-Policy: frame-ancestors ‘self’ https://www.servicenow.com.

• When you invoke the page in a browser such as Chrome, you can review it in the Response Headers section of Chrome Developer Tools.

To learn more about how browsers handle a page with frame-ancestors, see https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Content-Security-Policy/frame-ancestors.

⚠️ **Warning:** When using URLs with custom name-value pairs, proceed with caution because there is a potential security risk when doing so. The signed security amendment to the Now Platform contract has implied security. You may potentially or accidentally override it when you use custom name-value pairs in the resulting URLs.

• If you want to entirely disable HTTP response header configuration functions, set the `glide.http.headers_config.enabled` property to `false`.

• Once you set it to false, Now Platform does not use any of the header configurations you defined in the `sys_response_header` table.

**Special handling of the Content-Security-Policy: frame-ancestor header**

Normally, the Now Platform automatically includes the X-Frame-Options: SAMEORIGIN header.

• It supports use of this header in all types of browsers, based on the setting of the `glide.set_x_frame_options` global property, which is enabled by default.

• When you configure a page with a Content-Security-Policy: frame-ancestor ‘self’ URL1 URL2 header, the Now Platform does not automatically include
the X-Frame-Options: SAMEORIGIN header. Excluding it prevents the browser from being confused, because Content-Security-Policy: frame-ancestor 'self' already has a similar effect.

**Special handling of Content-Security-Policy: frame-ancestor header for Internet Explorer**

Using the Content-Security-Policy: frame-ancestor 'self' URL1 URL2 header enables you to configure multiple URL sources to include the page from within an iFrame rendered from a third-party site. However, Internet Explorer does not support this type of header.

- Instead, the Internet Explorer only supports the X-Frame-Options: ALLOW-FROM URL (ALLOW-FROM) directive in this header, although the restriction is for a single host URL.
- If you configure the frame-ancestor 'self' URL1 URL2 header, and Internet Explorer is in use, the Now Platform automatically uses the X-Frame-Options: ALLOW-FROM URL (ALLOW-FROM) header instead.

If the Internet Explorer request includes the referrer URL header:

- It attempts to match it with the host URLs (full or wildcard http://*.example.com type URL format only) configured in the Content-Security-Policy: frame-ancestor 'self' URL1 URL2 header.
- If there is a match, include the matched URL as X-Frame-Options: ALLOW-FROM URL1.
- If there is no referrer header, it uses the first non-wildcard based host URLs configured in the Content-Security-Policy: frame-ancestor 'self' URL1 URL2 header.

**Note:** When configuring URLs, do not include a forward slash at the end of the URL.

- This example of an incorrect configuration that may not work properly with this special handling:
  
  Name: Content-Security-Policy
  
  Value: frame-ancestors 'self' https://microsoft.com/

- Use this correct syntax instead:
  
  Name: Content-Security-Policy
  
  Value: frame-ancestors 'self' https://microsoft.com
Related information

- Control request and response content type
- Cache-Control HTTP header value
- Content-Security-Policy: frame-ancestor 'self' URL1 URL2
- X-Frame-Options: SAMEORIGIN
- X-Frame-Options: ALLOW-FROM URL

Configure HTTP response headers

Configure standard name-value pairs for HTTP response headers. You designate if the configuration applies to all pages, or to specific types (Service Portal, UI Page, or UX application record).

Before you begin
Role required: An elevated access security_admin role is required to configure an All Pages type header. An admin role is required to configure a Specific Type header.

Procedure

1. In the Navigator pane, type sys_response_header.list.
2. Click New.
3. Fill in the fields on the form.

<table>
<thead>
<tr>
<th>HTTP Response Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box that designates that this HTTP response header configuration is active.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for this record.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Type of record the HTTP response header configuration applies to.</td>
</tr>
<tr>
<td>Specific Type</td>
<td>HTTP response header configuration is for the specific type and record you select in the Type and Record fields.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>All Pages</strong></td>
<td>HTTP response header configuration is for all pages and record types.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Only users with an elevated access privilege security_admin role can configure HTTP response headers for the All Pages type header.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of record the HTTP response header configuration applies to.</td>
</tr>
<tr>
<td><strong>Service Portal [sp_portal]</strong></td>
<td>Records related to the Service Portal.</td>
</tr>
<tr>
<td><strong>UX Application [sys_ux_page_registry]</strong></td>
<td>Standard UX applications in the Now Platform.</td>
</tr>
<tr>
<td>Record</td>
<td>Specific record the HTTP response header configuration applies to. To select a record:</td>
</tr>
<tr>
<td><strong>a.</strong></td>
<td>Click the Search (🔍) icon to access the Select the document form.</td>
</tr>
<tr>
<td><strong>b.</strong></td>
<td>In the Table name field, the default is the type you selected in the Type field. Do not change it.</td>
</tr>
<tr>
<td><strong>c.</strong></td>
<td>In the Document field, select the record from the table.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Name | Name you want to assign to the name-value pair for the HTTP response header.
Value | Value you want to assign to the name-value pair for the HTTP response header.
Description | Detailed description for the HTTP response header.

**d. Click OK.**

You can only access this field if you selected **Specific Type** in the **Applies to** field.

4. **Click Submit.**

**HTTP header configuration for advanced users**

The HTTP response header table (sys_response_header) in the List view contains two additional columns - **Add by** and **Order**.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
</table>
| Order | Adds a default integer order value to a header configuration regardless of the type of header (**All Pages** or a **Specific page**).  
  - When a specific page request takes place, both of the header types are interleaved based on the **Order**.  
  - The net headers, regardless of the type, are sorted first, based on the **Order** and added to the response based on the ordered header list.  
| Add By | Contains the following values:
### Column Description

<table>
<thead>
<tr>
<th>Append</th>
<th>(Default value) This option is relevant when multiple headers with the same name are configured. In this case, they are both added to the HTTP response header.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overwrite</td>
<td>This option is relevant when the same header (a header with the same name) is attempting to add twice in the ordered header list (see Order description). The header with the higher order and with an Overwrite selection in Add By overwrites the same header trying to be set with a lower order.</td>
</tr>
</tbody>
</table>

You may have situations where a couple of similar All Pages type header configurations could overwrite a Specific Type type header configuration. An example of a Specific Type configuration would be one for a specific UI page. You can remedy this situation by adjusting the Add by and Order columns, as in the following examples.

### Append example

The Now Platform is trying to set headers in the following order, and Append is the default value for each in the Add By column.

In this example, the second (Header 2) and third (Header 3) response header configurations have the same name (Content-Security-Policy). In this case,
Header 3 is appended to Header 2. If a request is made for a specific page you configured with a Header 3 response, the net HTTP response headers are both Header 2 and Header 3.

Overwrite

The Now Platform is trying to set headers in the following order, and you've selected Overwrite in the Add By column for the third header.

In this example, the second (Header 2) and third (Header 3) response header configurations have the same name (Content-Security-Policy). In this case, Header 3 overwrites Header 2. If a request is made for a specific page you configured with a Header 3 response, the net HTTP response header is only Header 3.
Instance Data Replication

ServiceNow® Instance Data Replication (IDR) copies data updates from one instance, called the producer instance, to one or more other instances called the consumer instances. IDR enables you to maintain consistent data across different organizations in your company.

IDR provides a one-to-many replication, which enables one instance to propagate data across different departments and business units to keep data synchronized. With IDR, you can also modify data during replication. For example, you could localize the data during replication.

IDR also supports bidirectional replication. Bidirectional replication enables you to copy data from a producer instance to a consumer instance and from a consumer instance back to the producer instance.

Watch this video to learn how to set up IDR between multiple instances on the Now Platform. Create an Instance Data Replication.

Benefits

• Data is automatically replicated to one or more other instances.

• Data can be modified and mapped to any table and table column on other instances. For example, you can modify and map table columns to localize data for different locales.

• Data that is updated on consumer instances can be replicated to the producer instance.

Data, such as problem requests, can be copied to consumer instances for third parties to use. The third party can update the problem issue on the consumer instance. The data can then be updated on the producer instance.
• Business rules can trigger post-replication workflows, such as generating notifications or validating the replication.

• Data that is in transit during a crash is recoverable.

How Instance Data Replication works

You use the Instance Data Replication plugin (com.glide.idr) to replicate data updates on one instance, called the producer instance, to one or more other instances, called the consumer instances.

By configuring a producer replication set, you can specify the tables and table columns on the producer instance to replicate. When you configure a consumer data set, you can specify the tables and table columns on the consumer instances that receive the producer replication set data.

Next, you activate both producer and consumer replication sets to turn on the IDR functionality. The data that is updated in a producer replication set automatically updates the corresponding data in the consumer replication sets.

Syncing the producer and consumer replication sets requires that you do a one-time download (called seeding) of all the producer replication set data to the consumer instances.

You can initiate seeding requests on a consumer instance when you activate a consumer replication set. Beginning with the Rome release, you can use a filter criterion feature (called partial seeding) to restrict the number of records that are seeded. Use partial seeding to divide large jobs into smaller jobs when you have a large number of records to duplicate.

After seeding, replication involves data updates only. An audit trail contains a history of those record updates.

By default, the table data on a producer instance goes into the tables of the same name on consumer instances. Transformation is the process of replicating producer data in tables or table columns that have a different name on the consumer instances.

IDR adapters modify data before storing it on consumer instances. Adapters perform string and mathematical operations, such as converting one currency to another, or converting one time zone to another.
IDR overview

⚠️ Warning: IDR overwrites data on instances and can replicate sensitive data. Avoid potential data loss and data exposure, by testing your IDR implementation in a pre-production environment. See data privacy in IDR for more information.

Domain separation

IDR runs in ServiceNow datacenters only. It functions at the data level so IDR does not explicitly support domain separation. For a typical use case, data moves from a producer instance to a consumer instance and back without regard to which domain the instance is in. You can use IDR to filter data, enabling you to segregate specific data between instances. IDR does not support domain separation. If you must go beyond the IDR record-level filtering capability, you can use business rules to convert data from one domain to another. For more information, see Before Query business rules.

Producer and consumer instance data replication delays

After IDR has been set up on the producer instance, the IDRProducerJob job runs on producer instances to detect data updates. When there are updates to replicate, the producer instance sends the updates to consumer instances.

The IDRConsumerJob job runs on the consumer instances to detect the data updates from a producer. When the IDRConsumerJob job detects updates, it updates the data in consumer tables.
It takes some time for the data updates in a producer replication set to appear in consumer replication sets. You can look on the monitoring dashboard to see how long data updates take from a producer replication set to consumer replication sets. Look at the queue dashboard to see the replication record queue, message queue, and messages processed for all replications sets.

If you have significant data delays, contact Customer Service and Support.

**IDR limitations and when not to use IDR**

- Do not use IDR to clone instances.

  IDR does not replicate metadata tables, child metadata tables, and most user and system tables. IDR is designed to replicate data, not to clone instances.

- IDR seeding limitations:
  - Replication seeding must not take longer than seven days to complete.
  - Initial seeding of the tables must not exceed 3 million records per replication set.

перед

**Note:** To overcome these limitations, reduce the number of tables in the seeding request, reduce the size of the records, or use partial seeding.

**Request an Instance Data Replication (IDR) subscription**

The IDR plugin requires a separate subscription and must be activated by ServiceNow personnel.

**Before you begin**

Role required: admin
About this task

IDR is supported in the New York and later releases. The IDR plugin ID is com.glide.idr. When purchasing an IDR subscription, ServiceNow personnel also activate the following plugins that IDR depends upon:

- com.snc.db.data_replicate
- com.glide.transform
- com.glide.kmf

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don’t have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Procedure

1. Navigate to System Applications > All Available Applications > All.

2. On the All Applications page, click Request Plugin to open the Request form on HI.

3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.
4. On the form, fill in the fields.

**Activate Plugin request form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the <em>Reason/Comments</em> field.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**What to do next**

Create and activate a producer replication set.

**Related information**
Set up Instance Data Replication (IDR)

Determine which instance will be your producer instance, configure producer replication sets with consumer instances, and then modify records or mappings as necessary.

Before you begin
Role required: admin, idr_admin

Procedure
1. Request that ServiceNow install the IDR plugin.
2. Create a producer replication set.
   The producer replication set specifies the tables and table columns to replicate to one or more consumer instances.
3. Create one or more consumer replication sets and request data from the producer instance.
   A consumer replication set specifies the tables and table columns on consumer instances that receive producer data updates. The replicated data overwrites the corresponding consumer instance data. Consumers must initiate a request to the producer instance before they receive the replication data.
4. Approve the consumer replication set request.
   The producer instance must approve the request from the consumer instance to access replication data.
5. Optional: Map replicated data into different tables or table columns on consumer instances.
6. Optional: Modify records during replication.
   As an example, you might change time zone or currency records to make them appropriate for a different geographic region.
7. Optional: Set up bi-directional replication.
   (Optional) Bidirectional replication enables data to flow from a producer instance to a consumer instance and accept data from a consumer instance to flow back to the producer instance.
8. Set up discrete mapping.
   Adding discrete mapping to producer replication sets enables different consumer replications to be distinguishable.
Create a producer replication set in Instance Data Replication

A producer replication set specifies the tables and table columns to replicate on consumer instances. Creating the producer replication set is the first step of setting up Instance Data Replication.

Before you begin

- Verify that the producer and consumer instances belong to the same customer.
- Role required: idr_admin or admin

About this task

Seeding is the initial download of all the records in the producer replication set to the tables in the consumer replication set. After seeding, Instance Data Replication (IDR) only replicates data updates. The seeding limitations are:

- The maximum record size is 32 MB.
- The maximum seeding size is 3 million records.

Note: If your replication set contains more than 3 million records, seeding cannot start. To fix this situation, break the replication set into multiple replication sets with fewer records in each or use partial seeding.

- The maximum seeding time is 7 days.
Procedure

1. On the producer instance, navigate to **Instance Data Replication > Producer Replication Sets** and click **New**.
2. On the form, fill in the fields.

### Producer Replication Set form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Names can only contain alphanumeric characters and hyphens.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The consumer replication set must have the same name as the producer replication set, so the name should not be producer-specific.</td>
</tr>
<tr>
<td>Bi-Directional</td>
<td>Option to enable bi-directional replication on consumer instances. Bi-directional replication enables changes to records made on the consumer instance to propagate to the producer instance. If you want to set up a producer replication set with bi-direction for consumer instances, see <strong>Bidirectional replication</strong>.</td>
</tr>
<tr>
<td>Discrete</td>
<td>Option to enable discrete mapping from a producer replication set. This mapping distinguishes different consumer instances. For more information, see <strong>create discrete mappings for a producer replication set</strong>.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the replication set.</td>
</tr>
<tr>
<td>Entry Set</td>
<td>Set of outbound entries. If you imported an update set from another instance or you created one earlier on your instance, you can choose an existing entry set.</td>
</tr>
</tbody>
</table>
After you submit the Producer Replication Set form, the system auto-generates the producer ID. The **Producer ID** field identifies the producer instance in the system.

3. To add outbound entries to your producer replication set, click the **Outbound Entries** tab and click **New**.

4. On the form, fill in the fields.
   For each outbound entry, you must select a source table from the producer instance to replicate data records. You can also select associated table columns, include attachments to records, and set filter conditions for each source table.
Replication entry form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Table</td>
<td>Name of one of the tables on the producer instance to replicate. For example, .NET Application [cmdb_ci_dot_net].</td>
</tr>
<tr>
<td>Name</td>
<td>Filter criteria to control the records in the table that are being replicated. In the Filter section, click Add Filter Condition. For example, you might want to replicate only active records. In that case, select Active from the choose field list, Is from the oper list, and True from the value list. If you do not use a filter, all the fields in the producer replication set table appear in the Available column.</td>
</tr>
<tr>
<td>Include</td>
<td>Attachments Option to replicate the files associated with the records that you are replicating.</td>
</tr>
<tr>
<td>Included Fields</td>
<td>Fields to include. Move table fields into the Selected column to replicate them or into the Available column to prevent replicating them.</td>
</tr>
</tbody>
</table>

Note: The Available column contains the fields in the Source Table that you specified. That table might not contain the Active field.

Note: The system must replicate some fields, such as sys_id (Mandatory). The system cannot replicate some fields, such as Edge Encrypted and Password1. They do not appear in either column.

5. Click Submit.

Note: If the table that you add to the replication set has child tables, add the child tables to the replication set to maintain data integrity.

6. Repeat step 3 for each table that you want to include in the replication set. After you submit, the Activate button is added to the form.

7. Click Activate.

Replication can't happen until you link the producer replication set to one or more consumer replication sets. Activating the producer replication set makes the producer data available for replication to consumers.
8. Click the **Notification Configuration** related link and choose a tab to configure notification details:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When to send</td>
<td>Specify the conditions for sending a notification.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Record inserted or updated</strong>—You can send notifications when records are updated or inserted.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Event is fired</strong>—Specify the event type that sends the notification.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Triggered</strong>—A notification is sent when triggered by a ServiceNow® Flow Designer flow. For more information, see <a href="#">Flow Designer</a>.</td>
</tr>
<tr>
<td>Who will receive</td>
<td>Send notifications to users, groups, or user groups in fields on the ServiceNow record that generate the notification.</td>
</tr>
<tr>
<td>What it will contain</td>
<td>You can choose an email template to populate the Subject and Message HTML. You can also override the template and customize text as appropriate.</td>
</tr>
<tr>
<td>What Digest will contain</td>
<td>If you select Allow Digest, you can configure an email digest interval through the Digest Interval module in System Notification.</td>
</tr>
</tbody>
</table>

9. Click **Update**.

10. To see a preview of the notification, click **Preview Notification**.

11. To discard the Producer Replication Set, click **Delete**.

**Results**

The producer is ready to send the data that is specified in the replication set to one or more consumer instances.
What to do next

- Create and activate a consumer replication set.
- Grant access to replication data.

After creating a consumer replication set, you must ask for permission to receive the producer replication data. See Grant access to replication data to see how to grant or deny access.

- If you believe that a consumer set should no longer receive replication data, you can revoke the consumer set access.

Create a consumer replication set for Instance Data Replication

You can use a consumer replication set to specify the tables and columns on a consumer instance that receives the producer data. Creating the consumer replication set is the second step of setting up Instance Data Replication (IDR).

Before you begin

- Create and activate a producer replication set.
- Make sure that the producer and consumer instances are in the same geographic region and belong to the same customer.
- Role required: idr_admin or admin

About this task

Create a consumer replication set and link it to a producer replication set. IDR replicates data from the producer to the tables and table columns of the same name on the consumer instance. The administrator of the producer replication set must grant the consumer instance access to the replication data.

