- To configure the event ribbon, click **Edit**.

To learn more about the event ribbon and how to configure it, see Monitor security events and Configure the security event ribbon.

**Daily compliance score**

The Daily Compliance Score section contains the Daily Compliance Score, Session Management, Hardening, Auditor, and Resources tiles.

You use the Daily Compliance Score to gauge how healthy your instance is from a security standpoint.

The Daily Compliance Score is a percentage score. It is based on how compliant the current settings of your instance security properties are with the compliance values published in the Instance Security Hardening Settings.

- To learn more about Daily Compliance Score calculations, and how hardening settings impact it, see Check the daily compliance score and configure security property settings.
- The **Refresh** button enables an administrator to instantly recalculate the Daily Compliance Score. To learn more, see How Daily Compliance score, trend, and graph data is refreshed.
Hardening
Use this process to adjust the specific security configuration properties that affect the Daily Compliance Score:

1. To access the Hardening Compliance Configurations page and perform instance security hardening, click the Daily Compliance Score tile or the Hardening link.

2. Specify whether you want to view all or only recommended security controls. Then, select the category you want to work in.

3. Set each security configuration property in the selected category. Click More Info to view detailed information for a property.

To learn more about hardening and optimizing security configuration properties to further increase compliance, see Adjust instance security settings to increase compliance.

To learn more about how trend and graph data is refreshed, see How Daily Compliance score, trend, and graph data is refreshed.

Auditor
Run the Auditor to scan your instance and find incorrect security definitions. It provides findings you can correct to help improve the security posture of your instance.

To access the Auditor page, click the Auditor tile or the Auditor link. To learn more, see Scan for incorrect security definitions.

Session management
Use Session Management to:
• View and manage user login sessions.
• See all users who are currently logged in to the instance.
• See detailed information about each session, such as the user name and IP address.
• Isolate and lock out specific user sessions that pose security risks.

To access the Session Management page, click the Session Management tile or link.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Name of the user associated with this login session.</td>
</tr>
<tr>
<td></td>
<td>• To locate a specific user session, click the spotlight search icon to search by user, user agent keyword, or IP address. For example, if you want to find all current logins from a specific type of browser, enter the browser name as a keyword into the User Agent field.</td>
</tr>
<tr>
<td></td>
<td>• Click a user name to access the user profile record. You can modify the user profile only if you have an assigned admin role.</td>
</tr>
<tr>
<td>MFA</td>
<td>Check box indicating if Multifactor Authentication (MFA) is enabled for the logged in user. To learn more about MFA, see Multifactor authentication (MFA).</td>
</tr>
<tr>
<td>Active</td>
<td>Check box indicating if the logged in user is active or inactive.</td>
</tr>
<tr>
<td>User Agent</td>
<td>Type of browser and the device operating system for the user login session.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>

<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IP Address</td>
<td>IP address of the logged in user.</td>
</tr>
<tr>
<td>Last Accessed</td>
<td>Date and time this user session last accessed the instance.</td>
</tr>
</tbody>
</table>

**Note:** To view detailed information for a particular login session, or to lock out the session itself, click the **User Agent**, **IP Address**, or **Last Accessed** fields.

**Metrics**

View detail for the following types of metrics:

<table>
<thead>
<tr>
<th>Type of metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Security metrics that are associated with user activity in the instance.</td>
</tr>
<tr>
<td></td>
<td>To access the User Metrics page, click the <strong>Metrics</strong> link, and then select <strong>User Metrics</strong>.</td>
</tr>
<tr>
<td>Export</td>
<td>Security metrics that are associated with data exported from the instance.</td>
</tr>
<tr>
<td></td>
<td>To access the Export Metrics page, click the <strong>Metrics</strong> link, and then select <strong>Export Metrics</strong>.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Security metrics that are associated with</td>
</tr>
<tr>
<td></td>
<td>To access the Export Metrics page, click the <strong>Metrics</strong> link, and then select <strong>Authentication Metrics</strong>.</td>
</tr>
<tr>
<td>Email</td>
<td>Security metrics that are associated with user activity in the instance.</td>
</tr>
<tr>
<td></td>
<td>To access the User Metrics page, click the <strong>Metrics</strong> link, and then select <strong>User Metrics</strong>.</td>
</tr>
<tr>
<td>Antivirus</td>
<td>Security metrics that are associated with antivirus event activity in the instance.</td>
</tr>
<tr>
<td></td>
<td>To access the Antivirus Metrics page, click the <strong>Antivirus</strong> tile or click the <strong>Metrics</strong> link, and then select <strong>Antivirus</strong>.</td>
</tr>
</tbody>
</table>

**Note:** To learn more about monitoring each type of metric, see **Monitor instance metrics**.

**Resources**

Access Now Support Knowledge Base articles, resources, and blogs that are related to instance security. These resources include security settings, coding, compliance, fixes, and related topics. To access the Resources page:

1. Click the **Resources** tile or link.
2. In the Resources page, click a category:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recommended</td>
<td>Access to recommended security guidelines, including the <strong>Instance Security Hardening Settings</strong> and <strong>ServiceNow Secure Coding Guide [KB0623354]</strong> articles.</td>
</tr>
<tr>
<td>Guidelines</td>
<td></td>
</tr>
<tr>
<td>Security Resources</td>
<td>Access to security-related resources in the Knowledge Base, including:</td>
</tr>
</tbody>
</table>
Security notifications

A notifications bell icon (𫖯) appears in the Instance Security Center, with a count total of unread security notifications. Notifications persist and are included in this count until you mark them as read.

1. Click the bell icon to view the first five unread security notifications.

A notification appears when Admin Login, Admin Unlocked, Failed Login, High Privilege Role, Impersonation, Security Elevation, and Weekly Digest events take place in your instance. To learn more about these security events, see Monitor security events.

2. To view detailed information for a specific security event, click the notification.

For example, if you click a High Privilege Role notification, you can view the Roles (sys_user_role) table. Use this table to see which users were assigned privileged roles during the calendar day. Using this history helps you to determine if roles have been properly assigned.

3. If there are more than five unread notifications, click View All Notifications to access an All Notifications page with a listing of all unread notifications.
   - To view detailed information for a specific security event, click the notification.
   - To mark all listed notifications as read, click Mark All as Read.

Note: As an administrator, you can also configure preferences for sending specific types of notifications for each type of security event. To learn more, see Set preferences for security event notifications.

Tours

Click the Tours link to view a guided visual tour of the Instance Security Center.

- The guided tour includes only the security monitoring functions that are listed on the homepage.

- It does not include the security functions that you access when you click the tiles or links on the homepage.

Security testing portal, security center, and help

The Now Support Service Portal is a central resource that you use to manage instances, tasks, and accounts. You can also access useful resources you can use to diagnose and resolve security and technical issues in your instance.

To access these resources, click Learn More or Get Help in the following tiles:

<table>
<thead>
<tr>
<th>Tile</th>
<th>Description</th>
</tr>
</thead>
</table>

</table>

**Virtual Agent access**

The Virtual Agent is a platform for providing user assistance through conversations within a messaging interface.

With the associated plugins installed, administrators can access the Virtual Agent and Natural Language Understanding (NLU) functions by clicking the Virtual Agent icon:

It enables you to perform the following tasks:

• Ask security-related questions, then get quick summary answers and reference links to learn more.

• Get answers related to processes such as:
  ◦ Instance Security Center
  ◦ Platform Security
  ◦ ServiceNow security policies
  ◦ Trust, Governance, and Risk

• Search for security-related resources, such as Knowledge Base topics in the Now Support Security Portal.

ℹ️ **Note:** To learn more about how to use and activate the Virtual Agent, see:

• Virtual Agent
  • Activate the ISC Virtual Agent interface

**Monitor security events**

Analyze the event metrics in your instance so that you can identify and prevent potential security events.

In the event ribbon, which is on the Instance Security homepage, you can analyze these metrics and accompanying detail to identify potential security events in the instance.
For each event metric, a real-time single score count appears, indicating how many times that the event occurred during the day in this instance. These single score reports are updated automatically as the corresponding events take place.

Each event metric also contains compliance trend and graph information over a range of dates. This information updates on a daily basis when you run the performance analytics job. To learn more, see the Analyzing event trend detail section.

### Event types

You can monitor at least six of the following types of events. For more than six events, use the left or right arrows below the event ribbon to scroll through them. To learn how to configure the event ribbon, see Configure the security event ribbon.

<table>
<thead>
<tr>
<th>Notification preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin Logins</td>
<td>Number of login attempts in this instance, during the calendar day, by users who have an assigned admin role.</td>
</tr>
<tr>
<td>Admin Users Added</td>
<td>Number of users with an admin role that were added in this instance during the calendar day. For example, your instance may have a security issue if the count is 10, but 4 users are known to have an assigned admin role.</td>
</tr>
<tr>
<td>External Incoming Email</td>
<td>To learn more, see Email metrics.</td>
</tr>
<tr>
<td>External Logins</td>
<td>Number of users with an assigned snc_external role who logged into this instance during the calendar day. These logins typically occur for maintenance, support, consulting, or audit purposes. Monitoring this metric enables you to verify that the external login attempts are legitimate and not potential security issues. To learn more about assigning external user roles, see Explicit Roles.</td>
</tr>
<tr>
<td>Failed Logins</td>
<td>Number of attempted logins that failed in this instance during the calendar day. This metric may indicate that attempts are being made to log in and compromise your instance security.</td>
</tr>
<tr>
<td>Impersonations</td>
<td>Number of impersonation logins in this instance during the calendar day. To learn about impersonating users, see Impersonate a user.</td>
</tr>
<tr>
<td>Quarantined Files</td>
<td>Number of files that were quarantined when you ran Antivirus Scanning in this instance during the calendar day. To learn more about quarantined files and Antivirus Scanning, see Antivirus metrics and Antivirus Scanning.</td>
</tr>
<tr>
<td>Notification preference</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Security Elevations    | Number of times that a security administrator has elevated security for standard users by changing their assigned user role to a high privilege security role during the calendar day. These high privilege security roles include oauth_admin, admin, security_admin, and impersonator.  
  • This metric indicates that someone might have tried to elevate the security of an unauthorized user. Do not use this metric by itself to detect a specific security compromise. Instead, treat this metric as an indication that you should check another metric to see if a security compromise has occurred.  
  • To learn more about elevating user security, see Elevate to a privileged role and Elevated privilege roles. |
| SNC Logins             | Number of Customer Service and Support personnel who logged into this instance using the hi-hopping technique during the calendar day. These logins typically occur for maintenance, support, consulting, or audit purposes.  
For information on how to control ServiceNow corporate employee access, see ServiceNow access control. |
| Spam                   | To learn more, see Email metrics. |
| Trusted Incoming Email | To learn more, see Email metrics. |
| Untrusted Incoming Email | To learn more, see Email metrics. |
| Virus Types            | Number of different types of antivirus events that occurred in this instance during the calendar day. To learn more about antivirus event types, see Antivirus metrics. |

### Analyzing event trend detail

To view trend details for an event metric, click the event count to access the Analytics Hub page. The details that appear for the instance depend on the type of metric.

For example, to view a listing of each failed attempt on the Security Dashboard Event Logs page:

• Select the Failed Logins metric.  
• In the Analytics Hub page, click Show Records.  
• Click one of the failed login attempts.  
• The detail includes the name of the user who attempted to log in, their IP address, and the table name that they tried to access.
You can set up event threshold triggers in the Analytics Hub to provide alerts when a certain event occurs within a range of scores for an indicator. You can also set targets that enable you to visualize the difference between the desired score and the actual score of an event.

For example, you can set a threshold of 10 for the Failed Logins metric. When ten or more failed login attempts occur during the day, an alert is sent to specific security personnel. You can also set a similar target that provides a visual highlight in the Analytics Hub when 10 failed logins occur during a day.

Trend data and graphs that appear in Event ribbon tile and the Analytics Hub are updated after the performance analytics job executes at 02:00 local time. To learn more, see How Daily Compliance score, trend, and graph data is refreshed.

Configure the security event ribbon

Configure the security event ribbon on the Instance Security Center homepage to include only those events that are relevant for tracking instance security in your operations. You can also change the order in which the security event tiles appear on the ribbon.

Before you begin
Role required: security_dashboard_user or admin

About this task
The security event ribbon is initially populated with a full set of standard security events. You can customize it by removing the events that are not relevant to your organization.

- For example, if you suspect that security issues are due to the actions of internal personnel, include the Admin Logins, Admin Users added, and Security Elevations event indicators.
- These indicators monitor how many times users with admin roles attempted to log in and, if admin users were added, what attempts were made to elevate security roles.

Note: To learn about the types of security events that appear in the event ribbon, see Monitor security events.

Procedure
1. Navigate to All > System Security > Instance Security Center.
2. In the event ribbon, click Edit (Edit).
   On the Edit Events form, the Selected column contains the events that are already listed.
3. To add security events to the event ribbon, move them from the Available column to the Selected column.
   To change the order the events appear on the ribbon, select an event, then click the up or down arrow to move it to its correct position.
• Place the events in the same sequential order they should appear on the Instance Security Center event ribbon.

• The events you place at the top of the Available column appear sequentially, beginning on the left side of the Instance Security Center event ribbon. The events placed towards the bottom of the column appear on to the right on the event ribbon.

4. To remove security events from the event ribbon:
   • In the Selected column, select the security events that you want to remove from the event ribbon.
   • Move them from the Selected column to the Available column.

5. Click Save.

Related information
Instance Security Center

Set preferences for security event notifications
Configure preferences for the types of notifications you want to receive for occurrences of specific security events. For each type, you designate whether to receive notifications by email, by push notification in Now Mobile, or in third party messaging applications such as Slack or Microsoft Teams.

Before you begin
To enable third party messaging applications to send security event notifications, you must activate the Messaging Notification (com.glide.notification.messaging) plugin. Individual users must configure their own settings. For details, see Notifications in messaging applications.

Role required: admin

Procedure
1. In the Instance Security Center home page, click the profile menu, then click Notification Preferences.

Notification preferences

<table>
<thead>
<tr>
<th>Notification preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin Login</td>
<td>Send the selected type of notification whenever other users with assigned admin roles log into this instance from a different IP address.</td>
</tr>
<tr>
<td>Admin Unlock</td>
<td>Send the selected type of notification whenever an account for a high privilege user has been unlocked.</td>
</tr>
<tr>
<td>Failed Login</td>
<td>Send the selected type of notification whenever other users fail to log in into this instance in less than the number of attempts defined in the glide.user.max_unlock_attempts property. If you don’t configure this property, the default value is 5. To learn more about this property, see Specify lockout for failed login attempts.</td>
</tr>
</tbody>
</table>
Notification preference | Description
--- | ---
HP Role Added | Send the selected type of notification whenever a high privilege security role (including oauth_admin, admin, security_admin, and impersonator roles) is granted to another user. To learn more about elevating user security, see [Elevate to a privileged role](#) and [Elevated privilege roles](#).

Impersonation | Send the selected type of notification whenever another user is impersonating you. To learn more about impersonating users, see [Impersonate a user](#).

Security Elevation | Send the selected type of notification whenever other users are elevated to a security admin role in this instance.

Weekly Digest | Send a weekly digest on the selected type of notification. It includes:
- A summary all security activities that took place in this instance throughout the week.
- The current daily compliance score for the instance.

2. For each type of security event, select the appropriate check boxes to designate the type of notifications to send you. You can select multiple notification methods for each.

<table>
<thead>
<tr>
<th>Check box</th>
<th>Description</th>

<tr>
<td>Slack</td>
<td>Send notifications for this type of security event through Slack. &lt;i class=&quot;fa fa-info-circle&quot;&gt;&lt;/i&gt; <strong>Note:</strong> This column appears only if you have set up Slack integration to the Now Platform.</td>
</tr>
<tr>
<td>Teams</td>
<td>Send notifications for this security event through Microsoft Teams. &lt;i class=&quot;fa fa-info-circle&quot;&gt;&lt;/i&gt; <strong>Note:</strong> This column appears only if you have set up Microsoft Teams integration to the Now Platform.</td>
</tr>
<tr>
<td>Push</td>
<td>Send push notifications on Now Mobile for this type of security event. &lt;i class=&quot;fa fa-info-circle&quot;&gt;&lt;/i&gt; <strong>Note:</strong> This column appears only if you first log into Now Mobile.</td>
</tr>
<tr>
<td>Select All</td>
<td>Select a specific type of notification for all types security events.</td>
</tr>
</tbody>
</table>
3. Click **Save**.

**Check the daily compliance score and configure security property settings**

Review the Daily Compliance Score metric and security configuration properties to see if your instance complies with the suggested security requirements. You can affect the daily compliance score by updating non-compliant security properties in the Hardening Compliance Configurations page.

The Daily Compliance Score is a percentage score. It is based on how compliant the current settings of your instance security properties are with the compliance values published in the Instance Security Hardening Settings.

Review the daily compliance score of your instance regularly. Follow these guidelines when you are evaluating your daily compliance score:

- Greater than or equal to 90% indicates that the instance is compliant with critical security controls.
- Greater than or equal to 50% and less than 90% indicates a moderate level of security compliance.
- Less than 50% indicates a low level of security compliance.

**Adjust instance security settings to increase compliance**

Using the Hardening Compliance Configuration page, harden and optimize non-compliant security properties that affect the daily compliance score of your instance. Its use ensures that your instance complies with the published security hardening standards, while fulfilling your company's security requirements.

**Before you begin**

Refer to the **Instance Security Hardening Settings** content for detailed descriptions, and compliance values, for the security-related system properties and plugins in the Now Platform.

- Consult the Instance Security Hardening Settings whenever you set or update security-related properties, even if some of the compliance values may not be suitable for your instance.
- When you are updating these properties, ensure that the instance continues to behave as expected. Consult with the appropriate internal personnel who have the expertise to determine the security impacts.

Role required: security_dashboard_user or admin

**Note:** If you have an admin role, you can view and edit security controls. If you have a security_dashboard_user role, you can view security controls, but you cannot edit them.

**Procedure**

1. Navigate to **All > System Security > Instance Security Center**.

2. Click the **Daily Compliance Score** tile or the **Hardening** link to access the Hardening Compliance Configuration page.
3. In the Hardening Compliance chart, view the statistics for compliant and non-compliant security configuration properties.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compliant</td>
<td>Number of security configuration properties that comply with the compliance values in the Instance Security Hardening Settings.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot change the settings for compliant security properties in the Hardening Compliance Configuration. If you want to do so, you must update them in System Properties. To learn more, see Add a system property.</td>
</tr>
<tr>
<td>Non-Compliant</td>
<td>Number of security configuration properties that do not comply with the compliance values in the Instance Security Hardening Settings. You can update settings for non-compliant properties.</td>
</tr>
</tbody>
</table>
4. In the **Show** list below the chart, specify whether you want to access all security configuration properties, or only recommended ones.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>All</strong></td>
<td>(Default) All compliant and non-compliant security configuration properties in each selected category. Only recommended security configuration properties appear in each selected category. These security configuration properties are a selected subset of the most critical ones used to secure the Now Platform. Consider these security configuration properties to be the bare minimum number of settings you must set to secure the Now Platform.</td>
</tr>
</tbody>
</table>
5. In **Categories**, select the category that contains the security configuration properties you would like to access:

### Access Control

Access controls determine whether to grant or deny user access to a particular resource based on who is permitted to use those resources. To learn more, see **Access control (instance security hardening)** in the Instance Security Hardening Settings.

### Attachments

Attachment security controls enable validation of incoming attachments to protect your instance against malicious files sent by attackers. To learn more, see **Attachments (instance security hardening)** in the Instance Security Hardening Settings.

### Email Security

Email security encompasses security configuration properties an administrator can configure to ensure that proper security policies are in place for all inbound emails. To learn more, see **Email security (instance security hardening)** in the Instance Security Hardening Settings.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input Validation</td>
<td>Input validation includes security-related properties that an administrator can configure to minimize entry of malformed data, regardless of source. To learn more, see Input validation (instance security hardening) in the Instance Security Hardening Settings.</td>
</tr>
<tr>
<td>Secure communications</td>
<td>Secure communications properties are those that an administrator can configure to secure the transportation of HTTP traffic. To learn more, see Secure communications (instance security hardening) in the Instance Security Hardening Settings.</td>
</tr>
<tr>
<td>Security Best Practices</td>
<td>Security best practices encompass security tasks that an administrator should perform periodically, within a certain interval of time, and include related configuration properties. To learn more, see Security best practices (instance security hardening) in the Instance Security Hardening Settings.</td>
</tr>
<tr>
<td>Security Inclusion Listing</td>
<td>Security inclusion listing includes security-related properties that an administrator can configure to restrict behavior to known inclusion listings. To learn more, see Security inclusion listing (instance security hardening) in the Instance Security Hardening Settings.</td>
</tr>
<tr>
<td>Session Management</td>
<td>Session management includes security-related properties that an administrator can configure to ensure secure session management in the Now Platform. To learn more, see Session management (instance security hardening) in the Instance Security Hardening Settings.</td>
</tr>
</tbody>
</table>

6. Configure the non-compliant security properties in the selected category.

- Unless otherwise specified, sliding the switch on sets a security property to its recommended setting. For example, you set most controls to true or false, but some require entry of a value, or values, such as a comma-separated value list.
- To access the dedicated Instance Security Hardening Settings topic for the security control, and learn more about it, click More Info.

**Results**
The Daily Compliance score increases or decreases depending on the changes that you make to the non-compliant security control settings.

**Related information**
Instance Security Center
How Daily Compliance score, trend, and graph data is refreshed

Trend and graph data in the Instance Security Center is updated after the performance analytics job executes at 02:00 local time. It appears in the Daily Compliance Score tile, in the Event ribbon tiles, and in the Analytics Hub page detail when you click one of the event tiles.

The [AppSec] Daily Data Management job is a regularly scheduled job that runs nightly and performs the following tasks:

1. Verifies if valid users have been assigned to the [AppSec] Daily Data Management and [PA AppSec] Daily Data Collection jobs when you first schedule them.
   - If you entered a valid user into the Run As field, the job continues processing. A valid user is one that is not locked out of the instance and has an assigned admin role.
   - If you entered an invalid user, an error message appears above the rotating security banner in the Instance Security Center.

   **Note:** To learn more about updating the assigned user when running scheduled jobs, see Create or schedule a data collection job.

2. Executes business logic to set the compliance state for the security properties you configure in the Hardening Compliance Configuration page. To learn more, see Check the daily compliance score and configure security property settings.

3. Runs the [PA AppSec] Daily Data Collection performance analytics job to collect compliance data and update the Daily Compliance Score.

Manually refreshing the Daily Compliance Score

Alternately, if you have an assigned admin role, you can refresh and recalculate the Daily Compliance Score at any time by clicking Refresh.

- The Refresh function performs the same tasks as the Daily Data Collection performance analytics job but does it in real time, rather than in a batch process.
- You typically use it when you want to perform updates to the Daily Compliance Score to immediately view the impact of instance security activities.
- There may be a slight delay before the updated score appears.

**Note:** The Refresh button does not appear for users with an assigned security_dashboard_user role.

**Note:** When you perform an upgrade (for example, from London to San Diego), the Instance Security Center (ISC) plugin is automatically activated. A ServiceNow-supplied fix script automatically assigns a custom user without any assigned roles.

PCI compliance score dashboard

The PCI compliance score dashboard shows how your instance conforms to payment card industry (PCI) security standards. Use the dashboard to view your compliance score and modify your configuration to improve security.
Required Now Platform roles

- security_dashboard_user or admin, needed to view the PCI compliance score dashboard.

Access the PCI compliance score dashboard

To open the dashboard, navigate to System Security > Instance Security Center. From the instance security center, click Compliance Scores in the header, then select PCI Compliance Score.

Use cases

For examples of how different people in your organization would use this dashboard, see these use cases.

<table>
<thead>
<tr>
<th>User</th>
<th>Dashboard use</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security dashboard user (security_dashboard_user)</td>
<td>Continually monitor and manage instance security compliance.</td>
</tr>
<tr>
<td>Admin (admin)</td>
<td>Continually monitor instance security compliance to detect and respond to security threats.</td>
</tr>
</tbody>
</table>
Indicators

**PCI Compliance Score**

Displays your instance's compliance score as a percentage. This percentage represents the percentage of security configurations on your instance that meet compliance standards. The indicator also displays the date the compliance score was calculated, and a comparison with the previous calculated score.

Filters

Scan for incorrect security definitions

Run the Auditor to scan your instance and find incorrect security definitions. It provides findings you can correct to help improve the security posture of your instance.

The Auditor performs a “full-body” assessment of your instance health that analyzes your system configuration. For security scans, it compares your current security configuration to best practice definitions, and to security property compliance values.

From an instance security standpoint, it provides insights and recommendations into what you should continue doing, and where you might be able to improve. These insights and recommendations help you answer the following questions:

- Are the appropriate security-related properties set?
- Is the High Security plugin enabled?
- Do the right access control rules exist?

**Run the Auditor and analyze scan results**

1. To run the Auditor, click **Audit** on the Instance Security Center home page.
2. When it completes, open Scan Results to review and analyze the security findings.
3. To review the detail for a specific scan result, double-click the result number. This information includes its status, scan type, execution time, and error messages.

4. Each of the Auditor findings contains resolution details, and a URL to product content about how to address them. Follow the documented guidelines to resolve the issues in each of the findings.

Access control list rules

Monitor instance metrics

Monitor user, export, authentication, email, and antivirus metrics for your instance. For example, you can monitor your email security by checking metrics for spam, external emails, and inbound emails from untrusted and trusted domains for your instance. Analyze these metrics to look for anomalous security behaviors that are related to activities that take place in your instance.

User metrics

Analyze user metrics to look for anomalous behaviors that are related to specific types of user activity in your instance.

Not Logged in Last Month / Last Six Months / Last Year

Indicates the number of users who have not logged into the instance within the last month, within the last six months, and within the last calendar year. To view user detail for a specific metric:

- Click the metric to view a listing of users that have not logged in to the instance during the indicated time period.
- Click a user name to view more details about that user.

Users with High Privilege Roles

Indicates the number of users with the following high privilege role types:

<table>
<thead>
<tr>
<th>User role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>admin</td>
<td>Primary administrator role that has access to all system features, functions, and data, regardless of security constraints.</td>
</tr>
<tr>
<td>ais_high_security_admin</td>
<td>Elevated privilege role that enables a user to access High Security settings for AI Search. To learn more, see <a href="#">Assign roles to AI Search administrators and users</a>.</td>
</tr>
<tr>
<td>password_reset_admin</td>
<td>Administrator role that enables a user to view the status of password reset activities, identify potential security threats, and monitor for compliance with password security policies. To learn more, see Password Reset and Password Change reports and logs.</td>
</tr>
<tr>
<td>script_include_admin</td>
<td>Administrator role that also has access to script includes.</td>
</tr>
<tr>
<td>User role</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>security_admin</td>
<td>Elevated privilege role that enables a user to create and change access controls and High Security Settings. To learn more, see security_admin role</td>
</tr>
<tr>
<td>user_admin</td>
<td>Administrator role that can also manage users, roles, user groups, roles, and department assignments.</td>
</tr>
</tbody>
</table>

**Note:** To learn more about these administrative role types, see Special administrative roles.

To view user detail for a specific user role metric:
- Click the user count role metric to view a listing of users with that high privilege role type.
- Click a user name to view more details about that user. You can then determine if these security-critical roles are assigned to the proper personnel.

**Users Trend**
Shows count trend information over a time period for the following types of users:

<table>
<thead>
<tr>
<th>Count type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Users</td>
<td>Number of users who are marked as Active in the instance.</td>
</tr>
<tr>
<td>Inactive Users</td>
<td>Number of users who are marked as Inactive in the instance.</td>
</tr>
<tr>
<td>Locked Out</td>
<td>Number of users who are locked out of the instance.</td>
</tr>
</tbody>
</table>

To view user detail for a specific user count (for example, Locked Out Users):
- Click the Locked out users metric.
- In the Analytics Hub page, click Show Records.
- Click a user name to view more details about that user. You can then determine if there is a reason this person is locked out and remedy the situation.

**Events Trend**
Shows count trend information for specific types of events, over a time period:

<table>
<thead>
<tr>
<th>Event type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin login</td>
<td>Number of users with high privilege administrator user roles who logged in on a specific day.</td>
</tr>
<tr>
<td>External login</td>
<td>Number of users with an assigned snc_external role who logged into this instance during the calendar day. These logins typically occur for maintenance, support, consulting, or audit purposes. Monitoring this metric enables you to verify that the external login attempts are legitimate and not potential security issues.</td>
</tr>
<tr>
<td>Failed login</td>
<td>Number of failed login attempts on a specific day.</td>
</tr>
<tr>
<td>Impersonation</td>
<td>Number of users logged in on a specific day who are impersonating other users.</td>
</tr>
</tbody>
</table>
(continued)

<table>
<thead>
<tr>
<th>Event type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security elevation</td>
<td>Number of times that a security administrator has elevated security for standard users by changing their assigned user role to a high privilege security role during the calendar day. These high privilege security roles include oauth_admin, admin, security_admin, and impersonator.</td>
</tr>
<tr>
<td>SNC login</td>
<td>Number of Customer Service and Support who logged in to this instance using the hi-hopping technique during a specific day.</td>
</tr>
</tbody>
</table>

To view user detail for a specific event count (for example, Impersonation):

- Click the user count metric. The Security Dashboard Event Logs page lists event logs for that type of event.
- Click a user name to view more details about that event.

**Related information**

- **Analytics Hub**

**Export metrics**

Analyze export metrics to see what data is most commonly exported and which users export the most data.

1. **Export chart**

   Each report displays the number of export events by date, using a color coded key to indicate which users performed the export. Click a colored section of a column to see the list of Export Events [isc_export_event] records matching that entry.

2. **Report key**

   The key at the bottom of the report indicates which colors identify which users or tables.

3. **Preview pop-up**

   Point to an entry in the chart to see a pop-up preview. This preview shows the user or table name, as well as a count of exports and a percentage of the total on that column.

4. **Image export**

   Click the icon to save the report as an image. You can save the report in PNG or JPEG format.

5. **Report date range**
Use the **Show** list to display exports within the last 24 hours or within the last 7 days.

**Export metrics reports**

The export metrics page displays four reports.

**Exports by user**

Use the **Exports by User** report to see which of your users are exporting the most data.

**Classified exports by user**

Use the **Classified Exports by User** report to see which of your users are exporting the most data matching classifications like confidential, restricted, or personal information. Administrators can define which classifications this report uses in the **Settings** tab.

**Exports by table**

Use the **Exports by Table** report to see which tables are exported from most frequently.

**Classified exports by table**

Use the **Classified Exports by Table** report to see which tables are exported from most frequently that match classifications like confidential, restricted, or personal information. Administrators can define which classifications this report uses in the **Settings** tab.

**Note:** Export metric reports only track export events. Exports from other sources, such as rest APIs or workflows are not tracked as part of this feature.

**Export metrics settings**

Use the configuration options in the **Settings** tab to narrow down reporting results.

Access the settings for your export metrics by clicking the **Settings** tab.

---

**Settings configuration fields**
Export metrics configurations

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classifications for Metrics</td>
<td>Add or remove classifications to this field to determine which exports are included in the <strong>Classified Exports by User</strong> and <strong>Classified Exports by Table</strong> reports. These reports support the following classifications:</td>
</tr>
<tr>
<td></td>
<td>• Personally identifiable information</td>
</tr>
<tr>
<td></td>
<td>• Confidential</td>
</tr>
<tr>
<td></td>
<td>• Restricted</td>
</tr>
<tr>
<td></td>
<td>• Internal</td>
</tr>
<tr>
<td></td>
<td>• Public</td>
</tr>
<tr>
<td></td>
<td>For more detail on data classifications, see <a href="#">Data classifications</a>.</td>
</tr>
</tbody>
</table>
| Classifications for Alerts    | Add or remove classifications to this field to determine which exports trigger instance security notifications. The classifications supported in the **Classifications for Metrics** field are supported here. For more detail on these alerts, see the security notifications section on the **Instance Security Center** page. The **Record Threshold** field defines the number of records exported before your instance triggers and alert.
| Record Threshold              | Number of record a user must export to trigger an alert. To trigger an alert, these records must also match the classifications listed in the **Classifications for Alerts** field. |

Use the **Save (⌘ + s)** button to save your settings.

**Authentication Metrics**

Analyze authentication metrics to see information related to authentication, such as infrequently used IP addresses, failed logins, and types of authentication schemes used by your users.

Use the **Authentication Metrics** page to view reports relating to your authentication configuration. The following reports are displayed in this tab.

**Note:** The authentication metrics page requires the **REST API Access Policy plugin** (com.glide.rest.policy) plugin. For more details about this feature, see [REST API access policies](#).

**APIs without authentication policies**

Displays a real-time count of all API’s without an access policy

**Hardening: Account recovery flow**

**Hardening: Role-based MFA feature related setting**

**Web service access only accounts**
Shows the count of all user records with web service access option enabled in User [sys_user] table.

X509 certificates expiring in 30 days
Displays a count of all X.509 certificates from X.509 Certificates [sys_certificate] table which are due expire in 30 days.

Adaptive authentication metrics
Analyze adaptive authentication metrics to monitor and add insights on how adaptive authentication is being used on your instance.

View reports, settings, and policies associated with adaptive authentication in on place using the adaptive authentication metrics page. Security administrators can use reports to monitor the results of their adaptive authentication policies. Use this data to gain insights and adapt your policies to improve their performance.

ℹ️ Note: The adaptive authentication metrics page requires the Adaptive Authentication (com.snc.adaptive_authentication) plugin. For more details about this feature, see Adaptive authentication.

Metrics
Use the Metrics tab to view reports relating to your adaptive authentication configuration. The following reports are displayed in this tab.

• Policy Results Rates
• Event Failure Distribution
• Event Success Distribution
• Denied IP Addresses
• Authentication User Logins
• API User Logins
• Authentication Trend
Use the **Show** list to select a time span for the displayed reports

### Adaptive Auth Policies

Use the **Adaptive Auth Policies** tab to view the adaptive authentication policies and policy contexts on your instance. Click on any entry on these lists to view the associated record. For more details on these records, see **Adaptive authentication**

### Settings

Use the settings tab to view and configure adaptive authentication system properties. For more information on these properties, see **Configure adaptive authentication properties**

### Email metrics

Analyze your email metrics to look for anomalous behaviors that are related to the incoming emails to your instance. For example, if the metrics indicate a spike in spam emails from specific domains, you can define inbound actions that prevent their delivery to the instance.

For each email metric, a count appears for each type of email that is delivered or sent to the instance during the calendar day.

<table>
<thead>
<tr>
<th>Notification preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>External Incoming Email</td>
<td>Number of incoming emails for the calendar day that were delivered to the instance from external email domains.</td>
</tr>
<tr>
<td></td>
<td>✨ <strong>Note:</strong> The external email domains are those domains that are not listed in the security.list.internal.domains system property, because this property tracks only your internal email domains. To learn more about this property, see <strong>Available system properties</strong>.</td>
</tr>
<tr>
<td>Spam</td>
<td>Number of incoming emails for the calendar day that were delivered to the instance and marked as spam. A number that is out of line with historical trends may indicate that attempts are being made to compromise your instance security.</td>
</tr>
<tr>
<td>Trusted Incoming Email</td>
<td>Number of incoming emails to the instance for the calendar day from email domains designated as trusted.</td>
</tr>
<tr>
<td>Untrusted Incoming Email</td>
<td>Number of incoming emails to the instance for the calendar day from email domains designated as untrusted.</td>
</tr>
</tbody>
</table>

You can designate untrusted or trusted email domains in the Untrusted And Trusted Domain form so that you can track your inbound emails that are sent from them. To learn how to designate untrusted or trusted email domains, see **Designate email domains as untrusted or trusted**.
After you click an email metric, you can learn about the possible email security issues in your instance by clicking one of the following:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chart</td>
<td>Incoming email counts and count trends over time for the selected email type (spam, incoming external, untrusted, or trusted).</td>
</tr>
<tr>
<td>Records</td>
<td>Individual email records that compromise the daily count for the selected email type.</td>
</tr>
<tr>
<td>More Info</td>
<td>Additional information for the selected email type.</td>
</tr>
</tbody>
</table>

**Note:** The email metrics apply only to your incoming emails to the instance. The metrics do not apply to the normal traffic that is processed through your enterprise-wide email servers. To learn about defining inbound actions and how they impact the processing of your inbound emails, see [Inbound email actions](#).

**Designate email domains as untrusted or trusted**

Designate specific email domains as untrusted or trusted so that you can monitor the metrics for incoming emails from these sources in your instance.

**Before you begin**

Role required: security_dashboard_user or admin

**About this task**

When untrusted or trusted domains send emails to your instance, their daily counts appear on the **Untrusted Incoming Email** or **Trusted Incoming Email** metrics on the Email page. You can then track email activity from these domains and use email logs to view specific incoming emails. You can also specify a user, usually a manager, or a security analyst, to notify whenever activity occurs from the untrusted or trusted domain.

**Note:** Designating an email domain as untrusted is for security tracking purposes only. Administrators can also set up a system address filter to ignore emails from untrusted domains. To learn about filtering emails to block their delivery, see [System address filters](#).

**Procedure**

1. Navigate to **All > System Security > Instance Security Center**.
2. On the Instance Security Center homepage, click the **Email** tile, or click the **Email** link to access the Email page.
3. On the Email page, in the Untrusted And Trusted Domain section, click **New**.
4. On the form, fill in the fields.

**Untrusted And Trusted Domain form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td>Name of the email domain that you are designating as untrusted or trusted. For example, enter servicenow.com to designate ServiceNow employees can send trusted emails to the instance.</td>
</tr>
<tr>
<td>Category</td>
<td>Category that indicates if the email domain is untrusted or trusted:</td>
</tr>
<tr>
<td><strong>Field</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>-----------</td>
<td>----------------</td>
</tr>
<tr>
<td><strong>Untrusted</strong></td>
<td>Designates that the email domain as untrusted. You use it to identify domains that send suspicious or emails that pose a potential security threat to the instance.</td>
</tr>
<tr>
<td><strong>Trusted</strong></td>
<td>Designates that the email domain as trusted. You use it to identify domains when your metrics indicate that the incoming emails from it pose no security threats. Designating the domain as trusted enables you to track its inbound email activity over time.</td>
</tr>
</tbody>
</table>

| **Active** | Check box for enabling or disabling the designated untrusted or trusted status for the specified email domain. |
| **Notify** | Name of the user to notify by email when activity occurs in the untrusted or trusted domain. Click the spotlight search icon ( ) to search for the name of the user. Leave the **Notify** field blank if you do not want notifications sent. |

5. Click **Save**.

**Results**

Untrusted or trusted email domain information is also added to the **Untrusted And Trusted Domains** listing on the Email page.

**Related information**

- **Instance Security Center**
- **Email metrics**
- **Antivirus metrics**

If the Antivirus Scanning plugin is activated, Antivirus Scanning runs in your instance to help protect it against virus infections from attachments.

The following metrics appear for the last 60 days of activity, and enable you to assess the effectiveness of the Antivirus Scanning functions.

**Antivirus Events**

Antivirus Events indicate the number of antivirus events in your instance, by date. To access the antivirus events, navigate to **System Security > Instance Security Center** and select the Metrics tab. Color coded graph lines represent the following types of antivirus events:

<table>
<thead>
<tr>
<th><strong>Color</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Blue</td>
<td>Number of files quarantined by Antivirus Scanning in this instance for the indicated date.</td>
</tr>
<tr>
<td>Green</td>
<td>Number of infected files downloaded to the instance, and then quarantined for the indicated date. These files are primarily email attachments that contain a virus or rouge code.</td>
</tr>
<tr>
<td>Yellow</td>
<td>Number of quarantined files in the instance that were deleted for the indicated date.</td>
</tr>
<tr>
<td>Orange</td>
<td>Number of quarantined files in the instance that were restored for the indicated date.</td>
</tr>
</tbody>
</table>
**Note:** After Antivirus Scanning runs and finds any false positives, you can restore a quarantined file and make it accessible in the instance.

- To access the Analytics Hub page and view the detailed score card and analytics information for a specific date, click a colored line in the Antivirus Events graph. For example, click the blue graphics line to view analytics information for files quarantined for a specific date.

- To view the following breakdowns in the Analytics Hub page, click , then click:

<table>
<thead>
<tr>
<th>Breakdown</th>
<th>Description</th>
</tr>
</thead>
</table>
| AppSec - Antivirus Event Source | Source of the antivirus event.  
  ◦ **On Upload:** Occurred due to an upload of an infected file, usually an attachment.  
  ◦ **From Quarantine:** Occurred due to the quarantine of an infected file, usually an attachment.  
  ◦ **On Download:** Occurred due to a download of an infected file, usually an attachment.  
  ◦ **From Record:** Occurred due to an infected record in a table. |
| AppSec - Antivirus Event Type | Type of antivirus event.  
  ◦ **Quarantined:** Occurred due to the quarantine of a file, usually an attachment.  
  ◦ **Downloaded:** Occurred due to a download of a file, usually an attachment.  
  ◦ **Restored:** Occurred due to the restoration of a quarantined file.  
  ◦ **Deleted:** Occurred due to the deletion of a quarantined file. |
| AppSec - Antivirus Uploader | Name of the logged in user who uploaded the files that were the source of virus infections detected by the Antivirus Scanning application. |

**Quarantined Files**

Lists the infected files in the instance quarantined by Antivirus Scanning:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File name</td>
<td>Name of the infected file.</td>
</tr>
<tr>
<td>Content type</td>
<td>Type of content that was infected in the file. For example, application/x-dosexec is an infected application or DOS executable file, while text/plain is an infected .txt file.</td>
</tr>
<tr>
<td>Table</td>
<td>Name of the table that contains the infected file. For example, incident appears for an incident file record.</td>
</tr>
<tr>
<td>Virus</td>
<td>Name of the file quarantined by Antivirus Scanning.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Detected</td>
<td>Date and time the infected file was detected.</td>
</tr>
<tr>
<td>Created By</td>
<td>Name of the user who quarantined the infected file.</td>
</tr>
<tr>
<td>Created</td>
<td>Date and time the quarantine file record was created.</td>
</tr>
<tr>
<td>Table sys ID</td>
<td>Table system identifier assigned to the quarantine file record.</td>
</tr>
</tbody>
</table>

**Note:** You can also add Quarantined Files and Virus Types tiles to the Event ribbon. To learn more, see Monitor security events and Configure the security event ribbon.

**Related information**
- Antivirus Scanning
- Configure Antivirus Scanning

Activate the ISC Virtual Agent interface

If you have the admin role, you can activate the ISC Virtual Agent Conversations plugin (com.glide.isc_virtualagent). Activating this plugin installs the Virtual Agent and Natural Language Understanding (NLU) content packs, providing Virtual Agent access from the Instance Security Center.