If the producer replication set administrator generates a new encryption key, the encryption key value that is stored in the consumer replication set might not automatically update. If it does not update, replication stops. To restore access, see Restore access to replication data.

Procedure

1. On a consumer instance, navigate to Instance Data Replication > Consumer Replication Sets.
2. Click New.
3. On the form, fill in the fields.
### Consumer Replication Set form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Producer Replication Set Name</td>
<td>Name of the consumer replication set. The name on the consumer must match the name on the producer. Obtain the name from the producer administrator.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the purpose of the replication.</td>
</tr>
</tbody>
</table>

4. **Click Submit.**
   The list of all consumer replication sets appears. The system sends a request to the producer replication set administrator to approve or deny your request for a shared encryption key.

⚠️ **Warning:** Do not change any of the values.

5. In the list of all consumer replications sets, click the replication set.
   The Consumer Replication Set displays the replication set information.
The Consumer Approval Status shows Approval Pending. The producer administrator must approve your request to be a consumer.

**Note:** If you receive an error saying that your encryption key does not work, contact Customer Service and Support.

6. Wait until the producer administrator approves the request.
   The Consumer Approval Status changes to Approved. For more information, see [Grant access to replication data](#).

7. Refresh the browser page.
   The system replaces the **Request Producer Approval** button with the **Activate** button.

8. To update the Consumer Replication Entries configuration on the consumer to match the configuration on the producer after you receive confirmation, click the **Synchronize Replication Entries** related link.
   If you do not see this option, refresh the page.
   A modal confirms the synchronization. The tables that you select for replication in the producer replication set are replicated in the consumer replication
set and appear on the Inbound Entries tab. The initial seeding of all the table data may take some time. After initial seeding, only data updates are replicated to consumer replication sets. For more information about seeding, see Seed a consumer instance.

9. To configure who receives replication notifications, click the Notification Configuration related link.

10. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When to send</td>
<td>Trigger for sending a notification.</td>
</tr>
<tr>
<td>Who will receive</td>
<td>Person who receives the notifications.</td>
</tr>
<tr>
<td>What it will contain</td>
<td>Notification content.</td>
</tr>
</tbody>
</table>

11. Click Update.

12. Activate the consumer replication set by selecting the replication set that you want to activate. Then, on the Inbound Entries tab, click Activate.

After some time, the Status is Active Replication, and the Partial Seeding and Full Seeding buttons are displayed. With both seeding options, IDR generates audit trails of all record updates. If you encounter an error during seeding, see Fix seeding errors. For more information about seeding, see Seed a consumer instance.

13. To discard your seeding request before clicking Activate:
   a. On the Seeding Requests tab, click a seeding request.
   b. On the Seeding Request form, click Cancel.

14. To modify the behavior of the consumer, click a source table name on the Inbound Entries tab.
   a. To add the name of a user to an Activities entry, select the Preserve Modified By option on the Inbound Entry form.

   Preserve Modified By preserves the name of the person who updated a field of the Activity type in a record. For example, the Work Notes field is an Activity type in change request records. When someone updates a change request, the work note moves into the Activities stream. If you do not select this option, the Activities entry updates the attributes to IDR in the consumer records. With the option selected, the person who updated the change request is identified in the entry and the system prepends IDR to their name.
b. To run business workflows after a replication, select the **Run Business Rule** option.

A business rule is a server-side script that is associated with a table. Use business rules to trigger workflows that are associated with replications, such as sending a notification or validating the replicated data. For more information, see **Trigger workflows after replication**.

c. To replicate the data from the producer tables into tables with different names on the consumer instance, click **Enable Transform**. For more information, see **Transform replication data**.

d. Click **Update**.

**What to do next**

The consumer instances contain, at a minimum, the current data in the producer replication set tables. The consumer instances are now ready to accept replicated data updates. By default, the data in the producer tables is replicated into tables and table columns of the same name on the consumer instances. For more information about how to map the data into different tables and table columns and how to modify the data as it is replicated, see **Transform replicated data**.

- Map the replication data to different tables on the consumer instance.
- Modify the values during replication.
- Set up business rules to trigger post-replication workflows.
Reconfigure a replication set in Instance Data Replication

If you must change or update your original replication set, reconfigure Instance Data Replication (IDR) replication sets on the producer instance.

Before you begin
Role required: idr_admin or admin

About this task
After activating a revised producer replication set, update the producer replication set name, shared key, producer ID, and producer set ID on each consumer instance.

Note: Make sure that a seeding request is not in progress before you reconfigure a producer instance. Check the consumer replication sets seeding requests status.

Procedure
1. Reconfigure a producer instance:

   a. On the producer instance, navigate to Instance Data Replication > Producer Replication Sets.

   b. Select a producer replication set and make one or more of the following changes to the set:

      • To add a table to the set, on the Replication Entries tab, click New.

      • On the Replication Entries tab, click a replication set. In the Replication Entry form, modify the columns that are included in the replication set, and click Update.

      • To remove the table from the replication set, on the Replication Entries tab, click a replication set and click Delete.

      • To change the shared encryption key, click Generate New Shared Key.

        Only generate new shared keys when you discover that they are compromised or if you want to stop sending data to a consumer. After changing the encryption key on the producer instance, consumers that have the Consumer Approved Status of Denied must reapply for access to the producer replication set. For more information, see Grant access to replication data.

        These changes stop replication and produce this status message on the consumer instance: Producer Replication Set configuration has been modified. On the consumer instance, click Synchronize Replication Entries and then click Activate.
2. To update consumers with the changes made on the producer, update each consumer instance. Navigate to **Instance Data Replication > Consumer Replication Sets** and click the consumer replication set that you want to update.

The status of the replication set is Replication Error. See the following table to learn what action to take according to the status message.

<table>
<thead>
<tr>
<th>Status Message</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval was denied by producer instance.</td>
<td>The producer changed the shared key and that revokes this consumer's access to the replication data. Replication stops. Click the <strong>Request shared key</strong> related link. The producer must approve your request. For more information, see <strong>Grant access to replication data</strong>. If the consumer's access is not revoked, replication continues. Do nothing on the consumer instance.</td>
</tr>
<tr>
<td>Producer Replication Set configuration has been modified.</td>
<td>The producer added or subtracted tables or table columns in the producer replication set. Replication stops. Click <strong>Synchronize Replication Entries</strong> and then click <strong>Activate</strong>. The system keeps the tables on the consumer instance that the producer is no longer replicating.</td>
</tr>
</tbody>
</table>

3. To discard the entire IDR configuration and start over, delete the replication set on the producer and the consumer.

   • To delete a producer replication set from the producer instance, navigate to **Instance Data Replication > Producer Replication Sets**. Click the producer replication set that you want to delete, and click **Delete**.

   • To delete a consumer replication set on a consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets**. Click the consumer replication set that you want to delete, and click **Delete**.

**Deploy a producer or consumer replication configuration through an update set**

Package a replication set configuration from a producer or consumer instance to another instance and then deploy through an update set. For example, you copy a configuration from a test to a production environment.

**Before you begin**

Role required: admin, idr_admin

**Note:** To learn about access to update sets, see **update set administration**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
About this task
After you deploy the update set, you must activate the producer replication set. You must also update the consumer replication set with the producer instance URL on each consumer instance.

Procedure
1. Export the update set from the instance where you created the replication set.
   To learn about update sets, see Get started with update sets.
2. Import the update set to the instance where you must set up the replication set.
   To learn about update sets, see Get started with update sets.
   
   Note: On a consumer instance, you must select track an update set. This enables the entries to reference the transformations that are configured. Also, if you are importing a bi-directional replication set, you must create an update set. IDR cannot automatically create an update set for bi-directional replication.
3. On the producer instance, navigate to Instance Data Replication > Producer Replication Sets and select the producer replication set that you imported.
4. Click Activate.
   Replication can't happen until you link the producer replication set to one or more consumer replication sets. Activation just makes the producer data available for replication.
5. On the consumer instance, navigate to Instance Data Replication > Consumer Replication Sets and select the consumer replication set that you imported.
   Update the consumer replication set with the producer instance URL on each consumer instance.
   
   Note: If the producer instance URL doesn't automatically retrieve the producer ID and the producer set ID, you must enter these IDs.

Grant access to the replicated data for Instance Data Replication (IDR)
Approve or deny a request to grant access to the replication data.

Before you begin
Role required: admin, idr_admin
About this task
You can review consumer access requests for all of your producer replication sets or for a specific producer replication set. The administrators of consumer sets must apply for access before they can receive the replication data.

Procedure
1. On the producer instance, navigate to **Instance Data Replication** > **Consumers Pending Approval**.
2. Select the option for each consumer replication set that you want to approve.
3. On the Actions on selected rows... list, select **Approve**. The approved consumer sets start receiving the replicated data.

   ❓ **Note:** You can change the Consumer Approval Status to Denied to prevent the consumer from receiving the replicated data.
4. To approve a consumer access request for a specific producer replication set:
   a. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.
   b. Select the producer replication set where you want to approve consumer access.
   c. Under Related Links, on the **Consumer Subscriptions** tab, select the option for the consumer replication set that you want to approve.
   d. On the Actions on selected rows... list, select **Approve**. The approved consumer set starts receiving replicated data.

   ❓ **Note:** You can change the Consumer Approval Status to Denied to prevent the consumer from receiving the replicated data.

Revoke access to replicated data for Instance Data Replication (IDR)
Revoke a consumer's access to replicated data if you believe that consumer instance should no longer receive that data.

**Before you begin**
Role required: admin, idr_admin

**About this task**
When you generate a new, shared encryption key, approved consumer sets automatically receive the new key and data replication is not interrupted. Any
Consumer set with a status of Denied or Pending Approval does not receive the new encryption key, and replication ceases.

Procedure

1. On the producer instance, navigate to **Instance Data Replication > Producer Replication Sets**.

2. Select the producer replication set that has consumers whose access needs to be revoked. The instance identifies the consumers under the **Consumer Subscriptions** tab.

3. On the **Consumer Subscriptions** tab, select the option for the consumer instance whose permissions you want to revoke.

4. In the Actions on selected rows... list, select **Revoke**. Instance Data Replication generates a new encryption key and shares it with all approved consumer sets. All other consumer sets stop receiving replication data. Admins of those consumer replication sets must **reapply to restore access to the replication data**.

**Restore access to replication data for Instance Data Replication**

Restore Instance Data Replication (IDR) access to replicated data by sending a request to the producer replication set admin.

**Before you begin**

Role required: admin

**About this task**

When the producer replication set administrator generates a new encryption key, consumer sets with a status of Approved automatically receive the new key and data replication is uninterrupted. Consumer sets with a status of Denied or Pending Approval do not receive the new encryption key and replication stops.
Procedure
1. On the consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets**.
2. Select the consumer replication set to restore access to.
3. Click the **Request Shared Key** related link.
   The system sends a request to the producer replication set administrator. If you are granted access, the consumer Approval Status changes to Approved.
4. If the producer replication set has changed, click the **Synchronize Replication Entries** related link.
5. To get the latest data in the producer replication set, on the **Inbound Entries** tab, select all the tables and click **Activate**.

Transform replication data for Instance Data Replication (IDR)
Transform the producer instance data to tables or table columns that are named differently on consumer instances.

Before you begin
- Create and activate a producer replication set.
- Create, activate, and seed one or more consumer replication sets.
- Role required: idr_admin or admin

About this task
The replicated data from producer tables and table columns goes into tables and table columns of the same name on consumer instances. You can map the producer data into any table or table column on consumer instances. If existing tables or table columns have different names, you can replicate the data to a different table or table column. Adapters modify the data before storing it on consumer instances. For example, adapters can localize data from the producer instance before it is consumed by the consumer instance.

You can also use adapters to modify the producer data during replication. For example, you can localize the data or populate the data that has been labeled differently in consumer tables.

Transformations have the following limitations:
• sys_created, sys_created_by, sys_domain, sys_updated_by, sys_id, sys_mod_count, and other systems are automatically mapped to the consumer and can't be remapped.

No other sys_ fields can be replicated.

• Adapters can't operate on the sys_journal field type such as Comments or Worknotes columns in a Task table.

• Calculated fields won't be transformed.
  A calculated field, such as the name field from sys_user, will replicate but cannot be transformed. Allowing a transformation breaks the calculation for the resulting field.

   🔄 Note: Calculated fields will not show as an option to transform.

Procedure

1. Choose a producer or consumer instance and navigate to the replication set.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Consumer Instance</strong></td>
<td>Navigate to Instance Data Replication &gt; Consumer Replication Sets and click a consumer replication set.</td>
</tr>
<tr>
<td><strong>Producer instance</strong></td>
<td>Navigate to Instance Data Replication &gt; Producer Replication Sets and click a producer replication set.</td>
</tr>
</tbody>
</table>

2. Choose an inbound or outbound entry.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Consumer Instance</strong></td>
<td>On the Inbound Entries tab, click an inbound entry.</td>
</tr>
<tr>
<td><strong>Producer instance</strong></td>
<td>On the Outbound Entries tab, click an outbound entry.</td>
</tr>
</tbody>
</table>

An entry appears.
3. Select the **Enable Transform** option.

4. In the **Target Table Name** list, select the table into which you want to replicate the source table data and click **Update**.

5. On the **Inbound Entries** or the **Outbound Entries** tab, click the same entry.

6. Click the lock icon next to **Transform Map** to unlock it.

   The image shows a Transform Map, with the field names from the source table appearing in the left column. The middle column shows matching field names in the target table. All fields that do not have the same names in both tables appear in the – choose source field – or – choose target field – lists.

   ![Transform Map Image]

   **Note:** If a table in a producer replication set is not on a consumer instance, the consumer instance will fill the first column with the producer schema definition sent during synchronization.

7. Map a producer column to a consumer column that has a different name:
a. Click – choose source field – and select the source field that you want to map.

b. Click – choose target field –, select the target field into which you want to map the data, and then click Add.

c. If you want to remove a field from replicating the producer instance to the consumer instance, click the X at the end of the row to delete the field.

8. To modify the producer data before replicating it in the consumer instance, click Add Adapter.
The image shows the type of Adapter rules that you can create.

What kind of Adapter Rule do you want to create?

- Concatenate String Adapter Rule
- Replace Adapter Rule
- Split Adapter Rule
- Fixed-Width Format Adapter Rule
- Pattern Adapter Rule
- Task Number Adapter Rule
- Calculation Adapter Rule
- Map Adapter Rule
- Time Zone Conversion Adapter Rule

9. Click the adapter that you want to use and then configure it.
For more information about configuring adapters, see Adapter descriptions.

Note: Adapters do not modify the data on the producer instance.

Warning and error messages for schema validation in Instance Data Replication (IDR)
Understand error and warning messages relating to schema definitions. You can then troubleshoot or fix IDR replication issues.

Warning and Error Messages

<table>
<thead>
<tr>
<th>Message</th>
<th>Type</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>The consumer instance does not recognize the [specified] table from the associated IDR schema.</td>
<td>Error</td>
<td>The replication entry cannot process any messages. Please enable a transformation with this table to receive updates</td>
</tr>
</tbody>
</table>
Warning and Error Messages (continued)

<table>
<thead>
<tr>
<th>Message</th>
<th>Type</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>The consumer instance does not recognize the [specified] column from the associated IDR schema.</td>
<td>Warning</td>
<td>The replication entry cannot process any of the specified columns. Please enable a transformation with this table in order to receive updates from this column to the consumer instance.</td>
</tr>
<tr>
<td>The consumer instance does not recognize the column type or length from the associated IDR schema for these columns: [specified columns].</td>
<td>Warning</td>
<td>The consumer instance might lose data for those columns. Please enable a transformation with this table in order to receive updates from these table columns.</td>
</tr>
</tbody>
</table>

**Bidirectional replication for Instance Data Replication (IDR)**

Bidirectional replication enables data to flow from a producer instance to a consumer instance and accept data from a consumer instance to flow back to the producer instance.

By default, replicated data flows from a producer instance to a consumer instance. Bidirectional replication reverses that flow. For example, a company might outsource its networking issues. The third party receives the networking incident records from the consumer instance, fixes the networking issues, updates the records, and returns them to the consumer instance. Bidirectional replication then updates the incident records on the producer instance. Bidirectional replication only works for records that originated on the producer instance.

To make data flow bi-directionally on the consumer instance, the system creates a producer instance on the consumer instance and a consumer instance on the producer instance.
Choosing bidirectional replication creates producer and consumer instances

If you look at the replication sets on the original producer instance, you see the replication set name and the automatically generated consumer instance. It has the same name appended with the suffix, \(-<\text{long-number}>-\text{reverse}\), where \(<\text{long-number}>\) is a randomly generated number. For example, if Test is the producer replication set name, Test-2034802-reverse might be the name of the consumer replication set that automatically generates on the same instance. On the original consumer instance, you see the same names. Replication sets with the \text{reverse} suffix are read-only.

You can verify a consumer on a producer instance and a producer on a consumer instance by running https://<producer-instance-name>/xmlstats.do?include-idr and https://<consumer-instance-name>/xmlstats.do?include=dir on the producer and consumer instances. In the following image, the original producer instance is on the left and the original consumer instance is on the right.

Bidirectional replication has the following limitations:

- Auto-conflict resolution is unsupported.
- Merge conflicts happen if producer and consumer instances modify the same record at the same time.
The most recent update wins, which mean that the data on the consumer and producer tables might be different.

- Deleting data on a consumer instance does not delete the same data on the producer instance.
- Bidirectional replication supports the Number adapter but none of the other adapters.

If you must understand the implications of bi-direction and data transfer between instances, please see data privacy in IDR for more information.

Create a bidirectional replication for Instance Data Replication (IDR)

Replicate updated data on a consumer instance to the producer instance.

Before you begin
Role required: idr_admin or admin

Procedure

1. On the producer instance, navigate to Instance Data Replication > Producer Replication Sets:
   - Click New for a new replication set
   - Click on a producer replication set.
2. Check the Bi-Directional checkbox to enable bi-direction for your producer replication set.
   Bi-directional replication enables changes to records that are made on the consumer instance to propagate to the producer instance.
   
   Note: Bi-directional replication works for records that originate on the producer or consumer.
3. On a consumer instance, navigate to Instance Data Replication > Consumer Replication Sets and click a consumer replication set that is connected to the producer replication set.
4. On the Consumer Replication Set pane, click the Synchronize Replication Entries related link to update the Consumer Replication Entries configuration on the consumer to match the configuration on the producer.

Results
Data that is updated on this consumer instance automatically replicates on the producer instance, which then replicates the updates to its other consumer instances.
Discrete mapping in producer replication sets for Instance Data Replication (IDR)

Adding discrete mapping to producer replication sets enables different consumer replications to be distinguishable.

Every producer replication set has a unique relationship with each consumer subscription. One way of distinguishing this relationship is by mapping discrete field values for producer replication sets.

Once you enable discrete mapping, you can define for each outbound entry of a replication set a discrete value field. An administrator of the producer replication set can define the mapping of each consumer subscription by the setting this discrete value.

For example, you might have an ACME corporation as the producer instance, and have consumer subscribers of ACME US and ACME Europe. You could set a discrete value of region on the outbound replication entries for the incident table. While both of these entries reference the same company table, a rule set for the discrete value can display US for ACME US, and Europe for ACME Europe.

If you have bi-direction enabled with discrete mappings, different consumer subscriptions:

• Should never receive records sent from other consumer subscribers
• Should never receive records from a producer intended for other consumers subscribers

If you must understand the implications of discrete mappings and data transfer between instances, please see data privacy in IDR for more information.

Create a discrete producer replication set for Instance Data Replication (IDR)

Distinguish consumers for a producer replication set.

Before you begin
Role required: admin

Procedure
1. On the producer instance, navigate to Instance Data Replication > Producer Replication Sets:
   • Click New for a new replication set
   • Click on a producer replication set.
2. Check Discrete to enable discrete mappings for your producer replication set.
Once you enable discrete mapping, each outbound entry for a replication set has a discrete value column. You can define the mapping of each consumer subscription by setting a discrete value.

3. Navigate to **Outbound Entries** tab and click **New**.

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Table Name</td>
<td>Select one of the tables on the producer instance to replicate. For example, .NET Application [cmdb_ci_dot_net]</td>
</tr>
<tr>
<td>Discrete Field</td>
<td>Choose a field that defines the mapping for each consumer subscription. For example, if you choose the <strong>Assigned To</strong> field in the Incident source table, you can distinguish user assignments for specific consumers.</td>
</tr>
<tr>
<td>[Optional] Filter</td>
<td>Within the <strong>Filter</strong> section, you can use the <strong>Add Filter Condition</strong> to select filter criteria to control the records in the table that are being replicated. For example, you might want to replicate only active records. In that case, select <strong>Active</strong> in the <strong>– choose field – list</strong>, <strong>Is</strong> in the <strong>– oper – list</strong>, and <strong>True</strong> in the <strong>– value – list</strong>. If you do not use a filter, all the fields in the producer replication set table appear in the Available column.</td>
</tr>
<tr>
<td>[Optional] Include Attachments</td>
<td>Select this option to replicate files that are associated with the records that are being replicated.</td>
</tr>
<tr>
<td>[Optional] Included Fields</td>
<td>In the Included Fields columns, use the arrows to move table fields into the Selected column to replicate them or into the Available column to prevent replicating them.</td>
</tr>
</tbody>
</table>

**Note:** The Available column contains the fields in the Source Table that you specified. That table may not contain the **Active** field.

**Note:** Some fields, such as **SYS ID (Mandatory)**, must be replicated. Other fields, such as **Edge Encrypted** and **Password1**, can’t be replicated and do not appear in either column.

4. Navigate to **Discrete Mappings** tab, click **New**, and fill in the form fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discrete Value</td>
<td>This field sets a rule for what displays for the selected consumer instance within the producer replication set. For example, an <strong>Assigned To</strong> discrete value gives choices from a designated table of a specific user to show assignments.</td>
</tr>
<tr>
<td>Outbound Replication Entry</td>
<td>Select an outbound replication entry that you configured with a source table for this producer replication set.</td>
</tr>
<tr>
<td>Replication Subscription</td>
<td>Choose the consumer instance that displays the discrete value assignment.</td>
</tr>
</tbody>
</table>

**Note:** For each consumer that subscribes to a producer replication set with discrete mapping enabled, they must have a discrete value set.

### Seed a consumer instance for Instance Data Replication

Seed all or some of the tables in your Instance Data Replication (IDR) replication sets depending on the needs of your consumer instance.

#### Before you begin

Role required: idr_admin or admin

#### About this task

You can initiate seeding requests on a consumer instance while you are activating a consumer replication set.

**Note:** Seeding continues even if errors occur on some consumer tables. You can restart seeding specifically on the tables that have errors or on all tables in a replication set.

#### Procedure

1. On the consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets** and click a consumer replication set.
2. On the **Inbound Entries** tab, select the entry or entries that you want to initiate seeding for.
3. To initiate a full seeding, click **Full Seeding**. A modal opens stating that the system is requesting all matching records.
4. To configure a partial seeding, click **Partial Seeding**.
   a. If you selected more than one entry, select the Replication entry that you want to configure and select **Configure Seeding**.
   b. Configure one or more Custom Filter conditions, operators, and values.
   c. To download the current field values and to replicate the files that are associated with the records, select **Include Attachments**.
   d. To download the current field values and the history of all field updates, select **Include History**.
   e. In the Included Fields columns, use the arrows to move table fields into the Selected column to replicate them or into the Available column to prevent replicating them.
   f. Click **Save Configuration**.
   g. Configure other Replication entries as needed.
   h. When you are ready to initiate seeding, click **Request Partial Seeding**.

   **Note:** The Custom Filter determines which records to include in the partial seeding request.
   
   The system must replicate some fields, such as **SYS ID (Mandatory)**.
   The system cannot replicate some fields, such as **Edge Encrypted** and **Password**. They do not appear in either column.

5. To discard your seeding request before you click **Request Partial Seeding**, click **Cancel**.

   **Note:** If you encounter an error during seeding, see **Fix seeding errors**.

**Results**

In a successful seeding, all selected data on a producer instance is replicated on a consumer instance.

- After seeded, the consumer instance maintains a history of all field updates.
- Records that exist on the producer instance and not on the consumer instance are copied to the consumer instance.
- If the identical record exists on a consumer instance, the record on the consumer instance is not modified.
- The sys_id of the record identifies the record on both instances.
• If a replication set changes and no longer includes a table, IDR does not alter the records in the corresponding table on the consumer instances.

• The producer instance handles one seeding request at a time. When the producer instance is busy with a seeding request, subsequent seeding requests are queued and initiated in the order that they are received.

**Trigger workflows after replications for Instance Data Replication (IDR)**

Use platform business rules to trigger workflows after replications.

**Before you begin**
Role required: idr_admin or admin

**About this task**
A business rule is a server-side script that is associated with a table. Use business rules to trigger workflows that are associated with replications, such as sending a notification or validating the replicated data.
Business rules are part of the Now Platform. For more information, see Business rules.

**Procedure**
1. On a consumer instance, navigate to Instance Data Replication > Consumer Replication Sets and click a consumer replication set.
2. On the Inbound Entries tab, click a replication set table.
3. Select the Run Business Rule option.
4. Repeat this procedure for the other tables in the replication set.
5. Click Update.
IDR invokes the business rules that are associated with the specified table after replicating the data to the table.

**Data privacy in Instance Data Replication (IDR)**
The ability of replication sets to host multiple remote consumers in IDR means that there are potential data privacy issues to consider.

Replications sets in IDR serve multiple instances with multiple consumers. A replication set can have a single customer or can have multiple customers. A consumer could also be located within the same geographic region as the producer or located in a different geographical region.
Depending on how you configure your replication set, you can have data sharing internally, between offices of the same company, or externally, extending across multiple companies. You can also confine data sharing to a single location or region, or you can share data across all regions.

An active replication set occurs after the producer instance administrator approves a consumer subscription. An active replication set involves data transfer, which could include transfer of personal data, between geographical regions. The data transfer between different geographical regions could subject the data to differing personal data regulations.

During the approval process, if IDR determines that the consumer and producer instances are in different geographical regions, it alerts the producer before activation. This alert should make administrators aware of the potential for differing data transfer regulations between regions.

Once a replication set is active, a replication set with multiple consumers might have specific discrete rules which direct specific data to specific consumers. Any modification of a discrete rule on an active replication set which spans multiple consumers has the potential to expose data. This data exposure can include personal data, which might be viewable by unintended consumers that subscribe to the replication set.

If you set bi-direction between a producer and consumer instance, the consumer can originate data that shares back to the producer instance. This data can also potentially reach any other consumer that is part of the replication set.

**Instance Data Replication (IDR) monitoring dashboard**

With the IDR dashboard, you can monitor the status of active producer and consumer replication sets, scheduled jobs, seeding requests, and license or usage details.

**Accessing the IDR dashboard**

Users with the admin or idr_admin role can access the dashboard.

Navigate to the IDR dashboard in the following way:

- **Instance Data Replication > Monitoring Dashboard**

- Choose either: **IDR Overall Monitoring** or **IDR License and Usage Details** dashboard.

**IDR Overall Monitoring dashboard**

The IDR Overall Monitoring dashboard monitors the following:
- Active Producer Replication Sets
- Active Consumer Replications Sets
- IDR Scheduled Jobs
- Producer Seeding Requests Within Last 7 Days
- Consumer Seeding Requests Within Last 7 Days

### Active Producer Replication Sets

<table>
<thead>
<tr>
<th>Name</th>
<th>Replication Queue Reading Lag</th>
<th>Status</th>
<th>Status Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmdb-cisan-disk</td>
<td>00:00:39</td>
<td>active</td>
<td>Active Replication</td>
</tr>
<tr>
<td>cmdb-cisc-storage-device</td>
<td>00:00:39</td>
<td>active</td>
<td>Active Replication</td>
</tr>
<tr>
<td>id-incidentsync-up-bffa9f3d6b3443901d99</td>
<td>00:00:39</td>
<td>active</td>
<td>Active Replication</td>
</tr>
<tr>
<td>id-problem-sync-up</td>
<td>00:00:39</td>
<td>active</td>
<td>Active Replication</td>
</tr>
</tbody>
</table>

### Active Consumer Replication Sets

<table>
<thead>
<tr>
<th>Name</th>
<th>Data Lag</th>
<th>Network Lag</th>
<th>Status</th>
<th>Status Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>id-incidentsync-up</td>
<td>00:00:43</td>
<td>00:00:04</td>
<td>active</td>
<td>Active Replication</td>
</tr>
<tr>
<td>id-problem-sync-up-137c1a74dbb0104313d44</td>
<td>00:00:00</td>
<td>active</td>
<td>Active Replication</td>
<td></td>
</tr>
<tr>
<td>interaction</td>
<td>00:00:43</td>
<td>00:00:04</td>
<td>active</td>
<td>Active Replication</td>
</tr>
<tr>
<td>label</td>
<td>00:00:43</td>
<td>00:00:04</td>
<td>active</td>
<td>Active Replication</td>
</tr>
</tbody>
</table>

**Active Producer Replication Sets**

The Active Producer Replication Sets monitors your producer replication set status and reports the data lag time between your instance and the replication queue.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the producer replication set.</td>
</tr>
<tr>
<td>Replication Queue Reading Lag</td>
<td>Time between a record change on the producer instance and the moment it is sent over the outbound replication queue.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of a replication set, either active or in error.</td>
</tr>
<tr>
<td>Status Message</td>
<td>Message that describes the error status.</td>
</tr>
</tbody>
</table>

**Active Consumer Replication Sets**

The Active Consumer Replication Sets monitors your consumer replication set status, reports the network lag time, and reports the data lag time between the producer and consumer instance.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the consumer replication set.</td>
</tr>
<tr>
<td>Data Lag</td>
<td>Time between a record change on the producer instance and the moment it is recorded in the consumer instance.</td>
</tr>
<tr>
<td>Network Lag</td>
<td>Time between a record change logs in the outbound replication queue and the moment it is recorded in the consumer instance.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of a replication set, either active or in error.</td>
</tr>
<tr>
<td>Status Message</td>
<td>Message that describes the error status.</td>
</tr>
</tbody>
</table>

**Suite of IDR Scheduled Jobs**
The suite of IDR scheduled jobs poll for data changes, requests, and check the health of your producer and consumer instances. You can monitor the following jobs:

<table>
<thead>
<tr>
<th>Jobs</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IDRConsumerJob</td>
<td>Polls for record changes and seeding requests on the consumer instance in 15-second intervals.</td>
</tr>
<tr>
<td>IDRHeartBeatJob</td>
<td>Updates information about the health of every active producer or consumer set.</td>
</tr>
<tr>
<td>IDRMetadataConsumerJob</td>
<td>Polls for metadata record changes on the consumer instance in 15-second intervals.</td>
</tr>
<tr>
<td>IDRProducerJob</td>
<td>Polls for new, updated, or deleted records in the data replication queue for a producer instance in 15-second intervals.</td>
</tr>
<tr>
<td>IDRSeedingProducerJob</td>
<td>Checks for new seeding requests coming from consumer instances.</td>
</tr>
</tbody>
</table>

**Note:** You can set when your IDR scheduled jobs run and configure a periodic trigger that specifies how often the job runs.

### IDR Scheduled Jobs field types

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Scheduled job name.</td>
</tr>
<tr>
<td>Next Action</td>
<td>Date and time when the job next runs.</td>
</tr>
<tr>
<td>Trigger type</td>
<td>Job that you can configure to run daily, weekly, monthly, periodically, once, on-demand, or business calendar start or end</td>
</tr>
</tbody>
</table>
### IDR Scheduled Jobs field types (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>The trigger can repeat daily, hourly, by minute, or by second.</td>
</tr>
<tr>
<td>Job ID</td>
<td>ID of the scheduled job.</td>
</tr>
<tr>
<td>State</td>
<td>State of the job, for example, ready.</td>
</tr>
</tbody>
</table>

### Producer Seeding Request Within Last 7 Days

You can monitor the status of a producer seeding request within the last seven days.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replication Set</td>
<td>Producer set and the consumer set.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of the seeding request. The status can be completed, in progress, or failed.</td>
</tr>
<tr>
<td>Start Time</td>
<td>Time that the seeding begins.</td>
</tr>
<tr>
<td>End Time</td>
<td>Time that the seeding ends.</td>
</tr>
<tr>
<td>Percent Complete</td>
<td>Percentage of the seeding request job that is complete.</td>
</tr>
</tbody>
</table>

### Consumer Seeding Request Within Last 7 Days

You can monitor the status of a consumer seeding request within the last seven days.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replication Set</td>
<td>Corresponding consumer set.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of the seeding request. The status can be completed, in progress, or failed.</td>
</tr>
<tr>
<td>Start Time</td>
<td>Time that the seeding begins.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>End Time</td>
<td>Time that the seeding ends.</td>
</tr>
<tr>
<td>Percent Complete</td>
<td>Percentage of the seeding request job that is complete.</td>
</tr>
</tbody>
</table>

**IDR Dashboard Properties**

You can navigate to the IDR dashboard properties in the following way:

- **Instance Data Replication > Properties**

You can change the following properties on your dashboard:

<table>
<thead>
<tr>
<th>Property field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minutes of lag before the Data Lag field is highlighted in red on the IDR Monitoring Dashboard</td>
<td><strong>Data Lag</strong> field that is part of the Active Consumer Replication set. The field highlights if the actual lag time is greater than the time threshold that you set. The default is 15 minutes.</td>
</tr>
<tr>
<td>Minutes of lag before the Network Lag field is highlighted in red on the IDR Monitoring Dashboard</td>
<td><strong>Network Lag</strong> field that is part of the Active Consumer Replication set. The field highlights if the actual lag time is greater than the time threshold that you set. The default is 15 minutes.</td>
</tr>
<tr>
<td>Minutes of lag before the Replication Queue Reading Lag field is highlighted in red on the IDR Monitoring Dashboard</td>
<td><strong>Replication Queue Reading Lag</strong> field that is part of the Active Consumer Replication set. The field highlights if the actual lag time is greater than the time threshold that you set. The default is 15 minutes.</td>
</tr>
</tbody>
</table>

ℹ️ **Note:** You can set the colors on the fields through personalize list columns (`v_idr_dashboard_list.do`).

**IDR License and Usage Details**

The IDR License and Usage Details dashboard monitors the following:
• Subscriber Sent Messages
• Subscriber Received Messages
• IDR License Details
• IDR Messages Sent
• IDR Messages Received

**Subscriber Sent Messages**

The amount of messages each subscriber instance sent, by month.

![Subscriber Sent Messages Chart]

**Subscriber Received Messages**

The number of message each subscriber instance received, by month.

![Subscriber Received Messages Chart]

**IDR License Details**

You can monitor the status of a consumer seeding request within the last seven days.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the IDR license.</td>
</tr>
<tr>
<td>Type</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Category</td>
<td></td>
</tr>
<tr>
<td>Start date</td>
<td>Start of licensing period.</td>
</tr>
<tr>
<td>End date</td>
<td>End of licensing period.</td>
</tr>
<tr>
<td>Display only</td>
<td></td>
</tr>
<tr>
<td>Purchased</td>
<td>Number of purchased licenses.</td>
</tr>
<tr>
<td>Allocated</td>
<td>Number of allocated licenses.</td>
</tr>
</tbody>
</table>

**IDR Messages Sent**

The number of messages sent, per license, monthly.

**IDR Messages Received**

The number of messages received, per license, monthly.

**Instance Data Replication Queue dashboard**

Use the Instance Data Replication (IDR) Queue Dashboard to monitor the IDR replication record queue, message produced queue, message consumed queue, and messages processed for all replications sets.
Accessing the IDR Queue Dashboard

Users with the admin or idr_admin role can access the dashboard.
Access the IDR Queue Dashboard by navigating to Instance Data Replication > Queue Dashboard.

IDR Queue Dashboard

The IDR Queue Dashboard enables you to monitor the following:

• IDR Queued Producer Records which are hourly records queued for all tables over a 24-hour time period.
• Outbound Messages Remaining which are messages remaining in the replication queue that are not yet sent to the message queue.
• Outbound Messages Processed which are messages produced from this instance to the message queue.
• Inbound Messages Remaining which are messages remaining in the message queue, that have not yet been processed.
• Inbound Messages Processed which are messages consumed on this instance.

In any chart, select Last 24 Hours or Last 5 Days as the time period. For the 24-hour period, the number of messages is per hour. For the 5-day period, the number of messages is per day.
Select the legend link under the chart to exclude that data source.
IDR Queued Producer Records

With the IDR Queued Producer Records chart, you can see the number of records queued for each table over an hourly or daily period. It shows which tables account for the highest amount of traffic within IDR over time. Use this chart to identify activity spikes that cause predictable performance lags on the consumer instance.

For example, if you see that a large spike of activity occurs every day at 3:00 a.m. due to a business rule on a table, you should expect a performance lag to occur on the consumer around that time.

Select All Tables or a specific table. Position your cursor over a point in the chart to see the queue count and tables for that point.