Before you begin

The Virtual Agent interface in the Instance Security Center is only available for users with paid Virtual Agent subscriptions, and who have activated the Glide Virtual Agent (com.glide.cs.chatbot) plugin. To learn more, see Activate Virtual Agent.

Role required: admin

About this task

The ISC Virtual Agent interface enables you to perform the following tasks:
• Ask security-related questions, then get quick summary answers and reference links to learn more.
• Get answers related to the Instance Security Center, Platform Security, ServiceNow security policies, trust, governance, risk, and other processes.
• Search for security-related resources, such as Knowledge Base topics in the Now Support Security Portal.

### Plugins for ISC Virtual Agent

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISC Virtual Agent Conversations [com.glide.isc_virtualagent]</td>
<td>Activates the ISC Virtual Agent Conversations content pack for the Instance Security Center.</td>
</tr>
</tbody>
</table>

**Note:** Activating the com.glide.isc_virtualagent plugin automatically activates com.glide.isc_nlu. However, if you activate the com.glide.isc_nlu plugin first, you must manually activate com.glide.isc_virtualagent as well.

### Procedure

1. Navigate to **All > System Applications > All Available Applications > All.**
2. Find the plugin using the filter criteria and search bar.
   - You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see [Request a plugin](#).
3. Select **Install**, and then in the Activate Plugin dialog box, select **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

### General security settings properties

Security settings provide several properties to control the level of security on your instance.

There are several ways to set or change general security settings properties.

- Navigate to **System Properties > Security.**
  - Options on the Security page are **Yes** or **No**.
- Navigate to the **sys_properties.list** and search for the property you want to set or change.
  - Options in the System Properties table [sys_properties.list] are **true** or **false**.
- Navigate to **System Security > Instance Security Center**, then click **Hardening.**
  - You can configure the settings for the most important and critical security properties.
    - The Instance Security Hardening Settings content contains detailed descriptions, and
compliance values, for the security-related system properties and plugins in the Now Platform. To learn more about each of these properties, see Instance Security Hardening Settings.

⚠️ Warning: When implementing any of these security features, you must thoroughly test the features before you deploy them in a production instance.

Escaping and embedded script support

**glide.ui.security.allow_codetag**

Supports embedding HTML code using the `[code]` tag.

- Default value: Yes
- Instance Security Hardening Settings: Allow embedded HTML code (instance security hardening)

**glide.ui.security.codetag.allow_script**

Allows embedded HTML (using `[code]` tags) to contain Javascript tags.

- Instance Security Hardening Settings: Allow JavaScript tags in embedded HTML (instance security hardening)

**glide.ui.escape_all_script**

Forces all expressions within Jelly JavaScript `<script type="text/javascript">` tags to be escaped by default. Enforces escaping only if the type attribute in the `<script>` tag is empty, or if the value is `text/javascript`, `text/ecmascript`, `application/javascript`, `application/ecmascript`, or `application/x-javascript`.

- Default value:
  - New/zbooted instances: Yes
  - Upgraded instances: No
- Recommended value: Yes
- Instance Security Hardening Settings: Escape Jelly (instance security hardening)

Attachment limits and behavior

**com.glide.attachment.max_size**

Sets the maximum file attachment size in megabytes.

**glide.attachment.role**

Lists the roles (comma-separated) that can create attachments.

**glide.attachment.extensions**

Lists the file extensions (comma-separated) that can be attached to documents via the attachment dialog. Extensions should not include the dot (`.`). For example, xls, xlsx, doc, docx. Leave blank to allow all extensions.

- Instance Security Hardening Settings: Restrict file extensions (instance security hardening)

**glide.ui.attachment.force_download_all_mime_types**

Forces download of all multipurpose internet mail extensions (MIME) type attachment files.
Default value:
- New/zbooted instances: Yes
- Upgraded instances: No
- Instance Security Hardening Settings: Force Download MIME types (instance security hardening)

**glide.security.file.mime_type.validation**

Enables **Yes** or disables **No** MIME type validation for file attachments. File extensions configured via `glide.attachment.extensions` are checked for MIME type during upload.

Default value:
- New/zbooted instances: Yes
- Upgraded instances: No
- Instance Security Hardening Settings: Upload MIME type restriction (instance security hardening)

### Customer uploads

These properties affect customer uploads only. They do not affect attachments.

**glide.ui.strict_customer_uploaded_static_content**

When you set this property to **Yes**, turns on the ability to restrict the types of files that can be downloaded, when they have been uploaded using the Upload File functionality of the Now Platform. Used with `glide.ui.strict_customer_uploaded_content_types`

- Instance Security Hardening Settings: Enable file download restrictions (instance security hardening)

**glide.ui.strict_customer_uploaded_content_types**

When this parameter includes a list of comma-delimited file types, of the files that were uploaded using the Upload File functionality of the Now Platform, only these file types can be downloaded from the instance.

- Instance Security Hardening Settings: Downloadable file types (instance security hardening)

### Security Manager and options

**glide.security.manager**

Security Manager.

**glide.sm.default_mode**

Security manager default behavior in the absence of any ACLs on a table.

**glide.security.strict.updates**

Double-checks security on inbound transactions during form submission. Rights are always checked on form generation.

- Instance Security Hardening Settings: Double check inbound transactions (instance security hardening)

**glide.security.strict.actions**
Checks conditions on UI actions before execution. Normally, conditions are checked only during form rendering.

- Instance Security Hardening Settings: Check UI action conditions before execution (instance security hardening)

**glide.security.granular.create**
Enforces the create rules on new records (as opposed to the write rules, which may include creating and updating).

**glide.security.explain.write.locks**
Displays an explanation on locked form elements.

**Cookies**

**glide.ui.forgetme**
Removes the Remember me check box from the login page when the instance is using either LDAP or DB logins. User's active logged in sessions are timed out after X minutes of inactivity, where X is the value of the glide.ui.session_timeout system property.

- Default value:
  - New/zbooted instances: Yes
- Instance Security Hardening Settings: Remove remember me (instance security hardening)

**glide.ui.secure_cookies**
Enables secure session cookies to enforce additional cookie security. If Yes, strict session cookie validation is enforced. With version 3 cookies enabled, additional security requirements are also enforced.

- Instance Security Hardening Settings: Secure session cookies (instance security hardening)

**glide.secure_cookie.debug**
Secure session cookie debugging. Select to enable extensive debug logging of secure session cookie operations.

**Security restrictions for execution of scripts originating from the client**

**glide.script.use.sandbox**
Run client-generated scripts (AJAXEvaluate and query conditions) inside a reduced-rights sandbox. If enabled, only those business rules and script includes with the Client callable check box selected are available, and certain back-end application programming interface (API) calls are disallowed.

- Instance Security Hardening Settings: Client generated scripts sandbox (instance security hardening)

**glide.script.allow.ajaxevaluate**
Enables the AJAXEvaluate processor.

- Instance Security Hardening Settings: Enable AJAXEvaluate (instance security hardening)
Applies standard security access control lists (ACLs) to AJAXGlideRecord calls.

- Default value: **Yes** for new and upgraded instances. If **Yes**, cannot be changed to **No**.
- Instance Security Hardening Settings: Enabling AJAXGlideRecord ACL checking (instance security hardening)

**Miscellaneous**

**com.glide.communications.trustmanager_trust_all**

By default, the instance trusts a certificate's Certificate Authority (CA). Ensures that the instance accepts self-issued certificates. To validate a certificate's CA, set this property to **No**.

- Instance Security Hardening Settings: Certificate trust (instance security hardening)

**glide.outbound.sslv3.disabled**

When active, forces outbound connections from an instance to use the transport layer security (TLS) instead of the secure sockets layer (SSL).

- Instance Security Hardening Settings: Disabling SSLv2/SSLv3 (instance security hardening)

Additional properties are available for **High Security Settings**.

## High Security Settings

High Security Settings refer to several security options available in your instance.

The High Security Settings module is activated with the High Security Settings plugin, which is active by default on new instances. If High Security Settings are not active on your instance, see Requesting High Security Settings activation. To learn more about this plugin, see **High security plugin (instance security hardening)** in Instance Security Hardening Settings. Properties for these types of high security settings are available:

- Default property values: To harden security on your platform by centralizing all critical security settings to one location for management and auditing.
- Default deny property: Provides a security manager property to control the default security behavior for table access.
- Security Administrator role: Provides a role to prevent modification of key security settings and resources. The Security Administrator role is not inherited by the admin role and must be explicitly assigned.
- Elevated privileges: Allows users with the security admin role to operate in the context of a normal user and elevate to higher security role when needed.
- Property access controls: Allows security administrators to set the roles required to read and write properties.
- Transaction and system logs: Are read only.
- Access control rules: Control what data users can access and how they can access it.

**Note:** High Security Settings also automatically activates the Contextual Security plugin, if it is not already active. In addition, Platform Security Settings - High delivers settings and features in the context of increasing the security of your instance.
Note:
The Instance Security Hardening Settings content contains detailed descriptions, and compliance values, for the security-related system properties and plugins in the Now Platform. To learn more about each of these properties, see Instance Security Hardening Settings.

To learn more about each of these properties, see Instance Security Hardening Settings.

There are two ways to set or change High Security Settings properties.

  Options on the High Security Properties page are Yes or No.
- Navigate to the sys_properties.list and search for the property you want to set or change.
  Options in the System Properties table [sys_properties.list] are true or false.

Property access control
Two additional access control columns are created in the Properties [sys_properties] table when High Security Settings are active:

- **read_roles**: A comma-separated list of role names that are allowed to read all fields of this property.
- **write_roles**: A comma-separated list of role names that are allowed to write/modify all fields of this property.

Properties listed in the Properties table have read_roles of admin, and write_roles of security_admin. Users with the admin role can view and read the property values, but must elevate to the security_admin role to modify them.

Notifications
Activation of high security settings also activates security warning messages. The following is an example of a message that appears after an approval.

**Security Warning notification**

⚠️ Security Warning

Your submission token does not match your session token. This occurs when:

- You are performing an action
- Your session has expired
- High security plugin is enabled (with CSRF protection)

Click "Continue" to proceed with your action

Continue

High Security Settings properties

**glide.ui.escape_text**

Escape XML values at the parser level for the user interface. Prevents reflected and stored cross-site scripting attacks. This property is not applicable in Service Portal.
• Default value: Yes
• Instance Security Hardening Settings: Escape XML (instance security hardening)

**glide.ui.escape_all_script**

Forces all expressions within Jelly JavaScript `<script type="text/javascript">` tags to be escaped by default. Enforces escaping only if the type attribute in the `<script>` tag is empty, or if the value is `text/javascript`, `text/ecmascript`, `application/javascript`, `application/ecmascript`, or `application/x-javascript`.

• Default value: Yes in new instances
• Instance Security Hardening Settings: Escape Jelly (instance security hardening)

**glide.ui.rotate_sessions**

• Default value: Yes

If you are using the SAML 2.0 plugin for Single Sign-on authentication, set this property to No. Otherwise, it interferes with the session information sharing that takes place between the instance and the Identity Provider.

• Instance Security Hardening Settings: Rotate HTTP session identifiers (instance security hardening)

**glide.ui.secure_cookies**

Enable secure session cookies: Enable additional cookie security. If Yes, strict session cookie validation is enforced.

• Default value: Yes
• Instance Security Hardening Settings: Secure session cookies (instance security hardening)

**glide.security.password_reset.uri**

For mobile Password Reset, URL that the user is taken to when the user clicks the Forgot password? button.

**glide.security.strict.updates**

Double-check security on inbound transactions during form submission (rights are always checked on form generation).

• Default value: Yes
• Instance Security Hardening Settings: Double check inbound transactions (instance security hardening)

**glide.security.strict.actions**

Check conditions on UI actions before execution. Normally conditions are checked only during form rendering.

• Default value: Yes
• Instance Security Hardening Settings: Check UI action conditions before execution (instance security hardening)
**glide.security.use_csrf_token**
Enable usage of a secure token to identify and validate incoming requests. This token is used to prevent cross-site request forgery attacks.

- Default value: Yes
- Instance Security Hardening Settings: Anti-CSRF token (instance security hardening)

**glide.ui.escape_html_list_field**
Escape HTML for HTML fields in a list view.

- Default value: Yes
- Instance Security Hardening Settings: Escape HTML (instance security hardening)

**glide.html.escape_script**
Escape JavaScript tags in HTML fields.

- Default value: Yes
- Instance Security Hardening Settings: Escape JavaScript (instance security hardening)

**glide.ui.forgetme**
Remove the **Remember me** check box from the login page.

- Default value: Yes
- Instance Security Hardening Settings: Remove remember me (instance security hardening)

**glide.smtp.auth**
Authenticate with the SMTP server by the user name and password properties.

- Default value: Yes
- Instance Security Hardening Settings: SMTP authentication (deprecated)

⚠️ Note: This property is deprecated.

**glide.script.use.sandbox**
Run client-generated scripts (AJAXEvaluate and query conditions) inside a reduced-rights sandbox. If **Yes**, only those business rules and script includes with the **Client callable** check box set to **Yes** are available, and certain back-end API calls are disallowed. For more information, see Script sandbox property.

- Default value: Yes
- Instance Security Hardening Settings: Client generated scripts sandbox (instance security hardening)

**glide.soap.strict_security**
Enforce strict security on incoming SOAP requests. Requires incoming SOAP requests to go through the security manager for table and field access and checks SOAP users for the correct roles for using the web service.
- Default value: Yes
- Instance Security Hardening Settings: SOAP request strict security (instance security hardening)

**glide.basicauth.required.wdsl**

Require authorization for incoming WSDL requests.
- Default value: Yes
- Instance Security Hardening Settings: WSDL request authorization (instance security hardening)

**Note:** If you choose not to require authorization for incoming WSDL requests, you must modify the Access Control (ACL) rules to allow guest users to access the WSDL content.

**glide.basicauth.required.csv**

Require basic authorization for incoming CSV requests.
- Default value: Yes
- Instance Security Hardening Settings: CSV request authorization (instance security hardening)

**glide.basicauth.required.excel**

Require basic authorization for incoming Excel requests.
- Default value: Yes
- Instance Security Hardening Settings: Excel request authorization (instance security hardening)

**glide.basicauth.required.importprocessor**

Require basic authorization for incoming import requests.
- Default value: Yes
- Instance Security Hardening Settings: Import request authorization (instance security hardening)

**glide.basicauth.required.pdf**

Require basic authorization for incoming PDF requests.
- Default value: Yes
- Instance Security Hardening Settings: PDF request authorization (instance security hardening)

**glide.basicauth.required.rss**

Require basic authorization for incoming RSS requests.
- Default value: Yes
- Instance Security Hardening Settings: RSS request authorization (instance security hardening)

**glide.basicauth.required.scriptedprocessor**

Require basic authorization for incoming script requests.
• Default value: Yes
• Instance Security Hardening Settings: Script request authorization (instance security hardening)

**glide.basicauth.required.soap**
Require basic authorization for incoming SOAP requests.
• Default value: Yes
• Instance Security Hardening Settings: Basic auth: SOAP requests (instance security hardening)

**glide.basicauth.required.unl**
Require basic authorization for incoming unload requests.
• Default value: Yes
• Instance Security Hardening Settings: Unload request authorization (instance security hardening)

**glide.basicauth.required.xml**
Require basic authorization for incoming XML requests.
• Default value: Yes
• Instance Security Hardening Settings: XML request authorization (instance security hardening)

**glide.basicauth.required.xsd**
Require basic authorization for incoming XSD requests.
• Default value: Yes
• Instance Security Hardening Settings: XSD request authorization (instance security hardening)

**glide.cms.catalog_uri_relative**
Enforce relative links from the URI parameter on /ess/catalog.do. If Yes, only relative URLs are permitted through the /ess/catalog.do page using the uri parameter. If No, all URLs are permitted, which may permit linking to external unauthorized content.
• Default value: Yes
• Instance Security Hardening Settings: Enforce relative links (instance security hardening)

**glide.set_x_frame_options**
Enable this property to set the X-Frame-Options response header to SAMEORIGIN for all UI pages. The X-Frame-Options HTTP response header can be used to indicate whether a browser should be allowed to render a page in a <frame> or <iframe>. Sites can use this property to avoid clickjacking attacks by ensuring that their content is not embedded into other sites. [https://developer.mozilla.org/en/the_x-frame-options_response_header](https://developer.mozilla.org/en/the_x-frame-options_response_header)
• Default value: Yes
• Instance Security Hardening Settings: X-Frame-Options: SAMEORIGIN (instance security hardening)
**glide.ui.attachment.download_mime_types**

A list of comma-separated attachment mime types that do not render inline in the browser. Prevents cross-site scripting attacks. For example, text/html forces HTML files to be downloaded to the client as attachments rather than viewed inline in the browser.

- Default value: text/html,image/svg,image/svg+xml
- Instance Security Hardening Settings: Force Download MIME types (instance security hardening)

**glide.security.groupby_acl_check**

When this property is enabled, ACL checks for GroupBy operations are performed for the group names based on the actual data from the groups.

- Default value: Yes

**glide.security.diag_txns_acl**

If Yes, only the admin user or user from allowed IP address can access stats.do, threads.do, and replication.do.

- Default value: No
- Instance Security Hardening Settings: Performance monitoring (ACL) (instance security hardening)

**glide.ui.security.codetag.allow_script**

Allow embedded HTML (using [code] tags) to contain JavaScript tags.

- Default value: Yes
- Instance Security Hardening Settings: Allow embedded HTML code (instance security hardening)

**glide.script.allow.ajaxevaluate**

Enable the AJAXEvaluate processor. The AJAXEvaluate API call allows the client to send and execute arbitrary scripts on the server.

- Default value: No
- Instance Security Hardening Settings: Enable AJAXEvaluate (instance security hardening)

**glide.login.autocomplete**

Allow browsers to use auto-complete on password fields on login forms.

- Default value: No
- Instance Security Hardening Settings: Password field auto-complete (instance security hardening)

The following properties are defined in the sys_properties table, but are not visible on the High Security Settings page.

**com.glide.communications.httpclient.verify_hostname**

Verify the hostname and certificate chain presented by remote SSL hosts. Protect against Man-In-The-Middle (MITM) attacks.

- Default value: true
- Learn more: Set up Kubernetes spoke
Note: This property overrides the com.glide.communications.trustmanager_trust_all property.

**glide.basicauth.required.schema**

Require basic authentication for inbound table schema requests.

- Default value: true

**glide.security.csrf_previous.allow**

Allow usage of an expired secure token to identify and validate incoming requests. This token is used to prevent cross-site request forgery attacks.

- Default value: false

**glide.security.csrf_previous.time_limit**

Time in seconds for a secure token to expire. Allows control over the length of time that the previous CSRF token is valid. When the user session expires, the secure token expires with it unless the glide.security.csrf_previous.allow property is enabled and it is within the timeframe described by this property. This token is used to prevent cross-site request forgery attacks.

- Default value: 86400 seconds or 1 day

**glide.security.csrf.strict.validation.mode**

Enforces strict validation on CSRF tokens so that users cannot resubmit a request if the CSRF token does not match.

- Default value: false

- Instance Security Hardening Settings: CSRF strict validation (instance security hardening)

**com.glide.security.check_unsanitized_html**

Enforces sanitation behavior of translated_html fields on a global level for field assignments.

- Default value: enforce

**Script sandbox property**

Enable the script sandbox property (glide.script.use.sandbox) to run client-generated scripts inside a sandbox that has restricted rights.

There are two cases within the system that allow the client to send scripts to the server for evaluation.

- Filters and/or queries: It is legal to send a filter to the server such as: assigned_to=javascript:getMyGroups().
- System API: The API call AJAXEvaluate allows the client to run arbitrary scripts on the server and receive a response.

If you enable the script sandbox property (glide.script.use.sandbox), the script being evaluated via either of these two entry points runs within a reduced rights sandbox with the following characteristics:

- Only those business rules marked **client callable** are available within the sandbox.
- Only script includes marked **client callable** are available within the sandbox.
- Certain API calls (largely but not entirely limited to those dealing with direct DB access) are not allowed.
- Data cannot be inserted, updated, or deleted from within the sandbox. Any calls to `current.update()`, for example, are ignored.

**Note:** To learn more about this property, see [Client generated scripts sandbox (instance security hardening)](instance security hardening) in Instance Security Hardening Settings.

These methods are not allowed in client scripts when script sandboxing is enabled.

### Restricted methods

<table>
<thead>
<tr>
<th>Class</th>

### Request High Security Settings activation

The High Security Settings plugin is active by default on all new instances. If it is not active on your instance, you can request the plugin.

**Before you begin**

Before activating High Security Settings on an existing instance:

1. Review the following information to understand the new behavior:
   - Access control list rules
   - High Security Settings
   - Default deny property
2. Enable the plugin on a non-production instance. A recent clone of production is preferable.
3. Test the revised functionality, especially the added ACLs and default-deny functionality. Continue testing until the system performs as expected. If users cannot access expected resources, ensure they have appropriate roles and ACL rules to grant them the access.
4. Create update sets of any needed changes so you can apply them to production.

**Note:** To learn more about this plugin, see High security plugin (instance security hardening) in Instance Security Hardening Settings.
Procedure

1. Navigate to All > System Applications > All Available Applications > All.

2. On the All Applications page, select Request Plugin to open the Request form on HI.

3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. Select your instance.

5. Select Actions > Activate Plugin.

6. On the form, fill in the fields.

Activate Plugin request form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.

Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the...
Field | Description
---|---
| plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.

7. Select **Submit**.

**ServiceNow access control**

This SNC Access Control plugin (com.snc.snc_access_control) enables you to control which Customer Service and Support employees can access your instance, and when.

When you first activate the plugin, Customer Service and Support employees cannot log into the instance. Any currently logged-in Customer Service and Support employees remain logged in. You create records in the SNC Access Control table that grant access to specific SNC employees or all employees.

The plugin prevents Customer Service and Support personnel from accessing the instances without your express permission. However, other authorized ServiceNow Operations personnel, in their capacity to support and manage the product, are required to perform administrative actions on the underlying infrastructure. This infrastructure includes servers and databases, among other infrastructure components that make up the SaaS solution. This access method is fully auditable and tracked.

This plugin enables you to restrict access to your instance without your express permission, so it may affect support service levels and the Availability SLA. Availability SLA is then measured from the time that Support staff personnel are granted access to your instance.

**Login security**

Security for authorized Customer Service and Support employee logins to instances employs encrypted tokens generated by a secure server. Only properly authenticated Customer Service and Support employees are granted access to an instance. Without the SNC Access Control plugin, the security server ensures that access rights are enforced on hi.service-now.com. When the plugin is enabled, the encrypted login tokens must match names in the plugin-provided access list, using the criteria defined in those records. This method of authentication enables you to determine precisely which Customer Service and Support employees may access their instances, and when these employees may do so.

The architecture chosen for this system has several features designed to enhance security for your instances:

**Security server**

The security server is a locked-down, Linux host that only ServiceNow security personnel can access. This server is the only system that has access to the critical private encryption key necessary to produce the login tokens. By using this compartmentalization (a standard security practice), the private key is protected, even in the unlikely event that an attacker compromises the HI instance.

**Synthetic user**

The facility on instances that enables authorized Customer Service and Support employees to log into their instance does not require an account to be provisioned on that instance. There is no user record provisioned, and no permanent or persisted credentials. Instead, a synthetic user is created for each Customer Service and Support employee logon. This user exists only in memory and provides no ongoing privileges. If the SNC Access Control plugin is enabled, you can deauthorize any Customer Service and Support employee at any time.
Tokens

The security tokens are specific to an instance and a particular Customer Service and Support employee. In addition, the mechanism that generates the tokens only works with actual Customer Service and Support employee logins to HI, not impersonated users. Once a security token is generated, only a specific Customer Service and Support employee can use it to log into an instance.

Time limit

Security tokens expire four hours after they are generated. This expiration limits the utility of hijacked tokens, which can only be used during this short window.

Logging

Logins by Customer Service and Support employees to instances are recorded as a login event.

- Every action taken by the logged-in Customer Service and Support employee is added to the transaction log in the database.
- It is also added to the instance log on the file system, which is inaccessible to most ServiceNow employees.
- Customer Service and Support employee logins and actions are readily identifiable, since the user names all end in @snc (like frodo.baggins@snc).

These actions provide you with easy-to-use, robust, and reliable security logging for non-employee access.

Security processing flow

When a Customer Service and Support employee wants to log into an instance, the security processing flow is as follows:

2. HI checks that the technician has the proper role authorizing access to instances.
3. If the user has the proper role, HI sends the request for access to the Security Server.
4. The Security Server verifies that the request came from the HI IP address, and evaluates the request (user, role, and IP address of the requester). If the request is valid, the Security Server approves it and constructs a token. This token contains the user name, roles, the instance ID, and the time (the start of the 4-hour token life span). Finally, the Security Server encrypts the token with the private encryption key.
5. The Security Server sends the encrypted token to HI.
6. HI sends the token to the Support technician's browser.
7. The Support technician's browser initiates a login into the instance, using the special user name ending with @snc.
8. The instance uses the public key to decrypt the token. To verify the token, the instance matches it to the user name supplied in the previous step, the instance ID, and the authorized time window. If the SNC Access Control plugin is enabled, the instance verifies that the user is:
9. If the user is authenticated, the instance creates a synthetic user in memory with the given roles. This user does not persist after the time limit expires, the user logs off, or the instance is restarted.

**Audit logging**

The following logging tracks logins and activity by Customer Service and Support employees:

- Event logs: The event logs show all Customer Service and Support logins to an instance.
- Transaction logs: The transaction logs show all activity on the instance, including any efforts to delete logs.

ℹ️ **Note:** To learn more about this plugin, see [SNC Access Control plugin (instance security hardening)](https://example.com) in Instance Security Hardening Settings.

### Request ServiceNow access control

You request activation of the SNC Access Control plugin (com.snc.snc_access_control).

**Before you begin**

Role required: admin

**About this task**

There are two ways to request a plugin:

- Access the Now Support Service Catalog directly by selecting **All > Service Catalog > Activate Plugin** on Now Support.
- Access the Now Support Service Catalog through the All Applications page on your instance by following these steps.

**Procedure**

1. Navigate to **All > System Applications > All Available Applications > All**.
2. On the All Applications page, select **Request Plugin** to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. Select your instance.

5. Select **Actions > Activate Plugin**.

6. On the form, fill in the fields.

### Activate Plugin request form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>would like this plugin to be</td>
<td></td>
</tr>
<tr>
<td>enabled</td>
<td></td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are</td>
</tr>
<tr>
<td></td>
<td>activating the plugin. For example, if you need the plugin activated at a</td>
</tr>
<tr>
<td></td>
<td>specific time instead</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.
7. Select Submit.

### Configure ServiceNow access control

Configure an access control record to specify one or more Customer Service and Support employees who have permission to log in your instance.

**Before you begin**

Role required: admin

**About this task**

**Note:** The SNC Access Control (com.snc.snc_access_control) plugin prevents Customer Service and Support personnel from accessing the instances without your express permission. However, other authorized ServiceNow Operations personnel, in their capacity to support and manage the product, are required to perform administrative actions on the underlying infrastructure. This infrastructure includes servers and databases, among other infrastructure components that make up the SaaS solution. This access method is fully auditable and tracked.

This plugin enables you to restrict access to your instance without your express permission, so it may affect support service levels and the Availability SLA. Availability SLA is then measured from the time that Support staff personnel are granted access to your instance.

**Procedure**

1. Navigate to All > System Security > SNC Access Control.
2. Click New.
3. Fill in the form fields (see table).
4. Click Submit.

**SNC Access Control**

<table>
<thead>
<tr>
<th>Form fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Names each Customer Service and Support employee who has permission to log in this instance.</td>
</tr>
<tr>
<td></td>
<td>• Express the names as firstname.lastname in lower case letters, separated by a period (for example, john.smith). Each name must have a corresponding user record in hi.servicenow.com.</td>
</tr>
<tr>
<td></td>
<td>• If more than one Customer Service and Support employee has permission to log in this instance, enter multiple names and separate them by commas.</td>
</tr>
<tr>
<td></td>
<td>• To enable all Customer Service and Support employees login rights to access the instance, enter an asterisk (*) in place of the name.</td>
</tr>
<tr>
<td></td>
<td>• If you intend on restricting Customer Service and Support employee access to the instance, the values in the Name field must not have an asterisk (*) anywhere in the field.</td>
</tr>
<tr>
<td>Form fields</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Reason</td>
<td>Human-readable field that describes why you are granting access permission. This field is optional.</td>
</tr>
<tr>
<td>Start</td>
<td>Specifies the start date and time of the period during which the specified Customer Service and Support employees have login access. This field is mandatory.</td>
</tr>
<tr>
<td>End</td>
<td>Specifies the ending date and time of the period during which the specified Customer Service and Support employees have login access. This field is mandatory.</td>
</tr>
<tr>
<td>Active</td>
<td>Controls whether this permission record is active. The default is Active.</td>
</tr>
</tbody>
</table>

**Audit logging**

The following logging tracks logins and activity by ServiceNow employees.

| Event logs | The event logs show all ServiceNow logins to a customer instance. |
| Transaction logs | The transaction logs show all activity on the instance, including any efforts to delete logs. |

**Access control list rules**

Rules for access control lists (ACLs) restrict access to data by requiring users to pass a set of requirements before they can interact with it.

**Components of ACLs**

All access control list rules specify:

- The **object** and operation being secured
- The **permissions** required to access the object

The object is the target to which access needs to be controlled. Each object consists of a type and name that uniquely identifies a particular table, field, or record.

For example, all these entries specify an object:

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Object secured</th>
</tr>
</thead>
<tbody>
<tr>
<td>record</td>
<td>[incident].[-- None --&gt;]</td>
<td>The Incident table.</td>
</tr>
<tr>
<td>record</td>
<td>[incident].[active]</td>
<td>The Active field in the Incident table.</td>
</tr>
<tr>
<td>REST_Endpoint</td>
<td>user_role_inheritance</td>
<td>The record for the user_role_inheritance Scripted REST API.</td>
</tr>
</tbody>
</table>

Each operation describes a valid action the system can take on the specified object. Some objects, such as records, support multiple operations, while other objects, such as a REST_Endpoint, only support one operation.

For example, all these entries specify an operation:
<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Operation</th>
<th>Operation secured</th>
</tr>
</thead>
<tbody>
<tr>
<td>record</td>
<td>[incident].[-- None --]</td>
<td>create</td>
<td>Creating records in the Incident table.</td>
</tr>
<tr>
<td>record</td>
<td>[incident].[active]</td>
<td>write</td>
<td>Updating the Active field in the Incident table.</td>
</tr>
<tr>
<td>REST_Endpoint</td>
<td>user_role_inheritance</td>
<td>execute</td>
<td>Running the user_role_inheritance REST API.</td>
</tr>
</tbody>
</table>

The permissions specify when someone can access the named object and operation. Security administrators can specify permission requirements by adding:

- One or more user roles to the **Requires role** list.
- One or more conditions.
- A script that evaluates to true or false or sets the answer variable to true or false.

To gain access to an object and operation, a user must pass all permissions listed in an access control. For example, this access control restricts access to write operations on the incident table.

To update a record in the incident table, a user must have the listed role and the record must meet the condition.
<table>
<thead>
<tr>
<th>Permission type</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requires role</td>
<td>Requires role: itil</td>
<td>Only allow users with the itil role to update incidents.</td>
</tr>
<tr>
<td>Condition</td>
<td>[Incident state] [is not] [Closed]</td>
<td>Only allow updates to active incident records.</td>
</tr>
</tbody>
</table>

**ACL evaluation process**

An ACL rule only grants a user access to an object if the user meets all of the permissions required by the matching ACL rule.

- The condition must evaluate to **true**.
- The script must evaluate to **true** or return an answer variable with the value of **true**.
- The user must have one of the roles in the required roles list. If the list is empty, this condition evaluates to **true**.
- [Record ACL rules only] The matching table-level and field-level ACL rules must both evaluate to **true**.
Whenever a session requests data, the system searches for access control rules that match the requested object and operation. If there is a matching access control rule, then the system evaluates if the user has the permissions required to access the object and operation. If an access control rule specifies more than one permission, then the user must meet all permissions to gain access to the object and operation. Failing any one permission check prevents the user from accessing the matching object and operation.

If a user does not meet the permissions of the first matching rule, the system evaluates the permissions of the next matching access control rule as specified by the access control processing order. If the user fails to meet the permissions of any matching access control rule, the system denies access to the requested object and operation.

**Note:** If there are no matching access control rules for the requested object and operation, then the system grants the user access to it. In practice, it is rare for the system to find no matching rules because the system has a set of default access control rules that protect all record operations.
The effects of being denied access to an object depend on the ACL rule that the user failed. For example, failing a read operation ACL rule prevents the user from seeing the object. Depending on the object secured, the ACL rule hides a field on a form, hides rows from a list, or prevents a user from accessing a UI page. The following table contains complete list of results of failing an ACL rule for a given operation and object type.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Results of failing an ACL rule on object</th>
</tr>
</thead>
<tbody>
<tr>
<td>execute</td>
<td>User cannot execute scripts on a record or UI page.</td>
</tr>
<tr>
<td>create</td>
<td>User cannot see the <strong>New</strong> UI action from forms. The user also cannot insert records into a table using API protocols such as web services. <strong>A create</strong> ACL with a condition requiring that a field contain a specific value always evaluates as false. Fields on new records are considered empty until the record is saved.</td>
</tr>
<tr>
<td>read</td>
<td>User cannot see the object in forms or lists. The user also cannot retrieve records using API protocols such as web services.</td>
</tr>
<tr>
<td>write</td>
<td>User sees a read-only field in forms and lists, and the user cannot update records using API protocols such as web services.</td>
</tr>
<tr>
<td>delete</td>
<td>User cannot see the <strong>Delete</strong> UI action from forms. The user also cannot remove records from a table using API protocols such as web services.</td>
</tr>
<tr>
<td>edit_task_relations</td>
<td>User cannot define relationships between task tables.</td>
</tr>
<tr>
<td>edit_ci_relations</td>
<td>User cannot define relationships between Configuration Item [cmdb_ci] tables.</td>
</tr>
<tr>
<td>save_as_template</td>
<td>Used to control the fields that should be saved when a template is created.</td>
</tr>
<tr>
<td>add_to_list</td>
<td>User cannot view or personalize specific columns in the list mechanic.</td>
</tr>
<tr>
<td>list_edit</td>
<td>User cannot update records (rows) from a list.</td>
</tr>
<tr>
<td>report_on</td>
<td>User cannot create a report on the ACL table. For more information, see Restrict report creation with an ACL rule.</td>
</tr>
<tr>
<td>report_view</td>
<td>User cannot view the content of a report on the ACL table or on the ACL field. For more information, see Restrict report creation with an ACL rule.</td>
</tr>
<tr>
<td>personalize_choices</td>
<td>User cannot right-click a choice list field and select <strong>Configure Choices</strong>.</td>
</tr>
</tbody>
</table>

**ACL matching requirements for objects**

<table>
<thead>
<tr>
<th>Object Type</th>
<th>Matching ACL Rules Required to Access Object</th>
<th>Existing Wildcard ACL Rules</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client-callable script</td>
<td>Users must meet the permissions of two ACL rules:</td>
<td>By default, there are no wildcard (*) rules for these object types. If you create a wildcard ACL rule for one of these objects, then the ACL</td>
</tr>
<tr>
<td>include Processors</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Object Type</td>
<td>Matching ACL Rules Required to Access Object</td>
<td>Existing Wildcard ACL Rules</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------</td>
<td>------------------------------</td>
</tr>
<tr>
<td></td>
<td>1. All wildcard ACL rules for the object (if any ACL rule exists for the operation).</td>
<td>rule applies to all objects of this type.</td>
</tr>
<tr>
<td></td>
<td>2. The first ACL rule that matches the object’s name (if any ACL rule exists for the operation).</td>
<td></td>
</tr>
</tbody>
</table>

**UI pages**

Users must meet the permissions of two ACL rules:

1. The first ACL rule that matches the record’s field (if any ACL rule exists for the operation).
2. The first ACL rule that matches the record’s table (if any ACL rule exists for the operation).

By default, there are wildcard table rules (*) for the create, read, write, and delete operations and wildcard field rules (*.*) for the personalize_choices, create, and save_as_template operations. When you create a new table, create new ACL rules for the table unless you want to use the provided wildcard ACL rules.

**Note:** The Security manager default behavior (glide.sm.default_mode) property determines whether users can access objects that only match against wildcard table ACL rules. When this property is set to Deny access, only administrators can access objects that match the wildcard table ACL rules.

**Note:** The wildcard field ACL rule (*.*) for the create operation reuses the same permissions as the write operation. This means that the create permissions are the same as the write permissions unless you define an explicit create operation ACL rule.

### Multiple ACL rules at the same point in the processing order

If two or more rules match at the same point in the processing order, the user must pass any one of the ACL rules permissions to access the object. For example, if you create two field ACL rules for `incident.number`, then a user who passes one rule has access to the number field regardless of whether the user failed any other field ACL rule at the same point in the processing order.

### Required role

Normal admin users can view and debug access control rules. However, to create or update existing access control rules, administrators must elevate privileges to the security_admin role. See Elevate to a privileged role for instructions.

### ACL rules in scoped applications

You can create ACL rules for objects in the same scope as the ACL rule and for tables with at least one field that is in the same scope as the ACL rule.

For tables that are in a different scope than the ACL rule record, the types of rules are limited.

- You can create an ACL rule for any table, UI page, or other object that is in the same scope as the ACL rule.
- You can create an ACL for a field that is in the same scope as the ACL rule.
If the table is in the same scope, you can use a script to evaluate permissions.

If the table is in a different scope, you cannot use a script to evaluate permissions.

- You cannot create or modify ACL rules for objects that are in a different scope than the application you have selected in the application picker, including adding a role to an ACL in a different scope.

- You can create wildcard table rules (*) only in the global scope.

- You can create wildcard field rules (*) only for tables in the same scope as the ACL rule.

**ACL rule types**

Create ACL rules on different components of the system.

**Record ACL rules**

Record ACL rules consist of table and field names.

- The table name is the table that you want to secure. If other tables extend from this table, then the table is considered a parent table. ACL rules for parent tables apply to any table that extends the parent table.

- The field name is the field that you want to secure. Some fields are part of multiple tables because of table extension. ACL rules for fields in a parent table apply to any table that extends the parent table.

ACL rules can secure the following record operations:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>create</td>
<td>Enables users to insert new records (rows) into a table.</td>
</tr>
<tr>
<td>read</td>
<td>Enables users to display records from a table.</td>
</tr>
<tr>
<td>write</td>
<td>Enables users to update records in a table.</td>
</tr>
<tr>
<td>delete</td>
<td>Enables users to remove records from a table or drop a table.</td>
</tr>
<tr>
<td>edit_task_relations</td>
<td>Enables users to extend the Task [task] table.</td>
</tr>
<tr>
<td>edit_ci_relations</td>
<td>Enables users to extend the Configuration Item [cmdb_ci] table.</td>
</tr>
<tr>
<td>save_as_template</td>
<td>Enables users to save a record as a template.</td>
</tr>
<tr>
<td>add_to_list</td>
<td>Prevents users from viewing or personalizing specific columns in the list mechanic.</td>
</tr>
</tbody>
</table>

**Note:** Conditions and scripts are not supported.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list_edit</td>
<td>Enables users to update records (rows) from a list.</td>
</tr>
<tr>
<td>report_on</td>
<td>Enables users to report on tables.</td>
</tr>
<tr>
<td>report_view</td>
<td>Enables users to report on field ACLs.</td>
</tr>
<tr>
<td>personalize_choices</td>
<td>Enables users to configure the table or field.</td>
</tr>
</tbody>
</table>

Record ACL rules are processed in the following order:

- Match the object against table ACL rules.
- Match the object against field ACL rules.
This processing order ensures that users gain access to more general objects before gaining access to more specific objects. A user must pass both table and field ACL rules to access a record object.

- If a user fails a table ACL rule, the user is denied access to all fields in the table, even if the user passes a field ACL rule.
- If a user passes a table ACL rule, but fails a field ACL rule, the user cannot access the field described by the field ACL rule.

**Processor ACL rules**

Processor ACL rules specify the processor you want to secure. For a list of available processors, navigate to **System Definition > Processors**.

By default, an ACL rule for the EmailClientProcessor is included to restrict the email client to users with the itil role.

Processor ACL rules honor the STAR (*) rule if they cannot find a more specific ACL for those resources.

**Table ACL rules**

The user must first pass the table ACL rule. Since the base system includes STAR (*) table ACL rules that match every table, the user must always pass at least one table ACL rule. The base system provides additional table ACL rules to control access to specific tables.

Table ACL rules are processed in the following order:
1. Match the table name. For example, incident.
2. Match the parent table name. For example, task.
3. Match any table name (*). For example, *

If a user fails all table ACL rules, the user cannot access the fields in any table. If a user passes a table ACL rule, the system then evaluates the field ACL rules.

**Field ACL rules**

After a user passes a table ACL rule, field ACL rules are processed in the following order:

1. Match the table and field name. For example, incident.number.
2. Match the parent table and field name. For example, task.number.
3. Match any table (*) and field name. For example, *.number.
4. Match the table and any field (*). For example, incident.*.
5. Match the parent table and any field (*). For example, task.*.
6. Match any table (*) and any field (*). For example, *.*.

A user must pass the table ACL rule to be granted access to the table’s fields. For example, the user must first pass the table ACL rule for the incident table to access the **Number** field in the incident table.

The first successful field ACL evaluation stops ACL rule processing at the field level. When a user passes a field ACL rule, the system stops searching for other matching field ACL rules. For example, if a user passes the field ACL rule for incident.number, the system stops searching for other ACL rules that secure the **Number** field in the incident table.

**UI page ACL rules**

UI page ACL rules specify the UI page to be secured. For a list of available UI pages, navigate to System UI > UI Pages. When defining an ACL rule for a UI page, use the fully scoped page name. For example, x_myapp_mypage.

Note: You can use the STAR (*) character in the Name field on ui_page type ACLs to match any UI pages.

UI page ACL rules honor the STAR (*) rule if they cannot find a more specific ACL for those resources. For example, if you have a UI page named mysecretpage but do not define an ACL for this UI page, the STAR (*) rule for the UI page processor is used for access check.

ACL rules can secure the following UI page operation:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>read</td>
<td>Allows users to display the UI page.</td>
</tr>
</tbody>
</table>

**Client-callable script include ACL rules**

Script include ACL rules specify the client-callable script include to be secured. For a list of available script includes, navigate to System Definition > Script Includes. You can personalize the list to show the Client callable column.

The base system does not include any ACL rules for client-callable script includes.

Client-callable script include ACL rules honor the STAR (*) rule if they cannot find a more specific ACL for those resources.
ACL control of function fields

When evaluating access to a function field, in addition to checking access to the function field itself, the system also checks access to the function's contributing fields. Contributing fields are those used as the arguments in a given function definition.