Outbound Messages Remaining

With the Outbound Messages Remaining chart, you can determine whether a producer instance is catching up to real-time replication after a large spike in activity.

When replication is working correctly, the messages remaining count should be very low. If there is a spike in activity, you can expect a large value. For example, when a business rule is changing tens of thousands of records within a minute.
You can also expect messages remaining to decrease over time as the jobs process the messages.

If the messages remaining count continues to grow without resolution, it might indicate:

- An issue processing the messages. For example, the IDRProducerJob is not running, or cannot send messages to the message queue.
- The instance is recording changes faster than IDR can produce them.

Select All Sets or a specific set. Position your cursor over a point in the chart to see the message count and replication set name for that point.

**Outbound Messages Processed**

With the Outbound Messages Processed chart, you can see the flow of records from a producer instance to the message queue over time.

Trends for messages processed and the messages remaining over time indicates if replication is recovering from a lag or if there are issues sending data to the message queue.

Along with the Data Replication Queued Producer records chart, you can see if the instance is sending data. If your instance has queued records that are not being sent, it might indicate:

- The instance is not able to run the producer job. For example, due to other resource-intensive processes running on the instance and all worker threads being busy.
- There is an issue connecting to the message queue.

To see the message count and replication set name for a graph point, select All Sets or a specific set and position your cursor over a point in the chart.

**Inbound Messages Remaining**

With the Inbound Messages Remaining chart, you can determine whether a consumer instance is catching up to real-time replication after a large spike in activity.

You can expect a temporary large value when there is a spike in activity. The value normally decreases as the messages are processed.

If this value continues to grow without resolution, it might indicate:

- An issue processing the messages. For example, the IDRConsumerJob is not running, or cannot read messages from the message queue.
- The instance is recording changes faster than IDR can consume them.
Select **All Sets** or a specific set. Position your cursor over a point in the chart to see the message count and replication set name for that point.

**Inbound Messages Processed**

With the Inbound Messages Processed chart, you can see the flow of records for each consumer set over time.

Use the inbound messages chart to determine which replication sets have the most traffic and see trends for messages processed and the messages remaining.

If the producer is sending records to the message queue and the consumer is not processing them, it might indicate issues with the producer or the consumer instance.

Position your cursor over a point in the chart to see the message count and replication set name for that point.

**Resolve data replication errors for Instance Data Replication (IDR)**

Resolve errors and monitor status of IDR replication sets.

**Monitoring and troubleshooting checklist**

When you notice that data is not being replicated, you can use the troubleshooting checks to investigate a broken replication. To monitor the overall health of all replication sets, see **IDR monitoring dashboard**.

<table>
<thead>
<tr>
<th>IDR Check</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Monitor</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Check connectivity</strong></td>
<td>Test your IDR instance connectivity to determine the connectivity of your instance to the message queue.</td>
</tr>
<tr>
<td><strong>Check IDR monitoring dashboard to see if replication jobs are active</strong></td>
<td>For the dashboard to properly display replication set information, these IDR scheduled jobs must be available and running on your instance:</td>
</tr>
<tr>
<td></td>
<td>• IDRConsumerJob</td>
</tr>
<tr>
<td></td>
<td>• IDRHeartbeatJob</td>
</tr>
<tr>
<td></td>
<td>• IDRMetadataConsumerJob</td>
</tr>
</tbody>
</table>
### IDR (continued)

<table>
<thead>
<tr>
<th>Check</th>
<th>Description</th>
</tr>
</thead>
</table>
| • IDRProducerJob  
• IDRLockingProducerJob  
• IDRSeedingProducerJob |  
**Note:** If any of these jobs are missing or not running, contact Customer Service and Support. |

### Producer replication set

- **Check activation of producer replication set**
  - If the status of your producer replication set is In Draft, click **Activate**.

- **Check consumer subscription approval**
  - Review the consumer access requests for your producer replication sets. A consumer replication set must apply for access before they can receive replication data.

- **Check producer replication log errors**
  - Identify IDR errors by viewing the metadata for messages between producer and consumer instances, payload error logs, and message logs.

### Consumer replication set

- **Check activation status of consumer replication set**
  - If the status of your consumer replication set is In Draft, click **Activate**.

- **Check if you need to synchronize replication sets**
  - A synchronization issue occurs when a producer instance doesn't send data or a consumer instance doesn't receive data. Synchronization errors appear in the **Status** field on the consumer instance as **Replication Error**.

- **Check your consumer replication set status**
  - Review the status of your consumer replication set and what that means for your replication.

### Error and status messages
### Run Instance Data Replication (IDR) diagnostics

You can check IDR to verify whether the services and the connection between your instance and the message queue are set up and enabled.

**Before you begin**
Role required: admin or idr_admin

**Procedure**
1. Navigate to Instance Data Replication > Diagnostics.
2. Select the diagnostics to run:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Configuration</strong></td>
<td>Choose Local or Remote to run diagnostics on a local or remote instance. For a remote instance, enter the URL of the remote instance, and a username and password for any of the following roles:</td>
</tr>
<tr>
<td></td>
<td>• idr_rest</td>
</tr>
<tr>
<td></td>
<td>• idr_read</td>
</tr>
<tr>
<td></td>
<td>• idr_admin</td>
</tr>
<tr>
<td><strong>Key Management Service</strong></td>
<td>Check the status and setup of your key management service.</td>
</tr>
</tbody>
</table>

**Note:** The local datacenter to your producer instance regional proximity is the default.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certificate Management Service</td>
<td>Check the status and setup of your certificate management service.</td>
</tr>
<tr>
<td></td>
<td>Note: IDR requires a certificate management service to be up and running.</td>
</tr>
<tr>
<td>Message Queue System</td>
<td>Check the status and setup of your message queue system.</td>
</tr>
<tr>
<td></td>
<td>Note: IDR requires a key management service to be up and running.</td>
</tr>
</tbody>
</table>

3. Click **Run Diagnostics**. Results show for the diagnostic options that you select. The resulting messages validate enabled services or if messages read or write successfully.

**Review synchronization errors in Instance Data Replication**

Review the status field to check if synchronization is working correctly on the Instance Data Replication (IDR) consumer instance.

**Before you begin**

Before identifying synchronization errors, complete the tasks in **check for common issues**.

Role required: idr_admin or admin

**About this task**

Synchronization errors occur when a producer instance doesn’t send data or a consumer instance doesn’t receive data. Synchronization errors appear in the **Status** field on the consumer instance as **Replication Error**.

**Procedure**

1. Determine if the consumer successfully sent the synchronize request to the producer:

   a. On the consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets**.

   b. Select a consumer replication set.
c. Click the Replication Metadata Logs related link.

d. Sort the logs in a descending order in the Log Sequence column.

e. Find the most recent payload with the REPL_SET_DETAIL_REQUEST type and open it.
   If you do not see this payload type, refresh the log until you see a payload with the REPL_SET_DETAIL_REQUEST type.

f. Verify that you see the correct producer instance ID in the To column.
   If the producer instance ID is incorrect, update the ID and click Activate.

g. Verify that you see Sent in the Status column.
   If you don't see Sent in the Status column, the producer didn't send any updates.

2. Determine if the producer received the synchronize request from the consumer:

   a. On the producer instance, navigate to Instance Data Replication > Producer Replication Sets.

   b. Select a producer replication set.

   c. Click the Replication Metadata Logs related link.

   d. Sort the logs in a descending order in the Log Sequence column.

   e. Find the most recent payload with the REPL_SET_DETAIL_REQUEST type and open it.
      If you don't see this payload type, refresh the log until you see the REPL_SET_DETAIL_REQUEST type.

   f. Verify that you see the correct consumer instance ID in the From column.
      If the consumer instance ID is incorrect, update the ID.

   g. Verify that you see Received in the Status column.

Discover replication delays in Instance Data Replication (IDR)

Monitor possible data replication issues by using the IDR Monitoring Dashboard.
Before you begin
Role required: admin

About this task

Procedure

1. To view the time lag on a producer instance, navigate to **Instance Data Replication > Monitoring Dashboard**, and check the Active Producer Replication Sets for the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the producer replication set.</td>
</tr>
<tr>
<td>Replication Queue Reading Lag</td>
<td>Time between a record change on the producer instance and the moment it is sent over the outbound replication queue.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of a replication set, either active or in error.</td>
</tr>
<tr>
<td>Status Message</td>
<td>Message that describes the error status.</td>
</tr>
</tbody>
</table>

To get additional information, view the producer instance xmlstats at [https://<producer-instance-name>/xmlstats.do?include=idr](https://<producer-instance-name>/xmlstats.do?include=idr).

The xmlstats shows:

- The **producer_last_run** indicates the last time that the replication job ran on the producer instance.
- The **last_message_sent_on** indicates the last time that the producer sent updated data to consumers.

ℹ️ Note: The timestamps are GMT.

2. To view the time lag on a consumer instance, navigate to **Instance Data Replication > Monitoring Dashboard** and check the Active Consumer Replication Sets for the following:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the consumer replication set.</td>
</tr>
<tr>
<td>Data Lag</td>
<td>Time between a record change on the producer instance and the moment it is recorded in the consumer instance.</td>
</tr>
<tr>
<td>Network Lag</td>
<td>Time between a record change logs in the outbound replication queue and the moment it is recorded in the consumer instance.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of a replication set, either active or in error.</td>
</tr>
<tr>
<td>Status Message</td>
<td>Message that describes the error status.</td>
</tr>
</tbody>
</table>

To get additional information, view the consumer instance xmlstats at https://<consumer-instance-name>/xmlstats.do?include=idr.

```xml
<xmlstats created="Thu Jun 11 13:26:50 PDT 2019" include="idr" version="2">...
</xmlstats>
```

The xmlstats shows:

- The `consumer_last_run` indicates the last time that the consumer job ran and received changes from the producer.
- The `last_heartbeat_received_on` shows the timestamp when the consumer last received a heartbeat from the producer instance.

⚠️ **Note:** The timestamps are GMT.

**Fix seeding errors in Instance Data Replication**

Retry Instance Data Replication (IDR) seeding on tables with seeding errors, which occur from network problems and failed inserts, so that you don't have to do a full seeding.
Before you begin
Role required: idr_admin or admin

About this task
The maximum for a retry reseeding request is 10,000 errors. If you have more errors, perform a full seeding.
Do not retry full seeding if you exceed any of the following limitations:

- Record size exceeds 32 MB.
- Seeding request exceeds 3 million records.
- Replication takes longer than seven days to complete.

Note: To avoid these limitations, reduce the number of tables in the seeding request, reduce the size of the records, or use partial seeding.

Procedure
1. On the consumer instance, navigate to Instance Data Replication > Consumer Replication Sets.
2. On the Seeding Requests tab of the Consumer Replication Set pane, click a seeding request that failed.
3. On the Seeding Request pane, click the Payload Errors tab and examine the values in the Message column.
4. Click Retry All Errors or select specific errors, and then click Retry Selected Errors.
The image shows areas where you can retry errors.

Find Instance Data Replication (IDR) errors
Identify IDR errors by viewing the metadata for messages between producer and consumer instances, payload error logs, and message logs.

Before you begin
Role required: idr_admin or admin

Procedure
1. View the producer or consumer metadata logs:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Producer</td>
<td>Navigate to Instance Data Replication &gt; Producer Replication Sets, select a producer replication set and click the Replication Metadata Logs related link.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Consumer</td>
<td>Navigate to Instance Data Replication &gt; Consumer Replication Sets, select a consumer replication set and click the Replication Metadata Logs related link.</td>
</tr>
</tbody>
</table>

2. On either the producer instance or the consumer instance, to view transformation errors and replications that failed to load:

   a. Navigate to Instance Data Replication > Replication Payload Error.
      If the Source value is Seeding, the error occurred during seeding. If the source value is different, the error occurred during a replication set update. If any column breaks during transformation, transformation for the entire table breaks and data is not replicated in the table.

   b. Select an error in the Created column.
      The Error Message field on the Payload Error pane describes the payload error.

3. View the replication log on either the producer instance or the consumer instance:

   a. Navigate to Instance Data Replication > Replication Log.

   b. Select an entry.
      The Instance Data Replication Log form shows the message and message level.

**Status messages and status errors for a consumer replication set in Instance Data Replication**

Review the status of your consumer replication set and research error messages to identify or fix Instance Data Replication (IDR) replication issues.

**Consumer replication set status and status message**

Navigate to Instance Data Replication > Consumer Replication Sets to access a consumer replication set, and view the status and status messages.
To use your consumer replication set, click **Activate**.

After you initiate an activation, you must wait for the producer instance to respond to your request. If the wait time is excessive, then check the replication log for errors.

The seeding job must complete before replication can resume.

The seeding job must resume before the seeding can continue.

Normal status.

Check the Status Messages in the following table for a specific message and associated fix.

The replication process must resume before the replication can continue.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>In Draft</td>
<td>To use your consumer replication set, click <strong>Activate</strong>.</td>
</tr>
<tr>
<td>Activation Requested</td>
<td>After you initiate an activation, you must wait for the producer instance to respond to your request. If the wait time is excessive, then check the replication log for errors.</td>
</tr>
<tr>
<td>Seeding</td>
<td>The seeding job must complete before replication can resume.</td>
</tr>
<tr>
<td>Seeding Paused</td>
<td>The seeding job must resume before the seeding can continue.</td>

<tr>
<td>Active</td>
<td>Normal status.</td>
</tr>
<tr>
<td>Replication Stopped</td>
<td>Check the Status Messages in the following table for a specific message and associated fix.</td>
</tr>
<tr>
<td>Replication Paused</td>
<td>The replication process must resume before the replication can continue.</td>
</tr>
</tbody>
</table>
### Status (continued)

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replication Error</td>
<td>Check the Status Messages in the following table for a specific message and associated fix.</td>
</tr>
<tr>
<td>Replication Deactivated</td>
<td>Activate the producer and consumer instances.</td>
</tr>
<tr>
<td>Subscription Requested</td>
<td>Approve the request for a consumer subscription on the producer instance.</td>
</tr>
</tbody>
</table>

### Status Messages

<table>
<thead>
<tr>
<th>Message</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>All Producer Replication Sets have been deactivated due to fatal replication error</td>
<td>All consumer replication sets are moved to the error state. Contact Customer Service and Support.</td>
</tr>
<tr>
<td>Error while seeding data. Please refer to the Replication Payload Error table for details</td>
<td>On the consumer instance, more than one record failed to seed. To recover, go to the Replication Payload Error table to find and fix the error, and then activate the replication set.</td>
</tr>
<tr>
<td>Error while seeding data. Please retry seeding this table</td>
<td>To recover, reseed the table.</td>
</tr>
<tr>
<td>Producer has encountered an error while seeding</td>
<td>To recover, contact the administrator of the producer instance to determine the cause of the problem.</td>
</tr>
<tr>
<td>Producer Replication Set configuration has been modified</td>
<td>To recover, activate the replication set on the consumer instance.</td>
</tr>
<tr>
<td>Producer Replication Set has been deactivated due to replication error</td>
<td>Contact Customer Service and Support.</td>
</tr>
<tr>
<td>Producer Replication Set has been deactivated</td>
<td>To recover, activate the producer replication set, and then activate the consumer replication.</td>
</tr>
<tr>
<td>Producer Replication Set has been deleted</td>
<td>To recover, delete the consumer replication set.</td>
</tr>
</tbody>
</table>
## Status Messages (continued)

<table>
<thead>
<tr>
<th>Message</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Producer Replication Set is inactive</td>
<td>To recover, <strong>activate the producer replication set</strong>, and then <strong>synchronize and activate the consumer replication set.</strong></td>
</tr>
<tr>
<td>Producer Replication Set not found</td>
<td>To recover, <strong>delete the consumer replication set.</strong></td>
</tr>
<tr>
<td>Replication Set Paused</td>
<td><strong>To recover, click Resume or Activate.</strong></td>
</tr>
<tr>
<td>Replication set was in pause/error/seeding pause state for more than 7 days</td>
<td>The consumer replication set has been in the pause state, error state, or seeding pause state for more than the timeout period. The replication set is put into the disabled state. <strong>To recover, check for seeding errors and activate the replication with seeding.</strong></td>
</tr>
<tr>
<td>Seeding has been terminated due to timeout</td>
<td><strong>To recover, retry the seeding request or contact Customer Service and Support.</strong></td>
</tr>
<tr>
<td>Seeding request for a Producer Replication Set containing more than X number of records is not supported</td>
<td><strong>To recover, change the filter criteria to reduce the number of records to be seeded or use partial seeding. The default limit is 10 million records. Contact Customer Service and Support to change the default limit.</strong></td>
</tr>
<tr>
<td>Seeding was cancelled by a consumer admin</td>
<td><strong>To recover, activate the replication set.</strong></td>
</tr>
<tr>
<td>Seeding was cancelled by a producer admin</td>
<td><strong>To recover, activate the consumer replication set.</strong> Only seeding requests in the queued, paused, or started states can be canceled. In this case, the consumer replication state is Replication Error.**</td>
</tr>
<tr>
<td>Shared key not matching</td>
<td>The producer and consumer replication sets have different shared keys. <strong>To recover, copy the shared encryption key on the producer</strong></td>
</tr>
</tbody>
</table>
Status Messages (continued)

<table>
<thead>
<tr>
<th>Message</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>replication set, paste it into the consumer replication set, and activate the replication set.</td>
<td></td>
</tr>
</tbody>
</table>

**Instance Data Replication (IDR) XML stats**

Extract IDR related data from your instance to monitor replication status.

**IDR XML Stats**

You can view key metrics from your IDR producer and consumer instances to monitor performance and the status of IDR processing.