For more information about function fields, see Function field.

In Paris and earlier, the system simply checks access to the function field itself (as with any other field). If the ACLs on that field allow access, the user receives the resulting value, regardless of whether the user has access to the contributing fields.

In San Diego, the system also requires access to all contributing fields in order to allow access to the function field. If one or more of the contributing field ACLs refuse access, the function field also refuses access.

The only operations affected by the new requirement are read and report_view. Report_view has its own additional requirements.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>read operation</td>
<td>A user has read access to a function field only if both of the following are true:</td>
</tr>
<tr>
<td></td>
<td>• The user has read access to the function field.</td>
</tr>
<tr>
<td></td>
<td>• The user has read access to all of the contributing fields used in the function.</td>
</tr>
<tr>
<td>report_view operation</td>
<td>A user has report_view access to a function field only if all of the following are true:</td>
</tr>
<tr>
<td></td>
<td>• The user has report_view access to the function field.</td>
</tr>
<tr>
<td></td>
<td>• The user has report_view access to each of the contributing fields.</td>
</tr>
<tr>
<td></td>
<td>• There is a role-only ACL without conditions and without a script, and the user has that role.</td>
</tr>
<tr>
<td></td>
<td>• The user has role-only read access to the contributing fields, such that only ACLs without condition or script can allow.</td>
</tr>
</tbody>
</table>

Examples

Given:

• Table: salary
• Columns: base, bonus, total (all are Integers in this example)
• Function field: The total column is marked as a function field, with function definition glidefunction:add(base, bonus).
• Contributing fields: base and bonus, since they're used in the function definition
• Roles: salary_admin, bonus_admin

Example 1: All fields allow access

<table>
<thead>
<tr>
<th>ACLs</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>total, base, bonus: read and report_view for role salary_admin, with no conditions or scripts</td>
<td>A user with the salary_admin role is granted read and report_view access to total because they have the required role.</td>
</tr>
</tbody>
</table>
### Example 2: Contributing field refuses read access

<table>
<thead>
<tr>
<th>ACLs</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>• total, base: read and report_view for role salary_admin, with no conditions or scripts&lt;br&gt;• bonus: report_view for role salary_admin, with no conditions or scripts&lt;br&gt;• bonus: read for role bonus_admin, with no conditions or scripts</td>
<td>A user with the salary_admin role is refused read and report_view access to total, because bonus refuses read access to their role.</td>
</tr>
</tbody>
</table>

### Example 3: Contributing field ACL has script

<table>
<thead>
<tr>
<th>ACLs</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>• total, base: read and report_view for role salary_admin, with no conditions or scripts&lt;br&gt;• bonus: report_view for role bonus_admin, with no conditions or scripts&lt;br&gt;• bonus: read for role salary_admin, with a script (note that it doesn’t matter what’s in the script, only that it’s there)</td>
<td>A user with the salary_admin role is granted read access to total, because they have the required role for all fields.&lt;br&gt;But the same user with the salary_admin is refused report_view access, because the read ACL with the script refuses access by default for this case, even though they have the required role.</td>
</tr>
</tbody>
</table>

### Create an ACL rule

Create a custom ACL rule to secure access to new objects or to change the default security behavior.

**Before you begin**
Role required: security_admin

**About this task**
To create ACL rules, you must elevate privileges to the security_admin role. For tables that are in a different scope from the ACL rule record, the types of rules are limited.

**Procedure**
1. **Elevate privileges** to the security_admin role.
2. **Navigate to System Security > Access Control (ACL).**
3. **Click New.**
4. **Complete the form.**
## Access control fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>Select what kind of object this ACL rule secures. The type of object determines how the object is named and what operations are available. This field becomes read only after the ACL rule is created. If you want to change the type, you must delete the ACL and create a new one with the correct type.</td>
</tr>
<tr>
<td><strong>Operation</strong></td>
<td>Select the operation this ACL rule secures. Each object type has its own list of operations. An ACL rule can only secure one operation. To secure multiple operations, create a separate ACL rule for each.</td>
</tr>
<tr>
<td><strong>Admin overrides</strong></td>
<td>Select this check box to have users with the admin role automatically pass the permissions check for this ACL rule. Admin users pass regardless of what script or role restrictions apply. However, the nobody role, which only ServiceNow personnel can assign, takes precedence over the admin override option. If an ACL is assigned the nobody role, admin users cannot access the resource even when Admin overrides is selected. See Base system roles. Clear this check box if administrators must meet the permissions defined in this ACL rule to gain access to the secured object. Since administrators always pass role checks (see the description of the Requires role field), use the condition builder or Script field to create a permissions check that administrators must pass.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Select this check box to enforce this ACL rule.</td>
</tr>
<tr>
<td><strong>Advanced</strong></td>
<td>Select this check box to display the Script field.</td>
</tr>
</tbody>
</table>

**Note:** If there is script in the Script field. This script executes even if the field is not displayed on the form.

| **Name**            | Enter the name of the object being secured, either the record name or the table and field names. The more specific the name, the more specific the ACL rule. You can use the wildcard character asterisk (*) in place of a record, table, or field name to select all objects that match a record type, all tables, or all fields. You cannot combine a wildcard character and a text search. For example, inc* is not a valid ACL rule name, but incident.* and *.number are valid ACL rule names. |

**Note:** Click the blue triangle to manually enter the record name or the table and field names of the object being secured. Use this option to secure an object that does not appear in the dropdown.

| **Description**     | Enter a description of the object or permissions this ACL rule secures.                                                                                                                                   |
| **Requires role**   | Use this list to specify the roles a user must have to access the object. If you list multiple roles, a user with any one of the listed roles can access the object. The Requires role list appears as a related list. |

**Note:** Users with the admin role always pass this permissions check because the admin role automatically grants users all other roles.

| **Condition**       | Use this condition builder to select the fields and values that must be true for users to access the object.                                                                                           |
| **Script**          | Enter a custom script describing the permissions required to access the object. The script can use the values of the current and previous global |
Field | Description
--- | ---
variables as well as system properties. The script must generate a true or false response in one of two ways:
- return an answer variable set to a value of true or false
- evaluate to true or false
In either case, users only gain access to the object when the script evaluates to true and the user meets any conditions the ACL rule has. Both the conditions and the script must evaluate to true for a user to access the object.

Note: If the evaluated item is in a related list, current points to the item the related list is on, not to the current item the ACL is for. However, if the item you are evaluating the ACL for is not in a related list, current points to the actual item.

5. Right-click the form header and select Save.

Secure records in an embedded list
To apply security to the records in embedded lists, limit editing and deleting records in embedded lists to specific roles.

Before you begin
Role required: security_admin

Procedure
1. Navigate to All > System Security > Access Control (ACL).
2. Open the Write or Delete record for the appropriate table.
3. In the Requires Role section of the form, add the roles that have write or delete permission for that table.
4. Save the changes.
   When records from the associated table appear in an embedded list, the edit and delete options are available only to users with the specified roles.
Contextual Security Manager

Contextual Security Manager protects your data by controlling read, write, create, and delete authorization.

Key advantages

The Contextual Security Manager is aware of the system table hierarchy, enabling you to create specific security rules for a field based on where in the hierarchy it is displayed. Benefits of the Contextual Security Manager include:

- **Contextual security**: Secure a record based on the contents of the record.
- **Hierarchical security**: Apply security rules to any level in the object hierarchy.

Securing fields and tables

With the legacy Simple Security Manager, you could secure fields and tables by adding roles to the appropriate dictionary entry. With the Contextual Security Manager, these dictionary roles are no longer tested. Instead, the system looks for ACL rules on fields and tables.

⚠️ Warning: After you install the Contextual Security Manager, you must secure fields and tables via ACL rules. Even if you configure the dictionary form and add roles to a dictionary entry, no change in rights occurs.

Contextual security and roles

You can grant roles to users or groups. However, after installing the Contextual Security Manager, the `roles` field on the user record is no longer checked and no longer appears on your user and group forms. Instead, you must add roles to the Roles related list instead of to the user or group record.

Applications and modules contain lists of the roles required to view them. For example, to view the System Definition application, the admin role is required. Security rights for applications and modules are still defined using role arrays.

Both catalog items and catalog variables contain lists of the roles required to view them. Security rights for catalog items and catalog variables are still defined via these role arrays.

Under the Contextual Security Manager, a group still automatically inherits any role granted to the group when the inherits flag for the role is set to true.

Activating the Contextual Security Manager

The Contextual Security Manager is active in the base system. If there are many duplicate entries in the User Roles table, you may need to upgrade to Contextual Security: Role Management V2 to eliminate duplicate roles. Plugins include:

- **Contextual Security: Role Management [com.glide.role_management]**
  
  Provides contextual security functionality. This plugin is automatically installed.

- **Contextual Security: Role Management V2 [com.glide.role_management.inh_count]**
  
  Prevents duplicate entries caused by inherited roles in the User Roles [sys_user_has_role] table. This plugin is automatically installed on new instances and can be activated for upgrades. The Contextual Security: Role Management Enhancements plugin is a previous version of this plugin. The Role Management Enhancements plugin does not include the RoleManagementVerify() script. This script returns a list of changes that an upgrade will perform, enabling you to monitor changes made by the plugin.

Upgrade to Contextual Security: Role Management V2

Contextual Security: Role Management V2 is automatically installed on new instances. You can upgrade from Contextual Security: Role Management to Contextual Security: Role Management V2 to eliminate duplicate roles in the User Roles table and prevent future duplicates.

Before you begin
Role required: admin, security_admin
You must have the admin role and Elevate to a privileged role to obtain the effective security_admin role.

Note: Before upgrading to Contextual Security: Role: Management V2, you must enable the Audit Roles table to create audit records related to user roles. To learn more about setting the required system property, see Enable role auditing with Contextual Security: Role Management V2.

About this task
This procedure describes how to upgrade your Contextual Security role and how to activate the related plugins described in the following table.

Plugins for Contextual Security: Role Management V2

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contextual Security: Role Management V2 [com.glide.role_management.inh_count]</td>
<td>Prevents duplicate entries in the User Roles [sys_user_has_role] table.</td>
</tr>
</tbody>
</table>

Before upgrading from Contextual Security: Role Management to Contextual Security: Role Management V2, test the results of an upgrade by running the script. The script returns a list of changes that an upgrade will perform. If the changes are acceptable, install the Contextual Security: Role Management V2 plugin. If the changes are not acceptable, do not install the Contextual Security: Role Management V2 plugin. Alternatively, you can perform the upgrade and then manually make any necessary changes.
Procedure

1. Test the impact of an upgrade prior to upgrading by running the following script.

   a. Navigate to **System Definition > Scripts - Background**.

   b. Run the following script in global scope.

   ```java
   new RoleManagementVerify().verifyInheritedRoles();
   ```

   For large `sys_user_has_role` tables, the execution may take up to several hours to complete. Do not edit or add user roles during this time.

   Example result based on test data:

   ```
   *** Script: 2016-12-01 19:58:54 Starting checking of inherited roles for all users...
   *** Script: User: itam, inherited roles to be ADDED: financial_mgmt_user
   *** Script: User: bernard.laboy, inherited roles to be DELETED:
                   api_analytics_read,pa_viewer,rest_api_explorer,a123
   *** Script: User: bernard.laboy, inherited roles to be ADDED: dependency_views
   *** Script: Number of inherited-role records in sys_user_has_role, current: 260,
               after re-calculation: 258
   *** Script: Number of users with discrepancies for inherited roles: 2
   *** Script: 2016-12-01 19:58:55 Finished checking of inherited roles for all users!
   ```

   c. Evaluate the script results to determine whether the proposed changes are acceptable.

2. Activate the Contextual Security: Role Management V2 plugin.

   a. Navigate to **System Definition > Plugins**.

   b. Find and click the plugin name.

   c. On the System Plugin form, review the plugin details and then click the **Activate/Upgrade** related link.

   d. Click **Activate**.

Results

After activating Role Management V2, the changes outlined in the script result are enacted. The Inheritance Count (`inh_count`) column in the User Roles table is read-only and automatically reflects the number of times the user inherits a role.

Enable role auditing with Contextual Security: Role Management V2

Set a system property to enable the Audit Roles table to create audit records related to user roles.

**Before you begin**

Role required: admin

**About this task**

When enabled, the Audit Roles (`sys_audit_role`) table maintains changes to user records. For more information about role audits, see **Audit user roles**. If the Contextual Security: Role Management V2 (`com.glide.role_management.inh_count`) plugin is installed, you must set a system property to `true` to enable role auditing.
Procedure

2. Add the glide.role_management.v2.audit_roles system property and set it to true.

   If the Contextual Security: Role Management V2 [com.glide.role_management.inh_count] plugin is installed, setting this property to true enables the Audit Roles [sys_audit_role] table to create records when user roles change.

Double-check form submission

When the system determines that a particular field (such as task.number) should not be written to by the current user, the system renders that field in a read-only mode, which is why the number field is not writable on most incidents.

If you set the system to double-check the values of any incoming fields for writability, then the system applies the same set of security rules to the inbound leg of a transaction. When you submit an incident, for example, the system double-checks to determine if the number field can be written to before posting any changes.

If you tell the system not to double-check inbound transactions, then the system allows you to write to a nominally read-only field if that is the transaction the client sends back. In many deployments this is actually a desirable behavior if, for example, you are using client scripts to set nominally read-only fields in response to user selections in other, writable fields.

<table>
<thead>
<tr>
<th>Property</th>
<th>Location</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Double check security on inbound transactions during form submission (rights are always checked on form generation)</td>
<td>System Properties &gt; Security</td>
<td>Disabled (no double-checking)</td>
</tr>
</tbody>
</table>

Default deny property

The default deny property (glide.sm.default_mode) controls the security manager default behavior when the only matching ACL rules are the wildcard table ACL rules.

A set of wildcard table ACL rules for the most common record-based operations are available: read, write, create, and delete. A significant number of ACLs to provide role-based access to system tables are also available. For example, there are ACLs that grant sys.script access to the business_rule_admin role because that role is documented as being able to manage business rules.

Use the glide.sm.default_mode property to deny or allow these operations on all tables:

- **Deny Access**: The wildcard table ACL rules restrict the read, write, create, and delete operations on all tables unless the user has the admin role or meets the requirements of another table ACL rule. Other operations, such as report_on and personalize_choices, are unaffected by this setting.

- **Allow Access**: The wildcard table ACL rules allow the read, write, create, and delete operations on all tables unless there are specific table ACL rules in place to restrict such operations.

You cannot reset glide.sm.default_mode to Allow Access once it has been set to Deny Access.
Note: By default, the wildcard table ACL rules are the only ACL rules that check for the value of the glide.sm.default_mode property. If you want to control other operations with this setting, create your own ACL rules to check for this property value.

To learn more about this property, see Default deny (instance security hardening) in Instance Security Hardening Settings.

Advanced ACL configuration

In addition to creating new ACLs or modifying existing ones, you can configure other aspects of ACL functionality.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply ACL script conditions to reference fields</td>
<td>Enable a property to allow script conditions to apply to reference fields if you want to control access to the data that a reference field displays on a form or in a list. There might be an impact to the performance of your instance if you enable this.</td>
</tr>
<tr>
<td>Apply ACLs to AJAXGlideRecord (client-side Glide record)</td>
<td>Apply ACLs to GlideAjax API calls so that the system queries only the data that the currently connected user has rights to access.</td>
</tr>
<tr>
<td>Evaluate the admin override at the access level</td>
<td>Force ACL evaluation for admin overrides at the access level. By default, users with the admin role automatically pass the permissions check for this ACL rule when the Admin Overrides option is selected on the ACL rules form.</td>
</tr>
<tr>
<td>Use ACL debugging and troubleshooting tools</td>
<td>Use tools like the ACL watcher, field level debugging, and access ACL rule output messages to help you troubleshoot and debug ACLs.</td>
</tr>
</tbody>
</table>

Provide external users access to a table

To enable users with only the snc_external role to access the list view of a table, you must create a series of ACLs.

Before you begin
Role required: security_admin

Procedure

1. Elevate to the security_admin role.
2. Create a new ACL with the following settings:
   - **Type**: ui_page
   - **Operation**: read
   - **Name**: {table_name}_list
   - **Required role**: snc_external
3. On the default read ACL for the table, add snc_external in the Required role list. Create the ACL if it does not already exist.
4. Use these settings to create another ACL:
5. Use these settings to create another ACL to give the user write access to a field in the table:

- **Type**: record
- **Operation**: create
- **Name**: `{table_name} {column_name}`
- **Required role**: snc_external

Repeat this step for every field that you want to give the user write access to. Use an asterisk `*` instead of the column name to provide access to all fields at once.

Apply ACL script conditions to reference fields

If you want to enable script conditions for reference fields, you can add a system property.

The default behavior is intended to improve instance performance. If you want to enable script conditions for reference fields, add the following system property.

<table>
<thead>
<tr>
<th>System property</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
</tr>
<tr>
<td>glide.sys_reference_row_check</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

Apply ACLs to AJAXGlideRecord (client-side Glide record)

From within client scripts, it is possible to query arbitrary data from the server via the AJAXGlideRecord (renamed GlideAjax) API, by using syntax similar to a server-side glide record. This is an extremely powerful and useful tool in many deployments. You can set a system property to perform ACL validation when server-side records (for example, tables) are accessed using GlideAjax APIs within a client script.

If you choose to apply access control lists (ACL) to GlideAjax API calls, then you can only query data to which the currently connected user has rights to access. For example, if the user is logged in as an ESS user who has no rights to read the cmn_location table, then any GlideAjax API call by the user will fail.

If you run the system without an ACL checking on GlideAjax calls, then the API can return information that the currently logged in user could not otherwise access via the UI.

**Note**: Set this property in **System Properties > Security**.
<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply standard security ACLs to AJAXGlideRecord calls</td>
<td>ACL checking enforced</td>
</tr>
</tbody>
</table>

**Note:**
To learn more about this property, see Enabling AJAXGlideRecord ACL checking (instance security hardening) in Instance Security Hardening Settings.

**Evaluate the admin override at the access level**

If you want to force ACL evaluation for admin overrides at the access level, you can add a system property.

**Before you begin**
Role required: security_admin

**About this task**
ACLs are evaluated cumulatively. If there are number of ACLs on any given field and the Admin Overrides option is false (not selected) on one of them, then the effective admin overrides for all the ACLs are considered to be false. This causes admins to be unable to pass even the ACL where the override should be in effect.

**Procedure**
Add the following property to the system properties table:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.security.admin.override.accessterm</td>
<td>Evaluates the admin override condition at the access term level.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true for new instances, false for upgrades</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>

**ACL debugging tools**
Field level debugging and access ACL rule output messages are available to help you troubleshoot and debug ACLs. The ACL configuration watcher lets you know what related ACLs exist when you modify one.

**Field level debugging**
When debugging is enabled, a small bug icon (_bug) appears beside each field with an ACL rule. Clicking the icon lists the ACL rules that apply for the field and the evaluation results.
Field level security on an incident

After enabling ACL debugging, you can impersonate another user to see what ACL rules the user passes and fails. When you impersonate a user, you can only see what that user is allowed to see. For example, you cannot view a record that an ACL prevents the user from seeing. To make debugging easier, read-only access to certain ACL-related tables is enabled by default, even when impersonating a user that does not have read access to the tables. To change this functionality, set the following property to false.

To enable ACL rule debugging, navigate to System Security > Debug Security Rules.

<table>
<thead>
<tr>
<th>System property</th>
<th>Description</th>
<th>Default setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.security.access_acl_as_impersonator</td>
<td>Provides read access to the following tables while impersonating a user: sys_security_acl, sys_security_operation, sys_security_type, and sys_user_role. As a result, the impersonating user can read data that the impersonated user cannot read.</td>
<td>true</td>
</tr>
</tbody>
</table>

**Note:** When the property is set to false, the impersonated user might be prevented from reading ACL-related data. In this case, a second session logged in as admin or security admin might be required to debug ACLs.

**ACL rule output messages**

ACL debugging displays ACL rule output messages at the bottom of each list and form. The output message displays the following:

<table>
<thead>
<tr>
<th>Message element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIME</td>
<td>The total time used to process this ACL rule.</td>
</tr>
<tr>
<td>PATH</td>
<td>Information that uniquely identifies each ACL rule in the format: &lt;ACL rule type&gt;/&lt;ACL rule name&gt;/&lt;Operation&gt;.</td>
</tr>
<tr>
<td>CONTEXT</td>
<td>The object being evaluated by the ACL rule.</td>
</tr>
<tr>
<td>Message element</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------</td>
</tr>
<tr>
<td>RC</td>
<td>The return code of the ACL rule. A true value passes the ACL rule. A false value fails the ACL rule.</td>
</tr>
<tr>
<td>RULE</td>
<td>A brief summary of processors and scripts, followed by ACL results for each table-level and field-level ACL evaluation. Most ACL evaluations show an overall pass or fail result followed by a breakdown of the results for each type of ACL criteria:</td>
</tr>
<tr>
<td></td>
<td>• iAccessHandler: An internal system check using hidden source code on the platform. This is a system security check that you cannot modify. iAccessHandler can grant or deny access to a resource without evaluating ACLs. If iAccessHandler is ignored, then the ACLs are evaluated. You cannot modify the iAccessHandler checks in any way. For example, an iAccessHandler implementation is used for access checks on application resources and this cannot be changed. This is available starting with the Istanbul release.</td>
</tr>
<tr>
<td></td>
<td>• Roles: Verification that the user has the correct role.</td>
</tr>
<tr>
<td></td>
<td>• Condition: Verification that the user passed the condition specified on the ACL rule (if any).</td>
</tr>
<tr>
<td></td>
<td>• Script: Verification that the user passed the script specified on the ACL rule (if any).</td>
</tr>
</tbody>
</table>

The icons that appear show how the ACL was evaluated:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A green checkmark (✓)</td>
<td>Indicates the table or field passed the criteria.</td>
</tr>
<tr>
<td>A red x icon (✗)</td>
<td>Indicates the table or field did not pass.</td>
</tr>
<tr>
<td>An empty gray circle icon (⊙)</td>
<td>Indicates the ACL evaluation did not need to be performed.</td>
</tr>
<tr>
<td>A blue checkmark, x, or empty circle</td>
<td>Indicates that the ACL was taken from a cached result of a previous ACL check. The icons mean the same as the above.</td>
</tr>
</tbody>
</table>

You can perform these actions on the ACL debug output:

- Select or clear these check boxes at the top of the debug output:
  - **Security rules**: Show or hide the results of the ACL checks.
  - **Others**: Show or hide other warnings or messages.
- Click the name of the ACL next to any of the output messages to open that ACL record.
Hover the cursor over any of the icons for the four ACL checks to see more information.

**ACL troubleshooting reference**

A list of common ACL rule errors and their solutions.

Enable debugging to help troubleshoot an issue.

<table>
<thead>
<tr>
<th>Error or symptom</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>You cannot access records from a custom table.</td>
<td>Create a table ACL rule for the custom table granting users access to the table. Without an explicit table ACL rule, users must pass the permissions in the table wildcard (*) ACL rule, which by default restricts access to administrators only. Enable debugging and determine what ACL rules are evaluated for the custom table.</td>
</tr>
<tr>
<td>You create a custom ACL rule that does not work properly.</td>
<td>The most likely problems are that another rule takes precedence over your custom rule in the processing order or that the user does not meet all the permission requirements for the object type. Enable debugging and verify that the ACL rule is being evaluated.</td>
</tr>
<tr>
<td>Your field ACL rule does not work properly.</td>
<td>There is likely a table ACL rule that the user has not met. Enable debugging and determine what ACL rules are evaluated for the field. Verify that there is not a conflicting table ACL rule or duplicate field ACL rule.</td>
</tr>
<tr>
<td>Your table ACL rule does not work properly.</td>
<td>There is either an ACL rule higher in the processing order or a duplicate table ACL rule interfering with the table ACL rule. Enable debugging and determine what ACL rules are evaluated for the table.</td>
</tr>
<tr>
<td>You can see a field in a list but not in form.</td>
<td>It is possible that the ACL rule conditions or script are being triggered in the list but not in the form. Enable debugging and determine when the ACL rules evaluate to true. Update the conditions or script to have the same behavior on the list and form.</td>
</tr>
<tr>
<td>You receive an error message when trying to execute a processor or client-callable script include.</td>
<td>There is an ACL rule for the processor or client-callable script include that the user has not met. If the user should have access to the object, enable debugging and determine what ACL rules are evaluated for the processor or script include. Update the ACL rule or the user roles as needed to access the object.</td>
</tr>
</tbody>
</table>

**ACL configuration watcher**

The ACL configuration watcher lets you know what related ACLs exist on a table when you insert, update, or delete an ACL on the same table.
The ACL configuration watcher is an interceptor window that displays every time you make important changes on the Access Control [sys_security_acl] table. It displays a security rules summary window where you can view ACLs related to the one you are modifying. You cannot modify any ACLs from the security rules window. To make any modifications, close the watcher window and go to those ACLs.

The ACL configuration watcher does not appear in the following situations:

- If you save or update an ACL record without actually making any changes.
- If you make minor updates (not an insert or delete), such as updating scripts, conditions, and the admin-overrides option.
- If the ACL record is not active.

**ACL Security Rules window**

The configuration watcher shows the ACL execution plan. The execution plan is displayed in the security rules pop-up window. You can view this kind of information:

**ACL configuration window elements**

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>red highlight</td>
<td>An ACL that is deleted or deactivated.</td>
</tr>
<tr>
<td>blue highlight</td>
<td>An ACL that is modified.</td>
</tr>
<tr>
<td>green highlight</td>
<td>An ACL that is added or becomes active.</td>
</tr>
<tr>
<td>Masked</td>
<td>An ACL that was effective until you made a change.</td>
</tr>
<tr>
<td>Unmasked</td>
<td>An ACL that was just made effective when you made a change.</td>
</tr>
</tbody>
</table>

**Configuration watcher example**

Verify Security Rules for "vtb_task.short_description"

![Configuration watcher example](image)

**ShowACL execution plan**

Administrators can view how ACLs relate to each other by viewing an execution plan for any ACL in the instance.

**Before you begin**

Role required: security_admin
Procedure

1. Elevate to a privileged role.
2. Open an ACL that is a record-type ACL.
3. Click **Show ACL Execution Plan**.
   The security rules window appears for the ACL.

4. Click **Show all** to show all related ACLs, including those ACLs that are overridden and generic ACLs that apply to all records. Overridden ACLs have a line through the name, and generic ACLs have the wildcard character asterisk (*) for the name.

5. Click **Show Effective** to show only the immediate ACLs related to the one you are viewing. This action hides the ACLs on tables from which the ACL table is extended and the generic wildcard (*) ACLs.

**Use the ACL configuration watcher**
Use the ACL configuration watcher after you elevate to security_admin role.

**Before you begin**
Role required: security_admin
Elevate to a privileged role

**Procedure**

1. Open an ACL that is a record-type ACL.
2. Perform an action on the ACL, such as modifying it, or selecting an option from the context menu like **Insert**.
3. If you modified any values on the Access Control form, right-click the header and select **Save** or click **Update** or **Delete**.

The Security Rules window appears. The system did not yet perform the database action on the ACL, so the changes are not yet saved.

These are examples of security rules on the Visual Task Board application’s Private Task [vtb_task] table. See **ACL configuration watcher** for a description of the items on this window.
4. Just as with the execution plan, you can click Show all to show all related ACLs, including those that are overridden and generic ACLs that apply to all records, or click Show Effective to show only the immediate ACLs related to the one you are viewing.

5. Hover your mouse over any of the ACLs to see a description.

### Explicit Roles

You can give both internal users and external users access to your instance. However, you might not want both types of users to have the same level of access. To provide added security, every user must have at least one role so that the instance can distinguish between internal and external users.

As of the Paris release, no user can have both of the explicit roles (snc_internal and snc_external). Groups and role containment cannot include both roles, either, since that would cause any group member or user who is assigned to such a group or such a role to automatically have both roles. The Now Platform aborts any operation that would create such a scenario.

External users must obtain, at minimum, the snc_external role. The snc_external role indicates that the user is external to your organization. They should not have any access to resources unless explicitly allowed through ACLs for the snc_external role or additional roles that inherit the snc_external role. By default, users with the snc_external role cannot access:

- Scripted REST API resources that are not marked external.
- Tables without the role that inherits the snc_external role or the public role.
- Non-record type resources, such as processors and UI pages without granting access to the snc_external role or a role that inherits the snc_external role.
- Now Intelligence dashboards.

Do not mark the snc_internal role as elevated. Otherwise, internal users cannot access the instance.

**Note:** You can set up encryption contexts with the snc_internal and snc_external roles. However, adding encryption contexts to more detailed roles is recommended. For more information, see [Set up encryption contexts](#).

### Explicit Roles plugin

When the Explicit Roles plugin is activated:

- All users must have the snc_internal role to access internal resources or the snc_external role to access external resources. Users without either explicit role can access only public resources.
- All existing users are automatically assigned the snc_internal role. This role does not change existing access levels or system behavior. Instead, it provides a category to differentiate internal users from external users. All internal users maintain the same level of access as before the plugin was activated.
Tip: To prevent changing existing functionality for users, activating the Explicit Roles plugin assigns the snc_internal user role to all existing users in the instance. This includes any external users added before the Explicit Roles plugin was activated. After the Explicit Roles plugin is activated, do the following for all external users added before the Explicit Roles plugin was activated:

- Remove the snc_internal role.
- Add the snc_external role.

Doing the preceding ensures that external users added before activating the Explicit Roles plugin do not have access to internal resources that should be available only to internal users.

- Newly created users are automatically assigned the snc_internal role when they first attempt to log in to the instance, unless they have been explicitly assigned the snc_external role. You can add the snc_external role to a new user before they first log in to the instance to provide external user rights.

Important: Activate this plugin during a maintenance window or when few users are logged in. Users currently logged in when the plugin is activated will not be dynamically assigned the snc_internal role. Rather, users must log out and log back in to be assigned the snc_internal role. Once the plugin is activated, you can add or remove the snc_internal and snc_external roles at any time to change user rights.

- All existing ACLs that do not have a role requirement are automatically assigned the snc_internal role. Because both existing ACLs and users are assigned the snc_internal role, existing access levels do not change.

- Newly created ACLs that do not have a role requirement are automatically assigned the snc_internal role. This role assignment does not apply to a newly created ACL with a role assigned.

- For all existing Processor [sys_processor] records or newly created Processor [sys_processor] records with Type=script, the snc_internal role is automatically added to the Roles field if the field is empty.

- To restrict access to UI pages to internal users, the plugin automatically assigns the snc_internal role to the * ACL with a Type of ui_page.

- To restrict access to processors to internal users, the plugin automatically assigns the snc_internal role to the * ACL with a Type of processor.

- External users must obtain, at minimum, the snc_external role to access the instance. This role must be manually granted to external users. Access to records is granted through ACLs.

Do not move system update sets among instances with and without the Explicit Roles plugin enabled. For more information, see System update sets.

Note: This plugin also requires the Contextual Security Manager plugin.

Providing table access to external users
You can provide external users access to a table by adding a role to the table that inherits the snc_external role. For more information, see Provide external users access to a table.

The hasRoles() method
The hasRoles() method is still available, but is deprecated in the Geneva release. Use the hasRole(role name) method instead.

If you do use the hasRoles() method, note these changes:
• This method automatically excludes the default snc_internal role when it checks for roles. This means that if a user has only the snc_internal role, the hasRoles() method still returns false.
• If the user has the snc_external role, the method returns false because the instance considers external users to be without a role.

**Mutual exclusion: snc_external versus snc_internal**
The Now Platform prevents users from having both the snc_external role and the snc_internal role. The Now Platform applies this mutual exclusion everywhere in the system and writes error messages to the logs for each conflict.

⚠️ **Note:** ACLs can have both roles if the ACL resources should be accessible to all users.

Example: Adding both explicit roles to a user (direct collision):
1. Assign user Abel Tuter the snc_internal role.
2. Assign user Abel Tuter the snc_external role.

Result: Adding the snc_external role fails because Abel Tuter has the snc_internal role.

Example: Adding both explicit roles to a group (direct collision):
1. Consider a group called Test Group that currently has no explicit roles assigned to the group.
2. Add Abel Tuter to the Test Group.
3. Add the snc_external role to Test Group.

Result: Adding the snc_external role fails because Abel Tuter already has the snc_internal role and can't have both roles.

Example: Adding an explicit role to a group where a group member has the conflicting explicit role (indirect collision):
1. Assign user Abel Tuter the snc_internal role.
2. Consider a group called Test Group that currently has no explicit roles assigned to the group.
3. Add Abel Tuter to the Test Group.
4. Add the snc_external role to the Test Group.

Result: Adding the snc_external role to the group fails because Abel Tuter would inherit the snc_external role through group membership. Both explicit roles would be assigned to the same user, which isn't allowed.

For other examples, see the following table:

<table>
<thead>
<tr>
<th>Role</th>
<th>Attempted action</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Direct collision</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>The user has the snc_internal role.</td>
<td>Add the snc_external role.</td>
<td>The action is aborted.</td>
</tr>
<tr>
<td>The user has the snc_external role.</td>
<td>Add the snc_internal role.</td>
<td>The action is aborted.</td>
</tr>
<tr>
<td>Role</td>
<td>Attempted action</td>
<td>Result</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>The user has no explicit role.</td>
<td>Add the snc_internal or snc_external role.</td>
<td>The role is added.</td>
</tr>
<tr>
<td>The user has both explicit roles (existing collision).</td>
<td>Add the user to a group with no roles.</td>
<td>The action is aborted.</td>
</tr>
<tr>
<td>A role not associated with any users contains the snc_internal role.</td>
<td>Add the snc_external role.</td>
<td>The action is aborted.</td>
</tr>
<tr>
<td>A role not associated with any users contains the snc_external role.</td>
<td>Add the snc_internal role.</td>
<td>The action is aborted.</td>
</tr>
<tr>
<td>A role contains both explicit roles (existing collision).</td>
<td>Add the role to a user, role, or group.</td>
<td>The action is aborted.</td>
</tr>
<tr>
<td>A group with no members has the snc_internal role.</td>

<td>The action is aborted.</td>
</tr>
<tr>
<td>A group with no members has the snc_external role.</td>
<td>Add the snc_internal role.</td>
<td>The action is aborted.</td>
</tr>
<tr>
<td>A group with no members has no roles.</td>
<td>Add the snc_internal or snc_external role.</td>
<td>The role is added.</td>
</tr>
</tbody>
</table>

**Indirect collision**

Role containment with collision

1. Grant a role called Test Role to a user with the snc_internal role.
2. Add the snc_external role Test Role.

The action is aborted.

Role containment without collision

1. Grant a role called Test Role to a user with no roles.
2. Add the snc_external role to Test Role.

The role is added to both the user and Test Role.

Group containment with collision

1. Add a user who has the snc_internal role to a group called Test Group 2 (child of Test Group 1).
2. Add the snc_external role to Test Group 2.
3. Add the snc_external role to a parent group called Test Group 1 (parent of Test Group 2).

The action is aborted.
<table>
<thead>
<tr>
<th>Role</th>
<th>Attempted action</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group containment without</td>
<td>1. Add a user with no roles to a group called Test Group 2 (child of Test Group 1).</td>
<td>The role is added to the parent group, the child group, and the user.</td>
</tr>
<tr>
<td>collision</td>
<td>2. Add the snc_external or snc_internal role to Test Group 1 (parent of Test Group 2).</td>
<td></td>
</tr>
<tr>
<td>Group containment plus</td>
<td>Add contains_external to Test Group 1, the parent of Test Group 2.</td>
<td>Test Group 1 and Test Group 2 both get contains_external, but don’t explicitly get the snc_external role.</td>
</tr>
<tr>
<td>role containment with</td>
<td></td>
<td></td>
</tr>
<tr>
<td>collision</td>
<td>Add the snc_internal role to Test Group 2, the child of Test Group 1.</td>
<td>The action is aborted.</td>
</tr>
<tr>
<td>Group parent change plus</td>
<td>1. Remove Test Group 1 as the parent of Test Group 2.</td>
<td>The action is aborted. Repeat for already nested groups, with the same expectation.</td>
</tr>
<tr>
<td>group containment</td>
<td>2. Add the snc_internal role to Test Group 1.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>3. Add the snc_external role to Test Group 2.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>4. In Test Group 2, set Test Group 1 as the parent group and save.</td>
<td></td>
</tr>
</tbody>
</table>

The cause of an aborted action appears in the error message and must be addressed before another attempt succeeds.

For direct cases, such as adding an explicit role to an individual user, verify which explicit role the user should have. If the user has the wrong explicit role, it must first be removed, and then the correct explicit role must be added.

For indirect cases, such as adding an explicit role to a group (so that a group member would be assigned both explicit roles), evaluate whether that user should be in the group. Also determine whether the group should be given the explicit role, including any inheritance through group hierarchy and role containment.

Note that the Now Platform reports only the first potential collision encountered. If repeated attempts continue to fail after remediation, with a new root cause each time, re-evaluate the relevant user/group/role interdependence more broadly. You may want to rethink how groups and role containments are structured.

**Request Explicit Roles**

Activate Explicit Roles by requesting the Explicit Roles plugin (com.glide.explicit_roles) through the Now Support Service Catalog.

**Before you begin**

Role required: admin

**Important:** Activate this plugin during a maintenance window or when few users are logged in. Users currently logged in when the plugin is activated will not be dynamically assigned the snc_internal role. Rather, users must log out and log back in to be assigned the snc_internal role. Once the plugin is activated, you can add or remove the snc_internal and snc_external roles at any time to change user rights.
Procedure

1. Navigate to All > System Applications > All Available Applications > All.

2. On the All Applications page, select Request Plugin to open the Request form on HI.

3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. On the form, fill in the fields.

### Activate Plugin request form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Enter: Explicit Roles (com.glide.explicit_roles)</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.
5. Select **Submit**.

### Elevated privilege roles

Elevated privilege roles require you to manually accept the responsibility of using the role before you can access the features of the role.

By default, you do not have elevated privilege roles upon login. You must manually elevate to the privilege of the role. An elevated privilege role lasts only for the duration of your user session. Session timeout or logout removes the role.

You can designate any role as an elevated privilege role, and then assign that role to one or more users. Do this when you want to restrict users from having access to the rights that the role provides immediately after login. You can designate the privilege role on the Role form. See [Create a role](#) for instructions.

To use an elevated role, you must meet these conditions:

- The elevated role must be assigned to you.
- You must manually elevate to a specific elevated role to get its privileges, even if you are already elevated to a second elevated role that contains the first elevated role.

  For example, if elevated role A contains elevated role B, even if you elevate to role A, you must still elevate to role B to get its privileges.

### The admin role

To grant the admin role to a user, the granting user must also have the admin role. For example, a user with only the user_admin role cannot grant the admin role to other users.

- Non-admin users cannot add a user to a group that contains the admin role.
- To grant the security_admin role to a user, the granting user must also have the admin role and must elevate to the security_admin role before granting the security_admin role to other users. A user with only the admin role cannot grant the security_admin role to other users.
- A user without the security_admin role cannot add a user to a group that contains the security_admin role.

⚠️ **Warning:** The use of elevated privilege on the admin role is not supported and may cause unexpected behavior. To require administrators to manually elevate, see [Force administrators to manually elevate](#).

### The security_admin role

In the base system, the security_admin role is the only role that has elevated privileges. This role is automatically assigned to the user who is the default System Administrator (admin) user. It provides access to **ACLs** and **High Security Settings**.
Roles assigned to the System Administrator (admin) user

<table>
<thead>
<tr>

User = System Administrator

- **admin**: Active, false
- **inc_internal**: Active, false
- **teamdev_codeReviewer**: Active, true, 1
- **security_admin**: Active, false

Note: To see this role, you must actually elevate to the security_admin role first. If you are logged in as the System Administrator (admin) user only, you cannot see the security_admin record in the list of roles.

The security_admin role record

<table>
<thead>
<tr>
<th>Roles</th>
<th>Go to</th>
<th>Name</th>
<th>Search</th>
<th>Search</th>
<th>Elevated privilege</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>security_admin</td>
<td></td>
<td></td>
<td>True</td>
</tr>
</tbody>
</table>

Note: The record for the System Administrator (admin) role is only visible to users who elevate privileges to the security_admin role.

security_admin role

The security_admin role is an elevated privilege role provided with High Security Settings that lets users create and change access controls and change High Security Settings.

In the base system, only the default System Administrator (admin) user has the security_admin role. Since it requires elevating privileges, the admin user does not have this role at login. After elevating privileges, the admin user has the security_admin role for the duration of the user session.

The security_admin role

- **Name**: security_admin
- **Application**: Global
- **Elevated privilege**: True

Description: Grant modification access to High Security Settings, allow user to modify the Access Control List

Note: To maintain high security, the security_admin role requires elevating privileges. Limit the users and groups to which you assign this role.
Elevate to a privileged role

The base system admin can elevate to a privileged role to have access to the features of High Security Settings.

Before you begin
Role required: admin

Note: If you grant additional users the admin role, they cannot elevate to a privileged role. Only the base system admin can elevate.

Procedure

1. Do the appropriate action for your version of the UI:

<table>
<thead>
<tr>
<th>Next Experience UI</th>
<th>UI16</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. In the banner frame, click your image or initials.</td>
<td>a. In the banner frame, click your user name.</td>
</tr>
<tr>
<td>b. Select Elevate Roles.</td>
<td>b. Select Elevate Roles.</td>
</tr>
</tbody>
</table>

A dialog box appears.
2. Select an elevated role and click OK. This role grants the user elevated privileges to all resources controlled by the role for the remainder of the session. When the user logs out, they lose the elevated privileges and must reestablish them at the next login. When elevated privileges are activated, the icon has an unlocked appearance.

**Note:** Any unsaved edits made when the page reloads are lost.

**Force administrators to manually elevate**

A property is available to force all users with the administrator role to manually select the role that they want to elevate to.

**Before you begin**

Role required: security_admin

**Procedure**

1. Log in as admin.
2. Elevate your role to security_admin.
3. Navigate to `sys_properties.list`.
4. Search for and select the `glide.security.strict_elevate_privilege` property.
5. Set the Value field to `true` and click **Submit**.

**Results**

When the user logs in, they are presented with a dialog window to select the role to which they can elevate.
## Login and authentication security

Configure login security options to control access to your instance.