In a browser where the instance is running, append the following text to the instance URL: `xmlstats.do?include=idr`. The following output is an example of the IDR XML stats.

```xml
<idr status="enabled">
  <producer producer_last_run="2020-11-06 13:45:30"
    replication_queue_position="data_replication_queue0001@2020-11-05T22:58:32Z,2732,0,1"
    replication_queue_reading_lag="00:01:00">
    <replset last_message_sent_on="2020-11-06 13:44:31"
      last_position="data_replication_queue0001@2020-11-05T22:58:32Z 2731,0,1"
      last_sent_message_id="f339a84ac81820105b07c7cf110d4135" name="N-2NormalStickyReplication" status="active" topic_name="d59f4226db6680504d2bac44d69619a0.570532d91b582010ef39fccc4cc4bcb4a1">
      <subscriber name="persistencetestingora9" remote="false"/>
    </replset>
  </producer>
  <consumer consumer_last_run="2020-11-11 14:22:36">
    <replset data_lag="00:02:22" last_heartbeat_received_on="2020-11-11 14:22:36"
      last_message_received_network_time="00:00:05"
      last_position="data_replication_queue0002@2020-11-11T18:50:47Z,212,0,1"
      name="N-2NormalTransformerReplication" producer_name="byungidrorlondoni6" remote="false" status="active"
      topic_name="d59f4226db6680504d2bac44d69619a0.6f0572d91b582010ef39fccc4cc4bcb01"/>
  </consumer>
</idr>
```
IDR Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>idr status</td>
<td>Shows whether IDR is enabled for your instance.</td>
</tr>
<tr>
<td>Producer instance</td>
<td></td>
</tr>
<tr>
<td>producer producer_last_run</td>
<td>The last time the IDRProducerJob ran (GMT).</td>
</tr>
<tr>
<td>producer replication_queue_position</td>
<td>Position of the cursor in the replication queue.</td>
</tr>
<tr>
<td>replication_queue_reading_lag</td>
<td>The time between when a change is made, and when IDRProducerJob sends that change to the network.</td>
</tr>
<tr>
<td>replset last_message_sent_on</td>
<td>The last time data was sent to the network from this replication set.</td>
</tr>
<tr>
<td>replset last_position</td>
<td>The cursor position in the data_replication_queue when the last message was sent for this replication set.</td>
</tr>
<tr>
<td>last_sent_message_id</td>
<td>The message ID of the last sent message from the data_replication_queue.</td>

<tr>
<td>replset data_lag</td>
<td>Time since the last heartbeat was received. Heartbeats should occur every minute for a replication set.</td>
</tr>
<tr>
<td>last_heartbeat_received_on</td>
<td>Time of the last heartbeat for this replication set</td>
</tr>
<tr>
<td>last_message_received_network_time</td>
<td>For the last received message, time difference between when it was sent to the message queue and when it was picked up by the consumer instance.</td>
</tr>
<tr>
<td>replset last_position</td>
<td>The cursor position in the data_replication_queue, at which the last message was sent for this replication set.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the replication set.</td>
</tr>
<tr>
<td>status</td>
<td>The replication set status.</td>
</tr>
<tr>
<td>topic_name</td>
<td>The topic name in the message queue for this replication set.</td>
</tr>
</tbody>
</table>

### Adapter descriptions for Instance Data Replication (IDR)

During replication, adapters modify the producer data before inserting the data on consumer instances.

#### Adapter fields

Each adapter has **Name** and **Description** fields. The name appears in the Adapter column. Use the **Description** field to explain the purpose of the data conversion.

#### Calculation adapter

Use the calculation adapter on the producer data to specify the operation and the value that is used in the operation.
**Parameter examples**

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Operation</strong>: Multiply</td>
<td>10</td>
<td>10.80</td>
</tr>
<tr>
<td><strong>Constant Value</strong>: 1.08</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Operation</strong>: Max</td>
<td>1020</td>
<td>1000</td>
</tr>
<tr>
<td><strong>Constant Value</strong>: 1000</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Operation</strong>: Floor</td>
<td>5.5</td>
<td>5</td>
</tr>
<tr>
<td><strong>Constant Value</strong>: 0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Max** specifies the highest and **Min** specifies the lowest possible values. Values above or below those limits are set to those limits. Value types such as **int** and **long** have maximum and minimum values. Values above or below those limits cause precision errors.

**Concatenate String adapter**
Use the concatenate string adapter to append a specified string to the source data.

**Parameter example**

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>String</strong>: _v2</td>
<td>Patch10236</td>
<td>Patch10236_v2</td>
</tr>
</tbody>
</table>

**Fixed-width format adapter**
Use the fixed-width format adapter to reformat fixed-width input data. Use # to represent any positive integer, @ to represent any character, and \ as the literal escape character.

**Parameter examples**

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Match</strong>: #########</td>
<td>7605551212</td>
<td>(760) 555-1212</td>
</tr>
<tr>
<td><strong>Output</strong>: (####) ####-#####</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Match</strong>: ######</td>
<td>10000</td>
<td>100.00</td>
</tr>
<tr>
<td><strong>Output</strong>: ###.,###</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Match</strong>: ##.,###</td>
<td>10,000</td>
<td>10000</td>
</tr>
</tbody>
</table>
**Parameter examples (continued)**

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Map</strong>: PRB=TASK, done=complete</td>
<td>PRB</td>
<td>TASK</td>
</tr>
<tr>
<td><strong>Map</strong>: PRB=TASK, done=complete</td>
<td>done</td>
<td>complete</td>
</tr>
<tr>
<td><strong>Map</strong>: PRB=TASK, done=complete</td>
<td>PRB1000</td>
<td>(no mapping)</td>
</tr>
</tbody>
</table>

**Map adapter**

Use the map adapter for comma-separated pairs of literals to map source-to-target conversions. Matches must be exact. For example, PRB=TASK would not convert PRB1000 to TASK1000.

**Pattern adapter**

Use the pattern adapter for regular expressions to identify input patterns. Use parentheses in the **Regex** to identify groups. In **Output Pattern**, use $\$0$ to specify groups. $\$1$ represents the entire input, $\$1$ represents the first group, $\$2$ represents the second group, and so on. You can also insert, prefix, and append literal characters, including spaces so they appear in the adapter output.

---

© 2021 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
In the second example, the match is ABC followed by two letters, followed by ABC and two letters. $1$ of this input is ABCDE. $2$ of this input is ABCFG. $0$ is the entire input string. So $1$ $0$ is ABCDE ABCDEABCFG.

**Replace adapter**

Use the replace adapter to replace a specified input string or substring with a specified string. Use $ to replace only some of the occurrences of the string. $1$ replaces only the first occurrence; $2$ replaces only the second. Use curly braces to replace the first $N$ occurrences. For example, ${3}$ replaces the first three occurrences.

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Find: London</td>
<td>The product is London. The product is London.</td>
<td>The product is Madrid. The product is Madrid.</td>
</tr>
<tr>
<td>Replace: Madrid</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Find: $2$ London</td>
<td>The product is London. The product is London.</td>
<td>The product is London. The product is London.</td>
</tr>
<tr>
<td>Replace: Madrid</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Find: $(2)$ London</td>
<td>The product is London. The product is London.</td>
<td>The product is Madrid. The product is Madrid.</td>
</tr>
<tr>
<td>Replace: Madrid</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Split adapter**

Use the split adapter for a specified delimiter, such as a space, to break a string into two or more strings. In **Output Pattern**, use $ to specify groups. $0$ represents the entire input, $1$ represents the first group, $2$ represents the second group, and so on. You can repeat a group in an output pattern, for example, $2$, $1$, $1$. Multiple instances of a delimiter in source data create three or more groups.

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delimiter: &quot; &quot;</td>
<td>John Smith</td>
<td>Smith, John</td>
</tr>
</tbody>
</table>
### Parameter examples (continued)

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Output Pattern:</strong> $2, $1</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Delimiter:</strong> &quot; &quot;</td>
<td>John Harry Smith</td>
<td>Harry, John, John</td>
</tr>
<tr>
<td><strong>Output Pattern:</strong> $2, $1, $1</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Delimiter:</strong> &quot; &quot;</td>
<td>John Harry Smith</td>
<td>Smith</td>
</tr>
<tr>
<td><strong>Output Pattern:</strong> $3</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Task number adapter

Use the task number adapter to add a prefix or suffix to a task number or replace the task number's prefix.

#### Parameter examples

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Modification:</strong> Replace</td>
<td>PRB80899</td>
<td>STRY80899</td>
</tr>
<tr>
<td><strong>Number Prefix:</strong> PRB</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>New Number Prefix:</strong> STRY</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Modification:</strong> Add Prefix</td>
<td>08099</td>
<td>STRY80899</td>
</tr>
<tr>
<td><strong>Prefix:</strong> STRY</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Time zone conversion adapter

Use the time zone conversion adapter to convert one time zone to another.

#### Parameter example

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Output time zone:</strong> PDT</td>
<td>07:00:00 am GMT</td>
<td>00:00:00 am PDT</td>
</tr>
</tbody>
</table>

### Instance Data Replication (IDR) and tables on an exclusion list

Some tables can't be included in IDR replication sets. Child tables of tables on the exclusion list are also excluded.

#### Excluded tables

These tables are excluded from IDR:
• Tables with the prefixes V_PREFIX, SYSX_, sys, ts_, ua_, usageanalytics_, wf_, ecc_, clone_, jrobin_, rrd_, imp_, pf_, pfd_, idr_
  sys_domain is an exception.
• Rotated tables, including syslog, sys_querystat, ecc_queue, ecc_event, cmdb_metric, sysevent
• Tables without a sys_id
• sso_federation
• saml2_update1_properties
• sso_properties
• digest_properties
• Instance

IntegrationHub

Automate integration tasks using ServiceNow components for Flow Designer, or develop custom integrations. A separate subscription is required.

Capabilities

IntegrationHub enables execution of third-party APIs as a part of a flow when a specific event occurs in ServiceNow. These integrations, referred to as spokes, are easy to configure and enable you to quickly add powerful actions without the need to write a script. For example, you can post a message and incident details in a Slack channel when a high priority incident is created.

IntegrationHub provides the following functionality:

**Spokes for base system integrations**

Using IntegrationHub actions in Flow Designer, you can:

• Post messages and ServiceNow incident, problem, and change record details to Slack spoke v1.5.6, or Microsoft Teams spoke communications channels.
• Synchronize data across multiple production instances using IntegrationHub Remote Process Sync.

Create custom integrations

Build custom integrations with Action Designer using a REST step or a Script step.

Automate the administration of servers and applications in your network
Use custom actions to delegate Flow Designer processes to a MID Server in your network. For example, actions that use the PowerShell step or REST step.

Watch this video to learn how to send data to a third-party system using IntegrationHub.

Integrating data with third-party systems using the Slack Webhooks spoke.

**Connection and Credentials**

IntegrationHub takes advantage of aliases to manage connection information and credentials when integrating with external systems. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. IntegrationHub only requires an alias, which then resolves to use the correct credentials and connection information during runtime. Learn more about credentials, connections, and aliases.

**Benefits**

IntegrationHub provides process owners and developers these benefits.

- Consolidates multiple Now Platform automation capabilities into a single environment so process owners and developers can build and visualize business processes and integrations from a single interface.
- Extends Flow Designer content to integrate business processes with external systems.
- Promotes business process automation by enabling subject matter experts to develop and share spokes with flow designers.
- Provides natural-language-descriptions of integration logic to help non-technical users understand triggers, actions, inputs, and outputs.

**Development process**

When developing a custom integration, develop all actions for the integration within a scoped application. When deployed to a target instance, these actions are grouped as a spoke in Flow Designer. Brand the spoke by adding a custom icon to the application record. To learn more about application development, see Applications.

When developing spokes, flow and action designers typically perform these application development tasks.

1. Create a scoped application on a development instance to build spokes.
2. Publish a test version of the scoped application to the application repository.
3. Deploy the scoped application to a test instance from the application repository.

4. Test the scoped application on the test instance.

5. When working as expected, publish the scoped application in one of the following ways.
   - Publish to the application repository for deployment on production instances.
   - Publish to the ServiceNow Store as an application that customers can request for their environments.
   - Publish to ServiceNow Share to provide content to other customers in the ServiceNow community.

Review Flow Designer design considerations in the Architecture Overview.

**Request IntegrationHub**

ServiceNow® IntegrationHub lets you build reusable integrations with third-party systems and call them from anywhere in the Now Platform. For example, you can request IntegrationHub to call external systems using integration APIs from the Action Designer Script step, run the Script step on the ServiceNow® MID Server, and activate protocol steps like REST, SOAP, and PowerShell.

Flow Designer is a Now Platform feature that enables you to automate processes within a single instance. Without an IntegrationHub subscription, you can use base system actions or steps, including the Script step, to manipulate records, send emails, trigger notifications, and perform operations within the instance. Request IntegrationHub to automate and create integrations with external systems from the Flow Designer interface.

**IntegrationHub usage and subscription**

Choose an IntegrationHub subscription package to build reusable integrations with third-party systems. Review the usage dashboard to determine the number of transactions used within your current subscription, and to view transaction details.

IntegrationHub usage overview

Navigate to IntegrationHub > IntegrationHub Usage to view the current transaction count for your instance and feature usage.

Request an IntegrationHub plugin

IntegrationHub plugins require a separate subscription and must be activated by ServiceNow personnel.

About this task

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don’t have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Procedure

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>this plugin to be enabled</td>
<td></td>
</tr>
</tbody>
</table>
### Field Description

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments. |

5. Click **Submit**.

<td>IntegrationHub Designer Core [com.glide.ihub.designer.core]</td>
<td>Enables automation of data imports through the IntegrationHub - Import environment. Installs with the ServiceNow IntegrationHub Action Template - Data Stream [com.glide.hub.action_type.datastream] plugin.</td>
</tr>
</tbody>
</table>

### Use the IntegrationHub Usage dashboard

This dashboard shows an overview of IntegrationHub usage metrics to show customers how their organization uses IntegrationHub and to support license compliance.

**Before you begin**
Role required: admin, flow designer, action_designer, or flow_operator

**Procedure**

1. To view the dashboard, navigate to **IntegrationHub > IntegrationHub Usage**. The IntegrationHub Usage dashboard displays. The tabs on the dashboard include All, Tx By Spoke, Tx by Calling Spoke, Feature Use by Spoke, and Feature Use By Calling Scope. Reports on these tabs include:
### Orchestration Usage Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AVG Tx a Month (Last 12 months)</strong></td>
<td>Average number of IntegrationHub transactions per month over the last 12 months.</td>
</tr>
<tr>
<td><strong>Max Tx a Month (Last 12 Months)</strong></td>
<td>Maximum number of IntegrationHub transaction per month over the last 12 months.</td>
</tr>
<tr>
<td><strong>Yearly Tx (Last 12 Months)</strong></td>
<td>Total number of IntegrationHub transactions over the last 12 months.</td>
</tr>
<tr>
<td><strong>Current Tx (Last 30 days)</strong></td>
<td>Total number of IntegrationHub transactions over the last 30 days.</td>
</tr>
<tr>
<td><strong>Transactions by Month for the Last 12 Months</strong></td>
<td>Number of IntegrationHub transactions per month over the last 12 months.</td>
</tr>
<tr>
<td><strong>Transactions by Month for Last 12 Months filtered by IntegrationHub Spoke</strong></td>
<td>Number of IntegrationHub transactions per month over the last 12 months for a selected spoke.</td>
</tr>
<tr>
<td><strong>Transactions by Month for Last 12 Months filtered by Calling Scope</strong></td>
<td>Number of IntegrationHub transactions per month over the last 12 months for a selected calling spoke.</td>
</tr>
<tr>
<td><strong>Usage by Month for Last 12 Months filtered by IntegrationHub Spoke</strong></td>
<td>Number of IntegrationHub license usages per month over the last 12 months for a selected spoke.</td>
</tr>
<tr>
<td><strong>Usage by Month for Last 12 Months filtered by Calling Scope</strong></td>
<td>Number of IntegrationHub license usages per month over the last 12 months for a selected calling spoke.</td>
</tr>
</tbody>
</table>

2. **Optional:** You can add more widgets to the dashboard by clicking the Add Content icon (++) in the upper right corner of the dashboard.

- **Note:** You should not modify the existing tabs in this Dashboard. If you want a different dashboard experience, add a tab and customize that with your usage reports.
IntegrationHub available spokes

Activate spokes to enhance your Flow Designer experience with integration-specific content. Use pre-built flows and actions to automate your integrations or create your own integration automation.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

ℹ️ Note: The IntegrationHub Standard spokes are available to new customers as part of an IntegrationHub Professional subscription. Existing customers can use the spokes as part of an IntegrationHub Standard subscription.

**Note:** The ServiceNow eBonding spoke is included by default in your instance and doesn't require an IntegrationHub or Orchestration subscription.
Adobe Experience Platform spoke v2
Automate the process of managing datasets and entities in Adobe Experience Platform from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Adobe Experience Platform released on September 10, 2019, but may be compatible with later versions.

Spoke requirements
• Registered Adobe ID account
• User with developer access
• Details such as API key and client secret

See the Adobe Experience Platform documentation for instructions on creating Adobe ID and adding developer.

Spoke actions
The Adobe Experience Platform spoke provides actions manage datasets and entities when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dataset Management</td>
<td>Get All Data Inlets</td>
<td>Retrieves the details of all data inlets.</td>
</tr>
<tr>
<td></td>
<td>Get All Datasets</td>
<td>Retrieves the details of all datasets.</td>
</tr>
<tr>
<td></td>
<td>Get All Union Schemas</td>
<td>Retrieves the list of all schemas that are part of unions.</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td></td>
<td>Get Metadata For All Unions</td>
<td>Retrieves the metadata of all union views.</td>
</tr>
<tr>
<td></td>
<td>Get Metadata For Union Schema</td>
<td>Retrieves schema for the selected fields of a union.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.
Note: Two connection and credential alias records are needed for the Adobe Experience Platform spoke; one for data inlet management and batch ingestion, and other for data collection. Each alias should be associated with the respective Adobe Experience Platform API.

Set up Adobe Experience Platform spoke
Integrate your Adobe Experience Platform account with your ServiceNow instance. Create a custom OAuth application in Adobe Experience Platform and authenticate requests from ServiceNow.

Before you begin
• Request IntegrationHub subscription
• Activate Adobe Experience Platform spoke
• Role required: admin

About this task
The Adobe Experience Platform spoke can also be set up using the Connection & Credential configuration templates. However, using templates, only one set of alias records can be used at a time.

Attach a Java Key Store certificate to the Adobe Experience Platform spoke
Enable the JWT Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the Adobe Experience Platform spoke.

Before you begin
• Valid Java KeyStore certificate
• Role required: admin

Procedure
1. Navigate to System Definition > Certificates.
2. Click New.
3. On the form, fill in the fields.