### Security options

You can control several aspects of user login and authentication security:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
<th>Related topics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log in and log out controls</td>
<td>Control several dimensions of the log in and log out process for users, such as specifying a landing page that the user sees upon login and control how users log out.</td>
<td>• Define login scenarios&lt;br&gt;• Enable the logout confirmation prompt&lt;br&gt;• Remove the Logout button&lt;br&gt;• Installation exits&lt;br&gt;• Specify lockout for failed login attempts</td>
</tr>
<tr>
<td>Authentication security</td>
<td>Control the password reset process and features like the Remember Me option. You can also use IP address-based controls for access to the instance and implement a nonce to be used with single sign-on digest authentication.</td>
<td>• Strengthen password validation rules&lt;br&gt;• Example: The default self-service Password Reset process&lt;br&gt;• Change settings for the Remember</td>
</tr>
</tbody>
</table>
### Define login scenarios

You can direct all users to the same page after login.

**Before you begin**

Role required: admin

**About this task**

When users log on to an instance directly, such as going to http://{instance_name}.service-now.com/, the system does the following:

1. Accesses the value in the property glide.entry.page.script. The default value of the property is derived from a script include named CMSEntryPage.
2. Directs the user to the instance login page if the entry page requires a login.
3. Applies login rules, if any, to the user.

To force the system to direct all users to the same page after login:

**Procedure**

1. Navigate to All > Content Management > Configuration > Configuration Page.
2. Select a value for the Login page field, or create a new page as desired. If this page is not the site default page, it always redirects here. If it is a site default page, it applies login rules. If this value is null, the system uses navpage.do as the entry page. Do not enter a login page here; otherwise, users need to log in twice.

Logging Into an Instance to access a record:

When users log into an instance to access a record by its globally unique identifier (sys_id), such as http://{instance}.service-now.com/incident.do?sys_id={sys_id}, then the system does the following:

- Directs the user to a login page if not already logged in.
- Directs the user to the appropriate record if they are allowed to access it. If the user does not have access rights to the record, a denial of access message appears.

Logging Into the Service Portal or a CMS site:

When users log on the Service Portal or a CMS site, such as http://<instance>.service-now.com/site-name/page.do, the system does the following:

- If there is a value in the Login page field on the Service Portal or the CMS site form, it directs the user to that login page and applies login rules, if any, to the user.
- If there is no login page specified, it directs the user to the value in the Home page field on the Service Portal or the CMS site form.

Logging Into the Service Portal or a CMS Site to access a record:
When users log on to the Service Portal or a CMS site to access a record, such as http://
{instance}.service-now.com/ess/incident_detail.do?sysparm_document_key=incident,
{sys_id}, the system follows the same procedure and finally takes the user to the record. If
the user does not have access rights to the record, a denial of access message appears.

Logins and the employee self-service portal
The system keeps track of the first starting page that a user is trying to access even if the user
wants to log in to the Employee Self-Service Portal.
Consider the following scenarios.
Example 1:
1. A user is not logged in, and then tries to access a record using a specific SYS ID in the URL.
2. The system redirects the user to the login page.
3. Rather than logging in, the user tries to access another site, such as the Employee Self-
Service (/ess) Portal.
4. The system redirects the user to the login page again.
5. The user logs in and is redirected to the record that the user was first trying to access rather
than the Employee Self-Service Portal.
Example 2:
1. A user is not logged in, and then tries to access a record using a specific SYS ID in the URL
through the Employee Self-Service (/ess) Portal.
2. The system redirects the user to the login page.
3. Rather than logging in, the user tries to access another record through the Employee Self-
Service Portal.
4. The system redirects the user to the login page again.
5. The user logs in and is redirected to the first record rather than the second.

Specify a login landing page
By default, users see their homepage upon login. You can specify a different login landing
page by using a system property or the content management system.

Before you begin
Role required: admin

About this task
To specify a login landing page for all users, change the property value on the sys_properties
table.

Procedure
1. Type sys_properties.list in the navigation filter.
2. Locate the glide.login.home system property.
3. In the Value field, enter the name of the page that all users see upon login.
   Use <page name>.do; you may omit the http://"instance".service-now.com/ portion of the
   URL. To determine the page name or the URL of a page in the system, you can point to a
   link. Some possible pages are welcome.do and incident.do.
To specify a dashboard landing page, set the property to $dashboards.do?dashboard=<SYS_ID>. Replace <SYS_ID> with the sys_id of the dashboard.

To direct users to service portal, set the property to /sp

**Note:** This property is system-wide, so setting it affects all users. To set a login specifically for users with no roles, you can apply these same steps and use the glide.entry.loggedin.page_ess property.

You can also specify a login landing page with the content management system.

### Specify lockout for failed login attempts

The system provides inactive script actions that enable you to specify the number of failed login attempts before a user account is locked and to reset the count after a successful login.

**Before you begin**

Role required: admin

**Procedure**

Navigate to **All > System Policy > Script Actions** to view or activate the scripts.

**Note:** Starting with the Kingston release, following a zBoot, the script actions SNC User Lockout Check with Auto Unlock and SNC User Clear are activated.

To learn more about properties that affect failed login attempts, see Managing failed login attempts (instance security hardening) in the Instance Security Hardening Settings.

<table>
<thead>
<tr>
<th>Script action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNC User Lockout Check with Auto Unlock</td>
<td>• Uses the value of the glide.user.max_unlock_attempts property to set the limit for failed login attempts.</td>
</tr>
<tr>
<td></td>
<td>• Unlocks the user account after the time period that is specified for the glide.user.unlock_timeout_in_mins property. If no value is specified, then the system unlocks the user account after the default period of 15 minutes.</td>
</tr>
<tr>
<td>SNC User Lockout Check</td>
<td>Tracks the number of failed login attempts and locks the user account after a specified number of failed login attempts (default: 5).</td>
</tr>
<tr>
<td>SNC User Clear</td>
<td>Updates the user record after a successful login: Resets the number of failed login attempts and updates the date of the last login.</td>
</tr>
</tbody>
</table>

**What to do next**

Each time a user attempts to log in, the action is recorded in an event log. You can view a log of failed login attempts.

1. Navigate to **System Policy > Event Logs**.
2. Filter for login.failed in the **Name** field. You can view the attempted login name, date, and IP address logged for the attempt.
Make UI pages public or private

You can make pages public if you want your users to see the pages without logging in.

Before you begin
Role required: admin

About this task
Most pages are only viewable by logged in users. A limited number of pages are public so that users do not have to log in to view them, such as the welcome page, the front page, and the login and logout pages.

⚠️ Warning: Several base system public pages are required for the functionality of many features. Do not disable base system public pages.

Procedure
1. In the application navigator filter, type sys_public.list.
2. Click New.
3. In the sys_public table, create a record with the following values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page</td>
<td>The name of the page. For example: $sp</td>
</tr>
<tr>
<td>Active</td>
<td>When selected, the page is publicly accessible. Deselect the Active option when you want the page to be private.</td>
</tr>
</tbody>
</table>

4. Click Save.
   By setting active to true, the page is public, so anyone visiting <instance_name>/sp or <instance_name>/$sp.do can access the page.

Enable the logout confirmation prompt

You can enable a logout confirmation prompt to prevent users from inadvertently logging themselves out.

Before you begin
Role required: admin

About this task

⚠️ Note: The following procedure only works in UI versions earlier than UI16, which is the most recent and most commonly used one.

Procedure
1. Navigate to All > System Properties > System.
2. Locate the Prompt user to confirm a logout request property and select the check box.
3. When the user clicks the **Logout** button, a confirmation dialog box displays.

![Confirmation Dialog Box]

### Remove the Logout button

You can remove the **Logout** button to prevent inadvertent logouts.

**Before you begin**

Role required: admin

**About this task**

⚠️ **Note:** The following procedure does not work in UI16.

**Procedure**

1. Navigate to **All > User Administration > User Preferences**.
2. Delete the system preference `user.can.logout`.

**Installation exits**

Installation exits are customizations that exit from Java to call a script before returning back to Java.

⚠️ **Note:** Functionality described here requires the **Admin** role.

**Available installation exits**

Navigate to **System Definition > Installation Exits**. Some installation exit names (Login, Logout, ValidatePassword, ExternalAuthentication) are reserved and cannot be changed. Other installation exits can override these with custom script that replaces the script in the default installation exit.

The following installation exits are available in the base system:

<table>
<thead>
<tr>
<th>Installation Exit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Login</td>
<td>Takes a username and password pair and authenticates with the user object</td>
</tr>
<tr>
<td>Logout</td>
<td>Takes the user to the welcome page upon signing out; can be overridden by LogoutRedirect</td>
</tr>
<tr>
<td>LogoutRedirect</td>
<td>Takes the user to a specified URL upon signing out</td>
</tr>
<tr>
<td>ExternalAuthentication</td>
<td>Authenticates using header, parameter, or cookie; can be overridden by DigestSingleSignOn and PGPSingleSignOn</td>
</tr>
<tr>
<td>Installation Exit</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DigestSingleSignOn</td>
<td>Authenticates using header, parameter, or cookie and decrypts Digest encryption</td>
</tr>
<tr>
<td>PGPSingleSignOn</td>
<td>Authenticates using header, parameter, or cookie and decrypts PGP encryption</td>
</tr>
<tr>
<td>ValidatePassword</td>
<td>Active by default, starting with the Helsinki release; allows customers to define their own password validation; can be overridden by ValidatePasswordStronger</td>
</tr>
<tr>
<td>ValidatePasswordStronger</td>
<td>Requires passwords be at least 8 characters long and contain a digit, an uppercase letter, and a lowercase letter</td>
</tr>
<tr>
<td>GetIntegrationSessionTimeout</td>
<td>Implements the default integration session timeout behavior.</td>
</tr>
</tbody>
</table>

**Login modifications**

The following modification to the **Login** installation exit sets each user’s session timeout value as the user is logging in. In this particular example, if the user name is **admin**, the session is set to timeout in 30 seconds.

```javascript
gs.include("PrototypeServer");

var Login = Class.create();
Login.prototype = {
  initialize : function() {
    },

  process : function() {
    // the request is passed in as a global
    var userName = request.getParameter("user_name");
    var userPassword = request.getParameter("user_password");

    var authed = GlideUser.authenticate(userName, userPassword);
    if (authed) {
      // ***********************************************************
      // customization - if the userName == admin, set the session
      // timeout to be 30 seconds. You can implement your own
      // session timeout algorithm here by checking to see if a user
      // belongs to a certain group or has a certain role.
      // Values of setMaxInactiveInterval exceeding 1440 minutes are
      // treated as one day (1440 minutes).

      if (userName == "admin") {
        request.getSession().setMaxInactiveInterval(30);
      }
      // ***********************************************************
      return GlideUser.getUser(userName);
    }

    this.loginFailed();
    return "login.failed";
  },

  loginFailed : function() {
    var message = GlideSysMessage.format("login_invalid");
    
```
Session timeout can also be set according to IP address.

```
gs.include("PrototypeServer");

var Login = Class.create();
Login.prototype = {
    initialize : function() {
    },

    process : function() {
        // the request is passed in as a global
        var userName = request.getParameter("user_name");
        var userPassword = request.getParameter("user_password");

        var authed = GlideUser.authenticate(userName, userPassword);
        if (authed) {

            // ***************************************************************
            // customization - if the user is logging in from a particular IP
            // range starting with XXX.XXX you can implement your own
            // session timeout algorithm here by checking the login IP
            // Values of setMaxInactiveInterval exceeding 1440 minutes are
            // treated as one day (1440 minutes).
            var clientIP = gs.getSession().getClientIP().toString();

            // if client IP starts with specified range
            if (clientIP.indexOf('XXX.XXX') == 0) {
                // set to 10 hours
                request.getSession().setMaxInactiveInterval(60 * 60 * 10);
            }
            // ***************************************************************

            return GlideUser.getUser(userName);
        }

        this.loginFailed();

        return "login.failed";
    },

    loginFailed : function() {
        var message = GlideSysMessage.format("login_invalid");
        var gSession = GlideSession.get();
        gSession.addErrorMessage(message);

        var userName = request.getParameter("user_name");
    }
};
```

Enable Password Reset Policy Checks (instance security hardening)

Strengthen password validation rules

You can customize password strength validation rules for the change password screen by overriding the installation exit associated with password validation.

Procedure

1. Navigate to All > System Definition > Installation Exits.
2. Locate ValidatePassword (inactive by default) and ValidatePasswordStronger (active by default, starting with the Helsinki release).
3. The ValidatePasswordStronger script (below) is a sample script that overrides the ValidatePassword script by using regular expressions to require that passwords be a minimum of 8 characters long, contain a numeric digit, and contain mixed-case letters.

```javascript
gs.include("PrototypeServer");
var ValidatePasswordStronger = Class.create();
ValidatePasswordStronger.prototype = {
    process : function() {
        var user_password = request.getParameter("user_password");
        var min_len = 8;
        var rules = "Password must be at least " + min_len + " characters long and contain a digit, an uppercase letter, and a lowercase letter."
        if (user_password.length() < min_len) {
            gs.addErrorMessage("TOO SHORT: " + rules);
            return false;
        }
        var digit_pattern = new RegExp("[0-9]", "g");
        if (!digit_pattern.test(user_password)) {
            gs.addErrorMessage("DIGIT MISSING: " + rules);
            return false;
        }
        var upper_pattern = new RegExp("[A-Z]", "g");
        if (!upper_pattern.test(user_password)) {
            gs.addErrorMessage("UPPERCASE MISSING: " + rules);
            return false;
        }
        var lower_pattern = new RegExp("[a-z]", "g");
        if (!lower_pattern.test(user_password)) {
            gs.addErrorMessage("LOWERCASE MISSING: " + rules);
            return false;
        }
        return true; // password is OK
    }
};
```

The script variable created by Class.create() must have the same name as the installation exit itself - "ValidatePasswordStronger" in this example. The script implements the process()
function which returns true if the password is acceptable and false if the password must be revised. The `gs.addErrorMessage` function can be used to return error messages on the change password screen. You can try this Installation Exit in your instance by checking the active flag and updating the record. Be sure and clear the cache after doing this so the change is recognized.

Also, keep in mind that modifying these scripts will not change the default ServiceNow behavior: Blank passwords are still prohibited by default and the password and verify password fields must match.

**Results**
To test, check the Password needs reset box on a user record then login with that user. Validation will occur at the point that the user attempts to set the password. Validation does not apply when an admin user updates the password in the user record directly (the admin can put anything in the password field).

**Note:** The change password screen only applies to customers who do not use single sign on and are not integrated with their local LDAP.

**Example: The default self-service Password Reset process**
The default self-service Password Reset process enables a user to reset the password without assistance from service desk agents.

**Example: The default self-service password reset flow**
1. If a user does not remember the password, the user can click the Forgot Password? link on the login screen.

   ![User login screen](image)

   2. The Password Reset application starts. On the Identity page, the user identifies himself or herself by entering a Username.

   ![Identity page](image)
3. On the **Verify** page, the user proves that they are the person who is associated with the username. In this example, the user enters the email address that is associated with the user profile. The admin can configure a different verification method or can require additional verifications, for example, a personal question that only the user can answer.

4. The **Reset** page tells the user to check email for instructions.

5. The user opens the email and clicks the **here** link to reset the password. The link is valid for a period that you specify (use the `password_reset.request.expiry` property).

 Preview email

Hello

A password reset was requested for your user account on the ServiceNow instance [https://demonightlyplatformsecurity.service-now.com/](https://demonightlyplatformsecurity.service-now.com/).

Click [here](https://demonightlyplatformsecurity.service-now.com/) to reset your password. If you do not want to reset your password, please disregard this email.

The link will expire in 12 hours.

If you did not request this password reset, please notify your company's ServiceNow administrator.
6. The **Reset Password** page guides the user to reset the password.

![Reset Password page](image)

The default self-service Password Reset process (`com.glideapp.password_reset`) defines:

- The URI that specifies where users are redirected when they click **Forgot Password?**. By default this value is `/pwd_reset.do?sysparm_url=ss_default`, which is the same value used in the `glide.security.password_reset.uri` property. In previous releases, this value was set to `/reset_password.do`.

- The **Enable Password Reset URL** option, which specifies that the user should receive an email with a link to reset their password after they click **Forgot Password?**.

- The **Personal Data - Enter Email Address** verification flow that specifies the three-step password reset flow.

See for instructions on accessing this form and configuring the fields.

**Note:**

- This feature works for locally authenticated users who enter the username and password specified in their user record. Users logging in to the instance via an SSO solution or an LDAP integration cannot reset passwords using the example self-service Password Reset process.

- The end user must enable and configure notification preferences. See **Subscription-based notifications**. Administrators can modify the email that is sent to the end user.

**Modify the Password Reset notification email text**

Users of the self-service Password Reset process receive an email notification when they request password reset. You can modify the text of the email and other aspects of the notification.

**Before you begin**

Role required: admin

**About this task**

This process is relevant only if users are subscribed to the notification.
Procedure
1. Navigate to All > System Notification > Notifications.
2. Select the Password Reset URL notification.
3. Modify the text of the email in the What it will contain section.
   For information on configuring other aspects of the notification, see Create an email notification.

Configure Password Reset properties
You can specify properties that configure the Password Reset experience for end users.

Before you begin
Role required: password_reset_admin

About this task
While there are no range limits for the values you can enter for properties, consider using only positive integer values starting at 1. When you determine the limit for the upper range of a property, consider the task that the user is performing.

For example, you would not want to allow 100 attempts for users to verify their identity. A more common value is 3 attempts. Similarly, you may not want to force users who are completing the enrollment process to spend time selecting and answering 30 security questions. The more commonly used number of security questions is between 5 and 7.

Procedure
1. Navigate to All > Password Reset > Properties.
2. Update settings as needed and then click Save.

**Password Reset Security Question properties**

<table>
<thead>
<tr>
<th>Property Label</th>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum number of characters in any answer</td>
<td>password_reset.qa.ans_min_len</td>
<td>Minimum number of alphanumeric characters that the user must enter in the answer text box for any security question.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default value: 3 characters</td>
</tr>
<tr>
<td>Number of security questions required during the password reset request</td>
<td>password_reset.qa.num_reset</td>
<td>Number of security questions that are displayed on the Verify page while a user is attempting to reset the password. The user must answer all questions correctly to verify identity. The questions are selected at random and are presented in random order.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: 3 questions</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Possible values: Integers that are less than the number specified for the <strong>Number of security questions</strong></td>
</tr>
</tbody>
</table>
### Property Label | Property Name | Description
--- | --- | ---
Number of security questions required during enrollment | password_reset.qa.num_enroll | Number of questions that a user must provide answers to while enrolling for the Password Reset process.

- **Type**: integer
- **Default value**: 5
- **Possible values**: Integers that are greater than or equal to the number specified for the **Number of security questions required during enrollment** property (the num_reset parameter).

#### Note:
While attempting to verify identity, if a user answers a question incorrectly, the application refreshes with a random set of the specified questions in random order. You should, therefore, require more questions than specified for the **Number of security questions required during enrollment** property (the num_reset parameter).
<table>
<thead>
<tr>
<th>Property Label</th>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note: You can override this property setting for a Password Reset process by configuring the num_enroll parameter. See Specify the number of required security questions.</td>
<td></td>

</tr>
<tr>
<td>Password Reset SMS Code properties</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Maximum number of SMS codes sent for verification per day | password_reset.sms.max_per_day                          | Maximum number of SMS codes that are sent to a user within one 24-hour period. The 24-hour period begins when a user clicks **Send Code**.  
  - Type: integer  
  - Default value: 10 (per day)  
  
  **Note:** You can override this SMS code property by adding the max_per_day parameter in the SMS code verification.                                                                                                                                                                                                                      |
| Number of minutes before the user can attempt to send another SMS code for verification | password_reset.sms.pause_window                         | Time that must pass before another SMS code can be sent to a user.  
  - Type: integer  
  - Default value: 2 (minutes)  
  
  **Note:** You can override this SMS code property by adding the pause_window parameter in the SMS code verification.                                                                                                                                                                                                                      |
<p>| Number of digits in the SMS code sent to the user  | password_reset.sms.default_complexity                   | Number of characters required for a user to reset their password.                                                                                                                                                                                                                                                                                                                                                                                                     |</p>
<table>
<thead>
<tr>
<th>Property Label</th>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of minutes before the SMS code expires</td>
<td>password_reset.sms.expiry</td>
<td>Time, in minutes, until the SMS code sent to the user expires. &lt;br&gt;• Type: integer &lt;br&gt;• Default value: 5 (minutes) &lt;br&gt;Note: You can override this SMS code property by the expiry parameter in the SMS code verification.</td>
</tr>
</tbody>
</table>

**Password Reset Monitoring and Reporting properties**

<table>
<thead>
<tr>
<th>Time interval, in minutes, for counting blocked users</th>
<th>password_reset.activity_monitor.incident_window</th>
<th>Time window to count the number of blocked users. &lt;br&gt;• Type: integer &lt;br&gt;• Default value: 60 (minutes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of blocked users, in the defined time interval, that triggers a system log event</td>
<td>password_reset.activity_monitor.incident_threshold</td>
<td>Number of blocked (or locked) users, within the specified time window, that triggers a system log event. &lt;br&gt;• Type: integer &lt;br&gt;• Default value: 10 (blocked users)</td>
</tr>
</tbody>
</table>

**Password Reset Style Sheet**

<p>| Style sheet to apply to end-user pages during the password reset process. | password_reset.stylesheet | Name of a custom CSS style sheet in the Style Sheet [content_css] table. You can use the default style sheet as a template for the custom style sheet. You cannot add element definitions to the style sheet. |</p>
<table>
<thead>
<tr>
<th>Property Label</th>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Email template for reminder emails | password_reset.email_template_default | Template to use to specify the subject and body of the email messages to remind users to enroll for the Password Reset process. For example:  
  • [Subject] Reminder: Enroll in the Password Reset program  
  • [Body] Click here to enroll for the password reset service.  
  Note: You must create an email template in the password_reset table to use it as a reminder.  
  • Type: string  
  • Default value: css_pwd_reset_default  

Note: Several components in the Self Service Password Reset (com.snc.password_reset) plugin and the Password Reset (com.glideapp.password_reset) plugin control the password reset flow. The following properties affect Password Reset, but do not appear on the Password Reset > Properties page:

• You can add the glide.pwd_reset.onetime.token.validity property to the System Properties [sys_properties] table to specify the number of hours that the Password Reset token should be valid. Default: 12.

  Note: The setting for the password_reset.request.expiry property (time period during which a user must perform the Password Reset process) takes precedence over the setting for glide.pwd_reset.onetime.token.validity.

Properties accessible from the System Properties [sys_properties] table:

• For Password Reset on mobile devices, you can specify the URL that the user is taken to when user taps the Forgot password? button. See the glide.security.password_reset.uri property in High Security Settings. Default: /$pwd_reset.do?sysparm_url=ss_default

• If glide.security.forgot_password.display.link is set to true, displays the Forgot Password? link on the login page.
Change settings for the Remember me check box and cookie

When the Remember me check box is selected at login, a cookie is stored on the user's computer. This cookie automatically authenticates the user upon subsequent visits.

If the user logs out, the cookie is destroyed. The default value of the Remember me check box is controlled by one property, and whether or not the check box appears on the login page is controlled by a different property.

Two properties, glide.ui.user_cookie.life_span_in_days and glide.ui.user_cookie.max_life_span_in_days control the glide_user system generated cookie expiration value. When a user accesses an instance with 'remember me' enabled, the access resets the cookie expiration period until the maximum (glide.ui.user_cookie.max_life_span_in_days) life span limit is reached.

Note: To learn more about these properties, see the following topics in Instance Security Hardening Settings:
- Absolute session timeout (instance security hardening)
- Session window timeout (instance security hardening)

Change the default value of the Remember me check box

You can change the default value of the Remember me check box.

Before you begin
Role required: admin

Procedure
1. Navigate to All > System Properties > UI Properties.
2. Locate the Default value of "Remember me" checkbox on login page property (glide.ui.remember.me.default).
3. To set the default value of the Remember me check box to No, clear the property check box.
4. To restore the default value of the Remember me check box to Yes, select the property check box.

Remove the Remember me check box

You can remove the Remember me check box so users do not have access to this feature.

Before you begin
Role required: security_admin

Note: To learn more about this property, see Remove remember me (instance security hardening) in Instance Security Hardening Settings.

Procedure
1. Elevate your role to security_admin.
3. Locate the Remove "Remember me" checkbox from login page property (glide.ui.forgetme).
4. Select the property check box.
This setting removes the **Remember me** check box, invalidates existing cookies, and disables Remember me functionality entirely.

5. To restore the **Remember me** check box to the login page, clear the property check box.

### IP range based authentication

One way to secure a web-based application is to restrict access based on the IP address. You can block access to a specific address or range of addresses that you suspect belong to malicious individuals. The instance allows you to control access by IP address.

**Notes and Limitations:**

- The system won't let you lock yourself out, so if you try to add a rule such that your current address would be locked out, the system warns you and refuses your insert.
- If you're inside of a corporate intranet, be very careful about setting up your IP rules. The IP address you see on your own computer (like 10.10.10.25) generally bears no relationship to the IP address you'll actually appear as out on the internet. Your company likely proxies and/or NATs your address into a predictable set of outbound addresses which you'll likely need to ask your network team about.
- A user whose access is restricted based on an access rule gets a 403 error on their browser.
- Restricted users do not use transactions, semaphores, or count towards any server resource counts.
- This feature does not supersede or override your existing access control rules if, for example, you're running a VPN to our data center. It's an additional check that must be met in addition to any access controls we may have set up on your PIX.
- Allow rules always supersede deny rules. So if an address is both allowed (by one rule) and denied (by a second rule) it is, in fact, allowed.
- Asterisks and CIDR blocks are not currently supported.
- Regarding forwarded proxy addresses, the allow rules are applied to each address in the chain and then the deny rules are applied to each address in the chain if none of the allow rules matched.

**Note:** To learn more about the `com.snc.ipauthenticator` and `glide.ip.authenticate.strict` properties, which restrict instance access to specific IP ranges, see the following topics in Instance Security Hardening Settings:

- **Restrict access to specific IP ranges (instance security hardening)**
- **Strict IP restriction (instance security hardening)**

### IP Address Access Control

Apply an IP access control to outbound traffic, inbound traffic, or bidirectional traffic. The system only blocks an IP address if a matching Deny rule exists and no matching Allow rule exists. By default, there are no restrictions on access to your instance.

**Before you begin**

Role required: admin
Procedure
1. Navigate to **All > System Security > IP Address Access Control** to see a list of your IP access controls. You might have to activate the IP Range Based Authentication [com.snc.ipauthenticator] plugin.

2. Complete the form.

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>The type of access control rule to include.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Allow</strong>: Any IP address in this range can interact with this instance.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Deny</strong>: Any IP address in this range cannot interact with this instance unless it is listed in an Allow rule. Also, when adding deny rules, you cannot deny your own public IP address or your instance does not update a deny rule.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>To support maintenance, upgrades, and Customer Service and Support, some ServiceNow internal IPs cannot be blocked by Deny rules.</td>
</tr>
<tr>
<td><strong>Direction</strong></td>
<td>The direction of the IP access control rule.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Inbound</strong>: Allows or denies inbound transactions.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Outbound</strong>: Allows or denies outbound transactions.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Bidirectional</strong>: Allows or denies both inbound and outbound transactions.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>When selected, the form is active.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Description of the access control.</td>
</tr>
<tr>
<td><strong>Range Start</strong></td>
<td>The starting range of IP addresses to allow or deny.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>These rules also affect transferring update sets. To ensure that IP address access control does not cause update sets to fail, add the target instance as an exception.</td>
</tr>
<tr>
<td><strong>Range End</strong></td>
<td>The ending range of IP addresses to allow or deny.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>To limit access to specific VPN addresses only, enter a Deny range of <strong>0.0.0.0 through 255.255.255.255</strong> into the <strong>Deny</strong> field, and only enter the specific allowed VPN ranges.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**Find denied IP addresses**
Denied IP addresses are by default not viewable from the system logs. However, you can still find them in the instance’s node log files.

**Before you begin**
Role required: admin

**About this task**
Log entries for blocked IP address appear as follows:
Procedure

1. Navigate to All > System Logs > Utilities > Node Log File Browser.
2. Browse the logs by criteria, such as time period and message.
3. You can also download log files when you know which log you are looking for, by navigating to System Logs > Utilities > Node Log File Download.

Implementing a nonce

You can implement a nonce to be used with single sign-on digest authentication.

To use a nonce with the unencrypted token or encrypted token methods of single sign on, these steps apply with only a few minor changes.

⚠️ Note: The nonce is used only for login requests, not for any other type of request. If the system receives a nonce value after login, the nonce is not consumed.

Benefits

The usage of a nonce prohibits a malicious user from performing a replay attack in order to log into your system.

Nonce process flow

When a customer has implemented the digested token Single Sign-on and wishes to add the security of a nonce, they follow a certain process flow.

1. A user logs into the customer’s portal.
2. The customer generates the required SSO parameters and appends a random nonce to the end. For example, if the customer were forwarding the authentication response via the query string, it may look something like this:

   ```
   SM_USER=itil&DE_USER=V1QuWMmxSfBgfRS099X0cAjKo5Q=©NONCE=1407743018
   ```

   The instance receives this request and retrieves the authentication variables. Before attempting to verify the integrity of the authentication response, the instance checks the nonce against an internal table (u_authentication_nonce) to verify that it does not yet exist. If the nonce does not exist within that table, the nonce is then added to the table and the authentication process is allowed to continue. However, if that nonce value already exists within the table, the authentication attempt is cancelled and an error code of failed_missing_requirement is returned, which typically takes the user back to the login page.

Implement a nonce

Add a cryptographic nonce to the authentication header to ensure that it can only be used once.

- Create a system property called glide.authenticate.header.nonce_key and set its value to whatever variable name you’re using for the nonce, such as NONCE or NCE.
- Create a new table called u_authentication_nonce. Add a field to the table called u_nonce.
- Go to System Properties > Installation Exits and create an item called DigestSingleSignOnNonce which overrides ExternalAuthentication (see image below).
Add the following code to the script portion of the newly created DigestSingleSignOnNonce.

```javascript
gs.include("PrototypeServer");

var DigestSingleSignOnNonce = Class.create();
DigestSingleSignOnNonce.prototype = {

  process : function() {

    var headerKey = GlideProperties.get("glide.authenticate.header.key", "SM_USER");
    var headerDigestKey = GlideProperties.get("glide.authenticate.header.encrypted_key", "DIGEST");
    var headerNonceKey = GlideProperties.get("glide.authenticate.header.nonce_key", "NCE");
    var fieldName = GlideProperties.get("glide.authenticate.header.value", "user_name");
    var fkey = GlideProperties.get("glide.authenticate.secret_key");

    // Look in the Headers
    var data = request.getHeader(headerKey);
    var encdata = request.getHeader(headerDigestKey);
    var nonce = request.getHeader(headerNonceKey);

    // If not, then check the URL Parameters
    if (data == null || encdata == null || nonce == null) {
      data = request.getParameter(headerKey);
      encdata = request.getParameter(headerDigestKey);
      nonce = request.getParameter(headerNonceKey);
    }

    // then maybe its a cookie
    if (data == null || encdata == null || nonce == null) {
      var cookies = request.getCookies();
      data = GlideCookieMan.getCookieValue(cookies, headerKey);
      encdata = GlideCookieMan.getCookieValue(cookies, headerDigestKey);
      nonce = GlideCookieMan.getCookieValue(cookies, headerNonceKey);
    }

    // if found run encryption
    if (data != null && encdata != null && nonce != null) {
      try {

        // Replace all spaces with plus(+)’s, converted in url
        encdata = encdata.replaceAll(' ', '+');
      }
    }
  }
};
```
var key = this.getDigest( data + "|" + nonce, fkey);

// Check for match of received encoded data
// and your encoding of user name
if (encdata == key) {
    var ugr = new GlideRecord("sys_user");
    ugr.initialize();
    if (!ugr.isValidField(fieldName)) {
        GlideLog.warn("External authorization is set to use field: "+ fieldName + " which doesn't exist");
        return "failed_missing_requirement";
    }
    ugr.addQuery(fieldName, data);
    ugr.query();
    if (!ugr.next()) {
        var userLoad = GlideUser.getUser(data);
        if (userLoad == null)
            return "failed_authentication";
        ugr.initialize();
        ugr.addQuery(fieldName, data);
        ugr.query();
        if (!ugr.next())
            return "failed_authentication";
    }
    if (this.processNonce(nonce)) {
        var userName = ugr.getValue("user_name");
        return userName;
    } else return "failed_missing_requirement";
} else {
    return "failed_authentication";
}
} catch(e) {
    gs.log(e);
    return "failed_authentication";
}

getDigest : function( data, fkey ) {
try {
    // default to something JDK 1.4 has
    var MAC_ALG = "HmacSHA1";
    return SncAuthentication.encode(data, fkey, MAC_ALG);
} catch (e) {
    gs.log(e.toString());
}
throw 'failed_missing_requirement';
}

processNonce : function( sentNonce ) {

  var ngr = new GlideRecord("u_authentication_nonce");

  ngr.addQuery("u_nonce", sentNonce);
  ngr.query();
  if (ngr.next()) {
    gs.log("This SSO entry has already been processed! (Nonce: " + sentNonce + ")");
    return false;
  }

  var ngrNew = new GlideRecord("u_authentication_nonce");
  ngrNew.initialize();
  ngrNew.u_nonce = sentNonce;
  ngrNew.insert();
  gs.log("Inserted new nonce: " + sentNonce);
  return true;
}

• Once you’ve saved your new installation exit, go to the DigestSingleSignOn installation exit and make sure that it is set Active=false.

Your instance should now be configured to implement a nonce.

Certificates

Your instance requires certificates to establish secure connections and validate signatures. Certificates are used for features such as:

• LDAPS
• Outbound web services mutual authentication
• Web services security
• MID Server

In order to use a certificate, you need to generate or purchase a certificate for the secured server or client and upload it to an instance.

LDAP certificates

An SSL certificate is required for the instance to establish an LDAP over SSL (LDAPS protocol) connection with an LDAP server.

The instance accepts two types of LDAP certificates:

<table>
<thead>
<tr>
<th>Certificate</th>
<th>Type</th>
<th>Required for</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAP server certificate</td>
<td>Any supported type</td>
<td>All LDAP configurations</td>
</tr>
<tr>
<td>LDAP client certificate</td>
<td>Java keystore type</td>
<td>Mutual authentication</td>
</tr>
</tbody>
</table>
If there are multiple server certificates, the instance tries each server certificate in turn until the LDAP server allows the connection. If you use multiple LDAP servers, be sure to include the SSL certificate for each LDAP server.

If your LDAP server requires mutual authentication, which requires the client to present a certificate in addition to the server, you must also provide your LDAP server's client certificate in a Java keystore type certificate.

**Certificate criteria**
A valid certificate must meet these criteria:

- The certificate can have a key size up to 2048 bits.
- The certificate must have one of these file extensions:

<table>
<thead>
<tr>
<th>Extension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DER</td>
<td>The <em>Distinguished Encoding Rules</em> format is a binary message transfer syntax. This format also supports the .CER and .CRT file extensions.</td>
</tr>
<tr>
<td>CER</td>
<td>Certificate file extensions for certificates using the <em>Distinguished Encoding Rules</em> format.</td>
</tr>
<tr>
<td>CRT</td>
<td>Certificate file extensions for certificates using the <em>Distinguished Encoding Rules</em> format.</td>
</tr>
<tr>
<td>PEM</td>
<td>The <em>Privacy Enhanced Mail</em> format is a base-64 encoded DER certificate enclosed between &quot;-----BEGIN CERTIFICATE-----&quot; and &quot;-----END CERTIFICATE-----&quot; text strings.</td>
</tr>
</tbody>
</table>

**Certificate trust**
By default, your instance trusts only certificates from a Certificate Authority (CA) recognized in the Java Virtual Machine (JVM). In this case, your instance does not trust self-signed certificates.

⚠️ **Note:** To learn more about the properties that affect use of certificates, see Secure communications (instance security hardening) in Instance Security Hardening Settings.

**Generate an LDAP client certificate**
Generate an LDAP client certificate for mutual authentication using OpenSSL. The final output is a PKCS#12 certificate stored within a Java keystore.

**Before you begin**
Role required: admin

**About this task**
See the OpenSSL documentation for more information about generating certificates. These steps assume you have access to OpenSSL.

Enter these commands in a command line interface.

**Procedure**

1. Generate a self-signed client certificate.

**Example**
For example, this command creates a client certificate test1-cert.crt based on the test1-key.key private key.

```bash
code
```
2. Convert both the certificate file and private key to PKCS#12 (a file with a .pfx or .p12 extension).

   **Example**
   For example, this command converts the client certificate and private key to a PKCS#12 certificate called test1-certificate.pfx.
   ```bash
   openssl pkcs12 -export -out test1-certificate.pfx -inkey test1-key.key -in test1-cert.crt
   ```

3. Generate the Java Key Store and import the pkcs12 file into it.

   **Example**
   For example, this command imports the certificate to the test1.jks Java keystore.
   ```bash
   keytool -importkeystore -srckeystore test1-certificate.pfx -srcstoretype PKCS12 -destkeystore test1.jks
   ```

4. **Upload the certificate** in the keystore file (test1.jks) to the instance.

   **Note:**
   If you are uploading to an on-premise instance using a certificate with the .jks extension and you receive an error saying "No valid certificate found to process the application upload", use a certificate with the .pfx extension instead.

   **What to do next**
   Upload a certificate to an instance

**Generate a server certificate**

You can use keytool to generate a new Java keystore file, create a certificate signing request (CSR), and import the private key, public certificate pair, and signed certificates into the keystore.

**Before you begin**
Role required: admin

**About this task**
See the [Java keytool documentation](https://docs.oracle.com/javase/7/docs/api/java/security/keytool.html) for more information on generating keys and CSRs.

Enter these commands in a command line interface:

**Procedure**

1. Generate a Java keystore and key pair.

   **Example**
   For example, this command creates a keystore called my.keystore and generates a private key called mydomain within the keystore.
   ```bash
   keytool -genkey -alias mydomain -keyalg RSA -keystore my.keystore
   ```

2. Generate a CSR for an existing Java keystore.

   **Example**
   For example, this command generates a CSR called mydomain.csr or the mydomain key.
3. Import a root or intermediate certificate authority, or CA, certificate to the Java keystore.

   **Example**
   For example, this command imports the CA certificate for Thawte. This command assumes that Thawte was the CA that signed the CSR.

   ```bash
   keytool -import -trustcacerts -alias root -file Thawte.crt -keystore my.keystore
   ```

4. Import a signed primary certificate to the Java keystore.

   **Example**
   For example, this command imports the signed certificate mydomain.crt into the keystore.

   ```bash
   keytool -import -trustcacerts -alias mydomain -file mydomain.crt -keystore my.keystore
   ```

5. Upload the certificate in the keystore file (my.keystore) to the instance.

**What to do next**

Upload a certificate to an instance

**Upload a certificate to an instance**

You can add a certificate to the instance from the Certificates module.

**Before you begin**

Role required: admin

**About this task**

When a certificate is updated on the ADFS server, you also need to upload an updated certificate to the instance.

**Procedure**

1. Navigate to **All > System Definition > Certificates**.
2. Click **New**.
3. Fill in the following fields (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify a unique name for the certificate.</td>
</tr>
<tr>
<td>Expiration notification</td>
<td>[Optional] Select whether you want to send a notification when the certificate is about to expire.</td>
</tr>
<tr>
<td>Active</td>
<td>Select whether the instance should use this certificate for secure communications and signing requests.</td>
</tr>
<tr>
<td>Short Description</td>
<td>[Optional] Enter a text description of the certificate such as the requester or server name.</td>
</tr>
<tr>
<td>Format</td>
<td>Select the certificate format. The instance supports the PEM and DER formats.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the certificate container. The instance recognizes certificates from trust</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
| | stores, Java keystore, and PKCS#12 keystores.
| **PEM Certificate** | Enter the base-64 encoded PEM-formatted text containing the DER certificate. The instance decodes the certificate to populate the **Valid from**, **Expires**, **Expires in days**, **Issuer**, and **Subject** fields.

4. **Click Submit.**
   During the upload, the module extracts and displays the certificate's read-only properties in these fields:
   - **Valid from** date
   - **Expiration date**
   - **Issuer**
   - **Subject of the certificate**

5. **Click Validate Stores/Certificates** to check if the certificate is correct. If the instance encounters any errors with the certificate or keystore, it displays an error message.

### Upload a trusted server certificate

By uploading the service provider's trusted server certificate, the instance ensures it is connecting to a valid and secure service.

#### Before you begin
- **Role required:** admin

#### About this task
The instance validates outbound Web Service calls by using the certificate provided by the service provider.

#### Procedure
1. Create a new Certificate record with the type "Trust Store Cert".
2. Do one of the following actions:
   - Attach the service provider's DER formatted certificate.
Web service security

Enforce security using basic authentication, mutual authentication, or WS-Security.

Basic Authentication

To enforce basic authentication on each request for a WSDL document or posting of SOAP messages, you may set the property glide.basicauth.required to true. If you do so, each WSDL or SOAP request would have to contain the "Authorization" header as specified in the Basic Authentication protocol. Because the request is non-interactive, the Authorization header is always required during a request.

Supplying basic authentication information whether or not it is required has the added advantage that the data created or updated as a result of the Web Service invocation is done on behalf of the user supplied in the basic authentication credentials. As an example, when creating an Incident record, the journal fields have the user id of the basic authenticated user, instead of the default Guest user.

To make the authorization header ignore the capitalization rules, use the glide.security.script.include.name.case.insensitive.list property. You can modify this property in the System Properties [sys_properties] table and add the script includes that are necessary to process the authentication. By default, this property has these values:

- BasicAuth
- CustomAuth

Add other script includes as needed.