X.509 Certificate form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, AEP Certificate.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Expiration notification</td>
<td>Option to send a notification when the certificate is about to expire.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Users to be notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the certificate.</td>
</tr>
<tr>
<td>Format</td>
<td>Certificate format. The instance supports the PEM and DER formats.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of certificate. Select <strong>Java Key Store</strong>.</td>
</tr>
<tr>
<td>Valid from</td>
<td>Date from which the certificate is valid.</td>
</tr>
<tr>
<td>Expires</td>
<td>Date on which the certificate expires.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>Number of days until the certificate expires.</td>
</tr>
<tr>
<td>Key store password</td>
<td>Password associated with the certificate.</td>
</tr>
<tr>
<td>Short description</td>
<td>Summary about the certificate.</td>
</tr>
<tr>
<td>PEM Certificate</td>
<td>Contents of the X509 certificate.</td>
</tr>
</tbody>
</table>

4. Click the attachments icon ( modele) and attach a JKS certificate.

5. Click **Validate Stores/Certificates**.

**Results**
The JKS certificate is created and attached to the Adobe Experience Platform spoke.

**Create a JWT signing key for the Adobe Experience Platform spoke**
Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to **System OAuth > JWT Keys**.
2. Click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the JWT signing key. For example, AEP JWT Keys.</td>
</tr>
<tr>
<td>Signing Keystore</td>
<td>Valid JKS certificate attached in the previous task. For example, AEP Certificate.</td>
</tr>
<tr>
<td>Key Id</td>
<td>Key ID to identify which key is used when multiple keys are used to sign tokens.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Adobe Experience Platform spoke.</td>
</tr>
<tr>
<td>Signing Algorithm</td>
<td>Algorithm to sign with the JWT key.</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Password associated with the signing key.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the certificate.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Results**
The JWT key is created and assigned to the JKS certificate.

**Create a JWT provider for the Adobe Experience Platform spoke**
Add a JSON Web Token (JWT) provider to your ServiceNow instance.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to **System OAuth > JWT Providers**.
2. Click **New**.
3. On the form, fill in the fields.
### JWT Provider form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the JWT provider. For example, AEP JWT Provider.</td>
</tr>
<tr>
<td>Expiry Interval (sec)</td>
<td>Number in seconds to set the lifespan of JWT provider tokens.</td>
</tr>
<tr>
<td>Signing Configuration</td>
<td>JWT signing key from the previous step. For example, AEP JWT Keys.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**. The Standard Claims and Custom Claims related lists are displayed.

5. Enter values for **iss**, **sub**, and **aud** in the Standard Claims related list. See the Adobe Experience Platform documentation for instructions.

6. Enter these values in the Custom Claims related list.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claim Name</td>
<td><a href="https://ims-na1.adobelogin.com/s/entdataservices_sdk">https://ims-na1.adobelogin.com/s/entdataservices_sdk</a></td>
</tr>
<tr>
<td>Claim Value Type</td>
<td>true</td>
</tr>
<tr>
<td>Claim Value</td>
<td>true</td>
</tr>
</tbody>
</table>

7. Click **Update**.

**Results**

The JWT provider is added to your ServiceNow instance.

### Register Adobe Experience Platform as OAuth Provider

Use the information generated during Adobe ID account creation and configuration to register Adobe Experience Platform as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **System OAuth > Application Registry**.

2. Click **New**.

   The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**. The system displays a blank Application Registries form.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter <strong>AEP OAuth</strong>.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Consumer key you generated during the Adobe ID account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Consumer secret you generated during the Adobe ID account configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select <strong>OAuthUtilAEP</strong>.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select <strong>JWT Bearer</strong>.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Adobe Experience Platform.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>This field should be left blank.</td>
</tr>
</tbody>
</table>

**Note:** You can use only **Authorization Code** as the **Default Grant type** when **PKCE** is enabled.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Token Revocation URL</td>
<td>This field should be left blank.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>This field should be left blank.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**.
   - The system validates the OAuth credentials and populates the **Redirect URL**.
   - The system populates **OAuth Entity Profile** with **Grant Type** as **JWT Bearer**. For example, **OAuth Entity Profile** is created with default **Name**, **AEP default_profile**

6. Open the record of OAuth Entity Profile.

7. Select the JWT Provider record for **JWT Provider**. For example, **AEP JWT Provider**.

8. Click **Update**.

**Results**

The instance can request OAuth 2.0 tokens for the spoke.

ℹ️ **Note:** When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, an administrator can regenerate the spoke OAuth token.

**Create Credential records for the Adobe Experience Platform**

Create Credential records to the Adobe ID account you created. The Adobe Experience Platform spoke connection and credential alias uses these credentials to authorize actions.

**Before you begin**

Role required: admin

**About this task**

You must create two credential records; one for data inlet management and batch ingestion, and other for data collection.
Procedure

1. Navigate to Connections & Credentials > Credentials.

2. Click New.
   The system displays the message What type of Credentials would you like to create?

3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter AEP for data inlet management and batch ingestion, and AEP_Ingestion for data collection.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile you created when you registered the Salesforce connected app as an OAuth provider. For example, select AEP OAuth default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>This field isn't applicable.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.

6. Click the Get OAuth Token related link to generate the OAuth token.

Results
The credential records for the Adobe Experience Platform spoke is created.

Create Connection records for the Adobe Experience Platform spoke
Create Connection records to your Adobe ID account. The Adobe Experience Platform spoke connection and credential alias uses these connections to perform actions in Adobe Experience Platform.

Before you begin
Role required: admin

About this task
Two connection and credential alias records are available by default; one for data inlet management and batch ingestion, and other for data collection.
Perform these steps to associate each alias with the respective Adobe Experience Platform API.

**Procedure**

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the required Adobe Experience Platform spoke record.

   🔄 **Note:** There are two connection and credential records: **AEP** and **AEP_Ingestion**. The **AEP** record is for data inlet management and batch ingestion, and **AEP_Ingestion** is for data collection.

3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <strong>AEP Platform</strong> for data inlet management and batch ingestion, and <strong>AEP dcs</strong> for data collection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Adobe Experience Platform. For example, select <strong>AEP</strong> and <strong>AEP_Ingestion</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>🔄 <strong>Note:</strong> Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Adobe Experience Platform.</td>
</tr>
<tr>
<td></td>
<td>• If the connection record is for data inlet management and batch ingestion, enter <strong><a href="https://platform.adobe.io/">https://platform.adobe.io/</a></strong>.</td>
</tr>
<tr>
<td></td>
<td>• If the connection record is for data collection, enter <strong><a href="https://dcs.adobedc.net">https://dcs.adobedc.net</a></strong>.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>This field isn’t applicable.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. In the **Attributes** tab enter these values.
• Internal name of the sandbox in Sandbox.

  Note: Ensure that you provide the internal name of the required sandbox and not its label in Sandbox. To obtain the internal name of the required sandbox, use the Get All Sandboxes action.

• If the connection record is for data inlet management and batch ingestion, enter API Key and Organization ID.

• If the connection record is for streaming ingestion, enter Organization ID.

6. Right-click the form header and click Save.

Results
The Adobe Experience Platform spoke is set up and integrated with the ServiceNow instance.

Adobe Sign spoke v2
Automate the process of sending a legal document to an individual or list of recipients for digital signature using Adobe Sign. For example, automate employee onboarding and offboarding, or sending non-disclosure agreements, legal agreements, and statements of work for digital signature. Use ServiceNow data in document templates and enable users to upload documents for signature as needed.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Compatible versions
This spoke was built for Adobe Sign API version v6, but may be compatible with later versions.

Key features
Adobe Sign spoke enables a flow designer to:

• Automate the process of sending a legal document to an individual or list of recipients for digital signature.
• Copy and customize sample flows for sending transient documents or Adobe Sign library documents for digital signature.
• Discover and synchronize the Adobe Sign documents.
• Pause a flow until an agreement or document is signed. A scripted REST API webhook waits for the recipient to sign the document.
• Use values from a signed document in a flow.
• Manage the life cycle of documents in Adobe Sign from the ServiceNow instance.

Spoke requirements
• Adobe Sign account
• Adobe Sign account admin credentials to perform the required account specific tasks in Adobe Sign
• Adobe Sign group admin credentials to perform the required group specific tasks in Adobe Sign

Note: Account admin or group admin can add users to the groups. These users can access information specific to their group only.

• Adobe Sign application configured to integrate with ServiceNow
• Adobe Sign application details such as application ID and client secret.
• ServiceNow admin credentials to create and synchronise the required Adobe Sign groups with ServiceNow
Note:

- This is the default admin role that is created when the Adobe Sign spoke is activated.
- ServiceNow admin has access to information about all Adobe Sign groups synchronized with ServiceNow and all tables part of the Adobe Sign spoke.
- User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. Group users have access to information specific to their Adobe Sign groups only and can view only the group-specific data from the tables that are part of the Adobe Sign spoke.

• IntegrationHub subscription

See the Adobe Sign development documentation for instructions on creating and configuring custom applications.

Spoke flows

The Adobe Sign spoke provides sample flows to demonstrate automating the Adobe Sign tasks. To customize a sample flow, copy it to the required application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adobe Sign - Send NDA Demo</td>
<td>Sends a statement of work for digital signature using a Adobe Sign library document when a Service Catalog request is created by the Adobe Sign - Statement of Work Demo item. Before using this flow, activate the Adobe Sign - Statement of Work Demo catalog item.</td>
</tr>
<tr>
<td>Adobe Sign - Statement of Work Demo</td>
<td>Sends a non-disclosure agreement for digital signature using a Adobe Sign library document when a Service Catalog request is created by the Adobe Sign - Statement of Work Demo item. Before using this flow, activate the Adobe Sign - Statement of Work Demo catalog item.</td>
</tr>
</tbody>
</table>

The Adobe Sign spoke adds catalog items for use with the Adobe Sign spoke sample flows. Before triggering an Adobe Sign spoke sample flow, activate these catalog items.
## Catalog item

<table>
<thead>
<tr>
<th>Catalog Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adobe Sign - Send NDA Demo</td>
<td>Sends a non-disclosure agreement for digital signature using a Adobe Sign library document.</td>
</tr>
</tbody>
</table>

## Spoke subflows

The Adobe Sign spoke provides a sample subflow to demonstrate automating Adobe Sign tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Get Documents Per Group. The subflow retrieves documents relevant to an Adobe Sign group and stores them in the AdobeSign Documents table.

## Spoke actions

The Adobe Sign spoke provides actions to automate Adobe Sign tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document Management</td>
<td>Attach Adobe Sign Document To Agreement Record</td>
<td>Downloads an Adobe Sign document and attaches it to the relevant ServiceNow agreement record.</td>
</tr>
<tr>
<td></td>
<td>Convert Transient to Library Document</td>
<td>Converts a transient document to a library document. Ensures that the document is available in the library for more than the stipulated transient 7-day purging period.</td>
</tr>
<tr>
<td></td>
<td>Get Library Documents</td>
<td>Discovers the documents and document templates from Adobe Sign. Populates ServiceNow tables with the document names and descriptions.</td>
</tr>
</tbody>
</table>

**Note:** Access to the documents is based on the group user roles.

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lookup</td>
<td>Agreement ID</td>
<td>Retrieves the agreement ID from the ServiceNow Agreement table.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Look up Agreements Stream</td>
<td>Retrieves the list of agreements.</td>
<td></td>
</tr>
<tr>
<td>Look Up Library Document ID</td>
<td>Retrieves the library document ID from the ServiceNow Documents table.</td>
<td></td>
</tr>
<tr>
<td>Look up Library Documents Stream</td>
<td>Retrieves the list of library documents.</td>
<td></td>
</tr>
<tr>
<td>Set Agreement Field</td>
<td>Creates a list of fields for a draft agreement.</td>
<td></td>
</tr>
<tr>
<td>Upload Attachment As Transient Document</td>
<td>Uploads an attachment to Adobe Sign as a transient document. The transient document is available for a period of 7 days.</td>
<td></td>
</tr>
<tr>
<td>Signature Management</td>
<td>Add Participant to Agreement</td>
<td>Builds a participant list iteratively over time and adds a participants to the local ServiceNow agreement record.</td>
</tr>
<tr>
<td>Check Agreement Status</td>
<td>Retrieves the status of an agreement.</td>
<td></td>
</tr>
<tr>
<td>Create Draft Agreement</td>
<td>Creates an agreement in the draft state in Adobe Sign and draft record in the ServiceNow Agreement table.</td>
<td></td>
</tr>
<tr>
<td>Finalize Draft and Send Agreement</td>
<td>Sends a draft agreement to the participant list for signature.</td>
<td></td>

</table>

**Spoke module**

The Adobe Sign spoke adds a Adobe Sign module to your ServiceNow instance. The Adobe Sign spoke synchronizes and stores information about groups, documents, and agreements in ServiceNow. The Adobe Sign spoke includes these tables.

- Agreements [sn_adobesign_spoke_agreement]
- Documents [sn_adobesign_spoke_adobe_sign_documents]
- Groups [sn_adobesign_spoke_adobesign_group_details]
- Client Details [sn_adobesign_spoke_client_details]

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Fields</th>
</tr>
</thead>
</table>
| Agreements     | Adobe Sign agreements from the synchronized Adobe Sign groups and accounts. Records in the Agreements table are updated with the signing status only when webhook is configured. | • Name  
• Agreement ID  
• Declined Reason  
• Status  
• Participants Info  
• Form Fields Info |
<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Fields</th>
</tr>
</thead>
</table>
| **Documents** | Adobe Sign documents from the synchronized Adobe Sign groups and accounts. To synchronize accounts, see [Synchronize Adobe Sign with ServiceNow](#). The Get Documents Per Group subflow retrieves a list of documents in each Adobe Sign group. | • Next Signer  
• Group Name |
| **Groups**   | Adobe Sign groups that are synchronized with ServiceNow. Administrator creates groups in the ServiceNow instance and provides the required details to synchronize with Adobe Sign. | • Group Name  
• Group ID  
• Connection Alias |

### Note: Access to the documents is based on the group user roles.

### Note: User role is created when an Adobe Sign group is created in the ServiceNow instance. Users with the group-specific role can access the documents and agreements relevant to the Adobe Sign group.

</tbody>
</table>

### Groups and user roles

Create a group in your ServiceNow instance to synchronize the group with the corresponding group in Adobe Sign.

User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. For example, a HR group user role, sn_adobesign_spoke.HR, is created when the HR group is created in ServiceNow. ServiceNow admin can assign these group user roles to users and control access to the group-specific information such as:

- Documents and agreements
- Connection and credential aliases
- Credential records
- Application registries
- Data in tables of the Adobe Sign spoke

To run flows and subflows, group users must also have these roles:

- connection_admin
- credential_admin
- flow_designer
- oauth_admin
- script_debugger
- view_changer
Only ServiceNow admin has access to information about all Adobe Sign groups that are synchronised with the ServiceNow instance.

Adobe Sign account requirements
The Adobe Sign spoke requires creating a custom app on your Adobe Sign account to generate OAuth 2.0 tokens.

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Note: A connection and credential alias is specific to a group in Adobe Sign.

A sample connection and credential alias is provided for demonstration purpose. ServiceNow admin must create an alias for each Adobe Sign group to synchronize that group with the ServiceNow instance. For example, you can have different connection and credential alias records one for each BU in your organization such as HR, Legal, Finance and so on.

Synchronize Adobe Sign group with ServiceNow
Synchronize ServiceNow with the required group in Adobe Sign to access the group specific documents, and agreements from the Adobe Sign spoke.

Before you begin
- Request IntegrationHub subscription
- Activate the Adobe Sign spoke
- Role required: admin

About this task
These steps are performed to synchronize only one Adobe Sign group. To synchronize another Adobe Sign group, repeat this process.

Create custom OAuth application in Adobe Sign account
Create a custom OAuth application from your Adobe Sign account to enable OAuth 2.0 authentication with the Adobe Sign spoke.
Before you begin

- Adobe Sign account
- Adobe Sign admin credentials

About this task
Complete these steps from your Adobe Sign account. See the Adobe Sign development documentation for instructions on creating and configuring custom applications.

Procedure
1. From your Adobe Sign account, create an application.
2. Copy and record the Application ID and Application Secret for later use. These details are required to register the application as a third-party OAuth provider on your ServiceNow instance.

Results
The custom OAuth application from your Adobe Sign account is created and can be integrated with the ServiceNow instance.

Configure the webhook
Configure the webhook in your Adobe Sign application to enable Adobe Sign to send data to ServiceNow when a participant signs an agreement or document.

Before you begin
Role required: admin

About this task
If the scope of the Adobe Sign application is Account, use the same webhook for all the groups defined within the account scope. If the scope of the Adobe Sign application is Group, you must configure for each group.

Procedure
1. From your Adobe Sign account, create a webhook with these configurations.
   a. Enter the target URL in URL in this format: https://<instance-name>.service-now.com/api/sn_adobesign_spoke/adobesign_webhook.
   b. Enter Agreement all events and Mega Sign all events in Events.
c. Select all the required agreement events in **Notification Parameters**.
   See the Adobe Sign development documentation for more information about creating webhooks in your Adobe Sign account.

2. In your ServiceNow instance, add the client details.
   
a. Navigate to **Adobe Sign Spoke > Client Details**.
   
b. Open the record, **Adobe Sign Client ID**.
   
c. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication Key</td>
<td>Key to authenticate. Enter UB7E5BXCXY.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during the Adobe Sign account configuration.</td>
</tr>
</tbody>
</table>

   
d. Click **Update**.

**Results**
Webhook is created in your Adobe Sign account and signing events in Adobe Sign are updated in the tables of the Adobe Sign spoke.

**Register Adobe Sign as OAuth provider**
Use the information generated during Adobe Sign account configuration to register Adobe Sign as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
   The system displays the message What kind of OAuth application?
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Adobe Sign OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during the Adobe Sign account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Application Secret created during the Adobe Sign account configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td>Note: You can use only Authorization Code as the Default Grant type when PKCE is enabled.</td>
<td></td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Adobe Sign Spoke.</td>
</tr>
<tr>
<td>Note: You must ensure that the application scope is Adobe Sign Spoke.</td>
<td></td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>• Upon saving the record, the endpoint changes to <a href="https://secure.nal.echosign.com/oauth/refresh">https://secure.nal.echosign.com/oauth/refresh</a>.</td>
</tr>
<tr>
<td></td>
<td>• If the token is revoked from the Adobe Sign custom application, change the endpoint to <a href="https://secure.nal.echosign.com/oauth/token">https://secure.nal.echosign.com/oauth/token</a></td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. System generates the URL upon saving the application registry.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
</tbody>
</table>

5. Insert records for group scope modifiers in the OAuth Entity Scopes related list in this format, `<scope>:<modifier>`.  

**Example**  
For example, if the user_read scope for the Group modifier is enabled in the Adobe Sign application, insert the following record in the OAuth Entity Scopes related list.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_read:group</td>
<td>user_read:group</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click **Save**. The system validates the OAuth credentials and populates the **Redirect URL**.

7. Copy and record the **Redirect URL**.

8. Login to your Adobe Sign account and edit the configuration of your custom Adobe Sign application. See the Adobe Sign development documentation for instructions.

Results
The instance can request OAuth 2.0 tokens for the spoke and a refresh token is created to regenerate tokens.