To supply basic authentication when using Perl and the SOAP::Lite libraries, you can implement the following function:

```perl
sub SOAP :: Transport :: HTTP :: Client :: get_basic_credentials { return 'user_name' => 'password'; }
```
When using C# .NET VS 2005 or older, you can take advantage of the Credentials object, for example:

```csharp

service.ServiceNow proxy = new service.ServiceNow();
service.getService = newservice.get();
service.getResponse getServiceResponse = new service.getResponse();

try {
    proxy.Credentials = cred;
    getService.sys_id = "bf522c350a0a140701972dbf876f1610";
    getServiceResponse = proxy.get(getService); catch (Exception ex) { }
```

When using C# .NET VS 2008, you can take advantage of the ClientCredentials object, for example:

```csharp
Demo_Incident.ServiceNowSoapClient client = new Test08WebService.Demo_Incident.ServiceNowSoapClient();
client.ClientCredentials.UserName.UserName = "admin";
client.ClientCredentials.UserName.Password = "admin";

Then in your app.config file look for the following and change "None" to "Basic":

```xml
<transport clientCredentialType= "None" proxyCredentialType= "None" realm= "" />
```

When using VB .NET taking advantage of the Credentials object would look like the following:

```vb
Sub Main()
    Dim cred As New System.Net.NetworkCredential("user_name", "password")
    Dim proxy As New VB_Democm.incident.ServiceNow
    Dim getIncident As New VB_Democm.incident.get
    Dim getResponse As New VB_Democm.incident.getResponse
    proxy.Credentials = cred
    getIncident.sys_id = "[your sysID here]"
    getResponse = proxy.get(getIncident)
End Sub
```

The resulting response when Basic Authentication is turned on and no credentials are supplied looks like this:

```html
<html> <head> <title>Apache Tomcat/5.0.28 - Error report </title> <style> </style> </head> <body> <h1>HTTP Status 401 - </h1> <hr size = "1" /> <b>Bad Request</b> 
</body> </html>
```

WSDL request authorization (instance security hardening)

Setting up mutual authentication

Mutual authentication establishes trust by exchanging secure sockets layer (SSL) certificates. Before connecting to a server, the client requests an SSL certificate. The server responds by requesting that the client send its own certificate. Both respond by validating the certificates and sending acknowledgments before initiating an HTTPS connection.

Administrators do the preliminary work of setting up a keystore and generating certificates before certification requests are fulfilled.

⚠️ Warning: This feature only enables mutual authentication on outbound https connections.

Creating the Key Store

The instance currently supports uploading a Java keystore file to contain the private key, public certificate pair, and its signed certificates.

The following steps use commands that allow you to generate a new Java Keytool keystore file, create a certificate signing request (CSR), and import certificates. Any root or intermediate certificates need to be imported before importing the primary certificate for your domain. Type these commands in a command line interface.

1. Generate a Java keystore and key pair.

```bash
keytool -genkey -alias mydomain -keyalg RSA -keystore my.keystore
```

2. Generate a CSR for an existing Java keystore.

```bash
keytool -certreq -alias mydomain -keystore my.keystore -file mydomain.csr
```

3. Import a root or intermediate certificate authority CA certificate to an existing Java keystore.

```bash
keytool -import -trustcacerts -alias root -file Thawte.crt -keystore my.keystore
```

4. Import a signed primary certificate to an existing Java keystore.

```bash
keytool -import -trustcacerts -alias mydomain -file mydomain.crt -keystore my.keystore
```

Setting up the Key Store

Now that the key store has been created, it can be uploaded to the Certificates table. On the System Definition > Certificates page, click New and set the following fields:

- Enter a certificate Name.
- Store the key store as Active.
- Set Type = Java Key Store.
- Provide a Key store password. This is the password that was used to create the keystore.

Click Submit to create the Java Key Store entry.
Specifying a Trusted Server Certificate

During an outbound SSL connection, which is an HTTPS Web Service call, it is possible to specify a certificate provided by the service provider that ensures the validity of the service provider during the SSL connection. For example, a browser attempting to connect to a secure service which identifies itself by a certificate.

By uploading the trusted server certificate, ServiceNow ensures that the service it is connecting to is valid and secure.

Create a new Certificate entry with the type of "Trust Store Cert" and attach a DER formatted certificate, or copy and paste its PEM format into the PEM Certificate field.

Processing Mutual Authentication Requests

- When a client requests the server certificate for authentication, a certificate signing request (CSR) is generated.
- To respond to a CSR, the server generates two unique cryptographic keys: A public key, which is used to encrypt messages to the server and a private key, which is used to decrypt messages. Both keys are kept in the Key Store.
- Keys are used to decrypt the client secure messages so they can be read by the server. Any outgoing connection that is going to be HTTPS verifies the certification by checking the Key Store, offering its public certification, and uses the trust store certificates to verify mutual trust back.
- To complete the secure link between the client and the server, the server matches the certificate to the corresponding private key. Because only the server has access to the private key, the server can decrypt the data from the client.
Here is an example of a command that registers MYHTTPS with the 
com.glide.certificates.DBKeyStoreSocketFactory socket factory on port 443. The database key 
store factory is used during the SSL exchange process to offer a client certificate for mutual 
authentication.

```
glide.httpclient.protocol.myhttps.class = 
  "com.glide.certificates.DBKeyStoreSocketFactory"
glide.httpclient.protocol.myhttps.port = "443"
```

Having the above configuration affects any outbound myhttps://host.domain.com/target URL 
to use the custom socket factory and exchange certificates during SSL.

⚠️ Note: Overriding the default HTTPS protocol socket factory affects every outbound 
HTTPS connection. This is usually undesirable.

The server responds by sending a certificate. Is this a certificate that the client accepts?
If yes, a message is sent to the server accepting the certificate and a secure channel is 
initiated. If the certificate is not accepted, it may mean that the root authority is needed for 
certification.

**WS-Security**

Support for WS-Security 1.1 in the form of WSS X.509 Token Profile and WSS Username Token 
Profile is available for incoming SOAP requests.

The configuration to use WS-Security is separate from the requirement to enforce Basic 
Authentication, and is enforced when the SOAP envelope contains the WS-Security headers.

**WS Security Profiles**

The **WS Security Profile** module lists the WS-Security profiles that are currently in effect. The **Order** of the profiles indicates the order of authentication that is checked, all profiles are 
checked during the incoming SOAP request, when a profile fails authentication, it does not 
execute the next one in order. The **Bind session** check box indicates which profile to use to 
assume the session's identity, there can only be one "bound" session.

### WSS X.509 Token Profile

Use the X.509 authentication framework as defined by the Web Services Security: SOAP 
Message Security specification. An X.509 certificate specifies a binding between a public key 
and a set of attributes that includes (at least) a subject name, issuer name, serial number, 
and validity interval. An X.509 certificate is used to validate a public key that is used to sign 
the incoming SOAP message. Upload the certificate in the **Certificate** module and reference 
it in the **X509 Certificate** field. If this is a bound session, select the user to impersonate when 
the WS-Security authentication succeeds.

See the following document: [http://www.oasis-open.org/committees/download.php/16785/wss-v1.1-spec-os-x509TokenProfile.pdf](http://www.oasis-open.org/committees/download.php/16785/wss-v1.1-spec-os-x509TokenProfile.pdf)
WSS Username Token Profile

In addition to specifying the X.509 Token Profile, a UsernameToken can also be supplied in the SOAP request. A UsernameToken is used as a means of identifying the requester by “username”, and optionally using a password (or shared secret, or password equivalent) to authenticate that identity to the instance. The UsernameToken profile cannot be used independent of the X.509 Token Profile currently.

1. Authenticate using the Username of the incoming SOAP request to lookup a User by the specified User field to match UserName value. The password value in the incoming Username Token is used to authenticate the request. When the Bind session option is selected, the user that authenticates successfully is used for the session.

2. Authenticate using a separate pair of user name / password that is unrelated to users in the User table. When the Bind session option is selected, the user that is specified in the Run as user field is used for the session.
Example WS-Security SOAP Envelope Headers

Note:

This sample has been formatted with line returns to fit the content into the frame.

```xml
<SOAP-ENV:Header>  
  <wsse:Security xmlns:wsse="http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd">
    <wsse:BinarySecurityToken xmlns:wsu="http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-soap-message-security-1.0#Base64Binary">
      <wsu:Id>Signature-2</wsu:Id>
      <wsu:Algorithm URI="http://www.w3.org/2001/10/xml-exc-c14n#"/>
      <wsu:DigestMethod Algorithm="http://www.w3.org/2000/09/xmldsig#sha1"/>
      <ds:DigitalSignature xmlns:ds="http://www.w3.org/2000/09/xmldsig#"/>
      <ds:Transforms>
        <ds:Transform URI="#Base64Binary"/>
      </ds:Transforms>
      <ds:DigestValue>
        ...
      </ds:DigestValue>
    </wsse:BinarySecurityToken>
  </wsse:Security>
</SOAP-ENV:Header>
```
**HTML sanitizer**

Remove unwanted code and protect against security concerns such as cross-site scripting attacks by sanitizing HTML markup in HTML fields and translated HTML fields.

Use HTML sanitization to ensure HTML content within your instance doesn’t contain potentially harmful content. HTML sanitization works by removing HTML tags that could be used to compromise your instance, such as `<script>`, `<link>`, or `<embed>` tags that can be used to run unwanted scripts on your instance or direct your users to unwanted content. Safe tags that control the formatting of your content are preserved. As an administrator, you’re able to customize what content is removed or preserved. You’re also able to control whether sanitization applies to all content, or just fields you specify.

The HTML sanitizer works by checking the built-in inclusion list for markup that you always want to preserve. The sanitizer provides the HTMLSanitizerConfig script include that administrators can use to modify the built-in inclusion list. Items can also be added to the exclusion list to remove HTML markup. Contents of the exclusion list override the inclusion list.

The following types of items can be added to the inclusion and exclusion lists:

- Global attributes
- Any HTML elements

⚠ **Note:** By default, URL attributes like `href` and `src` support only these protocols:

- http
- https
- mailto
- data

For example:

```html
<a href="https://community.servicenow.com/community">Now Community</a>
```

⚠ **Note:** To learn more about the glide.html.sanitize_all_fields property that controls use of the HTML sanitizer, see [HTML sanitizer (instance security hardening)] in Instance Security Hardening Settings.

**Configure urlAttributes and the protocols**

You can configure urlAttributes and their protocols in the HTMLSanitizer script include. For example:

```javascript
HTML_WHITELIST : {
  urlAttributes: { "protocols" : [ "file", "notes" ] },
  - -
  - -
}
```

Because notes is in the inclusion list in this example, this URL isn’t sanitized:

```html
<a title="Lotus"
  href="Notes://ABC/X575C90019DE33/ABC594DCB76D86EB4925653E0011C4C1/ZZ90B7E2D33964749257EA003456FD">Lotus</a></p>
```
Default Inclusion List

BUILTIN_HTML_WHITELIST :

    globalAttributes: { attribute: ["id", "class", "lang", "title", "style"],
                         attributeValuePattern: {} },
    label: { attribute: ["for"] },
    font: { attribute: ["color", "face", "size"] },
    a: { attribute: ["href", "nohref", "name", "shape"] },
    img: { attribute: ["src", "name", "alt", "border", "hspace", "vspace", "align", "height", "width"] },
    tr: { attribute: ["background", "height", "width", "align", "valign", "char off", "char"] },
    thead: { attribute: ["align", "valign", "char off", "char"] },
    tbody: { attribute: ["align", "valign", "char off", "char"] },
    tfoot: { attribute: ["align", "valign", "char off", "char"] },
    colgroup: { attribute: ["align", "valign", "char off", "char", "span", "width"] },
    col: { attribute: ["align", "valign", "char off", "char", "span", "width"] },
    p: { attribute: ["align"] },
    style: { attributeValuePattern: { "type": "text/css" } }
    canvas: { attribute: ["height", "width"] },
    details: { attribute: ["open"] },
    summary: { attribute: ["open", "valign", "char off", "char"] },
    button: { attribute: ["disabled", "accesskey", "type"] },
    form: { },
Enable HTML sanitizer

The HTML sanitizer provides a property to enable or disable the sanitizer for all HTML fields in the system.

Before you begin
Role required: admin

About this task
By default, the property is set to true for new instances.
Procedure

1. In the navigation filter, enter `sys_properties.list`.

2. Set the properties `glide.html.sanitize_all_fields` and `glide.translated_html.sanitize_all_fields` to true.

Note: To learn more about this property, see HTML sanitizer (instance security hardening) in Instance Security Hardening Settings.

Trouble?
If the properties do not exist in the System Properties table, you can add them.

Configure HTML sanitizer
You must modify a script include to make configuration changes to the HTML sanitizer.

Before you begin
Role required: admin

Procedure

1. Navigate to All > System Definition > Script Includes.

2. Open `HTMLSanitizerConfig`.

3. To add items to the exclusion list, use the HTML_BLACKLIST class. To add items to the inclusion list, use the HTML_WHITELIST class.

   Use this format:

   ```json
   HTML_XXXXLIST : {
       globalAttributes : {
           attribute:[attribute-name1,...],
           attributeValuePattern:{ attribute-name2:attribute-value-regex-pattern,...}
       },<html-element-name>: {// Same as Above},----}
   ```

   • `globalAttributes` contains attribute or `attributeValuePattern` items that are applicable globally for all the HTML elements.
   • `attribute` is a comma-separated list of attributes.
   • `attributeValuePattern` is a dictionary of attribute to attribute-value-regex-pattern pairs. The attribute-value-regex-pattern is a regular expression which has to match the attribute value.

   Example:
   Consider the following example:

   ```json
   HTML_WHITELIST:{
       globalAttributes:{
           attribute:["id","name"],},
       img:{
           attribute:["style","align"],
           attributeValuePattern:{src:".*jpeg"},
       iframe:{}
   }
   ```

   It adds the following items to the inclusion list:
• The global attributes id and name. This is a list of strings that can be applied globally to all the elements.
• The img element where the attributes are style and align.
• The img element where the source attribute of the image is a file with the .jpeg extension. This is an example of a regular expression pattern that matches an attribute value.
• The iframe element.

Enable sanitation on individual fields
You can use field attributes to enable or disable the sanitizer on individual fields.

Before you begin
Role required: admin

About this task
You need to first set the sanitizer property to false, and then enable the sanitizer on a per-field basis for any form.

Procedure
1. Navigate to the sys_properties table and set the glide.html.sanitize_all_fields to false. This disables the sanitizer for all HTML fields in the system.
2. Navigate to the form that contains the HTML field.
3. Right-click the HTML field label, and select Configure Dictionary. The Dictionary Entry form opens for the HTML field.
4. Enter one of the following in the Attributes field:
   • To disable sanitization enter html_sanitize=false
   • To enable sanitization enter html_sanitize=true
5. Click Update.
6. To enable the HTML sanitizer for translated HTML fields, set the glide.translated_html.sanitize_all_fields property is true.

Enable HTML Sanitizer logging
When the HTML sanitizer removes elements or attributes, they are added to the system log.

About this task
You can review these sanitized elements by adding /syslog_list.do?sysparm_query=source %3DHTMLSanitizer to your instance URL.

Procedure
1. To review these sanitized elements add /syslog_list.do?sysparm_query=source %3DHTMLSanitizer to your instance URL.
2. To enable or disable logging, add the glide.html_sanitize.discarded_log.enable property to the system properties and set the value to true (enabled) or false (disabled). This property is true by default.
Encryption and Key Management

Encryption is a cryptographic procedure that converts plaintext into ciphertext to control the disclosure of information.

Overview

ServiceNow key management includes the activities involving the handling of cryptographic keys and related security parameters during the end-to-end key lifecycle, and is an effective control based on NIST 800-57 guidelines.

Encryption is used to convert plaintext strings of characters into ciphertext, which remains indecipherable without access to the correct key. The security benefits of encryption are derived from the combination of the strength of the algorithm used and the quality of key management.

Encrypting all information may not be necessary for all data and would greatly increase processing time due to the large number of data supported across all applications. When you determine encryption is needed for data, these Now Platform options are available:

Get started

<table>
<thead>
<tr>
<th>Key Management Framework (KMF)</th>

Encryption and Key Management subscription bundle

With key management, Column Level Encryption, formerly known as Encryption Support, is upgraded at no additional charge to the highly configurable encryption modules. You also have the option to upgrade to the unlimited-use Column Level Encryption Enterprise license. Subscribe to the new encryption entitlement bundle, ServiceNow Platform Encryption, that includes Column Level Encryption Enterprise, Cloud Encryption, and Database Encryption.

Column Level Encryption features

Column Level Encryption with encryption modules is included for free in your instance and includes NIST 800-57 key management and encryption modules with the following supported:

• ServiceNow managed keys are supported (customer-supplied keys are not supported).
• Access to encryption modules are role-based, only.
• Unlimited manual key rotation.
• A maximum of five encryption modules may exist at a given time.
• A maximum of five module access policies may exist at a given time.
• Existing field types supported. (No new field types will be added.)
• API supported can be utilized based on role access.
• Auditing of encryption actions.
• Column Level Encryption Guided Tour.

See Column Level Encryption for details.

ServiceNow Platform Encryption group features

The ServiceNow Platform Encryption group adds the following features and offerings:

• Column Level Encryption Enterprise:
  ◦ Customer-supplied keys.
  ◦ Auto key rotation.
  ◦ Advanced field type support and future updates.

  ▪ Expanded field type support includes the Journal, Journal List, Journal Input, and HTML and Translated (Field / Text / HTML) field types.
- Advanced Attachment Support.
- Encryption module access can be granted with a module access policy based on the following:
  - System user
  - Script
  - Specific application scopes
- Unlimited encryption modules and module access policies.
- Import a key from web service.
- Set future rotation date for encryption keys.
- Cloud Encryption with Key Management.
- Database Encryption.

Additional information
To learn more about key management, see Understanding the Key Management Framework.

Understanding the Key Management Framework
The Key Management Framework (KMF) API/UX lets you fully customize and manage how cryptographic operations are performed on your ServiceNow instance. The ServiceNow Key Management Framework provides a secure and comprehensive interface for instance-side cryptographic key management services.

In accordance with NIST 800-57 guidelines, KMF provides the following capabilities:
- Segregation of duties with dedicated roles for cryptographic management and operations, auditing, and integration
- Cryptographic modules enable configuration of cryptographic specifications for unique cryptographic purposes and key types
  - Symmetric key: encryption and decryption, key wrapping and unwrapping, and authentication
  - Asymmetric key: digital signature generation and verification, encryption and decryption, key wrapping and unwrapping
- Key life cycle management to generate, rotate, revoke, and suspend keys, including support of several key lifecycle states
- Enforcement of access controls with module access policies, ensuring that access is only granted to the cryptographic modules as configured in the policies.
- Key protection: FIPS 140-2-L3 hardware root of trust (RoT), Public Key Infrastructure (PKI), key hierarchy, and envelope encryption
- Auditing that includes key usage statistics

KMF activation
KMF is active by default.

⚠️ Note: KMF does not support domain separation, but can be used with on-premise instances.
How KMF works
This graphic shows you the components that comprise KMF:

• The cryptographic modules are used to define the encryption method.
• The cryptographic specification is a configuration that defines an algorithm for encryption.
• The specification also lets you define the key for the module, a ServiceNow key or your own customer-supplied key.
• A module access policy is an instance-level policy that governs the conditions in which access is granted or denied to cryptographic modules.

For more information on KMF, start with Cryptographic module overview.
The Key Management Framework (KMF) introduces specific roles for cryptographic module and key management related configurations. Only KMF Admins can assign users to other KMF roles. See Key Management Framework roles for more information.

For more information on the encryption framework that is the successor to CLE, see Column Level Encryption Enterprise.

Cryptographic module overview
Cryptographic modules are the centerpiece of Key Management Framework (KMF). They define the specific cryptographic mechanisms used for cryptographic operations for a given use case.

An example is using AES-CBC with a 256-bit symmetric key to encrypt and decrypt data within an HR application, using column level encryption.

Cryptographic modules also support best-practice key lifecycle management, such as generation and rotation, and can define the encryption method. Logically, cryptographic modules are comprised of the following components:
- **Cryptographic specification**: Defines cryptographic purpose and algorithms.
- **Cryptographic keys**: Either a ServiceNow key, or your own customer-supplied key with Column Level Encryption Enterprise.
- **Module access policies**: Instance-level definition of cryptographic modules.
- **Module policy exceptions**: Control mechanism to define exceptions to a module access policy.

The following screen shows these high-level components in a cryptographic module:

**Cryptographic module components**

How KMF works

Cryptographic purpose and algorithms encompass algorithm definition, which includes algorithm types, operation modes, key sizes, and cryptographic purposes. A default cryptographic specification template is provided in the base system with NIST algorithms and key sizes for configuration. See **Cryptographic purpose, algorithms, and key information** for details.

Generate cryptographic keys on the instance with ServiceNow keys or customer-supplied keys. Lifecycle definition and key management actions are also available.

Module access policies are the access controls mechanisms that can be applied to the cryptographic modules. See **Module access policy overview** for details on how the module access policies can be configured.

Module access policies can be used across multiple modules. Refer to **Multiple modules access policies** for details.

**Module access policy overview**

Module access policies are the access control mechanisms that can be applied to cryptographic modules to define instance-level controls.

Module access policies are introduced with the Key Management Framework (KMF) in the base system.

- **Note**: A subscription is required to utilize the Column Level Encryption Enterprise functionality. See **Activate Column Level Encryption Enterprise** for more information on obtaining Column Level Encryption Enterprise.
Module access policies expand on role-based designation that was provided with encryption modules. Module access policies can be based on the following:

- Basic (scope)
- Role
- System user
- Script
- Resource Exchange
  - See KMF Resource Exchange for details.

In a cryptographic module, you must configure correct module access policies to allocate access to encrypted data. Without a module access policy associated to a cryptographic module, encrypted data is not visible to users and associated fields and columns in lists display empty.

In this image, the absence of a module access policy on the encrypted Short Description field hides the content from all users accessing the Incident table. With a module access policy in place, users with the allowed role are able to see the encrypted data.

Encrypted short descriptions with and without module access policies

In this image, the absence of a module access policy on the encrypted Short Description field hides the content from all users accessing the Incident table. With a module access policy in place, users with the allowed role are able to see the encrypted data.

Note: The data in the column also appears blank to users without the correct role specified in the module access policy.

Refer to Create a module access policy for setup.

Instance level keys in the Key Management Framework

The Key Management Framework (KMF) architecture introduces a specific key structure built with security in mind. Using a Hardware Security Module (HSM), KMF uses envelope encryption to ensure that all platform keys under KMF management are protected through a chain of keys. Customer Data Encryption Keys (CDEKs) created by KMF are also included.

At the instance level, KMF defines several keys that are used internally for varying cryptographic purposes throughout the Now Platform.

The table and figure below provides examples of a subset of available customer/app keys that are managed and protected by KMF.

<table>
<thead>
<tr>

<tr>
<td>Instance Root Key (IRK)</td>
<td>HSM</td>
<td>Unique per instance, the IRK is used to envelope encrypt several instance internal keys.</td>
</tr>
<tr>
<td>Instance HMAC Key (IHK)</td>
<td>Instance</td>
<td>Unique per instance, the IHK is used internally for HMAC purposes. The IHK ensures the authenticity and integrity of module keys and is wrapped on either KeySecure or the File Key Store.</td>
</tr>
<tr>
<td>Instance Key Encryption Key (IKEK)</td>
<td>Instance</td>
<td>The IKEK wraps the module keys and is wrapped on either KeySecure or the File Key Store.</td>
</tr>
<tr>
<td>Instance Asymmetric Encryption Key (IAEK)</td>
<td>Instance</td>
<td>Unique per instance, the IAEK is used internally for asymmetric encryption purposes. The IAEK is used to transmit confidential messages between an instance during Key Exchange or Instance Data Replication consumer approval.</td>
</tr>
<tr>
<td>Instance Signature Key (ISK)</td>
<td>Instance</td>
<td>Unique per instance, the ISK is used internally for signing purposes.</td>
</tr>
<tr>
<td>Password2 (PW2)</td>
<td>Instance</td>
<td>With KMF, the key for PW2 fields is fully managed by KMF.</td>
</tr>
<tr>
<td>Customer Data Encryption Key (CDEK)</td>
<td>Instance</td>
<td>Encryption keys created through KMF are envelope encrypted by the IKEK.</td>
</tr>
<tr>
<td>Instance Data Replication (IDR) Data Encryption Key (DEK)</td>
<td>Instance</td>
<td>Specific encryption keys used for the IDR process.</td>
</tr>
</tbody>
</table>

Envelope encryption is the practice of encrypting a key with another key. The following figure provides an example of the envelope encryption. Here, CDEKs are envelope encrypted by the IKEK, which in turn is envelope encrypted by the IRK, which is finally envelope encrypted.
by the RK. Since the IRK is only be accessed by the HSM, the IKEK must be uploaded for decryption.

![Stored on HSM Diagram]

**Cryptographic purpose, algorithms, and key information**

Cryptographic specifications can be tailored to a specified cryptographic purpose, covering both asymmetric and symmetric key-based cryptographic operations. Selection of a cryptographic purpose offers further choices, namely to a set of supported algorithms and key length configurations.

<table>
<thead>
<tr>
<th>Cryptographic Purpose</th>

* AES-CBC supports equality persevering options.
#Column Level Encryption Enterprise utilizes AES-CBC.

The configuration of these parameters is covered in [Create a cryptographic module](#).

### Key Management Framework key lifecycle states

KMF supports several cryptographic key lifecycle states through the enforcement of specific allowable actions. For example, only keys that are in the active state can be used fully for their intended cryptographic purpose. The following table provides further detail on the varying key lifecycle states.

<table>
<thead>
<tr>
<th>Key lifecycle state or action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>There can be only one active key for a given cryptographic specification in a cryptographic module.</td>
</tr>
<tr>
<td>Compromised</td>
<td>Several keys can exist in the compromised state for revocation in a given cryptographic specification in a cryptographic module. Any active or suspended key can be moved to a compromised state. Compromised keys cannot be used to generate new content, such as encrypting or signing, but may still be used to identify the purpose of existing content, such as decryption or verification.</td>
</tr>
<tr>
<td>Deactivated</td>
<td>Any active key can be deactivated. There could be several keys in a deactivated state for a given cryptographic specification in a cryptographic module. For example, when the key is rotated, the current active key is deactivated. Deactivated keys cannot be used to generate new content, such as encrypting and signing, but may still be used to identify purposes of existing content, such as decryption or verification.</td>
</tr>
<tr>
<td>Key lifecycle state or action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Note:</strong> Compromised and revoked keys are treated as deactivated keys.</td>
<td></td>
</tr>
<tr>
<td>Destroyed</td>
<td>When a key is destroyed key material is permanently removed and can no longer be used for any cryptographic purpose. Any deactivated key can be destroyed using lifecycle automation when it has not been used in the configured designated time frame. There could be several keys in a destroyed state for a given cryptographic specification in a cryptographic module.</td>
</tr>
<tr>
<td><strong>Warning:</strong> Data associated with a destroyed key can no longer be accessed, therefore extreme caution should be exercised when performing a destroy key action.</td>
<td></td>
</tr>
<tr>
<td>Generated</td>
<td>Multiple keys can exist in the generated state for a given cryptographic specification in a cryptographic module. A generated key can be moved to an active state when no active key exists for the given cryptographic specification. The first key generated is automatically set to active.</td>
</tr>
<tr>
<td><strong>Note:</strong> If the choice is to generate a new key, then a new key is generated and made active even though there are keys in a generated state for the given cryptographic specification.</td>
<td></td>
</tr>
<tr>
<td>Renewed</td>
<td>An active key that has an expiration date can be renewed any number of times to extend the lifecycle period of the key.</td>
</tr>
<tr>
<td><strong>Note:</strong> The difference between the activation date and expiration date is calculated and the expiration date is postponed by that duration from the current day.</td>
<td></td>
</tr>
<tr>
<td>Resume</td>
<td>The UI action is available on suspended keys to move them back to an active state when no other active key exists for the given cryptographic specification.</td>
</tr>
<tr>
<td>Revoked</td>
<td>Any active or suspended key can be moved to the revoked state. Revoked keys cannot be used to generate new content, such as encrypting or signing, but may still be used to identify the purpose of existing content, such as for decryption or verification. Several keys in a revoked state may exist for a given cryptographic specification in a cryptographic module.</td>
</tr>
</tbody>
</table>
| Rotated | Key rotation results in deactivating the current active key and making another key active. Select the new active key from the following:  
  - Generation of a new key.  
  - Point to an existing imported key. Any active key can be rotated. |
| Suspended | There could be several keys in the suspended state for a given cryptographic specification in a cryptographic module. When the key is suspended, the key can be resumed and reassigned to an active state when no other active key exists for that cryptographic specification. |
Key Management Framework roles

The Key Management Framework (KMF) introduces specific roles for cryptographic module and key management-related configurations.

**Important:**
To assign the KMF admin role, you must have both the admin and security_admin roles. Use the KMF admin role to assign other KMF roles.

<table>
<thead>
<tr>
<th>Role</th>
<th>Role Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KMF admin</td>
<td>sn_kmf.admin</td>
<td>Only users with the KMF admin role can assign KMF roles, and in addition can perform all capabilities of the KMF cryptographic manager.</td>
</tr>
<tr>
<td>KMF cryptographic manager</td>
<td>sn_kmf.cryptographic_manager</td>
<td>Assigned to a user by a KMF admin. KMF cryptographic managers can perform create, read, and update operations on cryptographic modules (association of keys to cryptographic usage and algorithm configurations) and module access policies. Also, KMF cryptographic managers can perform key management (generate, rotate, revoke) and life cycle operations.</td>
</tr>
<tr>
<td>KMF auditor</td>
<td>sn_kmf.cryptographic_auditor</td>
<td>Assigned to a user by a KMF admin. KMF cryptographic auditors can view cryptographic module information, key metadata, and life cycle-related details, as well as module access policy information.</td>
</tr>
<tr>
<td>KMF integrator</td>
<td>sn_kmf.cryptographic_integrator</td>
<td>Assigned to a user by a KMF admin. KMF integrators can access and utilize (integrate) cryptographic modules in third party applications.</td>
</tr>
</tbody>
</table>
Assign KMF roles

Administrators with the security_admin role can assign KMF admins, who in turn can assign other KMF roles.

Before you begin
Role required: admin and security_admin

You must elevate to the security_admin role before assigning the KMF admin role. For instructions, see Elevate to a privileged role

Procedure

1. Elevate to the security admin role.
2. Navigate to User Administration > Users and select the user you want to be the KMF admin.
3. Verify that the user already has the admin and security_admin roles. If not, click Edit under the Roles related list and add admin and security_admin.
4. Navigate to System Security > Key Management Administration.
5. Select the user you want to be KMF admin in the Available Users column and move them to the Selected User(s) column.

6. Click Save.
7. Navigate to User Administration > Users and select the user you just gave the KMF admin role to.
That user now has the `sn_kmf.admin` role in the Roles related list. That user can now assign other KMF roles.

### What to do next

If you have the KMF admin role, follow these steps for assigning other KMF roles:

1. Navigate to **User Administration > Users** and select the user you want to have another KMF role, such as KMF Cryptographic Manager.

2. In the Roles related list, click **Edit** and select the KMF roles you want to assign the users. All KMF roles start with `sn_kmf`.

#### Configure field encryption settings to select key type

Cryptographic managers have the choice to use ServiceNow supplied keys or your own customer supplied keys (CSK) for encryption on the Now Platform.

**Before you begin**

Customer-supplied keys are only supported with Column Level Encryption Enterprise.
Procedure

1. Navigate to All > System Security > Field Encryption Settings.

2. From the Field Encryption Settings, select either ServiceNow Generated Keys or Customer Supplied Keys from the Key Source list.

   **Key source selection**
   
   ![Field Encryption Settings](image)

   This option changes the `com.glide.encryption.cle_kmf.key_source` property to either ServiceNow Generated Keys or Customer Supplied Keys.

3. Click Save.

**What to do next**

- If you are using your own customer supplied keys, see Configure properties for customer-supplied keys.
- If you are using ServiceNow supplied keys, start creating your cryptographic module. See Create a cryptographic module.

**Create a cryptographic module**

Create a cryptographic module to define the mechanisms used for cryptographic operations. After you create the module, you create a cryptographic specification, where you define an algorithm for encryption and generates a key.

**Before you begin**

Role required: sn_kmf.cryptographic_manager

If you are supplying your own keys, go to Configure and upload your customer supplied key.

**About this task**

This procedure describes options that are available with KMF in the ServiceNow platform base system. Column Level Encryption Enterprise functionality is available only when the `com.glide.now.platform.encryption` plugin is active. See Activate Column Level Encryption Enterprise for more information on obtaining Column Level Encryption Enterprise. See Create cryptographic module for Column Level Encryption.

**Procedure**

1. Navigate to All > Key Management > Cryptographic Modules > Create New.

2. On the form, fill in the fields:
Cryptographic Module fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module name</td>
<td>Alphanumeric string to be referenced when running scripts.</td>
</tr>
<tr>
<td>Crypto spec template</td>
<td>Select the Default template to use to create the cryptographic module, as it contains mappings of supported algorithms for crypto specifications.</td>
</tr>
</tbody>
</table>
| Default module access policy value | • Rely on system default:  
• Reject  
• Track |
| Actual module access policy result | Reject or track, based on the default policy value or the value selected upon creation of the module access policy. |
| Name                         | Crypto module name prepended with application scope name.                    |
| Crypto module lifecycle state | Lifecycle refers to the creation, use, and deactivation of a cryptographic module. Set to Draft initially during configuration. When using the module, set this field to Published. The Default template is automatically set to Published. |

3. Click Submit.

After submitting successfully, your cryptographic module is listed in the Cryptographic Modules table. The system prepends the name with the scope to avoid conflict with other scoped applications. For example, if you created a module with the name my_crypto_module in the global application scope, the name is saved as global.my_crypto_module.

What to do next
Create a cryptographic specification.

Create a cryptographic specification
After you create a cryptographic module, create a cryptographic specification to define the module algorithms.

Before you begin
Role required: sn_kmf.cryptographic_manager

Procedure
1. Navigate to Key Management > Cryptographic Modules > All.
2. Select the cryptographic module for definition to open the configuration options.
4. Complete the Algorithm Definition form. See Cryptographic purpose, algorithms, and key information for details.

The algorithm definition screen opens. Select options for the key generation. Repeat this step to generate multiple keys for the selected crypto module.

**Algorithm Definition fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crypto module</td>
<td>Read only. Name of the selected cryptographic module displays.</td>
</tr>
<tr>
<td>Crypto purpose</td>
<td>Select the purpose of this module. For example, you might use it for data encryption, signature generation, or key wrapping. The available algorithms adjust based on the selected crypto purpose. See Cryptographic purpose, algorithms, and key information for details.</td>
</tr>
<tr>
<td>Algorithm</td>
<td>Type of algorithm used to accomplish the crypto purpose. The algorithm also controls the key origin. Adjusts automatically based on the selected crypto purpose. Cryptographic purpose, algorithms, and key information for details.</td>
</tr>
<tr>
<td>Operation mode</td>
<td>This field may display based on the selected crypto purpose.</td>
</tr>
<tr>
<td>Size</td>
<td>Select the bit size.</td>
</tr>
<tr>
<td>Hash</td>
<td>This field becomes available based on the algorithm selected.</td>
</tr>
<tr>
<td>Equality preserving</td>
<td>Enables non-deterministic encryption.</td>
</tr>
</tbody>
</table>
Field | This option appears when you select Symmetric Data Encryption/Decryption with AES and in Cipher Block Chaining (CBC) mode. Selecting this option means that if the same data is encrypted again the encoded data is different each time. Non-deterministic encryption does not support filtering a list of encrypted data using equality comparison operators.

Integrity | GCM operation mode provides Integrity.

5. Click Next.
The crypto specification is listed on the Key Lifecycle table based on the algorithms selected.

What to do next
Perform one of the following operations:

- Select an entry in the Key Lifecycle table to define key lifecycle behavior. See Configure key lifecycle states for details to complete the lifecycle definition for the key.
- Click Next to create a cryptographic key. See one of the following tasks for key generation:
  - Generate a ServiceNow cryptographic key.
  - Configure properties for customer-supplied keys.
  - Import a key from web service.

Configure key lifecycle states
After you have created a cryptographic specification, you can configure the lifecycle actions for the keys in your instance.

Before you begin
Role required: kmf_crypto_admin

Procedure
1. Navigate to Key Management > Cryptographic Modules > All.
2. Select the cryptographic module to configure the lifecycle of a key.
3. Click a key alias on the Crypto Specifications tab.
   The Algorithm Definition form opens for the selected key.
4. Click **Next**.
The Field Lifecycle Template loads. Default Key Lifecycle values are created based on the selected algorithms for the defined crypto specification.

5. Select a Key Lifecycle from the **Applies to** column on the Lifecycle Definition step for the crypto specification.

### Key Lifecycle fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applies to</td>
<td>Selected key that the lifecycle applies to.</td>
</tr>
<tr>
<td>For field</td>
<td>Select the type of control for the key that the lifecycle applies to.</td>
</tr>
<tr>
<td>Type</td>
<td>Select if the valuation for the key lifecycle is a relative value or an absolute value:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Relative</strong>: Enter a value that depends on other data entries in the system, such as key generation, activation, and deactivation.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Absolute</strong>: Enter an exact value, such as a date.</td>
</tr>
<tr>
<td>Lifecycle default</td>
<td>Read only. Displays a value if set.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the sequence in which to process the key lifecycle state for the crypto specification.</td>
</tr>
<tr>
<td>Relative duration type</td>
<td>Duration of the lifecycle: <strong>Years</strong>, <strong>Months</strong>, or <strong>Days</strong>.</td>
</tr>
<tr>
<td>Relative duration</td>
<td>Number of years, months, or days the key is valid.</td>
</tr>
<tr>
<td>Relative operation</td>
<td><strong>Before</strong> or <strong>After</strong>.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Relative to | Field the duration is relative to. Displays if a relative duration or operation is selected.

- **Activation date [activation_date]**
- Compromise date [compromise_date]
- Deactivation date [deactivation_date]
- Destruction date [destruction_date]
- Expiration date [expiration_date]
- Generation date [generation_date]
- Last renewal date [last_renewal_date]
- Last rotated date [last_rotated_date]
- Revocation date [revocation_date]

Generate a ServiceNow cryptographic key
Follow this procedure to upload and configure a ServiceNow cryptographic key to encrypt sensitive data.

**Before you begin**
Role required: sn_kmf.cryptographic_manager

**About this task**
Cryptographic managers have the choice to use ServiceNow supplied keys or their own customer-supplied keys (CSK) for encryption on the Now Platform with Column Level Encryption Enterprise. For information on CSK, see Configure properties for customer-supplied keys.

**Procedure**

1. Set field encryption settings to use ServiceNow Generated Keys. See Configure field encryption settings to select key type for details.
2. Navigate to Key Management > Cryptographic Modules > All.
3. Select the corresponding crypto module to open the Cryptographic Module details page.
4. Click the row for the key alias entry on the Crypto Specifications tab. If a key has not yet been generated, the key alias field is empty.
5. Click Next to navigate to the Key Origin tab of the Crypto Specification components. The Lifecycle Definition tab displays along with the Key Lifecycle table and can be reviewed or edited. See Configure key lifecycle states for details.
This field varies based on the field encryption settings from Step 1 and the algorithm selected. To use an imported key, see Import a key from web service. See Configure properties for customer-supplied keys if you are using your own key.

7. Enter a friendly name for the Key alias.

8. Click Next to move to the Key Creation tab.

9. Click Generate Key.
   After you generate the key, the Cryptographic Module form reloads displaying the crypto specification.

10. Click the Module Keys tab to view the keys.
    Secure information for the key will be stored on the Module Keys tab along with the number of keys that exist for the crypto specification.

11. Select a key to perform key management actions. See Key management actions for details.

Create a module access policy
Module access policies are the access control mechanisms that place limits on whether data can be encrypted or decrypted.

Before you begin
Role required: sn_kmf.cryptographic_manager or sn_kmf.admin

About this task
Column Level Encryption (CLE) supports role-based module access policies and additional configuration options become available with Column Level Encryption Enterprise (CLE_Ent) functionality.
• Configure the specific cryptographic operation in module access policies for cryptographic modules that support symmetric operations. For instance, a user can be allowed to encrypt data but not decrypt data.

• Set a default module access policy value per Key Management Framework or Password2 cryptographic module.

• Associate specific script versions where changes to the script are tracked and invalidate the script policy providing better security for script-type module access policies.

Column Level Encryption Enterprise functionality is available with a paid subscription. Refer to Encryption and Key Management subscription bundle for supported features and options available with each offering. See Activate Column Level Encryption Enterprise for more information on obtaining Column Level Encryption Enterprise.

Procedure
1. Navigate to All > Key Management > Module Access Policies > All. When you create a cryptographic module configured for Symmetric Data Encryption/Decryption and there are no corresponding manually created module access policies, an auto-generated module access policy is created and will be listed in the table.

2. Click New.
   • Select Specify purpose to choose a Crypto spec and set the Granular operation.
With cryptographic specifications for symmetric data encryption/decryption and symmetric wrapping/unwrapping, the Granular operation field is available if you select the Specify purpose checkbox.

**Symmetric Encryption and Decryption**

**Symmetric Encryption**

**Symmetric Decryption**

**Symmetric Wrapping and Unwrapping**

**Symmetric Wrapping**

**Symmetric Unwrapping**

3. Complete the form. Module Access Policies fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy name</td>
<td>Enter a name for the policy.</td>
</tr>
<tr>
<td>Crypto module</td>
<td>Click the search icon (Q) to select a module.</td>
</tr>
<tr>
<td>Crypto spec</td>
<td>Select or create a new cryptographic specification while generating the module access policy. This field becomes available when the Specify purpose checkbox is selected.</td>
</tr>
<tr>
<td>Granular operation</td>
<td>Select the cryptographic purpose for the cryptographic specification. The values available will depend upon the type of cryptographic specification that is selected. See Cryptographic purpose, algorithms, and key information for details on crypto purposes.</td>
</tr>
<tr>
<td>Type</td>
<td>• <strong>Scope</strong>: Controls access by the application scope.</td>
</tr>
<tr>
<td></td>
<td>• <strong>System user</strong>: Allows access for system users to crypto modules.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Script</strong>: Control access by script. See Configure script access to encrypted data for more information</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Role</td>
<td>Controls access by user role.</td>
</tr>
<tr>
<td>Note:</td>
<td>Only Role type is supported with Column Level Encryption. All other types are available with Column Level Encryption Enterprise.</td>
</tr>
<tr>
<td>Target Scope</td>
<td>Field is visible as an identifier for the Scope type. Refers to the functionality for the policy. Select the applications from the search menu.</td>
</tr>
<tr>
<td>Note:</td>
<td>Target scope is not supported can be only be set with Column Level Encryption Enterprise.</td>
</tr>
<tr>
<td>Target Role</td>
<td>Field is visible as an identifier for the Role type. Role to which this policy applies.</td>
</tr>
<tr>
<td>Script Table</td>
<td>These fields appear when you select script as the type. Field is visible as an identifier for the Script Type. Select a table to which this policy applies. Document to which this policy applies. Select the Table name and then the related document for the policy.</td>
</tr>
<tr>
<td>Target Script</td>
<td>The first time a script calls a cryptographic module, access to the module is denied, and the developer receives an error. This gives the module owner the ability to grant or refuse access to the module.</td>
</tr>
<tr>
<td>Resource Exchange:</td>
<td>These options appear when you select Resource Exchange as the type.</td>
</tr>
<tr>
<td>Crypto Spec</td>
<td>Resource Exchange is supported by both KMF and by Column Level Encryption Enterprise when the parent module is <code>column_level_encryption</code>.</td>
</tr>
<tr>
<td>Approval Type</td>
<td>Select the crypto specification, One-time or Recurring, and the URL of the target instance. See KMF Resource Exchange for more information.</td>
</tr>
<tr>
<td>Target Instance Host</td>
<td></td>
</tr>
<tr>
<td>Impersonation</td>
<td>In role-based module access policies, users can access encrypted data using an impersonation session. When users, such as admins, impersonate other users, such impersonation enabled module access policies are applied.</td>
</tr>
<tr>
<td>Specify purpose</td>
<td>Select to toggle the Crypto spec field as an available field for the policy.</td>
</tr>
<tr>
<td>Active</td>
<td>Select to activate the policy.</td>
</tr>
<tr>
<td>Result</td>
<td>Select one of the following:</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>• StrictReject</td>
<td>to reject access under all circumstances.</td>
</tr>
<tr>
<td>• Reject</td>
<td>to prevent users with the Target Role or Target Scope from accessing this crypto module unless another policy allows them access.</td>
</tr>
<tr>
<td>• Track</td>
<td>to permit access and monitor use of the module.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

5. Select the policy name associated with the cryptographic module you want to examine.

**Using Script type module access policy**

A module access policy is auto-generated based on default access setting when the script is run. The module name is preceded with "AutoGen-: " For example, the "Module-TestPolicy" module is listed as "AutoGen-Module-TestPolicy" in the Policy name column.

The Crypto Caller Policy form lists the caller policy you selected. The Target Scope field specifies the scope of the script attempting to use the module. See **Configure script access to encrypted data** for additional information.

**Note:** A maximum of five module access policies are permitted with Column Level Encryption. See **Encryption and Key Management subscription bundle** for configuration options.

**Multiple modules access policies**

Multiple encryption modules enable data to be encrypted with more than one encryption module. If each module has its own access policy based on a role, for example, users with different roles can encrypt data on the same table but they can still be prevented from viewing each others encrypted data.

**About this task**

**Note:** Only encryption on columns supports multiple modules. Attachment encryption does not. Mass encryption is not available when using the multiple encryption modules method.

You cannot change a field using multiple encryption modules to use a single encryption module.

The field is encrypted by the encryption module of the first user to enter data. Because the encryption module is set on a per record basis, fields in a list can have different encryption modules. Within a single record, the field can be encrypted by only one module.

**Procedure**

1. Create multiple cryptographic modules and an access policy for each one.
   
   Make sure that you grant different roles to the different cryptographic modules through the access policies.

2. Navigate to **System Security > Field Encryption > Encrypted Field Configurations**.
   
   If you need more information on Encrypted Field Configurations, see Set encrypted field configurations.

3. In the **Type** field, you must select **Column**. Attachment encryption does not support multiple modules.

4. Select **Multiple Modules** in the **Method** field.
5. Select the **Table** and the **Column** in the table that you want to encrypt.

6. Click **Submit**.

**Results**

Newly created data for the specified field is encrypted with the key of the relevant module. When a user with the role specified in module A’s access policy writes to the specified table, the data is encrypted with module A’s key. Only users with the same role can read the data.

**Example:**

To encrypt the Short Description column on the Incident table. You would do the following:

1. Create two cryptographic modules A and B.

2. For each module, create a module access policy.
   
   For module A, give users with an HR role access. For module B, give users with a Sales role access.

3. Create an Encrypted Field Configuration record specifying the Short Description column on the Incident table, and make sure that you select **Multiple Modules** in the **Method** field.

4. Have two users, one with the HR role (user A) and one with the Sales role (user B), create an incident with a short description, and then have both users look at the list of incidents.

   The short description for the incident created by the user with the HR role is encrypted by the key for module A. Likewise, the short description for the incident created by the user with the Sales role is encrypted by the key for module B.

   Although all users with the HR and Sales roles have access to incidents, only a user with the HR role can decrypt and view the short description for those incidents created by user A, who had the HR role. Likewise, only users with the Sales role can decrypt and view the short descriptions for those incidents created by the user B, who had the Sales role.
Create a cryptographic module lifecycle policy

A cryptographic module lifecycle policy is an instance-level policy that places limits on cryptographic modules, such as how long the key is good for. Create policies to safeguard cryptographic modules by limiting their exposure.

Before you begin
Role required: sn_kmf.cryptographic_manager

About this task
The more exposure a cryptographic key has, the more likely it can be compromised. Safeguard keys by limiting how long the keys can be used and who can use them.

The following features govern cryptographic modules:

- Instance policies set boundaries for the instance. For example, if you specify in the instance policies that the expiration date should never be more than two years after the activation date, you cannot use the lifecycle rules to set an expiration date five years after the activation date.

- Instance lifecycle templates allow you to set different policies for different keys. Templates offer default lifecycle rules for cryptographic modules so that they don't have to be re-created for every module. For example, you can set different expiration dates for symmetric data encryption keys than for public key wrapping keys.

- Lifecycle rules affect the keys directly. For example, if you specify in the lifecycle rules that the expiration date should be two years after the activation date, keys will expire two years after the activation date.
Procedure

1. Navigate to All > Key Management > Lifecycle Policies > Instance Policies.
2. Click New.
3. Complete the form.

Cryptographic Lifecycle Policies fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applies to</td>
<td>Read only. The key the lifecycle applies to.</td>
</tr>
<tr>
<td>Active</td>
<td>Select to activate the policy.</td>
</tr>
<tr>
<td>Policy condition</td>
<td>Conditional statements that specify when to activate, renew, deactivate, and destroy the cryptographic module.</td>
</tr>
<tr>
<td>Result</td>
<td><strong>Reject</strong> to revoke access to the cryptographic module, or <strong>Track</strong> to permit access and monitor use of the cryptographic module.</td>
</tr>
</tbody>
</table>

What to do next
If you want to add exceptions to this lifecycle policy at the module level, see Create module lifecycle policy exceptions.

Create module lifecycle policy exceptions
Create a module policy exception to change the lifecycle policy of a key at the module level for an instance. The exception(s) applies only to that module and not to the entire instance. For example, if the administrator configured symmetric keys to be limited to one year at the instance level, an exception can be made at the module level to be two years.

Before you begin
Role required: sn_kmf.cryptographic_manager and sn_kmf.admin

Procedure

1. Navigate to All > Key Management > Cryptographic ModulesAll.
2. Select the cryptographic module that will use the policy exceptions.
3. In the Cryptographic Module table, select the Module Policy Exceptions tab.
4. Click New.
5. Complete the form.

Module Policy Exceptions fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crypto Module</td>
<td>Read only, name of the module selected.</td>
</tr>
<tr>
<td>Applies to</td>
<td>The specified key is auto-populated.</td>
</tr>
<tr>
<td>Key Type</td>
<td>Select the key type, as the exception policies are related to a specific key. Multiple exception policies can be created per crypto module.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Policy condition</td>
<td>Choose the qualifying conditions from the drop-down and complete the additional constraint criteria.</td>
</tr>
<tr>
<td>New criteria</td>
<td>Select additional policy conditions, as required.</td>
</tr>
<tr>
<td>Result</td>
<td>Select to <strong>Reject</strong> to reject usage of the key or <strong>Track</strong> to allow usage of it when the criteria is met.</td>
</tr>
</tbody>
</table>

6. Click **Submit** to be returned to the Cryptographic Module table.

**Encrypting fields and attachments**

After you create your cryptographic modules, create encrypted field configurations and specify whether to encrypt a field on a table or encrypt attachments.

**How to encrypt fields**

1. Specify the key source: system-generated keys or your customer supplied keys (bring your own key) in **System Security > Field Encryption Settings**.

2. After you specify the key source, create a new cryptographic module or use an existing cryptographic module. Start with **Create a cryptographic module** for instructions.

   **Note:** If you use customer-supplied keys, follow the directions in **Create cryptographic module for Column Level Encryption** and **Configure properties for customer-supplied keys**.

3. Create an encrypted field configuration, which is where you specify the table on which the encryption is performed and either the column in the table or the attachments in the table to encrypt. See **Set encrypted field configurations** to get started.

   **Note:** See **Column Level Encryption Enterprise examples** that illustrates how to encrypt fields and attachments using customer-supplied keys.

**Set encrypted field configurations**

Configure which table columns or attachments that the system will encrypt using a pre-configured cryptographic module.

**Before you begin**

Role required: sn_kmf.cryptographic_manager and security_admin or elevate role to security admin

**About this task**

Make sure you are in the correct application scope so you can see the tables in that scope. Only users with access to the cryptographic module that you specify in this encrypted field configuration can read data in the encrypted table column or access the attachment.

- If a user has read access but not write access, the field displays in read-only mode and the decrypted data entered will display as asterisks.
- If a user has all access, both read/write functionality is available on the encrypted field.

See **Create a cryptographic module** or **Create cryptographic module for Column Level Encryption** to begin.
Procedure
1. Navigate to **All > System Security > Field Encryption > Encrypted Field Configurations > New**.
2. Click **New**.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td><strong>Column</strong> to encrypt a table column or <strong>Attachment</strong> to encrypt all of a table’s attachments.</td>
</tr>
<tr>
<td></td>
<td>Types of data encrypted are:</td>
</tr>
<tr>
<td></td>
<td>• String text</td>
</tr>
<tr>
<td></td>
<td>• Attachments</td>
</tr>
<tr>
<td></td>
<td>• Date, Date/Time:</td>
</tr>
<tr>
<td></td>
<td>◦ You can create encrypted field configurations to encrypt existing Date and Date/Time fields. You can add a new encryption configuration to a parent table only. You cannot add a new encryption configuration to a child table.</td>
</tr>
<tr>
<td></td>
<td>• URL</td>
</tr>
<tr>
<td></td>
<td>• Column Level Encryption Enterprise also supports the following field types:</td>
</tr>
<tr>
<td></td>
<td>◦ HTML</td>
</tr>
<tr>
<td></td>
<td>◦ Journal</td>
</tr>
<tr>
<td></td>
<td>◦ Translated</td>
</tr>
<tr>
<td>Table</td>
<td>Table whose fields or attachments are to be encrypted.</td>
</tr>
<tr>
<td>Column</td>
<td>Column (field) to be encrypted if you selected column as the type.</td>
</tr>
<tr>
<td>Active</td>
<td>Select to mark the configuration active. Deselect if the configuration is not yet in use.</td>
</tr>
<tr>
<td>Crypto module</td>
<td>The cryptographic module that the encrypted field configuration applies to.</td>
</tr>
<tr>
<td>Method</td>
<td>Select <strong>Single Module</strong> to set the field configuration across one module. Attachment encryption supports <strong>Single Module</strong> only. Select <strong>Multiple Modules</strong> for role based access that will span across more than one cryptographic module.</td>
</tr>
<tr>
<td>Algorithm Encrypted Preserving [read-only]</td>
<td>Indicates if the crypto module that you selected is already configured to support non-deterministic encryption. This means that if the same data is encrypted more than once, the encryption is different each time.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Script access for cryptographic modules**

Scripts can be run to access a cryptographic module policy for a cryptographic purpose.
For Key Management Framework, policies can be based scripts. When an access policy is triggered for script access, the backend script can execute the module policy actions from the script.

Cryptographic modules can support one or more encryption purposes, such as Asymmetric Data Decryption and Symmetric Data Decryption. Each cryptographic purpose requires the generation of an encryption key and defined cryptographic purpose.

Consider the following when executing an encryption script request:

- The referenced cryptographic purpose must be defined in the cryptographic module.
- An active generated key must exist for the cryptographic module.
- The Module Access Policy type must be set to script.

Check script version
When creating a module access policy that is set to the script type, there is an option available to validate the integrity of the script version being accessed. Only the assigned version of the script is allowed access to the encryption modules. When the Check script version check box is selected in the module access policy, anytime the script is run, the system performs a version comparison. If the script has been changed, the user is notified.

Configure script access to encrypted data
Execute a script to run the cryptographic module policy for a cryptographic purpose. Specific read (decrypt/unwrap) or write (encrypt, wrap) access can be defined based on the module access policy operation granularity.

Before you begin
Role required: sn_kmf.cryptographic_manager

About this task
Examples of uses are for Business Rules and Script Includes. This procedure uses a script for Business Rules.
**Procedure**

1. Create a cryptographic module with the symmetric data encryption/decryption algorithm. Refer to *Create a cryptographic module* for details.

Specific access to the data or attachment is controlled with a module access policy with the following characteristics:

- **Symmetric encryption:** The script is able to encrypt data but unable to decrypt the data.
- **Symmetric decryption:** The script is able to decrypt uploaded encrypted data or attachment but unable to encrypt data or attachments.
- **Symmetric encryption and decryption:** The script is able to both encrypt and decrypt data or attachments.

2. Navigate to *System Definition > Business Rules*.

3. Click *New*.

4. Complete the form on the *When to run* tab and enter the script on the *Advanced* tab:

**Business Rule fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the business rule.</td>
</tr>
<tr>
<td>Table</td>
<td>Select <em>Incident [incident]</em> from the drop-down list.</td>
</tr>
<tr>
<td>Application</td>
<td><em>Global</em> is selected by default.</td>
</tr>
<tr>
<td>Active</td>
<td>Mark the rule as <em>Active</em>.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select the check box to display advanced options.</td>
</tr>
<tr>
<td>When to run tab</td>
<td>On the <em>When to run</em> tab, enable <em>Insert</em> and <em>Update</em> fields.</td>
</tr>
</tbody>
</table>
| Advanced tab        | On the *Advanced* tab, paste the following script text at line 3:  