Create Credential records for the Adobe Sign spoke
Authorize the Adobe Sign spoke actions by creating credential records for the application registered in Adobe Sign. The Adobe Sign spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Adobe Sign Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Adobe Sign spoke as an OAuth provider. For example, select Adobe Sign OAuth profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Save.
6. To generate the OAuth token, click the Get OAuth Token related link.

Results
The credential record for the Adobe Sign spoke is created.
Create Connection and Credential Alias for Adobe Sign group

Manage connection and credential information of an Adobe Sign group to authorize the group-specific actions by creating connection and credential alias for the Adobe Sign group.

Before you begin
Role required: admin

About this task
A sample connection and credential alias is provided for demonstration purpose. If you are using the sample alias, it is not necessary to create a connection and credential alias. However, admin must create an alias for every other Adobe Sign group to synchronize that group with the ServiceNow instance.

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the alias. For example, AdobeSign_Legal.</td>
</tr>
<tr>
<td>ID</td>
<td>System generated unique ID.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Adobe Sign Spoke.</td>
</tr>
<tr>
<td>Type</td>
<td>Alias type. Select Connection and Credential.</td>
</tr>
<tr>
<td>Connection type</td>
<td>Connection type. Select HTTP.</td>
</tr>
</tbody>
</table>
| Support Multiple Active Connections | Option to specify if the alias supports multiple active connections. | 4. Click Save.

Results
The connection and credential alias is created for the Adobe Sign group and the group can be synchronised with the ServiceNow instance.
Create Connection record and Connection Attributes for the Adobe Sign spoke

Perform actions in Adobe Sign by creating connection records and connection attributes for your Adobe Sign group. The Adobe Sign spoke connection and credential alias uses these connections to perform actions on Adobe Sign.

Before you begin
Role required: admin

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Adobe Sign.
3. In the Connections related list, click New.
4. On the form, fill in the fields.

HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Adobe Sign Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Adobe Sign spoke. For example, Adobe Sign Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Note: Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL. For example, <a href="https://api.eu1.echosign.com/">https://api.eu1.echosign.com/</a>.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click Submit.
6. In the Connections Attributes related list, click New.
7. On the form, fill in the fields.
Connection Attributes form

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Connection attribute type. Select <strong>String</strong>.</td>
</tr>
<tr>
<td>Label</td>
<td>Name to identify the connection attribute. Enter <strong>Version</strong>.</td>
</tr>
<tr>
<td>Column name</td>
<td>System generated value that is based on the value entered in Label.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Ensure that the application scope is <strong>Adobe Sign Spoke</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection attribute.</td>
</tr>
<tr>
<td>Read only</td>
<td>Option to disable modifications to the connection attribute.</td>
</tr>
<tr>
<td></td>
<td>Enter <strong>false</strong>.</td>
</tr>
<tr>
<td>Default value</td>
<td>Default value of the connection attribute. Enter v6.</td>
</tr>
</tbody>
</table>

8. Click **Submit**.

**Results**
The connection record and connection attribute is created for the connection and credential alias.

**Configure Application Access to ServiceNow tables**
Allow Adobe Sign spoke to create group admin user role when an Adobe Sign group is synchronized with ServiceNow tables by configuring the application access of the required ServiceNow tables.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to **System Definition > Tables**.
2. For each of the following tables, ensure that the **Can read**, **Can create**, and **Can update** options are selected in the Application Access related list.
3. Click **Update**.

**Results**
Application access of the required ServiceNow tables is configured.

**Create Adobe Sign group in ServiceNow**
Synchronize ServiceNow with the required group in Adobe Sign by creating a record in the AdobeSign Group Details [sn_adobesign_spoke_adobesign_group_details] table.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to **Adobe Sign Spoke > Groups**.
2. Click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Name</td>
<td>Name to uniquely identify the Adobe Sign group. For example, Legal.</td>
</tr>
<tr>
<td>Group ID</td>
<td>Unique ID associated with the record.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection alias created to synchronize the Adobe Sign group with ServiceNow.</td>
</tr>
</tbody>
</table>
Results
The required Adobe Sign group is created in ServiceNow and can be managed from the Adobe Sign spoke.
User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. For example, a HR group user role, sn_adobesign_spoke.HR, is created when the HR group is created in ServiceNow. ServiceNow admin can assign these group user roles to users and control access to the group-specific information such as:

- Documents and agreements
- Connection and credential aliases
- Credential records
- Application registries
- Data in tables of the Adobe Sign spoke

To run flows and subflows, group users must also have these roles:

- connection_admin
- credential_admin
- flow_designer
- oauth_admin
- script_debugger
- view_changer

Only ServiceNow admin has access to information about all Adobe Sign groups that are synchronised with the ServiceNow instance.

Synchronize documents in Adobe Sign group with ServiceNow
Synchronize ServiceNow with the required group in Adobe Sign to access the documents and agreements that are specific to the group, from the Adobe Sign spoke.

Before you begin
Role required: admin

About this task
Ensure that the groups are setup and configured with their respective connection and credential aliases before synchronizing the group documents.
Procedure

2. Click the Get Documents related list.

Note:
- If you have logged in as an admin, you can synchronize the documents of all Adobe Sign groups.
- If you have logged in as a group admin, you can synchronize only those documents that are specific to your Adobe Sign groups.

Results
Details of all documents specific to the required Adobe Sign groups are synchronized with ServiceNow.

Activate Adobe Sign spoke catalog items
Trigger events in Adobe Sign when an item is requested in Service Catalog. For example, the Adobe Sign - Statement of Work Demo catalog item triggers a sample flow that sends a Adobe Sign document to a designated recipient.

Before you begin
- Synchronize Adobe Sign group with ServiceNow
- Role required: admin

About this task
The Adobe Sign spoke adds catalog items for use with the Adobe Sign spoke sample flows. Before triggering a sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adobe Sign - Send NDA Demo</td>
<td>Sends a non-disclosure agreement for digital signature using an Adobe Sign library document.</td>
</tr>
</tbody>
</table>
Procedure
1. Navigate to Self-Service > Service Catalog.
2. Click the add content icon +.
4. Click Add here.
5. Search for and select Adobe Sign - Send NDA Demo.
6. Click Add here.

Results
When one of these items is requested in the Service Catalog, the associated Adobe Sign spoke sample flow is triggered and necessary actions are performed in Adobe Sign.

Aha! spoke
Manage Aha! accounts using your ServiceNow instance. Analyze data usage for Aha! and reclaim idle accounts.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Spoke requirements
• Aha! admin role

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Aha! spoke provides actions to automate Aha! tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Management</td>
<td>Look up Users Stream</td>
<td>Retrieves details of all members in an account.</td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Deactivates the specified user account.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Create an Aha! OAuth2 application
Create an Aha! OAuth2 application to get access to Aha! API.

Before you begin
Aha! role required: admin

Procedure
1. Go to OAuth2 Authentication.
2. Log in to the Aha! site using your admin credentials.
3. On the Personal settings page, under the OAuth applications tab, click Register OAuth applications. The Register new OAuth application form appears.
4. Enter https://instance/oauth_redirect.do as the Redirect URI, where instance is the name of your ServiceNow instance.
5. Click Create. The OAuth applications tab shows Client ID and Client Secret keys.
6. Note down the values in the Client ID and Client Secret fields.
Set up ServiceNow instance for Aha!

Set up your ServiceNow instance to add the Aha! Client ID and Client Secret keys.

Before you begin
Role required: admin

Procedure
1. Log in to your ServiceNow instance.
   Connection & Credentials Aliases page appears and shows the list of apps.
3. Locate and open the Connection & Credentials record for Aha!
4. Click the Create New Connection & Credential related link.
   Create Connection and add Credential form appears.
5. On the form, fill in the details.

Create Connection and add Credential form

<table>
<thead>
<tr>
<th>Fields</th>
<th>Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name of the integration profile.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL for Aha!</td>
</tr>
<tr>
<td>OAuth Client ID</td>
<td>OAuth2 key that you received while creating an OAuth2 authentication from the Aha! site.</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>OAuth Client Secret key that you received while creating an OAuth2 authentication from the Aha! site.</td>
</tr>
<tr>
<td>OAuth Redirect URL</td>
<td>ServiceNow redirect URL.</td>
</tr>
</tbody>
</table>

6. Click Configure and get OAuth Token and then click Authorize.

AI Search spoke
Store data from the required third-party application in the AI Search server through Flow Designer. Access data through the AI Search portal.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release
notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are activated:

- AI Search (com.glide.ais)
- AI Search Demo (com.glide.ais_demo)
- External Content for AI Search (com.glide.external_content)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The AI Search spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete By Query</td>
<td>Removes all the documents that match the given query from the search index.</td>
</tr>
<tr>
<td>Flush Ingestion</td>
<td>Flushes queued documents in the batcher and indexes them.</td>
</tr>
<tr>
<td>Get Max File Size</td>
<td>Retrieves the maximum file size which can be ingested into AI Search.</td>
</tr>
<tr>
<td>Ingest Data</td>
<td>Ingests properties of the specified document into the batcher.</td>
</tr>
<tr>
<td>Ingest Document Using Download URL</td>
<td>Downloads a document and ingests into the batcher.</td>
</tr>
</tbody>
</table>

Note:
- You must add the domain URL to the list of trusted domains before you specify the URL in this action.
- You must provide a pre-authenticated URL to the action input Download URL.
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initialize Batcher</td>
<td>Initializes a new batcher to queue documents for indexing.</td>
</tr>
<tr>
<td>Is AIS Available For Ingestion</td>
<td>Checks if AI Search is available for ingestion.</td>
</tr>
<tr>
<td>Look up Supported File Extensions</td>
<td>Retrieves file extensions supported by AI Search.</td>
</tr>
<tr>
<td>Purge All Documents</td>
<td>Removes all the documents under the external source from the search index.</td>
</tr>
<tr>
<td>Release Batcher</td>
<td>Releases a used batcher from pool.</td>
</tr>
<tr>
<td>Remove Document</td>
<td>Removes a document from the search index.</td>
</tr>
<tr>
<td>Update By Query</td>
<td>Updates all the documents that match the given query.</td>
</tr>
</tbody>
</table>

See [Set up the AI Search spoke](#) for information about setting up the AI Search spoke.

**Set up the AI Search spoke**

Configure the AI Search connection to store the data from the required third-party application.

**Before you begin**

- Request an IntegrationHub subscription
- Activate the AI Search spoke
- Role required: admin

**Procedure**

1. Set up the AI Search connection.
   
   a. Navigate to **AI Search > Connection**.
   
   b. Click **Enable AIS**.

   ![Note](https://via.placeholder.com/15) **Note:** Ensure that the **Global** scope is selected before you click **Enable AIS**.

   A connection record is created.
c. Open the created record.

d. Click the Test Connection related link to verify that the connection is established.

2. Create external content schema table.
   b. In the field, provide the name of your schema table. For example, AI Search table.
   c. Click Submit.

3. Create indexed sources.
   a. Navigate to AI Search > Indexed Sources.
   b. Click New.
   c. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the record. For example, AI Search indexed source.</td>
</tr>
<tr>
<td>Source</td>
<td>Schema table that you had created. For example, AI Search table.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the record.</td>
</tr>
</tbody>
</table>

d. Click Submit.

i Note: Ensure that the Type of the indexed source is external.

You can now use the AI Search spoke actions.

4. Add the domain URL to the list of trusted domains.
   a. Navigate to AI Search Spoke > Trusted Domains.
   b. Click New.
c. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the record</td>
</tr>
<tr>
<td>Domain</td>
<td>URL of the trusted domain.</td>
</tr>
</tbody>
</table>

5. Create search source.

a. Navigate to **Al Search > Search Experience > Search Sources**.

b. Click **New**.

c. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the record. For example, <strong>AI Search source</strong>.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope. Select <strong>AI Search Spoke</strong>.</td>
</tr>
<tr>
<td>Indexed Source</td>
<td>Indexed source you had earlier created. For example, <strong>AI Search indexed source</strong>.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Filter conditions that must be met.</td>
</tr>
</tbody>
</table>

d. Click **Submit**.

6. Create search profile.

a. Navigate to **Al Search > Search Experience > Search Profiles**.

b. Click **New**.

c. Provide a value in **Label** to identify the record.

d. Right-click the form header and click **Save**.

e. In the **Search Sources** tab, click **Link Existing**.
f. In **Search Source**, select the source you had created. For example, **AIS Source**.

**g. Click Submit.**
The search profile you had created in displayed.

**h. Click Publish.**
You can search for the indexed sources by navigating to **AI Search > External Content > Testing UI**.

**Amazon Alexa spoke**
Manage intents, skills, vendors, and slots in your Amazon Alexa account from your ServiceNow instance.

**Request apps on the Store**
Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Professional subscription package. For more information, see **Request IntegrationHub**.

**Supported versions**
This spoke was built for Amazon Alexa API version v1, but may be compatible with later versions.

**Spoke requirements**
Admin access to **Amazon Developer Portal** and AWS Lambda.

**Important security considerations**
Be aware of these considerations to securely use Amazon Alexa:

- Amazon stores voice recordings of the Amazon Alexa smart assistant customers forever unless the Amazon Alexa account is configured to delete the recordings. For more information about deleting the voice recordings, see **Delete Alexa Voice Recordings Automatically**.

- To stop recording conversations, turn the microphone off on the Alexa enabled devices.
To ensure safety and protect privacy when using Alexa devices, take measures such as, choosing a strong password and using a pin for voice purchases.

Install or activate only the legitimate skills.

Ensure proper credential management in AWS Lambda when invoking the ServiceNow Rest API.

Ensure that your AWS Lambda function is accessible to only the required skills by adding the Alexa Skills Kit trigger to the required AWS Lambda function. Using these triggers, you can allow only the required skills to access your AWS Lambda function. For more information, see Configure the trigger for a Lambda function.

**Note:** Use the AWS Lambda function as an endpoint of your skill. If you are using custom web service, validate the skills. For more information, see Host a Custom Skill as a Web Service.

You can securely store your sensitive data in the AWS Lambda function using environment variables. For more information, see Using AWS Lambda environment variables.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- **ServiceNow IntegrationHub Action Step - REST** (com.glide.hub.action_step.rest)
- **ServiceNow Flow Designer - Dynamic Inputs** (com.glide.hub.dynamic_inputs)
- **Complex Object** (com.glide.cobject)
- **ServiceNow IntegrationHub Runtime** (com.glide.hub.integration.runtime)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**

The Amazon Alexa spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intent Management</td>
<td>Create Intent</td>
<td>Creates an intent for the specified skill and locale.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delete Intent</td>
<td>Deletes the specified intent from the specified skill.</td>
</tr>
<tr>
<td></td>
<td>Look up Intents</td>
<td>Lists available intents for the specified skill and locale.</td>
</tr>
<tr>
<td></td>
<td>Update Intent</td>
<td>Updates an intent for the specified skill and locale.</td>
</tr>
<tr>
<td>Interaction Model</td>
<td>Get Interaction Model</td>
<td>Gets the interaction model schema for the specified skill.</td>
</tr>
<tr>
<td>Management</td>
<td>Look up Interaction</td>
<td>Lists the available versions of the interaction model for the specified skill.</td>
</tr>
<tr>
<td></td>
<td>Model Versions</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Update Interaction</td>
<td>Updates the interaction model for the specified skill and locale.</td>
</tr>
<tr>
<td></td>
<td>Model</td>
<td></td>
</tr>
<tr>
<td>Skill Management</td>
<td>Create Skill</td>
<td>Submits a skill creation request for the specified Vendor ID.</td>
</tr>
<tr>
<td></td>
<td>Delete Skill</td>
<td>Deletes the specified skill.</td>
</tr>
<tr>
<td></td>
<td>Get Skill</td>
<td>Gets the details for the specified skill.</td>
</tr>
<tr>
<td></td>
<td>Get Skill Status</td>
<td>Gets the status for the specified skill.</td>
</tr>
<tr>
<td></td>
<td>Look up Skills</td>
<td>Lists the skills for the specified Vendor ID.</td>
</tr>
<tr>
<td></td>
<td>Update Skill</td>
<td>Submits a request to update a skill for the specified Vendor ID.</td>
</tr>
<tr>
<td>Slot Type Management</td>
<td>Create Slot Type</td>
<td>Creates a slot type for the specified skill in the specified locale.</td>
</tr>
<tr>
<td></td>
<td>Look up Slot Types</td>
<td>Lists available slot types for the specified skill and locale.</td>
</tr>
<tr>
<td></td>
<td>Update Slot Type</td>
<td>Updates the specified slot type for the specified skill and locale.</td>
</tr>
<tr>
<td>Vendor Management</td>
<td>Look up Vendors</td>
<td>Lists details of all the available vendors.</td>
</tr>
</tbody>
</table>
Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Amazon Alexa spoke
Integrate the ServiceNow instance and Amazon Alexa account by creating a custom OAuth application in Amazon Alexa to authenticate ServiceNow requests.

Before you begin
• Request an IntegrationHub subscription.
• Activate Amazon Alexa spoke.
• Role required: admin

Create a security profile
Create and register a security profile through the Developer Console to use Login with Amazon on your ServiceNow instance.

Before you begin
Role required: admin

Procedure
1. Log in to Amazon Developer Portal with admin credentials.
2. Create a security profile. For information about creating a security profile, see Create an LwA Security Profile in Amazon Developer Documentation.
3. Copy and record the values of Client ID and Client Secret for later use.
4. Configure the security profile and specify these values in Web Settings:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowed Origins</td>
<td>ServiceNow instance URL.</td>
</tr>
</tbody>
</table>
For more information about configuring the security policy, see Add your Website to your Security Profile in Amazon Developer Documentation.

Register Amazon Alexa as an OAuth provider

Use the information generated during the configuration of security profile to register Amazon Alexa as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Procedure

1. Navigate to System OAuth > Application Registry.
2. Open for the record, Amazon Alexa.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Application Registries form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the configuration of the security profile.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the configuration of the security profile.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>OAuth authorization code endpoint. Enter: <a href="https://www.amazon.com/ap/oa">https://www.amazon.com/ap/oa</a></td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. Enter: <a href="https://api.amazon.com/auth/o2/token">https://api.amazon.com/auth/o2/token</a></td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.
Create a credential record for the Amazon Alexa spoke

Create a credential record for the Amazon Alexa account. The Amazon Alexa spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays this message: What type of Credentials would you like to create?
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Alexa Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Amazon Alexa as an OAuth provider. For example, Amazon Alexa default_profile.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Submit**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.
   You will be redirected to the Amazon portal.
7. Click **Allow**.
   You will be redirected back to ServiceNow instance.