```javascript
//
var gc = 
    global.GlideCryptoModule.getModule('global.acme_mod');
var value = 'test';
var encrypted = gc.encryptData(value);
gs.info('value: ' + value);
gs.info('Encrypted: ' + encrypted);
```
5. Click Submit.

   **Note:** For additional information, refer to Create a module access policy.

7. Click New.

8. Complete the form.

   **Module Access Policies fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy name</td>
<td>Enter a name for the policy.</td>
</tr>
<tr>
<td>Crypto module</td>
<td>Click the search icon to select a module with the symmetric data encryption/decryption algorithm.</td>
</tr>
<tr>
<td>Type</td>
<td>Select <strong>Script</strong> to control access by script.</td>
</tr>
<tr>
<td>Script Table</td>
<td>Select a value from the script table drop-down list. For this example, select <strong>Business Rule [sys_script]</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Target Script</td>
<td>Select the script document for the policy. Select the <strong>Table name</strong> and then the related document for the policy. For this example, select the Business Rule that you created in previous steps.</td>
</tr>
<tr>
<td>Active</td>
<td>Select to activate the policy.</td>
</tr>
<tr>
<td>Result</td>
<td>To give the script access to the module, select <strong>Track</strong> in the <strong>Result</strong> field.</td>
</tr>
</tbody>
</table>

9. Click **Submit**. The Module Access Policy for the script is now available in the system.

**View declined cryptographic module usage requests**

View cryptographic modules that rejected encryption requests made by scripts because of unsupported encryption mechanisms.

**Before you begin**

Role required: sn_kmfcryptographic_manager

**About this task**

Cryptographic modules can support one or more encryption purposes, such as Asymmetric Data Decryption and Symmetric Data Decryption. Encrypted data can only be accessed based on the module access policy. If a script tries to use a cryptographic module for a purpose not defined in the module, the script cannot access to the encrypted data.

In the following example, a cryptographic purpose was assigned to a cryptographic module, but a key was never generated for it.

**Procedure**

Navigate to **All > Key Management > Module Key Policies > Module Key Rejections**.

A list of cryptographic modules that rejected requests displays along with the encryption key used in the corresponding script.
Note: If a different script attempts to use the same cryptographic module using the same key type, the value for Last enforced updates. Another row does not generate.

In this example, at 2020-02-10_15:55:17, the first module rejected a request because module1’s key is compromised. At 2020-02-10_07:24:05, the second module rejected a request because the second module’s key is suspended.

To grant scripts permission to use the encryption module the next time they run, create a module access policy for script encryption. For more information, refer to Configure script access to encrypted data.

Schedule mass encryption, decryption, and rekeying jobs

Schedule encryption, decryption, and rekeying jobs to run at a time that is best for your instance.

Before you begin

Encryption, decryption, and rekeying jobs can be time and resource intensive, so consider scheduling at non-peak hours. Also ensure that the user scheduling the job has the appropriate access for each job.

Role required: sn_kmf.cryptographic_manager

About this task

Mass encryption and decryption is also available from the Encrypted Field Configurations form. See Run mass encryption or decryption for instructions.

Procedure

2. Click New.
3. Complete the scheduling form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the encryption, decryption, or re-keying job.</td>
</tr>
<tr>
<td>Type</td>
<td>Job type:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Key Migration Context to Module</strong>: Mass migration of Encryption Context keys to Encryption Modules, including creation of Module Access Policies records for access controls on the Encryption Modules</td>
</tr>
<tr>
<td></td>
<td>• <strong>Data Migration Context to Module</strong>: Migrates data encrypted by Encryption Contexts to Encryption Modules</td>
</tr>
<tr>
<td></td>
<td>• <strong>Mass Encryption Module</strong>: Encrypts any pre-existing value in the defined column/field used in the Field Encryption Configuration</td>
</tr>
<tr>
<td></td>
<td>• <strong>Mass Decryption Module</strong>: Decrypts any pre-existing value in the defined column/field used in the Field Encryption Configuration with Single Module.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Mass Decryption Multi Module</strong>: Decrypts any pre-existing value in the defined column/field used in the Field Encryption Configuration with Multiple Module.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Module Rekeying</strong>: Re-encrypts any pre-existing value in the defined column/field used in the Field Encryption Configuration using the current active key for the module.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <strong>Migrate Attachment Context to Module</strong>: Encrypts any pre-existing attachment on the table defined in the Field Encryption Configuration. Any attachment previously encrypted with a context is re-encrypted with the module.</td>
<td></td>
</tr>
<tr>
<td>State</td>
<td>The initial job state is New. After the job has been executed as scheduled, the state will update accordingly</td>
</tr>
<tr>
<td>Time window start</td>
<td>Start time for the job in 24-hour format.</td>
</tr>
<tr>
<td>Time window end</td>
<td>End time for the job in 24-hour format.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to be encrypted or decrypted.</td>
</tr>
<tr>
<td>Field</td>
<td>Field to be encrypted or decrypted.</td>
</tr>
<tr>
<td>Summary</td>
<td>Job status information when the job is running, has completed, or has errors.</td>
</tr>
</tbody>
</table>

**Note**: Because of system overhead, you should schedule mass encryption, decryption, and rekeying jobs to run at non-peak hours. The Now Platform runs the job between the **Time window start** and **Time window end**. If the job is not complete in one processing window, it continues during the next specified processing window until all processing is complete.

4. Click **Submit**.

5. After you schedule a job, you can do the following.
   - Click **Cancel Job** to cancel a running job.
   - Click **Start** to start a job immediately.
   - Click **Update** to save any changes you make to the job schedule.
   - Click **Delete** to delete the scheduled job.

**Run mass encryption or decryption**

You can run mass encryption on encryption configurations, as well as a mass decryption to decrypt previously encrypted values.

**Before you begin**

Role required: security_admin

**About this task**

You can also create scheduled jobs for mass encryption and decryption. See **Schedule mass encryption, decryption, and rekeying jobs** for instructions.

Mass encryption and decryption are available only when an encrypted field configuration uses the single cryptographic module. Mass decryption is available for both the single and multiple encryption methods.

**Note**: You should run mass encryption and decryption only during non-peak hours because the operations are resource and time intensive.
Procedure
1. Navigate to All > System Security > Field Encryption > Encrypted Field Configurations.
2. Open the encrypted field configuration for the field you would like to mass encrypt or decrypt.
3. Under Related Links, select an available option.
   - Schedule Mass Decryption job
   - Schedule Mass Encryption job
4. Confirm your selection in the dialog.

Results
If running a mass encryption, all values are encrypted with the encryption module defined in the encrypted field configuration record. If running a mass decryption, only fields encrypted with an encryption module you have access to are decrypted.

Key management actions
One of the core features of KMF is to provide the capability to manage keys, such as revoking or rotating keys. KMF properly secures sensitive data with the most up-to-date encryption materials and lifecycle operations.

The following table provides a summary of the key lifecycle operations and management actions. The cryptographic module purpose is applied to the data with the cryptographic module configuration and have no impact on data.

<table>
<thead>
<tr>
<th>Key management action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate key</td>
<td>Generates a new key for the given cryptographic module. A first generated key is set to active.</td>
</tr>
<tr>
<td>Rotate key</td>
<td>Deactivates the current key and generates a new one. The new module key is set to current (active).</td>
</tr>
<tr>
<td>Revoke key</td>
<td>Marks the current key and lifecycle state as revoked. The cryptographic module auto-generates a new key on new data and sets the key status to active. Revoke means that the key is no longer used for encryption. However, it can still be used for decryption. You cannot destroy a key.</td>
</tr>
<tr>
<td>Suspend key</td>
<td>Marks the current key as suspended. Manually resume the suspended key or revoke the suspended key to generate a new module key before using the cryptographic module again.</td>
</tr>
<tr>
<td>Resume key</td>
<td>Marks a suspended key as the active key.</td>
</tr>
</tbody>
</table>
| Renew key             | Extends the life of the current key. The Renew button becomes available under the following circumstances:  
  - You are assigned the cryptographic manager role.  
  - The lifecycle state is marked to either Active or Renewed.  
  - An expiration date is set in the module lifecycle definition. |

View and manage keys
Review the status of any key to determine further key action, such as when to renew, rotate, suspend, deactivate, or destroy a current key.
Before you begin
Role required: sn_kmf.cryptographic_manager

Procedure
1. Navigate to **All > Key Management > Cryptographic Modules > All.**

2. Select a cryptographic module.
   The Cryptographic Module <module-name> form appears.

3. On the Module Keys tab, click the key alias to review the key status on the Lifecycle <key name> form.

4. Review the form, as all fields are read-only.

### Cryptographic Lifecycle Key fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generation date</td>
<td>Displays the date the key was generated.</td>
</tr>
<tr>
<td>Activation date</td>
<td>Displays the date the key was activated.</td>
</tr>
<tr>
<td>Last renewal date</td>
<td>Displays the date the key was last renewed.</td>
</tr>
<tr>
<td>Last rotated date</td>
<td>Displays the date the key was last rotated.</td>
</tr>
<tr>
<td>Deactivation date</td>
<td>Displays the date the key was deactivated.</td>
</tr>
<tr>
<td>Destruction date</td>
<td>Displays the date the key was destroyed.</td>
</tr>
<tr>
<td>Key lifecycle state</td>
<td>Displays the key lifecycle state.</td>
</tr>
<tr>
<td>Future activation date</td>
<td>Displays the future key activation date.</td>
</tr>
<tr>
<td>Future renewal date</td>
<td>Displays the future key renewal date.</td>
</tr>
<tr>
<td>Future rotation date</td>
<td>Displays the future date for key rotation.</td>
</tr>
<tr>
<td>Future destruction date</td>
<td>Displays the future date when the key will be destroyed.</td>
</tr>
<tr>
<td>Expiration date</td>
<td>Displays the date when the key expires.</td>
</tr>
</tbody>
</table>

5. To perform an action on the key, click one of the following to take effect immediately:
   - **Revoke Key**: Select to deactivate the key and generate a new key. Enter the reason why you are revoking the key.
   
   - **Rotate Key**: Select to deactivate the current key and to generate a new key in its place. The new key is listed in the Module Key table and the Key Version number increments by 1. See Rotate keys for details.
   
   - **Suspend Key**: Select to deactivate the current key.
   
   - **Resume Key**: Select to marks a suspended key as the active key. This option is only available after the active key has been suspended.

### Rotate keys

For increased security, you can rotate your cryptographic keys on a pre-determined schedule. Key rotation is when you retire an encryption key and replace that old key by generating a new cryptographic key.

**Before you begin**
Role required: sn_kmf.cryptographic_manager
About this task
Encryption modules, unlike encryption contexts, support a rekey of records for re-encryption with a new key. The following demonstrates how to manually perform a key rotation operation on a KMF cryptographic module.

Procedure
1. Navigate to Key Management > Cryptographic Modules > All.
2. Select the cryptographic module for key rotation.
3. On the Module Keys tab, select the Active key.
4. Click Rotate Key. The key lifecycle state changes to "Deactivated." The Last rotated date, the Deactivation date, and the Key version updates.
5. Return to Cryptographic Module > Module Keys.

There is an extra module key listed in the table. The newly rotated key becomes "Active" and the previous key is "Deactivated."
Import a key from web service

Securely upload a customer key onto your instance using import a key from web service, or a REST endpoint. Both asymmetric public keys and symmetric keys can be uploaded onto a targeted KMF cryptographic module.

Before you begin
Role required: sn_kmf.cryptographic_manager (module configuration) or sn_kmf.cryptographic_operator (REST operation basic authentication)

About this task
Symmetric key import requires the key to be wrapped with the key import module’s public key. A public key does not require the key to be wrapped on import. The Key Import module is an internal KMF Cryptographic Module.

Note: This example uses OpenSSL for key and certificate generation and the Postman API test tool to show REST API use. Substitute other comparable tools based on your company requirements.

Procedure
1. Navigate to All > Key Management > Import Settings > Key Import Settings.
2. In the Algorithm Definition section, verify the Crypto Purpose is set to Asymmetric Key Unwrapping.
3. Select an appropriate algorithm that aligns with asymmetric key material for the imported keystore. See Cryptographic purpose, algorithms, and key information for additional information.
4. Click Next.
5. In the Lifecycle Definition section, click Next to continue.
6. In the Key Origin section, select Import from web service as the origin.
7. Enter a Key Alias to easily identify the key.
8. Click Next.
   The Key Creation section displays the upload of the keystore. The steps vary if you are importing a public key or a symmetric key. Refer to either Import a public key from web service or Import a private key from web service for details.

Import a public key from web service

This procedure guides you to upload a public key specifically into the correct cryptographic module using the import key from web service functionality.
Before you begin
Role required: sn_kmf.cryptographic_manager (module configuration), sn_kmf.cryptographic_operator (REST operation basic authentication)

About this task
KMF Import key endpoint access is required to complete the key import process.

Procedure
1. Create a new KMF cryptographic module.
   See Create a cryptographic module or Create cryptographic module for Column Level Encryption for additional information.
2. Add a cryptographic specification with the following:
   • **Crypto Purpose**: Asymmetric Data Encryption, Asymmetric Key Wrapping, or Signature Verification.
   • **Key Origin**: Import from web service

![Image of cryptographic specification creation]

See Create a cryptographic specification or Create a cryptographic specification for Column Level Encryption for more information.

3. Execute an HTTP POST request to the import from web service REST endpoint.

<table>
<thead>
<tr>
<th>Option</th>
<th>Value/Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>CryptoSpecSysID parameter</td>
<td>The sys_id of the newly created crypto specification.</td>
</tr>
<tr>
<td>Tip:</td>
<td>Right-click the header of the crypto specification to copy the sys_id.</td>
</tr>
<tr>
<td>Header-Content-Type</td>
<td>Application/octet-stream.</td>
</tr>
<tr>
<td>Body</td>
<td>Must contain a file attachment-binary and the public key to import (certificate.crt).</td>
</tr>
<tr>
<td>Import from web service REST endpoint</td>
<td>Uses basic authentication of &lt;username/password&gt;.</td>
</tr>
<tr>
<td></td>
<td>• Ensure that the designated user has the sn_kmf_cryptographic_operator role.</td>
</tr>
</tbody>
</table>
Successful import of the public key results in an HTTP response message with Status 200.

4. Verify that the key successfully imported to the targeted KMF cryptographic module.

**Import a private key from web service**

This procedure guides you to upload a symmetric private key specifically into the correct crypto module tied directly to the API.

**Before you begin**

Role required: sn_kmf.cryptographic_manager (module configuration), sn_kmf.cryptographic_operator (REST operation basic authentication)

**Procedure**

1. Key wrap your symmetric key with the Key Import module public key pair imported during the setup. See **Import a public key from web service** for more information.
   
   Example: 
   ```bash
   openssl pkeyutl -encrypt -pubin -inkey key_import_private_key.pem -in symm_key.bin -pkeyopt rsa_padding_mode:oaep -pkeyopt rsa_oaep_md:sha256 -out wrapped_key.txt
   ```

2. Create a new cryptographic module to be tied to the API.
   See **Create a cryptographic module** or **Create cryptographic module for Column Level Encryption** for additional information.

3. Add a cryptographic specification with the following:
   
   • **Crypto Purpose**: Symmetric Authenticity, Symmetric Data Encryption/Decryption, or Symmetric Key Wrapping/Unwrapping.

   • **Key Origin**: Import from web service.

   See **Create a cryptographic specification** or **Create a cryptographic specification for Column Level Encryption** for more information.

4. Execute an HTTP POST request to the import from web service REST endpoint.
## Field | Value/Format
--- | ---

**CryptoSpecSysID parameter** | The sys_id of the newly created crypto specification.

| **Header-Content-Type** | Application/octet-stream.
| **Body** | Must contain a file attachment-binary and a file containing the symmetric key to import (wrapped_key.txt).
| **Import from web service REST endpoint** | Uses basic authentication of <username/password>.
- Ensure that the designated user has the sn_kmf_cryptographic_operator role.

Successful import of the private key results in an HTTP response message with Status 200.

5. Verify that the key successfully imported to the targeted KMF cryptographic module.

### Key Management Framework Health

Access on-demand health status information for the Key Management Framework. Warning and malfunction errors contain a detailed message.

**Before you begin**
Role required: sn_kmf_cryptographic auditor or sn_kmf_admin or sn_kmf_cryptographic_manager

**About this task**
Each component of the Key Management Framework is outlined and reports the following statuses and colors:
- Green/Operational: The component is operational, no error to report.
- Gray/Disabled: The component is inactive, therefore no health check is performed.
• Yellow/Degraded: Warning, the component is working, but delays/transient issues are susceptible to occur.
• Red/Malfunction: A fatal error is preventing the component from operating, which is likely to cause partial outages.

Components can include subcomponents with individual reports and their own health status impacts the parent as follows:

• Disabled subcomponents do not impact the health of the parent. If all subcomponents are disabled, the parent shows as disabled.
• If at least one subcomponent is degraded or malfunctioned, the parent health shows as degraded.
• If all subcomponents report as malfunctioned, then the parent also reports as malfunctioned.

For additional information on subcomponents, see Instance level keys in the Key Management Framework.

⚠️ Note: Health checks run every 15 seconds. Refresh the health page to rerun the report.

Procedure
1. Navigate to All > Key Management > Diagnostics.
2. Review the following health status information:

<table>
<thead>
<tr>
<th>Diagnostic Information</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Category</strong></td>
</tr>
<tr>
<td>Key Secure</td>
</tr>
<tr>
<td>File Key Store</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>GlideEncrypter</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Instance Key Encryption Key (IKEK)</td>
</tr>
<tr>
<td>Instance HMAC Key</td>
</tr>
<tr>
<td>Vault PKI</td>
</tr>
<tr>
<td>EJBCA PKI</td>
</tr>
</tbody>
</table>
### Category | Details
---|---
Instance PKI | Checks File Key Store and KeySecure if the key can be fetched and if the certificate is present and matches the private key.

**Note:** Instance PKI is only available on instances within the ServiceNow datacenter.

For assistance in troubleshooting, contact Customer Service and Support.

**KMF Resource Exchange**

ServiceNow® Resource Exchange is a KMF feature that gives you the capability to exchange resources between instances in a secure manner.

**Terminology**

When using the Resource Exchange, reference the following terminology:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resource Exchange</td>
<td>The process to exchange resources across instances.</td>
</tr>
<tr>
<td>Key Exchange (KE)</td>
<td>The process to exchange keys over instances.</td>
</tr>
<tr>
<td>Key Source Instance (Key Source)</td>
<td>The instance that owns the keys.</td>
</tr>
<tr>
<td>Key Target Instance (Key Target)</td>
<td>The instance that requests the keys.</td>
</tr>
</tbody>
</table>

**Overview**

Resource Exchange utilizes KMF’s cryptographic APIs to provide confidentiality, integrity, authentication, and non-repudiation. Currently, Resource Exchange supports the Key Exchange functionality. See KMF Key Exchange for additional information.

**KMF Key Exchange**

KMF Key Exchange is a subset function of KMF Resource Exchange. Key Exchange securely transfers encrypted data across multiple instances.

**Overview of Key Exchange**

Key Exchange securely transfers keys across instances.

KMF Key Exchange provides a secure way for customers to exchange KMF keys between instances. One application use case is the data cloning process. With Key Exchange, crypto module keys are copied over during the data cloning of KMF components. Cryptographic modules, module key specifications, and module access policies are included in the cloning process, however the transfer of keys is not.

Another potential application can be Instance Data Replication (IDR) to use the existing key exchange flow.

**Using Key Exchange**

Administrators who use KMF for column level encryption can use Key Exchange to clone the keys between production instances when performing data cloning. In data cloning, the administrator/KMF cryptographic manager, can perform the following:
- Exchange all keys to the other instances.
- Exchange particular keys one time or periodically to the other instance.
- Send ad hoc requests from the target instance to the key source instance.
- Exchange keys from source to target for rekeying ciphertext.
  - Manage the expiration time of the request with the ability to delete keys or reject the key exchange request if the request has expired.
  - After the request is completed and the key is imported, the used key will be set as expired and timestamped.
  - Rekey ciphertext on the target instance that was encrypted with keys from the source.

**Supported modes**

Key Exchange supports several modes on the encryption module crypto specification level:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic (no configuration, default behavior)</td>
<td>All keys are sent over automatically during the data cloning process without additional configuration.</td>
</tr>
<tr>
<td>Configurable (one-time configuration setup)</td>
<td>The administrator configures the keys to be sent over during the data cloning process.</td>
</tr>
<tr>
<td>Manual (person in the loop)</td>
<td>The administrator sends an ad hoc request on the target instance to the source. The request must be approved by an administrator on the key source instance.</td>
</tr>
<tr>
<td>Rekey (automated request)</td>
<td>The administrator selects the option of rekey during the cloning setup process.</td>
</tr>
</tbody>
</table>

**Configure Key Exchange**

KMF Key Exchange generates automatic key exchange requests for supported cryptographic modules during the fresh installation or upgrade of the instance. KMF manages the data encryption key locally for the instance.

**Before you begin**

A KMF cryptographic module with a key must be created in both the target and source instances before using Key Exchange.

Role required: sn_kmf.cryptographic_manager

**About this task**

Key Exchange requests are initiated from the target instance.

Key Management Framework (KMF) Key Exchange uses the Key Management Framework plugin (com.glide.kmf.global) and the glide_encryption.auto_key_exchange.enabled system property to manage how keys are handled during an instance clone:

- **Automatic Key Exchange**: The base system property glide_encryption.auto_key_exchange.enabled is true by default, meaning that automatic key exchange is activated when cloning an instance. The property is cloned over to the target instance.
  - Turn off automatic key exchange: Set the property to false for recurring clone requests.
  - Send auto key exchange requests: Set this property to true.
**Important:** This value must be set to `false` if utilizing the Rekey ciphertext with Key Exchange or the recurring Key Exchange functionality. See Recurring Key Exchange walk-through for additional details.

**Procedure**

1. Navigate to **All > Key Management > Resource Exchange Requests > New.**
2. On the form, fill in the fields.

**Resource Exchange Request form**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Exchange Frequency        | • **Adhoc:** Sends requests from the key target instance to the source instance. Enter the Instance sys_id and the Host information for the Source. Not supported with Rekey of Key Exchange.  
  • **One Time Clone:** One-time exchange of the keys from the source crypto specifications to the target instance.  
  • **Recurring Clone:** Exchange keys from the selected source crypto specifications to the target instance on a defined recurring clone. |
| (Source or Target) Instance Sys Id | • **Adhoc:** Enter the sys_id for the source instance to request the keys from.  
  • **One Time Clone, Recurring Clone:** Enter the sys_id for the target instance that sends the requests.  

**Tip:** Enter `stats.do` in the application navigator to locate the instance ID.

| (Source or Target) Instance Host | Enter the host location or name of the source or target instance.  
**Note:** The instance name is the first entry in `stats.do`.  
Example: `testnode1788-node1.service-now.com`. |
| Crypto Specifications       | The keys from the crypto specification in a crypto module define the keys to clone. For both one-time and recurring clone requests, a module access policy of type **Resource Exchange** automatically generates. You do not have to manually configure a policy.  
**Note:** Click the lookup using list icon (🔍) to browse available cryptographic specifications. |
| Enable Rekeying After Key Imported | Option to enable auto rekey. See **Rekey ciphertext with Key Exchange** for details. |

3. Click **Submit.**

If successful, a confirmation displays at the top of the form. The Resource Exchange Requests table is updated with an entry of **Request Pending** in both the source instance and in the target instance. Open the Request Record to view the status of the request, the Imported Key Count, and the Total Key Count on the target or source host.
4. The pending request is accepted in the source instance to complete the exchange. At clone time, the module access policy on the source instance is invoked to auto-approve the request and send keys to the newly cloned target.

Rekey ciphertext with Key Exchange

Resource Exchange supports rekeying of ciphertext on the target instance that was encrypted with keys from the source. Rekey activity is tracked in the key lifecycle.

Overview

Administrators who use KMF for column level encryption can use Key Exchange to rekey cryptographic keys between production instances when performing data cloning. An active key must first be available on the target instance for rekey, as rekey requires an active key. An encryption job is automatically created and run by the system to rotate and rekey the source key and re-encrypt the ciphertext.

Use Key Exchange to do the following:

- Set an expiration time frame for rekey,
  - If the request has expired, then the request will be rejected and the key is deleted.
- Automate rekeying ciphertext that was encrypted with keys from source instances.
  - New cloned crypto key is used to re-encrypt ciphertext on the target instance.
- The Rekey purpose is set up during the cloning process and will be automated as part of the clone.
- Rekey activity is tracked on the Modules Key tab of the cryptographic module. Access the Key lifecycle state and Key version for key activity. See Rotate keys for additional information.

Configure a Key Exchange and select the Enable Rekeying After Key Imported check box for activation. See Configure Key Exchange for details.
Recurring Key Exchange walk-through

Use this walk-through to set up a recurring key exchange in your instance using KMF and Resource Exchange.

Before you begin
Roles required: sn_kmf.cryptographic_manager

About this task
This example shows you how a target instance requests keys from a host instance.

- Before you can perform this Key Exchange procedure, you must clone an instance. See System clone for more information.
- Automatic Key Exchange: The base system property glide_encryption.auto_key_exchange.enabled is true by default, meaning that automatic Key Exchange is activated when cloning an instance. The property is cloned over to the target instance.
  - Turn off automatic Key Exchange by setting the property to false.

Procedure
1. On the source instance, create a crypto module or access an existing crypto module using column_level_encryption and set up the encrypted field configurations for the ciphertext encryption for Key Exchange. See Create cryptographic module for Column Level Encryption and Set encrypted field configurations for details.
  a. Ensure that keys have been generated in the crypto module.

  Note: A module access policy of type Resource Exchange is automatically generated by the system on the execution of the Key Exchange clone request.

2. From the cloned instance, navigate to Key Management > Resource Exchange Requests > New.

3. Complete the form and select Recurring Clone as the Exchange Frequency.

4. From the target instance of the clone, navigate to Key Management > Resource Exchange Requests.
   The request from the host instance is displayed in the table.

Important: For both one-time and recurring clone requests, a module access policy of type Resource Exchange automatically generates. You do not need to manually configure a policy. At clone time, this policy on the source instance is invoked to auto-approve the request and send keys to the newly cloned target.
In the Resource Exchange Requests form, the status updates to **Request Approved** and the **Imported Key Count** field appears on the record.

5. Return to the host instance.
6. View the Resource Exchange Request record to see the number of exported keys.
7. View the Module Access Policy record to see that the Type is Resource Exchange.
**Note:** Resource Exchange also supports rekeying of ciphertext on the target instance. See Rekey ciphertext with Key Exchange for details.

**Password2 encryption with KMF**

Supported by the Key Management Framework, use the Password2 (2-way encrypted) field type to encrypt and decrypt custom fields with segregation of duties, key protection, and life-cycle management. It works in accordance with NIST 800-57 guidelines and provides FIPS 140-2-L3 protection.

Password2 is a text field that stores passwords with two-way encryption. The two-way encryption stores passwords as a secure encrypted value that can be decrypted within the instance.

**Activation**

Password2 functionality is active by default. It is controlled by the glide.kmf.encrypter.enabled property, which is set to true for all new instances and upgrades. You do not need to enable Column Level Encryption Enterprise to use Password2.

**How Password2 works**

The Key Management Framework provides a base system parent cryptographic module cm_glide_encrypter. This module provides a cryptographic specification and a key that can decrypt legacy Password2 fields.
Cryptographic Module for Password2

This cm_glide_encrypter module can have sub-modules, each with their own module key and specification. If a sub-module is present with the same application scope as the application where the Password2 field is, the system uses the sub-module. For example, if a table in the ServiceNow® Customer Service application has a sub-module, and you write information to a Password2 field on a table in the Customer Service application scope, the cryptographic process calls the Customer Service sub-module. The process also uses that sub-module’s key for encryption and decryption with a unique AES 256 GCM encryption key. One sub-module per application scope is allowed. Usually, when you write to a Password2 field for an application in the global scope, it uses the parent module.

Note: You cannot create your own sub-modules in San Diego. Sub-modules are provided in various application plugins on the Now Platform. You can rotate keys on sub-modules, but not the parent cm_glide_encrypter module.

Domain separation and on-premise customers

KMF Password2 does not support domain separation. You can use Password2 with on-premise instances.

Legacy Password2 and the current Password2

In San Diego, the existing Password2 field has been upgraded.

The current implementation of Password2:

• Uses the Key Management Framework in accordance with NIST 800-57 key wrapping guidelines and provides FIPS 140-2-L3 protection for the entire key hierarchy.
• Includes capabilities to create dedicated and unique KMF Password2 sub-modules for specific applications, providing control through application scope. Each sub-module has its own unique AES 256 GCM encryption key.

Password2 fields in scripts

When accessing Password2 fields with a script, run the script under the same scope as the table scope. Use setDisplayValue() to encrypt Password2 values and getDecryptedValue() to decrypt and read the value.

Note: Do not use the GlideEncrypter() API on Password2 fields.

This example script shows you how to encrypt my@Password in the password2 column of table ‘table_xyz’.
var gr = new GlideRecord('table_xyz');
gr.setDisplayValue('pwd2column_name', 'my@Password');
gr.insert();

**Important:** You cannot use the `setValue()` API for the `Password2` field.

This example script shows you how to decrypt the same field to retrieve the value:

```javascript
var gr = new GlideRecord('table_xyz');
gr.query();
gr.next();
var ge=gr.getElement('pwd2column_name');
var ged1 = ge.getDecryptedValue();