Create a connection record for the Amazon Alexa spoke

Create a connection record for your Amazon Alexa account. The Amazon Alexa spoke connection and credential aliases use these connections to perform actions in Amazon Alexa.
Procedure

1. Navigate to Connections & Credentials > Connections & Credentials Aliases.
2. Open the alias record, AmazonAlexa.
3. From the Connections tab, click New.
4. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Alexa Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Amazon Alexa spoke. For example, Alexa Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Amazon Alexa. Enter: <a href="https://api.amazonalexa.com">https://api.amazonalexa.com</a></td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

5. In the Attributes tab, enter v1 for version.
6. Click Submit.

Setup webhook for the Amazon Alexa spoke

Authenticate the inbound requests from Amazon Alexa account to your ServiceNow instance by creating a webhook registry.

Before you begin

Procedure

1. In the filter navigator, enter token_verification.list.
   - Records in the Token Verifications [token_verification] table are displayed.
2. Click New.
3. On the form, fill these values.
4. Click **Submit**.

5. Navigate to **Alexa Webhooks > Alexa Webhook Registries**.

6. Click **New**.

7. On the form, fill these values.

### Alexa Webhook Registry form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Name      | Name to identify the webhook registry record. For example, *Alexa token*.
| Description | Brief description of the webhook registry record. |
| Token     | Token you have created. For example, *Alexa token*. |
| Path      | Scripted REST endpoint. A default endpoint is available. You can change the default value as per your requirement. |

8. Right-click the form header and click **Save**.

9. Click **Callback URL**.

   Webhook Callback URL is displayed in the confirmation message. Copy and record this value.

10. Log in to **AWS Management Console**.

11. In the AWS Lambda function, specify the Webhook Callback URL and save the changes.
12. Log in to Alexa Developer Console.

13. Navigate to Build > CUSTOM > Endpoint and specify ARN of the AWS Lambda function you had configured.

Amazon Cloudwatch spoke
Integrate ServiceNow instance with Amazon Cloudwatch. Manage and monitor your Amazon Web Services (AWS) resources and applications from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.
Supported versions
This spoke was built for Amazon Cloudwatch version 2010-08-01, but may be compatible with later versions.

Spoke requirements
• User with full access to Amazon Cloudwatch account.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Amazon Cloudwatch Spoke provides actions to automate Amazon Web Services (AWS) resource and application monitoring tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alarm Management</td>
<td>Create Composite Alarm</td>
<td>Creates a composite alarm.</td>
</tr>
<tr>
<td></td>
<td>Delete Composite Alarm</td>
<td>Deletes the specified alarms.</td>
</tr>
<tr>
<td></td>
<td>Look Up Alarm</td>
<td>Retrieves a list of specified alarms.</td>
</tr>
<tr>
<td></td>
<td>Set Alarm State</td>
<td>Assigns a temporary state to an alarm for testing.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Anomaly Management</td>
<td>Create Anomaly Detector</td>
<td>Creates an anomaly detection model for a CloudWatch metric.</td>
</tr>
<tr>
<td></td>
<td>Delete Anomaly Detector</td>
<td>Deletes the specified anomaly detection model from an account.</td>
</tr>
<tr>
<td>Metric Management</td>
<td>Delete Metric Alarm</td>
<td>Deletes the specified alarms.</td>
</tr>
<tr>
<td></td>
<td>Look up Metric Data</td>
<td>Retrieves different metrics in a single request.</td>
</tr>
<tr>
<td></td>
<td>Upsert Metrics Alarm</td>
<td>Create a new alarm or updates an alarm and associates the alarm with the specified metric, metric math expression, or an anomaly detection model.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Set up the Amazon Cloudwatch spoke**

Integrate the ServiceNow instance and Amazon Cloudwatch by using the AWS credentials to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate Amazon Cloudwatch spoke.
- Role required: admin
Create a credential record for the Amazon Cloudwatch spoke

Create a credential record for the Amazon Cloudwatch account. The Amazon Cloudwatch Spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to IntegrationHub > Connections & Credentials > Credentials.
2. Click New.
   
   The system displays this message: What type of Credentials would you like to create?
3. Select AWS Credentials.
4. On the form, fill these values.

AWS Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Amazon Cloudwatch Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of your AWS account.</td>
</tr>
<tr>
<td></td>
<td>Access Key ID of the user with full access to Amazon Cloudwatch.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of your AWS account.</td>
</tr>
<tr>
<td></td>
<td>Secret Access Key of the user with full access to Amazon Cloudwatch.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Custom authentication algorithm for outbound signing requests. Select AmazonCloudWatchAlgo.</td>
</tr>
<tr>
<td>Note:</td>
<td>Users are cautioned against directly modifying the default authentication algorithm.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke. AWS_Cloud_Watch</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Submit.
Amazon Connect spoke
Manage and provide customer service across voice, chat, and tasks using your Amazon Connect account from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Amazon Connect API Version 2017-08-08, but may be compatible with later versions.

Spoke requirements
• User with full access to Amazon Connect.
• Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

### Spoke actions

The Amazon Connect spoke provides actions to automate Amazon Connect tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact Flow Management</td>
<td>Create Contact Flow</td>
<td>Creates a contact flow for the specified Amazon Connect instance.</td>
</tr>
<tr>
<td></td>
<td>Get Contact Flow Details</td>
<td>Retrieves details of the specified contact flow.</td>
</tr>
<tr>
<td></td>
<td>Look up Contact Flows</td>
<td>Retrieves a list of contact flows.</td>
</tr>
<tr>
<td></td>
<td>Update Contact Flow Content</td>
<td>Updates content of the specified contact flow.</td>
</tr>
<tr>
<td></td>
<td>Update Contact Flow Name</td>
<td>Updates name of the specified contact flow.</td>
</tr>
<tr>
<td>Contact Management</td>
<td>Resume Contact Recording</td>
<td>Resumes recording the call when a contact is being recorded and the recording has been suspended using suspend contact recording. Only voice recordings are supported at this time.</td>
</tr>
<tr>
<td></td>
<td>Start Contact Recording</td>
<td>Starts recording the contact when an agent joins the call. Only voice recordings are supported at this time.</td>
</tr>
<tr>
<td></td>
<td>Start Outbound Voice Contact</td>
<td>Places an outbound call to a contact and initiates the contact flow.</td>
</tr>
<tr>
<td></td>
<td>Stop Contact</td>
<td>Ends the specified contact.</td>
</tr>
<tr>
<td></td>
<td>Stop Contact Recording</td>
<td>Stops recording the call. If you use stop contact recording to stop recording an ongoing call,</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>you can’t use restart the contact recording. Only voice recordings are supported at this time.</td>
</tr>
<tr>
<td></td>
<td>Suspend Contact Recording</td>
<td>Suspends recording the call when a contact is being recorded.</td>
</tr>
<tr>
<td><strong>Instance Management</strong></td>
<td>Create Instance</td>
<td>Initiates an Amazon Connect instance with all the supported channels enabled.</td>
</tr>
<tr>
<td></td>
<td>Delete Instance</td>
<td>Deletes the specified instance.</td>

<td>Update User Hierarchy</td>
<td>Updates the specified user hierarchy.</td>
</tr>
<tr>
<td></td>
<td>Update User Identity Information</td>
<td>Updates the specified user identify information.</td>
</tr>
</tbody>
</table>
### Category | Action | Description
--- | --- | ---
Update User Phone Configuration | Updates details of the specified user phone configuration.
Update User Routing Profile | Updates the specified user routing profile.
Update User Security Profiles | Updates details of the specified user security profiles.

## Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

### Set up the Amazon Connect spoke
Integrate the ServiceNow instance and Amazon Connect account using AWS credential to authenticate ServiceNow requests.

**Before you begin**
- Request an IntegrationHub subscription
- Activate the Amazon Connect spoke
- Role required: admin

### Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Amazon Connect.
3. From the Credentials tab, click New. The system displays the message What type of Credentials would you like to create?.
4. Select AWS Credentials.
5. On the form, fill these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Amazon Connect Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon Connect.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon Connect.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select Amazon Connect.</td>
</tr>
</tbody>
</table>

**Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

**Results**
The credential record the Amazon Connect spoke is created.

**Amazon DynamoDB spoke**
Manage streams, tables, and tags in your Amazon DynamoDB database from your ServiceNow instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

⚠ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions
This spoke was built for API version 2012-08-10, but may be compatible with later versions.

Spoke requirements
• User with full access to Amazon DynamoDB.
• Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke actions
The Amazon DynamoDB spoke provides actions to automate Amazon DynamoDB tasks when events occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stream Management</td>
<td>Disable Stream</td>
<td>Disables the stream for the specified table.</td>
</tr>
<tr>
<td></td>
<td>Enable Stream</td>
<td>Enables the stream for the specified table.</td>
</tr>
<tr>
<td></td>
<td>Get Shard Iterator</td>

# Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

⚠️ **Note:** Two Credential aliases are available for the Amazon DynamoDB spoke.

## Set up the Amazon DynamoDB spoke

Integrate the ServiceNow instance and Amazon DynamoDB account using AWS credential to authenticate ServiceNow requests.

### Before you begin

- Request an IntegrationHub subscription
- Activate the Amazon DynamoDB spoke
- Role required: admin

## Create Credential records for the Amazon DynamoDB spoke

Create two Credential records for your Amazon DynamoDB account. The Amazon DynamoDB spoke connection and credential alias uses these credential records to perform actions in your Amazon DynamoDB account.

### Procedure

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **Amazon DynamoDB**.
3. From the **Credentials** tab, click **New**.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The system displays the message *What type of Credentials would you like to create?*.

4. Select **AWS Credentials**.

5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Amazon DynamoDB Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon DynamoDB.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon DynamoDB.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated Amazon DynamoDB credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select Amazon DynamoDB.</td>
</tr>
</tbody>
</table>

*Note:* Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

7. Navigate to **Connections & Credentials > Connection & Credential Aliases**.

8. Open for the record for **Amazon DynamoDB Streams**.

9. From the **Credentials** tab, click **New**.

   The system displays the message *What type of Credentials would you like to create?*.

10. Select **AWS Credentials**.

11. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Amazon DynamoDB Streams Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon DynamoDB.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon DynamoDB.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated Amazon DynamoDB Streams credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select Amazon DynamoDB Streams.</td>
</tr>
</tbody>
</table>

<i>Note: Users are cautioned against directly modifying the default authentication algorithm.</i>

12. Click **Submit**.

**Amazon EBS spoke**

Manage block level storage volumes and snapshots in Amazon EBS from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

⚠️ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Supported version**
This spoke was built for API version 2016-11-15, but may be compatible with later versions.

⚠️ Note: If you use different API version, ensure that you change the API version in all spoke actions.

**Spoke requirements**
• User with full access to Amazon EC2.
• Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

**Spoke actions**
The Amazon EBS spoke provides actions to automate Amazon EBS tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elastic Block Store Management</td>
<td>Attach Volume</td>
<td>Attaches an EBS volume to a running or stopped instance.</td>
</tr>
<tr>
<td>Elastic Block Store Management</td>
<td>Create Snapshot</td>
<td>Creates a snapshot of an EBS volume.</td>
</tr>
<tr>
<td>Elastic Block Store Management</td>
<td>Create Volume</td>
<td>Creates an EBS volume that can be attached to an instance in the same Availability Zone.</td>
</tr>
<tr>
<td>Elastic Block Store Management</td>
<td>Delete Snapshot</td>
<td>Deletes the specified snapshot.</td>
</tr>
</tbody>
</table>
### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

### Set up the Amazon EBS spoke

Integrate the ServiceNow instance and Amazon EBS account using AWS credential to authenticate ServiceNow requests.

**Before you begin**
- Request an IntegrationHub subscription
- Activate the Amazon EBS spoke
- Role required: admin

### Create Credential record for the Amazon EBS spoke

Create Credential record for your Amazon EBS account. The Amazon EBS spoke connection and credential alias uses this credential to perform actions on Amazon EBS.

**Procedure**

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Amazon EBS.
3. From the Credentials tab, click New. The system displays the message What type of Credentials would you like to create?.
4. Select AWS Credentials.
5. On the form, fill these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter EBS Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon EC2.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon EC2.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AmazonEBSAuthAlgo.</td>
</tr>
</tbody>
</table>

**Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

**Results**
The credential record the Amazon EBS spoke is created.

**Amazon Elastic Container Service spoke v1.0.1**
Manage clusters, instances, services and so on, in Amazon Elastic Container Service account from your ServiceNow instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported versions**
This spoke was built for Amazon Elastic Container Service API version 2014-11-13, but may be compatible with later versions.
Spoke requirements

- User with full access to Amazon Elastic Container Service.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

ℹ️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Amazon Elastic Container Service spoke provides actions to automate Amazon Elastic Container Service tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cluster Management</td>
<td>Create Cluster</td>
<td>Creates an Amazon ECS cluster.</td>
</tr>

</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Amazon Elastic Container Service spoke**

Integrate the ServiceNow instance and Amazon Elastic Container Service account by using the AWS credentials to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate Amazon Elastic Container Service spoke.
- Role required: admin

**Create a credential record for the Amazon Elastic Container Service spoke**

Create a credential record for the Amazon Elastic Container Service account. The Amazon Elastic Container Service spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   - The system displays this message: What type of Credentials would you like to create?
3. Select AWS Credentials.
4. On the form, fill these values.
AWS Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Amazon ECS Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon Elastic Container Service.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon Elastic Container Service.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AmazonECSAuthAlgo.</td>
</tr>
<tr>
<td>Note:</td>
<td>Users are cautioned against directly modifying the default authentication algorithm.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Amazon EC2 spoke v1.1**

Integrate ServiceNow instance with Amazon Elastic Compute Cloud (EC2). Manage Amazon instances, Amazon Machine Images (AMIs), Key Pairs, and Tags from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• Complex Object (com.glide.cobject)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

ℹ️ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported Versions
This spoke was built for API version 2016-11-15, but may be compatible with later versions.

Spoke requirements
• User with full access to Amazon EC2.
• Access Key ID and Secret Access Key of the user. Record these values for later use.

Spoke flows and subflows
This spoke has no flows and subflows.

Spoke actions
The Amazon EC2 spoke provides actions to automate Amazon EC2 tasks when events occurs in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon Machine Image Management</td>
<td>Copy Image</td>
<td>Copies an Amazon Machine Image (AMI) from the specified source region to the current region.</td>
</tr>
<tr>
<td></td>
<td>Create Image</td>
<td>Creates an Amazon EBS supported AMI from an Amazon EBS supported instance that is either running or stopped.</td>

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Setup the Amazon EC2 spoke

Integrate the ServiceNow instance and Amazon EC2 using AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an IntegrationHub Enterprise subscription
- Activate the Amazon EC2 spoke
- Role required: admin

Create Credentials record for the Amazon EC2 spoke

Create Credential records for the Amazon EC2 instance. The Amazon EC2 spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for AWS EC2.
3. From the Credentials tab, click New. The system displays the message: What type of Credentials would you like to create?.

© 2021 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
4. Select **AWS Credentials**.

5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter AWS Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to EC2.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to EC2.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AmazonEC2AuthAlgo.</td>
</tr>
</tbody>
</table>

**Note:** Do not directly modify the default authentication algorithm.

6. Click **Submit**.

**Amazon RDS spoke v1.0.1**

Integrate ServiceNow instance with Amazon Relational Database Service (RDS). Manage the process of performing various operations like set up, operate, and scale on Amazon RDS using this spoke.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.
Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

⚠️ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported Versions
This spoke was built for API version 2014-09-01 and 2014-10-31, but may be compatible with later versions.

Spoke Requirements
- User with full access to Amazon RDS.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

Spoke flows and subflows
This spoke has no flows and subflows.

Spoke actions
The Amazon RDS spoke provides actions to automate Amazon RDS tasks when events occurs in ServiceNow. Available actions include:

<table>

<td>Remove Tags From RDS Resource</td>
<td>Removes the tags from an RDS resource.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Amazon RDS spoke

Integrate the ServiceNow instance and Amazon RDS using AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an IntegrationHub Enterprise subscription
- Activate the Amazon RDS spoke
- Role required: admin

Create Credentials records for the Amazon RDS spoke

Create Credential records for the Amazon RDS instance. The Amazon RDS spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to Connections & Credentials > Connection & Credentials Aliases.
2. Open for the record for Amazon RDS.
3. From the Credentials tab, click New. The system displays the message What type of Credentials would you like to create?.
4. Select AWS Credentials.
5. On the form, fill these fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter AWS Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon RDS.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon RDS.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select Amazon RDS Auth Algorithm.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

**Amazon Route53 spoke**

Integrate ServiceNow instance with Amazon Route 53. Manage domain registrations, Domain Name System (DNS) routing, and health checking from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.
Supported versions
This spoke was built for Amazon Route 53 API version 2013-04-01, but may be compatible with later versions.

Spoke requirements
• User with full access to Amazon Route 53 account.
• Access Key ID and Secret Access Key of the user. Record these values for later use.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
• Complex Object (com.glide.cobject)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Amazon Route53 Spoke provides actions to automate Amazon Route 53 tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain Management</td>
<td>Check Domain Availability</td>
<td>Checks and returns the availability of a domain name.</td>
</tr>
</tbody>
</table>

⚠️ Note: If a domain name is in pending state, you must check the availability of the domain name again, until the status is processed.
<table>
<thead>
<tr>
<th>Category</th>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Get Domain Details</td>
<td>Retrieves detailed information about a specified domain that is associated with the current AWS account.</td>
</tr>
<tr>
<td></td>
<td>Look up Domain Suggestions</td>
<td>Retrieves a list of suggested domain names.</td>
</tr>
<tr>
<td></td>
<td>Look up Domains</td>
<td>Retrieves all the domain names registered with Amazon Route 53 for the current AWS account.</td>
</tr>
<tr>
<td></td>
<td>View Billing</td>
<td>Retrieves all the domain related billing records for the current AWS account for a specified period.</td>
</tr>
<tr>
<td>Hosted Zone Management</td>
<td>Create Hosted Zone</td>
<td>Creates a new public or private hosted zone.</td>
</tr>
<tr>
<td></td>
<td>Delete Hosted Zone</td>
<td>Deletes a hosted zone.</td>
</tr>
<tr>
<td></td>
<td>Get Change</td>
<td>Retrieves the current status of a change batch request.</td>
</tr>
<tr>
<td></td>
<td>Get Hosted Zone</td>
<td>Retrieves information about a specified hosted zone.</td>
</tr>
<tr>
<td></td>
<td>Get Hosted Zone Count</td>
<td>Retrieves total number of hosted zones for the account.</td>
</tr>
<tr>