**Important:** The `getDecryptedValue()` API is not scoped. It is available globally.
```

1. When you encrypt data in a `Password2` field, the system determines the scope of the application where the `Password2` field resides.

2. The system then looks for a sub-module of the `cm.glide_encrypter` parent module with the same scope as the application if the property is set to true.
   - If a sub-module with the same scope is present, it uses the sub-module specification and key to perform the encryption.

This illustration explains how your instance decrypts data in `Password2` fields:

**Password2 decryption flow**

![Diagram illustrating the decryption process]

**KMF Password2 migration job**

A migration job is provided for customers upgrading from previous releases. It takes data encrypted with a legacy `Password2` encryption and re-encrypts it with the key in a KMF `Password2` sub-module key. The re-encryption only applies to tables with `Password2` fields in application scopes that also have sub-modules created for that scope. For example, a legacy `Password2` field in `XYZ_example` application (with `XYZ_example` application scope) is re-encrypted only if a sub-module for the `XYZ_example` application scope exists under the `cm.glide_encrypter` parent module.

The KMF `Password2` encryption keys in the sub-module are protected (envelope encrypted) in the KMF key hierarchy.
Column Level Encryption

Column Level Encryption (CLE), formerly Encryption Support, permits and denies access to encrypted data based on user role. Column Level Encryption is enhanced in San Diego to basic key management using encryption modules at no additional charge.

About Column Level Encryption

Note: Previously configured encryption contexts are automatically converted to encryption modules. Column Level Encryption (CLE) is succeeded by Column Level Encryption Enterprise. To learn about the encryption options, see Encryption and Key Management subscription bundle.

Implementation of column-level encryption begins with defining one or more encryption modules in your instances of the Now Platform. This process includes selecting the desired encryption algorithm and providing an appropriate secret key. Access to data later encrypted using the feature is role-based, with modules being associated with roles. Users without the correct role do not see the field at all. Figure 1 illustrates how role-based encryption functions.

Figure 1 – Role-based encryption example

Here are the results of the relationships in Figure 1:

• User 1 is a member of Role 1, which provides access to encryption module 1. User 1 can see the contents of Field A and Field B.

• User 2 and User 3 are members of Group 1. Group 1 is a member of Role 1, which allows everyone in Group 1 access to encryption module 1 and allows User 2 and User 3 to see the contents of Field A and Field B.

• User 4 is not a member of any group or role and has no access to encryption module 1. Not only does User 4 not have access to Field A or Field B, but User 4 doesn’t even see these fields on a form. On a list view, the values would be empty.

You can implement considerably more complex role-based encryption, as well.

Role-based access also must be implemented appropriately for that field to be accessible to users who are assigned the encryption module via a role.

Customer encryption keys for use with column-level encryption, whether provided by a customer or randomly generated by the instance, are stored in the same unique instance database where the data encrypted by them is stored. As a further security measure, they are re-encrypted with a secondary key unique for that instance, which mitigates direct
access to the encryption key for any encryption module, either by an instance administrator or ServiceNow.

Column-level encrypted data cannot be filtered or sorted.

Column Level Encryption:

- Access to encrypted data is determined by user role.
- You can choose the strength of the encryption algorithm: AES-128 or AES-256.
- You can encrypt String text, Date and Date/Time fields, attachments, and URLs.
- Encryption modules provides Equality Preserving encryption.

Column Level Encryption Enterprise supports the following additional features:

- Customer-supplied keys.
- Key access allows a user session with access to the context/key works for other back-end or system user processes.
- Script, Resource Exchange, and app access
- Advanced attachment support.
- API access is available.
- Order Preserving encryption or standard, non-deterministic encryption is supported.

Encryption methods

Fields that use Column Level Encryption may include:

- New or existing Encrypted Text fields.
- String, Date, Date/Time, or URL fields included in encrypted field configuration records.

The Encrypted Field Configurations table [sys_platform_encryption_configuration] contains a record for each field encrypted with Column Level Encryption. This table enables a security_admin to monitor all fields in the instance that uses Column Level Encryption. On upgrade, encrypted field configuration records are created for all existing encrypted text fields. When a new encrypted text field is added, an encrypted field configuration record is created by default.

Encrypted field configurations can encrypt fields using one of the following methods.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single encryption module</td>
<td>The field is encrypted with the encryption method defined in the encryption module field. Users who do not have the encrypted module access cannot view or update field values.</td>
</tr>
<tr>
<td>Multiple encryption modules</td>
<td>The field is encrypted with the encryption module of the first user to enter data. If the user has two or more encryption modules, the module defined in the encryption module selector is used. Because the encryption module is set on a per record basis, fields in a list can have different encryption modules. However, within a single record, the field can be encrypted by only one module. When an Encrypted Text field is created, an encrypted field configuration is created with the multiple encryption modules method. Encrypted Text fields and fields encrypted with the multiple encryption modules method behave the same.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>Mass encryption is not available when using the multiple encryption modules method.</td>
</tr>
</tbody>
</table>

**Access to encrypted data**

An encryption module determines access to encrypted data. Security_admin users can grant an encryption module access policy to a user by granting the user an associated role. To monitor the assignment of roles, the customer or ServiceNow professional services can set up security measures. For example, an email can be sent to an appointed encryption manager whenever a role associated with an encryption module is granted to a user.

**Note:** Impersonation does not change the encryption module available to a user. Even while impersonating, you have only the encryption modules available to you originally. Column Level Encryption Enterprise introduces this functionality in San Diego.

<table>
<thead>
<tr>
<th>Access level</th>
<th>Data access to a field using the single encryption module method</th>
<th>Data access to a field using the multiple encryption modules method</th>
</tr>
</thead>
<tbody>
<tr>
<td>User with no encryption modules</td>
<td>The form hides the encrypted field. In list view, the field appears blank and cannot be edited, even if the data in the field is decrypted.</td>
<td>The form hides the encrypted field. In list view, the field appears blank and cannot be edited, even if the data in the field is decrypted.</td>
</tr>
<tr>
<td>User with one encryption module</td>
<td>To use the field, the user must have access to the encryption modules defined in the encrypted field configuration. If the user does not have access to the encryption modules, the form hides the field. In list view, the field appears blank and cannot be edited.</td>

<td>• If there is data in the field: If the user has access to the encryption module used to encrypt the field, the user can view and edit the field. The field always uses the original encryption module to encrypt changes to the field. This behavior prevents users with multiple encryption modules from changing the encryption module of a field.</td>
</tr>
</tbody>
</table>

Supported configuration information

- The following field types can be encrypted:
  - String text
  - Date
  - Date/Time
  - Attachments
  - URL
- Because module are tied to roles and roles are tied to users, you do not have access to keys from non-user sessions. Anything running as a system user or a scheduled job that doesn’t have a user session won’t be able to access the key to encrypt or decrypt data.
- You have the option to access the “value” or the “display value”:
  - When you choose “value,” ciphertext is returned.
  - When you choose “display value,” provided you have the right role, cleartext is returned.

Many scripts in the application layers are scripted in such a way that they ignore this distinction and use value. The data won’t be encrypted or decrypted if you don’t change the scripts to use display value.

Filtering and searching encrypted fields

When an Encrypted Text field or a field with an encrypted field configuration applied is selected as the left operand in a filter, the following operators are available:

- is
- is not
• is empty
• is not empty

For Date fields, use the date picker to specify the date:

For Date/Time fields, use the date and time picker to specify the date and time:

If a user with one or more encryption module filters for equality or searches for a value in a list:

• Only values encrypted with an encryption module available to the user are returned.
• The operators is empty and is not empty return all matching records. Fields encrypted with an encryption module not available to the current user appear blank.

If a user does not have any encryption modules, no records are returned.

The Show Matching and Filter Out options are supported in lists. Only exact matches are returned or filtered out.

Note: Adding encrypted fields in condition filters is supported in scripts such as UI policies and business rules.

Exporting data from encrypted fields

When exporting encrypted fields in a list or form to a file format, only fields encrypted by an encryption module available to the current user appear in the exported document.

To disable exports of encrypted data from a list view, add the glide.encryption.export_encrypted_data.allowed system property and set the value to false.

Column Level Encryption Guided Tour

The tour gives a brief overview of the Column Level Encryption (CLE) setup needed to encrypt table fields or attachments. Steps for the creation of Field Encryption Modules, Module Access Policies, and Encrypted Field Configurations are also covered. The tour
includes links to detailed documentation and the Now Learning Column Level Encryption Overview course.

**Before you begin**
Role required: sn_kmf.crypto_manager or security_admin

ℹ️ **Note:** The guided tour is not yet available when Next Experience is enabled.

**Procedure**

2. Open the Show Help icon in the upper left corner.
3. Select Take a Tour at the bottom of the sidebar.
4. Select Next to progress through the tour.

---

**Column Level Encryption Enterprise**

Column Level Encryption Enterprise utilizes the Key Management Framework (KMF) to enable you to fully customize and manage how fields and attachments are encrypted and decrypted on your instance. A subscription is required to utilize Column Level Encryption Enterprise.

Column Level Encryption Enterprise is premised with Column Level Encryption (CLE) and uses the Key Management Framework and its full support of key management functions. Column Level Encryption Enterprise provides key-protection and key lifecycle management for application-level field encryption. All keys are protected with a key-wrapping hierarchy ultimately rooted in FIPS 140-2-L3 Hardware Security Modules (HSM).

Column Level Encryption Enterprise gives you the ability to manage how supported fields are encrypted and decrypted in accordance with NIST 800-57 practices. It also uses the most updated version of field-level encryption, including integration for proper key protection and management.
Specifically, Column Level Encryption Enterprise utilizes KMF’s encryption modules, granting you more control of server-side encryption. KMF ensures proper data encryption key protection using key hierarchy and envelope encryption. Your instance encrypts data through cryptographic modules that you configure. You can create an access policy for each module then configure cryptographic specifications and access policies and control key lifecycle management control.

Column Level Encryption Enterprise supports module access policies based on:

- Scope
- Role
- Script
- Resource Exchange
- System User

See Create a module access policy for additional information.

**Note:** For details on the supported features of Column Level Encryption and how to upgrade and subscribe to the Column Level Encryption Enterprise entitlement refer to Encryption and Key Management subscription bundle.

</tr>
</tbody>
</table>

**Note:** If you choose not to activate Column Level Encryption Enterprise, you can still use CLE. Column Level Encryption modules permit and deny access to encrypted data based on user role. See Column Level Encryption for information.

Column Level Encryption Enterprise supports on-premise customers. It does not support Domain Separation.

**API support**

Column Level Encryption Enterprise updates the `setDisplayValue()` and `setValue()` APIs so they can insert encrypted data for encrypted fields. It also enables `getDisplayValue()` and `getValue()` to return cleartext values.

The following script illustrates these API changes when the Incident short description is encrypted:

```javascript
var gr = new GlideRecord('incident'); //creates a new incident
gr.setValue('short_description','test123'); //sets the value to test123
var sys_ID = gr.insert(); //inserts the record in the Incident table.
gs.info(gr.getValue('short_description')); //displays the unencrypted value
```

When using `getValue()` to get encrypted text, your script no longer returns the ciphertext. Your script returns the plaintext, assuming that the user has access to the cryptographic module. If the user does not have access to the cryptographic module, `getValue()` returns the ciphertext.

**Activate Column Level Encryption Enterprise**

You can activate the Column Level Encryption Enterprise plugin (com.glide.now.platform.encryption) after you purchase a subscription.

**Before you begin**

Role required: admin

**About this task**

The following items are installed or modified with the Column Level Encryption Enterprise plugin (com.glide.now.platform.encryption):

- The Encryption Support (com.glide.encryption) plugin is also activated.

  **Note:** The Key Management Framework (com.glide.kmf.global) plugin is already active by default.

- The glide_encryption.cle_replatforming_with_kmf property is set to `opt_in`.

- The glide_encryption.set_value_support_cle.disabled property is set to `false`, which turns on the SetValue feature. The SetValue support enables both `setDisplayValue()` and `setValue()`
APIs to support encrypted data. It also enables both `getDisplayValue()` and `getValue()` to return clear text values.

- Two scheduled jobs are enabled:
  - `autoKeyMigration`: Migrates encryption context keys to Key Management Framework (KMF) cryptographic module keys.
  - `autoDataMigration`: Migrates data that you already encrypted to use the KMF cryptographic module key.

Administrators can modify when these scheduled jobs run, and can pause or restart them at any time.

**Procedure**

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the plugin, Platform Encryption - com.glide.now.platform.encryption using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see [Request a plugin](#).
3. Select **Install**, and then in the Activate Plugin dialog box, select **Activate**.

   ❓ **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for `<plugin name>`.

**Migrating to Column Level Encryption Enterprise**

Scheduled jobs migrate your keys and encrypted data from Encryption Support to Column Level Encryption Enterprise.

You can review the scheduled jobs by navigating to **System Security > High Security Settings > Security Jobs**:

- `autoKeyMigration`: Migrates encryption context keys to Key Management Framework (KMF) cryptographic module keys.
- `autoDataMigration`: Migrates data that you already encrypted to use the KMF cryptographic module key.

You can modify when these scheduled jobs run, and can pause or restart them at any time.

Verify that the encrypted field configurations are using your newly migrated module keys by navigating to **System Security > Field Encryption > Encrypted Field Configurations**. Look for the following items:

- The **Method** field is **Single Module**.
- The **Crypto module** field is populated with the name of the cryptographic module that the system automatically creates. You can review that module and the module access policy, both of which are active and published.

**Create cryptographic module for Column Level Encryption**

Create a Column Level Encryption cryptographic module to define the mechanisms used for cryptographic operations.

**Before you begin**

Roles required: `sn_kmf.cryptographic_manager` or `sn_kmf_admin`, `security_admin`, `admin`
About this task
This procedure describes options that are available with Column Level Encryption (CLE) with the base system and additional configuration options that become available with Column Level Encryption Enterprise (CLE_Ent) functionality. Column Level Encryption Enterprise is available with a paid subscription. Refer to Encryption and Key Management subscription bundle for supported features and options available with each offering. See Activate Column Level Encryption Enterprise for more information on obtaining Column Level Encryption Enterprise.

Procedure
1. Navigate to All > System Security > Field Encryption Modules > New.

2. On the form, fill in the fields.

Cryptographic Module form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module name</td>
<td>Alphanumeric string to be referenced when running scripts.</td>
</tr>
<tr>
<td>Crypto spec template</td>
<td>Default template used to create the cryptographic module that contains mappings of many crypto purposes to crypto specifications and recommended algorithms.</td>
</tr>
<tr>
<td>Application</td>
<td>The selected application scope.</td>
</tr>
<tr>
<td>Name</td>
<td>Encryption module name is prepended with application scope name to avoid conflict with other scoped applications on module creation. For example, if you created a module with the name my_crypto_module in the global application scope, the name is saved as global.my_crypto_module.</td>
</tr>
<tr>
<td>Crypto module lifecycle state</td>
<td>The term lifecycle refers to the creation, use, and deactivation of a cryptographic module. Set to Draft initially during configuration. When using the module, set to Published. The Default template is automatically set to Published.</td>
</tr>
<tr>
<td>Parent crypto module</td>
<td>The parent is populated automatically as column_level_encryption.</td>
</tr>
</tbody>
</table>

3. Click Submit.

After submitting successfully, your cryptographic module is listed in the Cryptographic Modules table.

A default cryptographic specification is created with the crypto purpose set to Symmetric Data Encryption/Decryption and the algorithm as AES 256 CBC. Select the algorithm for updates.
4. To open the configuration options, click the newly created cryptographic module.

**Note:** A maximum of five Column Level Encryption modules are allowed before upgrading to CLE_Ent. An error message displays and you are prevented from adding additional cryptographic modules.

**What to do next**
Create a cryptographic specification for Column Level Encryption.

**Create a cryptographic specification for Column Level Encryption**
After you create a cryptographic module, access the corresponding cryptographic specification to define the algorithm.

**Before you begin**
Role required: sn_kmf.cryptographic_manager or sn_kmf_admin and security_admin or admin

**About this task**
This procedure describes options that are available with Column Level Encryption (CLE) with the base system and additional configuration options that become available with Column Level Encryption Enterprise (CLE_Ent) functionality. Column Level Encryption Enterprise functionality is available with a paid subscription. Refer to Encryption and Key Management subscription bundle for supported features and options available with each offering. See Activate Column Level Encryption Enterprise for more information on obtaining Column Level Encryption Enterprise.

A cryptographic specification will be created by the system when you create a cryptographic module for column level encryption.

**Procedure**
1. Navigate to **System Security > Field Encryption Modules > All.**
2. Select the cryptographic module to open the configuration options.
   Cryptographic module information is displayed at the top of the screen. A Symmetric Data Encryption/Decryption crypto specification is auto-created with an AES 256 CBC algorithm.
3. Select the crypto specification from the table to open the Algorithm Definition.
   For Column Level Encryption Enterprise see Configure advanced algorithms for Column Level Encryption Enterprise.
4. Click **Next** to access the Key Lifecycle.

**What to do next**
Perform one of the following operations:
• Select an entry in the Key Lifecycle table to define key lifecycle behavior. See Configure key lifecycle states for details to complete the lifecycle definition for the key.

• Click **Next** to create a cryptographic key. See one of the following tasks for key generation:
  ◦ Generate a ServiceNow cryptographic key.

**Configure advanced algorithms for Column Level Encryption Enterprise**

Create a cryptographic specification to define the algorithm for a cryptographic module. Customize the encryption specifications with advanced options that are available for Column Level Encryption Enterprise.

**Before you begin**
Role required: admin

**Procedure**
1. On the **Crypto Specifications (#)** tab, click **New**.

2. On the form, fill in the fields.

**Algorithm Definition form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crypto module</td>
<td>Name of the selected cryptographic module populates.</td>
</tr>
<tr>
<td>Crypto purpose</td>
<td>The value is <strong>Symmetric Data Encryption/Decryption</strong> for Column Level Encryption Enterprise.</td>
</tr>
<tr>
<td>Algorithm</td>
<td>The value is <strong>AES</strong> for Column Level Encryption Enterprise.</td>
</tr>
<tr>
<td>Operation mode</td>
<td>The value is <strong>CBC</strong> for Column Level Encryption Enterprise.</td>
</tr>
<tr>
<td>Size</td>
<td>Possible values are <strong>256</strong> and <strong>128</strong>.</td>
</tr>
<tr>
<td>Equality preserving</td>
<td>Option to enable non-deterministic encryption.</td>
</tr>
</tbody>
</table>

*Note:* 256-bit size is most secure for encryption and is used for Symmetric Data Encryption/Decryption for Column Level Encryption Enterprise.
### Field | Description
--- | ---
| **Note:** Select to encrypt the same data differently if encrypted more than once. List filtering of encrypted data using equality comparison operators is inactive because the encoded data is always different. Option to enable **Symmetric Data Encryption/Decryption** with **AES in Cipher Block Chaining (CBC)** mode.
| Integrity | Option to provide Integrity in GCM operation and does not apply for Column Level Encryption Enterprise functionality.

<table>
<thead>
<tr>
<th>Algorithm Definition</th>
<th>Lifecycle Definition</th>
<th>Key Origin</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Crypto module</strong></td>
<td>test</td>
<td>Equality preserving</td>
</tr>
<tr>
<td><strong>Crypto purpose</strong></td>
<td>Symmetric Data Encryption/Decryption</td>
<td>Integrity</td>
</tr>
<tr>
<td><strong>Algorithm</strong></td>
<td>AES</td>
<td></td>
</tr>
<tr>
<td><strong>Operation mode</strong></td>
<td>CBC</td>
<td></td>
</tr>
<tr>
<td><strong>Size</strong></td>
<td>256</td>
<td></td>
</tr>
</tbody>
</table>

3. **Click Submit.**

The following example shows AES CBC-256 encryption. When Column Level Encryption Enterprise is active and the parent module is column_level_encryption, only Symmetric Data Encryption/Decryption AES CBC-256 applies as the crypto purpose. See **Cryptographic purpose, algorithms, and key information** for details.

#### What to do next
Perform one of the following operations:

- Select an entry in the Key Lifecycle table to define key lifecycle behavior. See **Configure key lifecycle states** for details to complete the lifecycle definition for the key.
- Click **Next** to create a cryptographic key. See one of the following tasks for key generation:
  - Generate a ServiceNow cryptographic key.
  - Configure properties for customer-supplied keys.
  - Import a key from web service.

#### Configure properties for customer-supplied keys
If the Column Level Encryption Enterprise plugin is enabled, you can use system properties to define key padding, ephemeral key pair size, and a key validity period of your customer-supplied keys.

Column Level Encryption Enterprise with Key Management lets you manage the full key lifecycle of your data encryption keys. Optionally, you can securely exchange data encryption keys generated within your environment.
After the data encryption key is imported to the instance, a secure wrapping key protects new module keys on the instance. The wrapping key is an instance key encryption key (IKEK) generated by a hardware security module (HSM) on SafeNet KeySecure. See Instance level keys in the Key Management Framework for details in key types. When you provide your own key, you must wrap it with the RSA public key. Three properties define the size, padding algorithm, and validity period of the wrapping RSA key pair:

- glide.kmf.ephemeral_key.key_padding controls the key padding scheme for the ephemeral key. The default scheme is OAEP SHA256, but SHA1 is also supported.
- glide.kmf.ephemeral_key.key_size controls the key size of the ephemeral key pair. The default is 4096 bits, but 2048 bits are also supported.
- glide.kmf.ephemeral_key.key_validity_period defines the period for which the ephemeral key pair is valid. The default value is two hours.

Continue to Wrap your customer-supplied key.

**Wrap your customer-supplied key**

If you are using customer-supplied keys, wrap the private key to use for encryption with the downloaded public key.

**Before you begin**

Roles required: sn_kmf.cryptographic_manager or sn_kmf.admin

**Note:** This procedure describes options that are available with KMF base system and options to be used with Column Level Encryption Enterprise functionality. Column Level Encryption Enterprise functionality is available only when the com.glide.now.platform.encryption plugin is active. See Activate Column Level Encryption Enterprise for more information on obtaining Column Level Encryption Enterprise.

- Modify optional properties that control the size, padding algorithm, and validity period of the key.
- You must have your private key (.BIN) for encryption.
- You must have a cryptographic tool to wrap your key. This example uses OpenSSL 1.1.

**Procedure**

1. Navigate to **All > Key Management Framework > Cryptographic Modules > All**.
2. Select the cryptographic module that you created for the customer supplied key from the Crypto Specifications related list.
3. You will be directed to the **Key Creation** step.
4. If you have not previously downloaded the wrapping key, click the link to download the token_publickey<id>.zip file. Save the zip file to the same location as your key.

   **Note:** Do not rename the downloaded token_publickey<id>. file.
5. Unzip the file to your local network. 
   The zip file contains two files, an import token and a public key .PEM certificate. Wrap your private key with the public key to encrypt it.
6. Copy the name of the token_publickey file to your clipboard.

7. From a command line, use the copied token_publickey file name to open the folder of the unzipped files as a placeholder for the wrapped key.

8. Edit this script by replacing the examples with the names of your crypto files. Refer to the Key wrapping commands table for details:

```
"downloads user.name$ cd token_publickey_<token>
openssl pkeyutl -encrypt -pubin -inkey publickey_<keyname>.PEM
-in <keyname.bin>
-out wrapped_key_material -pkeyopt rsa_padding_mode:oaep -pkeyopt rsa_oaep_md:sha<128 or 256> "
```

<table>
<thead>
<tr>
<th>Directions</th>
<th>Command</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open the file directory where you downloaded the wrapping token.</td>
<td>cd</td>
<td>cd token_publickey123456789</td>
</tr>
<tr>
<td>Paste the name of the publickey.PEM certificate.</td>
<td>openssl pkeyutl -encrypt -pubin -inkey</td>
<td>publickey_586798643fff.PEM</td>
</tr>
<tr>
<td>Paste the name of your key here.</td>
<td>-in</td>
<td>mykey.bin</td>
</tr>
<tr>
<td>Enter the &lt;-out&gt; command and specify if the key is 128 bit or 256 bit.</td>
<td>-out wrapped_key_material -pkeyopt rsa_padding_mode:oaep -pkeyopt rsa_oaep_md:sha256</td>
<td>N/A</td>
</tr>
</tbody>
</table>

9. Run the command. A return displays the token_publickey_<keynumber>.

10. The key will be generated and a "wrapped_key_material" file added to the directory.

11. You are ready to upload the wrapped key.

**What to do next**
Return to Configure and upload your customer supplied key to upload your wrapped key.

**Configure and upload your customer supplied key**
You can use your own customer supplied key instead of using the ServiceNow® system-generated keys.

**Before you begin**
Roles required: security_admin, sn_kmf.cryptographic_manager
If you are NOT supplying your own keys, you do not need to perform this procedure. To create a cryptographic module with ServiceNow® keys, go to Create a cryptographic module or Create cryptographic module for Column Level Encryption.

**Note:** This procedure only applies to Column Level Encryption Enterprise functionality. See Activate Column Level Encryption Enterprise for more information.

**Important:** You cannot revoke a customer supplied key.
Procedure

1. Navigate to All > System Security > Field Encryption Settings and verify that Customer Supplied Keys is selected.

Key source selection

2. Click Submit.

Create new cryptographic module

4. Complete the Cryptographic Module form as follows:

Cryptographic Module fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module Name</td>
<td>Enter a name for the module.</td>
</tr>
<tr>
<td>Crypto spec template</td>
<td>The default cryptographic template is selected.</td>
</tr>
<tr>
<td>Name</td>
<td>Auto-populates based on the module name and prepends the name with the scope to ensure which application is being applied. In this case the global scope is applied.</td>
</tr>
<tr>
<td>Crypto module lifecycle state</td>
<td>Select Published to activate the crypto module.</td>
</tr>
<tr>
<td>Parent crypto module</td>
<td>The parent module column_level_encryption is selected automatically when using customer-supplied keys and encryption modules.</td>
</tr>
</tbody>
</table>

5. Click Submit.
6. Select the newly created cryptographic module from the table. In the Crypto Specifications related list, click the auto-generated key alias with the AES 256 CDB algorithm. The system populates the Crypto purpose and the Algorithm for CLE automatically and jumps to the Key Origin stage.

7. Notice that Upload customer supplied key is the Origin and the Key alias is already populated.

8. Click Next to move to the Key Creation stage. There are two links:

   - **Download wrapping key** downloads the key in a zip file containing an import token and a public key certificate, .PEM file. Use the import token to verify successful key wrapping per security specification for the instance. Use the public key certificate .PEM file to wrap your customer supplied key securely before uploading it along with the token.

   - **Upload customer supplied key** opens the file browser to select the token and the encrypted key that you wrapped.

9. Click Download wrapping key to save the token. Save the token to the same destination location as the key is saved on your system. Do not rename the downloaded token.

10. Run the BYOK command on a terminal to wrap the key. For more information, refer to Wrap your customer-supplied key.

11. Click Upload customer supplied key.

12. Click Browse to select the two files, the wrapped key and the token file. The attachments window opens and the two files are displayed in the list.
Select a file to remove and re-upload, if necessary.

13. Click **OK**.
You will be returned to the Cryptographic Module screen. A confirmation message displays for a successful upload of the customer key. The key will also be listed in the Module Keys related list.

**Confirmation of key upload**

**What to do next**
Now that you have finished configuring your cryptographic module with your customer-supplied key, move on to **Create a module access policy**

**Column Level Encryption Enterprise examples**
These examples walk you through the encryption of fields and attachments using customer-supplied keys.

**Field encryption walk-through**
This walk-through shows you how to encrypt a field in your instance using Column Level Encryption Enterprise with the Key Management Framework (KMF). It also shows you how to use your own key.
Before you begin

Note: This procedure only applies to Column Level Encryption Enterprise functionality. See Activate Column Level Encryption Enterprise for more information on obtaining Column Level Encryption Enterprise.

Role required: admin or security_admin

About this task
This walk-through starts with an instance where you have already created and uploaded your personal cryptographic key. You could use the ServiceNow key, but this example uses a customer-supplied key.

After the key has been stored in a cryptographic module, you can start configuring fields in your instance, such as salary or social security numbers that have limited access from certain users. In the Encrypted Field Configuration, specify which authorized personnel can access sensitive data.

This task demonstrates two scenarios. One example encrypts the Short Description field in an Incident for users who are not authorized to view the sensitive data.

Attachments can also be encrypted and only visible to users who are granted access, or is visible to all users that are not restricted from viewing the data. See Attachment encryption walk-through to encrypt an attachment.

Procedure
1. Make sure that Column Level Encryption Enterprise is enabled.
2. Create a cryptographic module for column_level_encryption. See Create cryptographic module for Column Level Encryption for more information.
4. Click New.
5. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Column is required to use your personal key.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that stores the sensitive information. For this example, select Incident [incident].</td>
</tr>
<tr>
<td>Column</td>
<td>Column, or specific information, that represents the sensitive date to be encrypted. For this example, select short_description.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to mark Active to use the field configuration.</td>
</tr>
<tr>
<td>Algorithm Equality Preserving</td>
<td>The option is automatically selected.</td>
</tr>
<tr>
<td>Crypto module</td>
<td>Module that you created to use with the personal key.</td>
</tr>
<tr>
<td>Method</td>
<td>The Single Module option is used to apply the policies for one module. Multiple Modules is used to apply the policies across multiple modules.</td>
</tr>
</tbody>
</table>
6. Click **Submit**.

Establish a Module Access Policy to assign access to the cryptographic module. See [Create a module access policy](#) for additional information.

7. Navigate to **Key Management > Module Access Policies > > Create New >**.

8. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy name</td>
<td>Name for the policy, such as short description.</td>
</tr>
<tr>
<td>Crypto module</td>
<td>Crypto module that you created to encrypt your key.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of access designation for the crypto policy. Use <strong>Role</strong> to grant access to the encrypted field to only those users that have the assigned role.</td>
</tr>
<tr>
<td>Target Role</td>
<td>The role that has access to the encrypted field. For this example, select <strong>Admin</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the Module Access Policy.</td>
</tr>
<tr>
<td>Result</td>
<td>The <strong>Track</strong> option enables the access to the field for the selected role. (To restrict access to that field for the selected role, select <strong>Reject</strong> or <strong>Strict Reject</strong>.)</td>
</tr>
</tbody>
</table>

9. Click **Submit**.

10. As a user with the sn_kmf.admin role, navigate to **Incident > New**.
You can now view the Short description field based on the module access policy configuration.

⚠️ Note: The sn_kmf.admin role was granted user access to the encrypted field, Short description, by setting the module access policy to Track. Notice the lock icon (🔒) under the field name indicating that the field is an encrypted field.

You can now access the Incidents module as an end user to test the encrypted field configuration.

11. Log in as a user to be restricted from viewing the encrypted data in the configured field.

When you access the incident number, the data in the Short description will not be visible.

**Results**

You have successfully used your private key to control access to a specific field using Column Level Encryption Enterprise.

**Attachment encryption walk-through**

This walk-through shows you how to encrypt an attachment in your instance using Column Level Encryption Enterprise with the Key Management Framework (KMF). It also shows you how to use your own key.

**Before you begin**

⚠️ Note: This procedure only applies to Column Level Encryption Enterprise functionality. See Activate Column Level Encryption Enterprise for more information on obtaining Column Level Encryption Enterprise.

Role required: kmf cryptographic manager

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
About this task
This walk-through starts with an instance where you have already created and uploaded your customer-supplied cryptographic key. You could use the ServiceNow key, but this example uses a customer-supplied key.

Upload confidential attachments in your instance and limit access from certain users. Use Encrypted Field Configuration to specify which authorized personnel can access sensitive data.

We show you how to encrypt attachments to only be visible to users who are granted access, or be visible to all users that are not restricted from viewing the data. In this example, we restrict a certain role from being able to access an attachment in the Incidents module.

**Note:** Although you can use multiple modules with column encryption, attachment encryption must use single modules.

Procedure

1. Make sure that Column Level Encryption Enterprise is enabled.
2. Create a cryptographic module.
   See [Create cryptographic module for Column Level Encryption](#) for more information.
3. Navigate to **System Security > Encrypted Field Configurations**.
4. Click **New**.
5. Complete the form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select <em>Attachment</em> to use your personal key for encrypting an attachment from the selected <em>Table</em>. For this example, select <em>Incident</em>.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the table to access the sensitive information. For this example, select <em>Incident [incident]</em>.</td>
</tr>
<tr>
<td>Active</td>
<td>Mark <em>Active</em> to be able to use the field configuration.</td>
</tr>
<tr>
<td>Algorithm Equality Preserving</td>
<td>When selecting column level encryption, this field is visible based on the table selected.</td>
</tr>
<tr>
<td>Crypto module</td>
<td>Select the module that you created to use with the personal key.</td>
</tr>
<tr>
<td>Method</td>
<td><em>Single Module</em> is selected, as the crypto module being used is a single module. Multiple modules are not supported for attachment encryption.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.
Establish a Module Access Policy to assign access to the cryptographic module. Refer to Create a module access policy for additional information.

7. Navigate to **Key Management > Module Access Policies > All**.

8. Click **New**.

9. Complete the form:

<table>
<thead>
<tr>
<th><strong>Module access policy fields</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Policy name</td>
</tr>
<tr>
<td>Crypto module</td>
</tr>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Target Role</td>
</tr>
<tr>
<td>Active</td>
</tr>
<tr>
<td>Result</td>
</tr>
</tbody>
</table>

10. Click **Submit**.

11. As admin or as a person that created the incident, navigate to **Incidents** and add an attachment to **Activities on the Notes related list**.

12. Log in as a user that restricted from accessing the encrypted attachment.
13. Open the incident and scroll to the **Activities** section. The link to open the attachment is not accessible for users with the restricted role.

14. You have now successfully used your customer-supplied key to control access to a specific attachment using column level encryption.

**Cloud Encryption with Key Management**

ServiceNow® Cloud Encryption offers block encryption of the full database host along with enhanced key management. Cloud Encryption is available with the ServiceNow Platform Encryption subscription bundle.

Cloud Encryption offers:

- Segregation of duties.
- Rotation of ServiceNow Managed keys.
- Customer Managed keys option.
  - You may want to use this option if your organization requires you to use key material generated by your own cryptographic tools or libraries, enterprise key management system, or hardware security module (HSM). See **Configure Customer Managed key settings** for details.

The following diagram shows how Cloud Encryption key management works.

![Cloud Encryption Overview](image)

The Cloud Encryption Key Management module consists of the following sub-modules:

- **Key Management Operations**:
  - Access the list of keys.
  - Perform key rotation operations.

- **Key Management Transactions**:
  - Reference all transactions that have occurred for the keys that have been used.

- **Configure Customer Managed key settings**:
  - Use your own customer-managed key for encryption.

See **Encryption and Key Management subscription bundle** for information on obtaining Cloud Encryption.
Key Management Operations

The Key Management Operations sub-module provides access to view and manage all encryption keys used with ServiceNow Cloud Encryption.

There is only one active key in the system at any given time. When selecting a key, you access the activity for the selected key, such as which keys were rotated or withdrawn and the corresponding timestamp.

The key lifecycle state updates according to the key management operation performed.

Key lifecycle state

See Rotate a ServiceNow Managed key or Rotate your Customer Managed key for details.

Rotate a ServiceNow Managed key

Rotate the active Cloud Encryption ServiceNow Managed key. Rotating keys on a planned basis helps meet industry standards and minimize exposure.

Before you begin

Role required: kmf_cryptomanager and kmf_admin

About this task

Key rotation retires the active encryption key and replaces that key with a newly generated cryptographic key.

Important: If you’re using Customer Managed keys, see Configure Customer Managed key settings to get started.

Procedure

1. Navigate to All > Cloud Encryption Key Management > Key Management Operations. The Cloud Encryption Key Metadata table loads. All keys used in your instance are listed. Only one key can be active at a given time.

If accessing the Cloud Encryption module for the first time, key entries will be available after an initial key rotation is performed. A ServiceNow Managed key is the default in the system.

2. Select the active key from the table.
3. Select **Rotate Key**.
   A notification is displayed with the option to continue the key rotation or to cancel the operation.

4. To rotate the key, select **OK**.
   A confirmation message is displayed at the top of the Key Definition page.

5. Return to the Key Management Operations screen to refresh the Cloud Encryption Key Metadata table.
   Entries are listed for the current active key and the key that is being generated to rotate in place of the current active key. See *Key Management Framework key lifecycle states* for the different available states.

6. To view the Key Management transactions, open the entry for the original key.
   See *Key Management Transactions* for more information.
The previously active key, version 0, updated to the key lifecycle state of Rotated. On rotation, the new key version is changed to 1 and becomes the Active key.

**Rotate your Customer Managed key**

Rotate your Customer Managed key to your instance after you have wrapped your Customer Managed key for Cloud Encryption. Rotating keys on a planned basis helps meet industry standards and minimize exposure.

**Before you begin**

Role required: kmf_cryptomanager and kmf_admin

**About this task**

Key rotation retires the active encryption key and replaces that key with a newly generated cryptographic key.

**Procedure**

1. Navigate to All > Cloud Encryption Key Management > Key Management Operations. The Cloud Encryption Key Metadata table loads. All keys that have been used in your instance are listed.

2. Select the Key alias link for the Active key with the origin value of customer_supplied key.

   The Customer Managed key has a key lifecycle state of Active. For additional information on the Cloud Encryption Key Metadata table, see Key Management Operations.

3. Select Rotate Key.
You are directed to the Upload Customer Managed key window.

4. Select Step 1 **Download Wrapping Certificate**.
   The public_certificate....zip downloads to your local machine and is used to wrap your Customer Managed key.

   **Warning:** Download a new wrapping certificate each time that you rotate or upload a customer managed key.

   **Note:** Step 2 **Read Customer Managed key preparation prior to uploading** in the interface links to Prepare your Customer Managed key.

5. Select **Browse** for Step 3 **Upload the wrapped Customer Managed key**.

6. In the Attachments window, browse for and select your wrapped encryption key.
   a. To choose a different file, select the file and select **Remove**.

7. Close the Attachments window.
   You are returned to the Upload Customer Managed Key window.

8. To upload your key, select **OK**.
   If the key is in the proper format, a confirmation message appears, otherwise, an error message appears. The key file is attached to the Key Definition record.

   In the Key Management Transactions table, the certificate download and key upload steps are listed. See **Key Management Transactions** for details on the request steps.
9. Verify that the previous key was rotated and that the new key is the active key.

The key alias is generated and is pre-pended by "ext" to distinguish the key as an external Customer Managed key.

**Key Management Transactions**

The Key Management Transactions sub-module displays all transactions that have occurred for the keys in your ServiceNow instance.

- A key transaction is defined by the following:
  - Several request steps comprise a transaction.
  - A single Request ID is shared across all request steps. Each Request ID is a system-generated unique ID for each key transaction being performed.
  - The initial step, request sequence 0, of a transaction provides the current state of the overall transaction.
    - As seen in the following image, the initial step 0 has an overall Request Status of Completed.
  - The following can be identified for the transaction by the individual request step:
    - The order of each step in a transaction can be identified by the sequence number for the step.
    - The status of each transaction is visible through the status of the request step.
    - The overall transaction has a status of Failed if any steps beyond the initial step fail. The transaction status reflects Completed when all steps are completed.

The following screen is a sample of the type of information that is displayed with a ServiceNow key rotation.
The following table displays the field information available on the Key Managements Transactions page.

### Key Management Transactions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request ID</td>
<td>Unique system-generated ID for the action being performed. One request ID is shared across all request steps.</td>
</tr>
<tr>
<td>Request action</td>
<td>Displays the action for the key operation being performed.</td>
</tr>
</tbody>
</table>
| Request status         | • Processing: A request has been entered but has not yet completed.  
                         • Completed: The request completed successfully.  
                         • Failed: An issue occurred and the process has not completed.  
                         ◦ Contact Customer Service and Support and provide the request number where the failure occurred. |
| Key alias              | Alphanumeric entry. |
| Key lifecycle state    | See [Key Management Framework key lifecycle states](#) for definitions. |
| Origin                 | • ServiceNow Managed key.  
                         • Customer Managed key. |
| Key version            | When a key rotates, the version number increments. |
| Request sequence       | Displays the order in which a request is being processed in the system. |
| Request step           | Displays which step is being processed in the system during key rotation. The quantity and content of the steps vary based on the type of key operation performed. |

Configure Customer Managed key settings

Configure encryption key settings to use your own Customer Managed key for ServiceNow Cloud Encryption By default, ServiceNow encryption key generation is active.

**Before you begin**

**Important:** Ensure that a copy of your encryption key is always available in a secure location for key management operations or your instance may be rendered inaccessible.

Role required: kmf_cryptomanager and kmf_admin

**About this task**

Customer managed keys offer greater flexibility to manage the keys that encrypt your data. By activating the Customer Managed key functionality, you are taking responsibility for managing the full life cycle of your key.
Procedure

1. Navigate to **All > Cloud Encryption Key Management > Customer Managed Key Settings**.

You are about to switch from a ServiceNow generated key to a Customer Managed key for Cloud Encryption.

**CAUTION:**
- Once your Customer Managed key is activated, you will be unable to revert back to a ServiceNow generated key.
- By activating Customer Managed key you are taking responsibility for managing the full lifecycle of your key.

After enabling Customer Managed key, you must rotate your Active key via Key Management Operations page.

The Customer Managed Key screen displays the information contained in this topic at a high level.

⚠️ **Warning:** Once your Customer Managed key is activated, you are unable to revert to a ServiceNow generated key.

2. Select the **Opt-in for Customer Managed Key** option.

3. Select **Submit**.

The following confirmation message is displayed at the top of the page.

4. Select the **Key Management Operations** link.

After enabling the Customer Managed key, the Customer Managed key function is available. You must initiate a key rotation of the ServiceNow managed key to activate your Customer Managed key.

What to do next
If you have already prepared your Customer Managed key, proceed to **Rotate your Customer Managed key**.

Prepare your Customer Managed key
Follow these steps to prepare your Customer Managed key for upload to your instance.

Before you begin

ℹ️ **Note:** You must have a cryptographic tool to generate and wrap your key with the downloaded certificate from your instance. This example uses OpenSSL version 1.1.x.

If you use a different tool, refer to the respective documentation to generate a wrapped key based on the required key attributes.

Roles required: sn_kmf.cryptographic_manager and sn_kmf.admin

Procedure

1. Generate a random value to use as your AES 256-bit private key using OpenSSL.

For compatibility, your private key must have the following attributes:
- **Key type**: Advanced Encryption Standard (AES) algorithm-based symmetric key.
- **Key size**: 256 bits (32 bytes)

**Key wrapping requirements**:
- RSA encryption algorithm
- Optimal Asymmetric Encryption Padding (OAEP)
- SHA-256 hash function (RSAES_OAEP_SHA_256)
- Encoded using Base64 algorithm

2. Save the key to a file similar to "openssl rand 32 > plaintext_key.bin."

| **Important:** | Save this file securely for future reference. This key will be wrapped with the public key for upload. |

3. Extract the public key from the downloaded wrapping certificate file from your instance:

   ```bash
   openssl x509 -pubkey -noout -in wrapping_cert.pem > public_key.pem
   ```

| **Note:** | Refer to Rotate your Customer Managed key for information to download the wrapping certificate. |

4. Wrap the generated key with the public key downloaded with the wrapping certificate using a RSAES_OAEP_SHA_256 algorithm:

   ```bash
   cat plaintext_key.bin
   openssl pkeyutl -encrypt -inkey public_key.pem -pubin -pkeyopt rsa_padding_mode:oaep
   -pkeyopt rsa_oaep_md:sha256
   openssl base64 -A -out wrapped_key.txt
   ```

   A file specified on this command contains a wrapped customer managed key that can be provided to your ServiceNow Instance. See Rotate your Customer Managed key for details.

**Database Encryption**

ServiceNow® offers database encryption (DBE) and full-disk encryption methods for customers with statutory obligations for data protection which may require at-rest protection for all data.

| **Note:** | Database encryption capability is available for all supported releases based on the following model:

- Existing customers may continue with DBE with Maria DB at the same renewal fee or upgrade to Cloud Encryption with Key Management at the same renewal rate.
- New DBE customers in San Diego must purchase the ServiceNow® Platform Encryption group SKU along with a one-time DBE setup fee. See Encryption and Key Management subscription bundle for more information. |

Database Encryption enables all data to be protected with symmetric AES-256 encryption, whether the database is online or offline. From the Now Platform perspective, all data flows in decrypted.

- Database Encryption supports all stored data to be encrypted in real time providing protection for data online and offline with no loss of functionality.
- Full disk encryption protects offline data if there is disk loss or theft.
With Database Encryption, all stored data is encrypted and individual records or tables are decrypted in memory while being accessed. New or changed data is encrypted as it is entered into a table and associated activity log files (bin, redo, undo, and error) are also encrypted.

Database Encryption is transparent to users, with no loss of functionality. When using this feature, all instances are encrypted, along with replication traffic and backups. Instance cloning is still available with a minor performance impact for using Database Encryption of up to 5%. Both new and existing instances on supported releases of the Now Platform can take advantage of database encryption.

As illustrated, ServiceNow stores and manages keys using a three-level key hierarchy:
1. A customer specific AES-256 key is created by the database engine and is used to encrypt the data.

2. A second customer specific AES-256 key is created by the database engine and is used to protect the first-level key.

3. A third AES-256 key is created by and stored within FIPS 140 validated key management appliances in the ServiceNow datacenters. This key protects the second-level key and is unique per customer instance.

The Now Platform also supports database encryption with a customer supplied switch, DBE with CCS. This is an encryption solution that encrypts all data-at-rest when not in use in the database. It uses industry standard AES encryption with no impact to functionality. The database encrypts data as it is written to the disk, and decrypts data as it is read from the disk. That means that applications always have the data in an unencrypted state to perform the necessary logic and functions without impact.

If you are using your own keys for database encryption, see Database Encryption with Customer-Controlled Switch.

Request database key rotation

Rotate the database key annually or as needed by submitting a request to support.

Before you begin
Role required: admin

About this task
Key rotation occurs at night within 24 hours prior to the expiration date and does not interrupt service for the instance.

Note: Currently, key rotation is only available in ServiceNow Commercial, GCC, France, and Singapore environments.

Procedure

Contact Customer Service and Support to request any of the following key rotation actions:

- Enroll to perform annual key rotation on all designated instances.

- Obtain a historical report of the last three key rotations containing the following:
  - Instance name.
  - Key name and version.
  - Dates and times of rotation.

- Schedule an early key rotation outside of the annual scheduled rotation.

Database Encryption with Customer-Controlled Switch

Database Encryption with Customer-Controlled Switch (DBE with CCS) is an encryption solution that encrypts all data-at-rest when not in use in the database.

Overview

Database Encryption with Customer-Controlled Switch uses industry standard AES encryption, with no impact to functionality. The database encrypts data as it is written to the disk and decrypted by the database as it is read from the disk. Applications always have the data in an unencrypted state to perform the necessary logic and functions.
DBE-CCS utilizes technology native to the database, often called Tablespace Encryption or Transparent Data Encryption. For more details on the technology, refer to the MariaDB website under "Tablespace Encryption."

DBE-CCS requires you to set up an HTTPS REST service endpoint that periodically provides the secret key to the ServiceNow instance. The CCS endpoint then returns the customer secret key encrypted with the public key of the database instance.

**Customer endpoint**

*Important:* Your organization is solely responsible for setting up and maintaining your CCS endpoint. The customer endpoint specification is provided in KB0789788.

Fortanix, a ServiceNow technology partner, is available to implement your customer endpoint for you. For details on a Fortanix integration, see Using Fortanix Data Security Manager with ServiceNow.

**Multiple ServiceNow version support**

*Important:* Database Encryption is a paid infrastructure offering that is release agnostic. It can be applied to any supported release and to new or existing instances.

**Other references**

Refer to these references for additional information about DBE with CCS:

<table>

<td>Architecture of Database Encryption Customer Controlled Switch</td>
</tr>
<tr>
<td>KB0789788</td>
<td>Implementation guide for DBE with CCS</td>
</tr>
</tbody>
</table>

**Full disk encryption**

Full disk encryption (FDE) applies encryption to the entire storage system within the database server only, because this is the only customer data-storing component. FDE protects only against physical loss or theft of storage devices. When encrypted disk servers are powered on and providing data, the encryption provides no additional protection.

**Full disk encryption**

Full disk encryption may be relevant to heavily regulated organizations, but can add significant cost to a customer’s ServiceNow deployment. Measures in place by ServiceNow to mitigate loss or theft of storage devices may also be a factor in its selection.

From the Now Platform perspective, all data flows in decrypted.

Commercial environments use full disk encryption (FDE) with FIPS 140 validated hardware or storage devices that are in the process of validation along with a ServiceNow dedicated hardware option at extra cost. FDE applies to the hardware itself, and therefore provides encryption at rest for all data stored in every instance assigned to you.

For further details on selecting FDE and dedicated hardware options, contact your ServiceNow representative.
Edge Encryption

ServiceNow® Edge Encryption™ encrypts sensitive data on your company premises before sending it over the Internet to your ServiceNow instance (encrypted in flight), where it remains encrypted at rest.

**Understanding Edge Encryption**

Edge Encryption is a network encryption system that resides on your network and that encrypts and decrypts sensitive data as it travels between your data center and the ServiceNow cloud.

**What is Edge Encryption**

Also referred to as ‘client-side’ encryption, Edge requires all bi-directional user traffic to pass through proxies that are maintained on your infrastructure. You have the full control over your key management because the keys are stored within your proxy on your infrastructure. The Now Platform cannot decrypt your ciphertext to access your keys.

The Edge Encryption feature is an additional cost option that provides you with the ability to control the end-to-end encryption of your data and key management. Edge Encryption uses a proxy application, provided by ServiceNow and installed by you within your own network. This proxy application tokenizes specified data patterns or encrypts string fields, Date fields, Date/Time fields, and attachment data before it is sent from your environment to your instance. The proxy application also decrypts the same data, again only within your own network, using keys stored only within your own network.

The relevant encryption keys and configuration exist only on the Edge proxy within your network and are not visible to ServiceNow. The data is encrypted from the moment it leaves your environment and is only decrypted upon retrieval. At no point is the data accessible in plaintext by ServiceNow systems or personnel.
Who uses Edge Encryption

Only a user logged into the instance through a proxy server on your network can view encrypted data in clear text. Likewise, only a security_admin user logged in to an instance through a proxy server in your network can configure and administer Edge Encryption. Because the proxy server resides in your network, you own and manage the encryption keys, and they are never sent to the instance. As a result, ServiceNow never shows sensitive data in clear text.

In addition to the Edge proxy configuration and management of rules, you are responsible for the usual requirements of operating a server within your environment (including hosting, routing, backup, DNS configuration, etc.) to enable and support your Edge proxies.

Encryption and tokenization

Edge Encryption supports both encryption (through encryption configurations) and tokenization (through encryption patterns) as a means of protecting your sensitive information.

Encryption configurations

You can encrypt individual fields using encryption configurations. Edge Encryption supports AES 128-bit and AES 256-bit encryption keys. Edge Encryption supports standard, equality-preserving, and order-preserving encryption types. In addition to attachments, you can encrypt the following field types:

- String
- Date
- Date/Time
- Journal
- Journal Input
- URL

If a Journal field marked for encryption is added to the activity stream, all user input to the field is encrypted in the activity stream.

⚠️ Note: Multi-byte characters within supported field types can be encrypted.

Encryption patterns

You can use encryption patterns to tokenize strings that match regular patterns such as social security and credit card numbers. While encryption configurations should be the primary method of encryption, use encryption patterns as a supplement to secure sensitive information found outside of encrypted fields.

⚠️ Note: The Edge Encryption proxy server requires a MySQL database in your network only if using order preserving encryption or encryption patterns. Clear text values are stored in the proxy database in your network. For this reason, it is critical that you secure and regularly back up your proxy database. For recommendations, see Edge Encryption components.
Edge Encryption on the Now Platform

Edge Encryption acts as a gateway between your browser and your ServiceNow instance. Traffic from your browser passes through the gateway on its way to the ServiceNow instance. The gateway, in turn, is configured to encrypt outbound data that is marked for encryption. Inbound traffic is decrypted through the gateway, and the end user sees clear text in the browser. The advantage of this implementation from a security control perspective is that the encryption and key management are handled externally from ServiceNow.

Pros and cons

As with Column Level Encryption Enterprise and Column Level encryption, Edge Encryption imposes some functional limitations within an instance as a result of the additional security. The local Edge proxy does, however, also provide some additional functionality relating to sorting when compared to column-level encryption.

Pros:

• Edge Encryption provides absolute control of who sees your information and prevents data breaches.
• Information remains on your proxy server and never leaves your network unencrypted.
• Information is encrypted in transit, before it even reaches the ServiceNow instance.
• You hold and manage all your own encryption keys. No one else, not even ServiceNow personnel, can access your keys.
• You can choose the strength of the encryption algorithm: AES-128 or AES-256.
• Edge Encryption includes the ability to encrypt String text, Date and Date/Time fields, attachments, URLs, and journals.
• Edge Encryption provides Standard, Equality Preserving, and Order Preserving encryption of data at rest within the database and instance.
• Encryption rules allow you to write custom scripts that tell the proxy server specifically what to encrypt and where to put that encrypted information in the instance. This is useful when the data structure doesn’t exactly match the ServiceNow instance.
• Encryption patterns allow you to tokenize information such as passwords.

Cons:
• Edge Encryption requires an extra network hop through the Edge proxies cluster, and extra processing, which can add delay to traffic. The added processing delay of the Edge Encryption application is negligible compared to the network hop.

• Maintaining your own encryption keys can be complex and time-consuming.

• You can maintain a maximum of two keys, with no flexibility to define different keys for different subsets of columns/data, or for different roles, etc.

• Edge Encryption has the side effect that the server or platform can’t decrypt the data to perform any manipulation of the decrypted data. As a consequence, functionality and data processing on the Now Platform may be restricted when encrypting columns with Edge Encryption.

What to know before you begin
Because encryption and tokenization change the nature of your data, Edge Encryption can affect other instance processes. Before using Edge Encryption, carefully consider the impact on your instance.

Because the proxy server is installed and maintained in your network, Edge Encryption requires network administration and management. Review the network requirements to ensure a smooth implementation.

Review the following topics to understand the impact of Edge Encryption on your instance:

• Planning for Edge Encryption
• Edge Encryption system requirements
• Sizing your Edge Encryption environment
• Calculate the order-preserving and tokenization database size
• Edge Encryption limitations
• Key management for Edge Encryption

Edge Encryption components
Edge Encryption is comprised of the Edge Encryption proxy server that runs on a server in your network, and the Edge Encryption plugin that must be installed on your ServiceNow instance. If using order-preserving encryption types or encryption patterns, a proxy database must also be installed in your network.

Proxy application
When going through the Edge Encryption proxy server, the Edge Encryption plugin allows you to specify which fields, patterns, and attachments should be encrypted. You can also manage encryption rules to encrypt specific requests and schedule mass encryption jobs.

Proxy server
The Edge Encryption proxy server uses encryption rules to identify in an HTTP request what, if anything, needs to be encrypted and encrypts it before forwarding the request to the instance. For decryption, the Edge Encryption proxy server looks at the HTTP responses for any encrypted data and decrypts it before sending the response back to the client. In order for this to happen, all HTTP requests and responses must go through the Edge Encryption proxy server. This includes any requests originating from a browser, as well as any SOAP or REST requests.
Proxy database

If using order preserving encryption or encryption patterns, your proxy servers rely on a MySQL database located in your network. All proxy servers in your network must use the same database.

The proxy database contains these tables.

### Proxy database tables

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>db_id</td>
<td>Unique database ID</td>
</tr>
<tr>
<td>edge_token_map</td>
<td>Encryption pattern data</td>
</tr>
<tr>
<td>token_map</td>
<td>Order-preserving encryption data</td>
</tr>
</tbody>
</table>

### Backing up your proxy database

Because encryption patterns rely on tokenization, clear text values are stored in your proxy database. If the database is lost, clear text values cannot be restored. It is critical that you maintain regular backups. To avoid data loss, back up your proxy database according to ServiceNow recommendations.

- Back up your database every 24 hours.
- Retain MySQL database binary log files for at least two days. After a backup has been restored, use the binary log to regenerate any data lost since the most recent backup. Refer to MySQL database backup best practices for your database version.

### Edge Encryption clients

Edge Encryption uses three clients to inform the instance that the proxy is running, to synchronize requests between the proxy and the instance, and to forward all end user requests to the instance after any potential encryption.

<table>
<thead>
<tr>
<th>Client</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>heartbeat/keepalive client</td>
<td>In charge of sending a request to the ServiceNow instance every 5 seconds to let the instance know that this proxy is up and running. The requests drive the last_response_on field on the Edge proxy table, and as a consequence drive the state of the proxy. If your system has issues sending the requests, or if the request or request processing is delayed, the instance may mark the proxy as unresponsive, even if the other clients (including the one for user traffic) are up and running. This client also controls the online status of the proxy on the instance. The edgeencryption.proxy.keepalive.interval property controls the polling rate for this client. The default is 5 (seconds).</td>
</tr>
<tr>
<td>polling-sync client</td>
<td>In charge of various requests the proxy sends to the instance to synchronize on the Edge</td>
</tr>
</tbody>
</table>
### Client Description

<table>
<thead>
<tr>
<th>Client</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>encryption configuration</td>
<td>Encryption configuration (for example, which table, column, or attachment to encrypt, keys, jobs, rules, and tokenization patterns). The edgeencryption.config.poll.interval property controls the polling rate for this client.</td>
</tr>
<tr>
<td>default/user traffic client</td>
<td>For everything else, this client handles all end user requests and forwards them to the ServiceNow instance after any potential encryption. This client also handles responses from the instance, forwarding them to the end user after any potential decryption.</td>
</tr>
</tbody>
</table>

---

**Key management for Edge Encryption**

You are responsible for providing and managing the encryption keys used by Edge Encryption.

This topic refers to keys for the Edge Encryption product. If you are looking for information on the Key Management Framework, which can be used with Column Level Encryption, see [Key Management Framework](#).

When obtaining and creating encryption keys to support the encryption types used by Edge Encryption, consider the following:

- Whether to use AES 128-bit or AES 256-bit. You must define a default AES 128-bit encryption key, even if it is not used.
- Whether to use file system, Java KeyStore, or Enterprise Key Management (EKM).
- When to rotate encryption keys.
- When and if to use a mass encryption job to re-encrypt data using the new key.

Before removing a key from the proxy configuration files and the keystore, it is critical that you decrypt all data on the instance that uses the key. You can do this by adding a new encryption key and scheduling a mass key rotation job.

**Keystores**

Edge Encryption supports the following types of key storage.

- **File store**
  
  Keys are stored in a file in a file system that is accessible by the Edge Encryption proxy. Encryption keys stored in a file are not encrypted, so it is your responsibility to protect these files.

- **Java KeyStore**
  
  Keys are stored in Java’s JCEKS KeyStore. A Java KeyStore is protected by a password, so it is more secure than storing keys in a file in the file store. A single
Java KeyStore can store multiple keys, and the keys are identified by a key alias, making it easier to manage multiple keys.

**Enterprise Key Management (EKM)**

Keys are stored and retrieved with the SafeNet KeySecure or Unbound Technology key management systems.

The Edge Encryption proxy ships with the Java JCEKS KeyStore file named keystore.jceks in the keystore directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.

ℹ️ **Note:** If using a keystore other than the base system Java JCEKS KeyStore, you must import the ServiceNow public key into your keystore. The public key alias is servicenow.

In addition to the encryption keys, the Java JCEKS KeyStore is used to store the RSA key pair for digitally signing the encryption configuration and encryption rules that are stored in the instance, and the digital certificate that the Edge Encryption proxy uses to establish a secure connection with the browsers and any other clients.

**SafeNet key versioning for Edge Encryption**

Use SafeNet key versioning to simplify changing keys. Instead of creating a new alias for every new key, SafeNet key versioning keeps the same alias and increments the version.

You must set up key versioning in SafeNet before you can configure SafeNet key versioning on the Edge proxy server.

ℹ️ **Note:** Edge proxies installed before the London release support SafeNet keys, but do not support SafeNet key versioning. If you mistakenly use a versioned key on a Kingston or earlier proxy, when you upgrade to a London or later release, the London or later proxy detects this problem, and to prevent potential data loss the proxy does not start.

You must first schedule a mass key rotation job or a single key rotation job to replace the old SafeNet versioned key with a non-versioned key, and then create a new SafeNet versioned key, if needed. This new versioned key is safe to use with the London or later proxy, and you can restart the proxy.

**Encryption key configuration**

If using SafeNet versioned keys, the Change Default Keys section of the Encryption Key Configuration form includes new fields for the **Key version** of the default 128-bit and 256-bit keys. **Key version** fields are grayed out and cannot be edited.

For procedures, see Configure encryption keys on the instance.

**Versioned keys**

If using SafeNet versioned keys, when you navigate to Edge Encryption Configuration > Encryption Key Configuration > All Keys, versioned keys include the **Key version**.
A version number does not appear for the initial entries you make in the Change Default Keys section of the Encryption Key Configuration form. When the proxy server requests a key from SafeNet, the system adds a new line for the alias and adds the Key version.

In the above example, **AES128key** is listed three times:

- The first listing, with no Key version indicated, is the initial entry.
- The second listing, with 1 in the Key version column, is the first version of the key returned from SafeNet.
- The third listing, with 2 in the Key version column, is the second version of the key returned from SafeNet.
- As other versions of the key are returned from SafeNet, new lines are added to record the Key version now in use.

**Encryption configurations and patterns**

With Edge Encryption, you can encrypt fields and tokenize strings.

**Encryption configurations**

You can encrypt individual fields using encryption configurations. Edge Encryption supports AES 128-bit encryption keys. If the Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy files are installed, Edge Encryption supports AES 256-bit encryption keys for each encryption type. Edge Encryption supports the following types of encryption configurations.

**Standard encryption**

The encrypted value of a field is different each time the field is encrypted, even when the field value remains the same. Standard encryption is the most robust form of encryption. Fields using standard encryption cannot be sorted, grouped by, or filtered on.

**Equality-preserving encryption**

The encrypted value of a field is the same when the field value remains the same. Supports equality comparisons and group by operations on a field.

⚠️ Note: When equality-preserving encryption is selected for a field that already contains data, performing a group by action on the field may not group fields with the same value if one is encrypted and the other is not.

**Order-preserving encryption**
Uses tokens and encryption to secure data in your proxy database. Supports equality comparisons, group by operations, and the ability to sort data. The order preserving encryption type is only supported if there is a MySQL database configured for the Edge Encryption proxy server.

Note: When using order-preserving encryption and the proxy database is down, updates can be made to fields using order-preserving encryption. However, the sort order will not be correct when trying to sort data based on those fields. Groups also will not work as expected. When the proxy database is again operational, schedule an order token repair job to repair missing tokens.

Encryption types
The following encryption types are listed in decreasing security quality.

<table>
<thead>
<tr>
<th>Encryption type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard AES 256</td>
<td>Fields cannot be filtered, sorted, or compared.</td>
</tr>
<tr>
<td>Standard AES 128</td>
<td>Fields cannot be filtered, sorted, or compared.</td>
</tr>
<tr>
<td>Equality preserving AES 256</td>
<td>Fields can be filtered using equality comparisons.</td>
</tr>
<tr>
<td>Equality preserving AES 128</td>
<td>Fields can be filtered using equality comparisons.</td>
</tr>
<tr>
<td>Order preserving AES 256</td>
<td>Fields can be sorted and equality comparison filtering can be used. Requires the use of a MySQL database in your network.</td>
</tr>
<tr>
<td>Order preserving AES 128</td>
<td>Fields can be sorted and equality comparison filtering can be used. Requires the use of a MySQL database in your network.</td>
</tr>
</tbody>
</table>

Encryption Patterns
You can secure sensitive data found in strings using encryption patterns. Once an encryption pattern is stored and activated, the Edge Encryption proxy server identifies strings that match the pattern in requests. Once located, the clear text string is stored in the proxy database and replaced on the instance with a token. Use encryption patterns to tokenize strings that match regular patterns such as social security and credit card numbers. While we recommend that encryption configurations be the primary method of encryption, use encryption patterns as a supplement to locate and secure sensitive information found outside of encrypted fields.

Note: The Edge Encryption proxy server requires a MySQL database in your network only if using order preserving encryption or encryption patterns. Clear text values are stored in the proxy database in your network. For this reason, it is critical that you secure and regularly back up your proxy database. For recommendations, see Edge Encryption components.
Related information

Encrypt fields using encryption configurations
Tokenize strings using encryption patterns

Installed with Edge Encryption

Edge Encryption installs tables to store encryption-related data, system properties to configure default behavior, and the edge_encryption role to administer Edge Encryption.

Tables installed with Edge Encryption

Edge Encryption adds the following tables.

- **Edge Encryption Configuration** [sys_encryption_configuration]
  Contains encrypted fields and tables for which attachments are encrypted.

- **Edge Encryption Rule** [sys_encryption_rule]
  Contains a record for each rule. A rule has a name, the condition when it is used, a script, and an order field.

- **Edge Encryption Invalid Insert Log** [sys_edge_encryption_invalid_insert_log]
  Contains log messages created for attempts to save unencrypted data to an encrypted field.

- **Edge Encryption Proxy** [sys_encryption_proxy]
  Contains information about the encryption proxy application.

- **Edge Proxy Encryption Type** [sys_proxy_encryption_type]
  Used for enabling and disabling encryption types on the encryption form.

- **Encryption Job Execution** [sys_encryption_job_execution]
  Supports mass encryption jobs.

- **Encryption Job Execution Chunk** [sys_encryption_job_execution_chunk]
  Supports mass encryption jobs.

- **Scheduled Encryption Job** [sysauto_encryption_job]
  Lists scheduled jobs for encryption, decryption, key rotation, order token repair, and database recovery.

- **Encryption Key Configuration** [sys_encryption_key_configuration]
  Lists default encryption keys.

- **Encryption Key** [sys_encryption_key]
  Lists available keys and key attributes.

- **Proxy Encryption Key** [sys_encryption_proxy_key]
  Lists proxy encryption keys.

Properties installed with Edge Encryption

Edge Encryption adds the following properties.

ibilidade

**Note:** To open the System Properties [sys_properties] table, enter sys_properties.list in the navigation filter.

- **glide.edge.pattern.disallowed.chars**
  A list of characters that are not allowed in patterns.
glide.edge.pattern.min.size
The minimum pattern size allowed. Allowing smaller patterns means finding more matches, which increases overhead.
- Type: number
- Default value: 5
- Location: System Properties [sys_properties] table

sn_edge_encryption.logging.destination
Where messages are logged.
- Type: string
- Default value: file
- Location: System Properties [sys_properties] table

sn_edge_encryption.logging.verbosity
The logging level to use.
- Type: string
- Default value: info
- Location: System Properties [sys_properties] table

sn_edge_encryption.encryption.proxy.buildtag
The proxy version registered with your instance.
- Type: string
- Location: System Properties [sys_properties] table

sn_edge_encryption.cleartext.allowed
When true, allows clear text to be saved in an encrypted field. This happens when a user is accessing the instance without going through the Edge Encryption proxy. When false, the system prevents clear text from being saved in an encrypted field.
- Type: Boolean
- Default value: false
- Location: System Properties [sys_properties] table

Role installed with Edge Encryption
edge_encryption
Edge Encryption proxies log into the instance as a user, with a user name and password. The user must have this role assigned.

Contains roles: None
Planning for Edge Encryption

Successful implementation of Edge Encryption requires planning and preparation. Answer the following questions in the planning stage.

• Which fields are to be encrypted?
• Which encryption types are to be used?
• How many Edge Encryption proxies are needed? See Sizing your Edge Encryption environment for recommendations and considerations.
• If an order preserving encryption type or encryption patterns are to be used, where is the MySQL database located?
• Which key management system is to be used?

System administrators, network administrators, and security team members have different tasks to fulfill for implementing Edge Encryption.

• System administrators need the security-admin role. The system administrator needs to:
  ◦ Download the Edge Encryption proxy application.
  ◦ Set up an Edge Encryption user account for the proxies to use to connect to the instance. The user must be assigned the edge_encryption role.
  ◦ Configure encryption keys, and set the default keys.
  ◦ Configure Edge Encryption on the instance.
  ◦ Schedule encryption jobs.
  ◦ Monitor Edge Encryption.
  ◦ Create and edit encryption rules.

• Your network administrator needs to:
  ◦ Install the Edge Encryption proxy application.
  ◦ Know the network addresses for the proxy servers and the proxy database used for order-preserving encryption and encryption patterns.
  ◦ Install the proxy database to be used for order-preserving encryption and encryption patterns.
  ◦ Start and stop the proxy applications.
  ◦ Perform encryption key management.
  ◦ Determine how to map users to encryption proxy applications. This can be done with DNS settings or routing rules, and is specific to each network.
  ◦ Manage multiple proxy servers.
  ◦ Configure load balancer pools and settings.

• Your security administrator must determine the encryption types to be assigned to each field.

Edge Encryption system requirements

You can run the Edge Encryption proxy application on servers or virtual machines that run on Microsoft Windows or Linux operating systems. For optimum performance, ensure that your configuration meets these requirements.
## Java requirements

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

- Java 8 update 121 (8u121)
- Java 8 update 141 (8u141)
- Java 8 update 151 (8u151) or later

**Note:** Java 8 update 131 (8u131) is not supported.

- Java 11.0.6 or later

**Note:** Before installing the Edge Encryption proxy server, check that the `$JAVA_HOME` variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the `$JAVA_HOME` variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

<table>
<thead>
<tr>
<th>Java Version</th>
<th>Enabling AES 256-bit Encryption</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java 8 update 141 (8u141) or earlier</td>
<td>Install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the <code>&lt;Java-home-directory&gt;/jre/lib/security</code> folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier.</td>
</tr>
<tr>
<td>Java 8 update 151 (8u151) or later</td>
<td>A <code>java.security</code> file is downloaded with the update. Edit the <code>java.security</code> file to enable AES 256-bit encryption. To edit the <code>java-security</code> file, see Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later. <strong>Note:</strong> If upgrading an Edge Encryption proxy server running on Windows to a new version of Java, you may need to copy the JCE policy files from your previous Java folder to the new Java folder.</td>
</tr>
</tbody>
</table>

**Note:** Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

## Support for OpenJDK

Starting with the Orlando release, the Now Platform supports the following versions of openJDK:

© 2022 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
• OpenJDK version 8
• AdoptOpenJDK version 8
• OpenJDK version 11

Proxy server minimum configuration
A proxy server requires this minimum configuration:

• 4 GB of RAM per proxy server (6 GB is recommended for most deployments).

>Note: The proxy server host requires at least 1 GB of RAM more than the proxy server. The proxy server host needs the extra 1 GB for operating system services. For example, if you configure a proxy server to use 4 GB of RAM, you must install at least 5 GB of RAM on the proxy server host.

Because the proxy server requires at least 4 GB of memory, 32-bit JREs and 32-bit operating systems are no longer supported starting with the London release.

• 3 or more GHz CPU (4-core CPU preferred for optimum performance).
• Multiple proxy servers behind a load balancer. The number of proxy servers you need depends on the number of application nodes, the number of simultaneous users, and the number of servers needed for failover. See Sizing your Edge Encryption environment for more information.
• Ability to run concurrently with other services, depending on the server utilization and resource availability.

Proxy server supported systems
The following systems are supported:

<table>
<thead>
<tr>
<th>Supported System</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows Server 2012, 2012-R2, and 2016 editions</td>
<td>• Virtual machines or physical hardware</td>
</tr>
<tr>
<td></td>
<td>• 64-bit systems</td>
</tr>
<tr>
<td>Linux</td>
<td>• Virtual machines or physical hardware</td>
</tr>
<tr>
<td></td>
<td>• 64-bit systems</td>
</tr>
<tr>
<td></td>
<td>On 64-bit Linux systems, you must install the 32-bit GNU C library (glibc). The installation command for CentOS is yum install glibc.i686.</td>
</tr>
</tbody>
</table>

Proxy server connection requirements
The proxy server that runs the Edge Encryption application must be able to communicate with machines in your network. Make sure that the proxy server has these network privileges:

<table>
<thead>
<tr>
<th>Network Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firewall access</td>
<td>Configure any firewalls between the proxy server and the client devices to allow a connection. If your network uses a DeMilitarized Zone (DMZ) to add an extra layer of security to your Local Area Network</td>
</tr>
</tbody>
</table>
Network Privilege | Description
---|---
| (LAN), and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a proxy server to a machine within the DMZ.

- **Network access**
  - Configure each client to enable the proxy server to connect with it. If network security prevents you from configuring new machines that can connect to the clients, install the proxy server on an existing machine with connection privileges.

- **Instance access**
  - Ensure that the proxy server has network access to the instance. Make sure that you configure the proxy server network to allow traffic over TCP port 443.

- **Network account**
  - Install the proxy server with either a local or domain administrator.

### Order-preserving and tokenization database system requirements

Order-preserving encryption and encryption patterns require that you configure an Oracle MySQL database for the Edge Encryption proxy server. Order-preserving encryption allows any comparison operation to be directly applied on encrypted data, without first decrypting the data. Encryption patterns let you replace string patterns with tokens (called tokenization) before they are sent to and stored in the database. Because of the size of the MySQL database, use a dedicated proxy server to run the order-preserving and tokenization database.

The minimum database system requirements include:

<table>
<thead>
<tr>
<th>MySQL Database</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Version</strong></td>
<td>MySQL database versions 5.5 to 5.7</td>
</tr>
<tr>
<td><strong>OS</strong></td>
<td>64-bit systems</td>
</tr>
<tr>
<td><strong>CPU</strong></td>
<td>2 or more GHz CPU (4-core CPU preferred for optimum performance)</td>
</tr>
<tr>
<td><strong>RAM</strong></td>
<td>16 GB</td>
</tr>
<tr>
<td><strong>Disk</strong></td>
<td>Storage Area Network (SAN) or local storage (RAID 10 recommended)</td>
</tr>
<tr>
<td><strong>Size</strong></td>
<td>Determined by the number of potential records multiplied by the record size. See <a href="#">Calculate the order-preserving and tokenization database size</a>.</td>
</tr>
<tr>
<td><strong>Configuration</strong></td>
<td>High availability cluster. If you are unsure of how to configure your MySQL server, contact <a href="#">MySQL</a> for configuration information.</td>
</tr>
</tbody>
</table>

*Note:* MySQL versions 5.5 and 5.6 are no longer tested and have reached the end of support.
Sizing your Edge Encryption environment
Choosing the number of proxy servers for your environment is an important task. Consider the number of users, redundancy needs, and acceptable latency.

Redundancy
Maintain redundant proxy servers in case of hardware failure. Proxy servers should be located behind a load balancer to provide a functional path for all users if a proxy server is unreachable. At a minimum, ensure that two proxy servers are always available.

Size
Size refers to the number of proxy servers required to avoid additional latency that the encryption of data produces. Depending on use, you may want to reduce the amount of latency by adding additional proxy servers. For example, if regular mass encryptions are run, add additional proxy servers to handle the load, or run the mass encryptions when the user load is light. In addition, the hardware that the proxy server runs on influences performance and latency. Proxy servers running on hardware with faster CPUs, more CPUs, and more RAM have higher throughput than slower, limited systems.

The following guidelines assume that your proxy server is running on at least the minimum hardware requirements. To determine the number of proxy servers:

• Consider setting up one proxy server for every two application nodes on the instance.
• For redundancy, set up a minimum of two proxy servers behind a load balancer.
• Add an extra proxy server for every 500 simultaneous users.
• Depending on the desired redundancy, add additional proxy servers for failover.

For example, for an instance with 2,000 users, you should have at least five proxy servers behind a load balancer. This calculation includes one proxy server for every 500 users, with an extra proxy server for failover. Determine ahead of time when you will approach a threshold of 500 users and place another proxy server in the load balancer pool.

Load balancers
To balance requests and improve server response time, distribute proxy servers in a load balancer pool. Configure load balancers to use the "least connections" method. This method connects requests to the proxy server with the fewest active connections, preventing the overloading of a single proxy.

CPU utilization
Because data encryption and tokenization are CPU intensive operations, CPU spikes while encrypting data are normal and expected. When CPU utilization is over 80% for several minutes at a time, it likely means that the proxy server has too much work to do. When this happens, latency increases for the period that the CPU utilization is high. If latency persists, adding another proxy server may help decrease the latency.

Memory
The proxy server must have a minimum of 4 GB of RAM available (6 GB recommended). Set the proxy server initial and upper bound memory limits to the recommended settings.

Calculate the order-preserving and tokenization database size
If using order-preserving encryption or encryption patterns, determine the size of your MySQL database by multiplying the number of potential records by record size.
About this task
Use a dedicated machine to run the order-preserving and tokenization database. Do not run the database on the same hardware as the proxy server.

Procedure
1. Determine the potential number of records that could include fields encrypted with order-preserving encryption.
   a. Multiply the number of encryption configurations using order-preserving encryption by the number of records each configuration is applied to.
   b. To allow for growth, multiply the result by three.
2. Multiply the result of step 1 by 1,536.
   1,536 is the average size of a record in bytes.
3. If using encryption patterns, perform steps 1–2 for tokenized records and add the result to the total.

Results
The calculated value is the recommended size in bytes for your order-preserving and tokenization database.

Edge Encryption limitations
Edge Encryption impacts system functions. Carefully evaluate the impact of encrypting a field.

Field type restrictions
You can encrypt only the following field types:
• String
• Date
• Date/Time
• Journal
• Journal Input
• URL

You cannot encrypt the following field types:
• Choice fields
• Virtual fields
• Fields in system tables, except for certain fields in sys_user
• System fields in tables
• Number fields or fields associated with an auto-numbering scheme
• Any other field type not listed above

Additional restrictions:
• When a Journal field is encrypted, the **Post** button is disabled, even if there are multiple Journal fields and only one of those fields is encrypted.

• Encrypted fields are not available in **Go to** and header filter boxes.

• When encrypting fields used as an index, you can use only order-preserving and equality-preserving encryption types. Indexed fields cannot be encrypted using the standard encryption type.

For more information, see [Field types](#).

### Filtering and searching restrictions

#### Standard encryption

When you select a String, Date, Date/Time, or URL field with a standard encrypted field configuration as the left operand in a filter, no filtering options are available.

#### Equality-preserving encryption

When you select a String, Date, Date/Time, or URL field with an equality-preserving encrypted field configuration as the left operand in a filter, the following operators are available:

• is

• is not

• is empty

• is not empty

#### Order-preserving encryption

When you select a String field with an order-preserving encrypted field configuration as the left operand in a filter, the following operators are available, in addition to **is**, **is not**, **is empty**, and **is not empty**:

• greater than

• less than

When you select a Date or Date/Time field with an order-preserving encrypted field configuration as the left operand in a filter, the following operators are available, in addition to **is**, **is not**, **is empty**, and **is not empty**:

• after

• before

• after or on

• before or on

#### Date and Date/Time pickers

For Date fields, use the date picker to specify the date:
For Date/Time fields, use the date and time picker to specify the date and time:

List condition filters

The Show Matching and Filter Out options are supported in lists. Only exact matches are returned or filtered out.

Note: Adding encrypted fields in condition filters is supported in scripts such as UI policies and business rules.

Configuration restrictions

Restrictions and behavior of encryption configurations:

- After you add a field to the Edge Encryption Configuration table, you cannot delete the configuration record. If you no longer want a field to be encrypted, deactivate the record in the Edge Encryption Configuration table and schedule an encryption job to decrypt the data.

- If a field in a parent table is marked to be encrypted, the field is also encrypted in all inherited tables. For example, if the Short description field in the Task table is encrypted, then the contents of the Short description field in the Incident table are encrypted.

- If a field inherited from a parent table is marked to be encrypted, the field in the parent table cannot be encrypted. For example, if the Short description in the Incident table is marked to be encrypted, then the Short description in the Task table cannot be encrypted. In this example, you can encrypt the Short description in the Problem table.

- When a field with an encryption configuration defined is exported to any format, the output includes encrypted values even when exported through the proxy server.

- You cannot import data to a field with an encryption configuration defined.

- You cannot encrypt inherited Date and Date/Time fields. Date or Date/Time fields inherited from a parent table are not listed on the Column field drop-down list, and you cannot create Date or Date/Time encryption configurations for those fields.

- You can encrypt a String or URL field only from a parent table or a child table, but not both.
Instance restrictions
Impact of using Edge Encryption on the instance:

• Back-end logic cannot process encrypted data. When the instance contains encrypted data, any business rule, back-end script, or back-end feature that relies on evaluating the data in the encrypted field does not run correctly.

  Note: Data encrypted with equality-preserving or order-preserving encryption still passes equivalence checks when compared against an identical encrypted value.

• Since email processing goes from the mail systems straight to the instance and cannot pass through the Edge proxy, data sent in or out via email cannot be encrypted or decrypted by the Edge proxy.
  ◦ Data and attachments in inbound emails are not encrypted.
  ◦ Data and attachments in outbound emails remain encrypted and cannot be decrypted.

• Scripts run on the server cannot change encrypted data.

• Global search is not supported. Because global search attempts to search both encrypted and clear text data, the results may not be as expected.

• Encrypted data cannot be copied and pasted into a record where the field is not encrypted.

• Depending on the type of encryption selected, the user interface functionality for the encrypted fields is reduced. For example, being able to compare, group by, sort, and search may be impacted. Generally, the stronger the encryption selected, the more functionality is reduced.

• Except for Java KeyStore, SafeNet, and Unbound Technology, no third-party software or hardware encryption key management is supported.

• Although multiple proxy servers connected to a single instance are supported, encryption proxy cluster management and monitoring are not available. Each proxy must be managed separately.

• System configurations such as workload and the number of encrypted fields can impact the performance of encrypted fields.

• The Edge Encryption proxy server can only connect to a single instance.

• If your instance uses an Oracle database and the String field you are marking to be encrypted is greater than 2925 characters, that field cannot be sorted even when order preserving encryption is selected.

• If your instance uses an Oracle database, Unicode AL32UTF8 is the only supported character set.

• Encrypted data cannot be used in reports.

Edge Encryption installation
You can install an Edge Encryption proxy manually or using the Edge Encryption interactive installer.

Java requirements
The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

• Java 8 update 121 (8u121)
• Java 8 update 141 (8u141)
• Java 8 update 151 (8u151) or later

⚠️ **Note:** Java 8 update 131 (8u131) is not supported.

• Java 11.0.6 or later

⚠️ **Note:** Before installing the Edge Encryption proxy server, check that the $JAVA_HOME variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the $JAVA_HOME variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

### Installing the proxy server

Installing Edge Encryption includes these steps.

• Install the Edge Encryption proxy application on a server in your network using the interactive installer or the manual installer.

• Generate the RSA key pair for digitally signing encryption configurations and encryption rules.

• Install the Java Cryptography Extension (JCE), if you plan to use AES 256 encryption.

• If you are using a secure SSL connection, obtain a server certificate and import it to the Java KeyStore.

• Set up your keystore and encryption key.

• If order preserving encryption types or encryption patterns are to be used, set up a MySQL database on a machine in your network.

• Set the desired properties. Properties are located in the `edgeencryption.properties` configuration file.

• Specify that a proxy server is a trusted source so that Edge Encryption can process requests coming from that proxy server.

### Accessing the proxy server

Once installation is complete, point each user's browser to an Edge Encryption proxy using the URL format: `<host>`: `<port>`. Values are determined by the `host and port properties` in the `edgeencryption.properties` file.

As an example with the following values:

<table>
<thead>
<tr>
<th>Property</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.host</td>
<td>hostname.mycompany.com</td>
</tr>
<tr>
<td>edgeencryption.proxy.http.port</td>
<td>8081</td>
</tr>
</tbody>
</table>

A client will access the proxy server using the following address: `http://hostname.mycompany.com:8081/`.

⚠️ **Note:** DNS settings and routing rules may be used. Host and port values are determined by your network administrator.
Request Edge Encryption

The Edge Encryption plugin (com.glide.edgeencryption) is available as a separate subscription.

Before you begin

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and subproduction instances, generally within a few days.

If you don’t have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Role required: none

Procedure

1. Navigate to All > System Applications > All Available Applications > All.
2. On the All Applications page, select Request Plugin to open the Request form on HI.

3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. Select your instance.
5. Select Actions > Activate Plugin.
6. On the form, fill in the fields.

Activate Plugin request form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Specify the date and time you would like this plugin to be enabled | The date and time must be at least two business days from the current time.  

>>> Note: Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field. |

| Reason/Comments               | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments. |

7. Select **Submit**.

**Set up an Edge Encryption user account**

The Edge Encryption proxies connect to the instance as a user to obtain and update encryption configuration information. Create a user account for this purpose and give the edge_encryption role to the user.

**Before you begin**

The Edge Encryption plugin must be installed before you can assign the role.

Role required: admin

**Procedure**

1. On your ServiceNow instance, create a user account to be used by the Edge Encryption proxy applications.
2. Assign the edge_encryption role to the user.

**Download the Edge Encryption proxy server**

Download the Edge Encryption proxy server application from your instance, and then copy the file to each computer that is to run the Edge Encryption proxy server.

**Before you begin**

Before starting this procedure, the Edge Encryption plugin must be installed and activated on your instance.

>>> Note: The Edge Encryption proxy is officially supported only on Oracle JRE. |

Role required: security_admin
About this task

Procedure
1. Navigate to All > Encryption Configuration > Installation & Downloads > Downloads.
2. If using the interactive installer, click Download. If manually installing the proxy server, select the OS version for your proxy server.

   **Note:** Because the proxy server requires at least 4 GB of memory to run, 32-bit JREs and 32-bit operating systems are no longer supported starting with the San Diego release.

3. Copy the installer to each computer that is to run the Edge Encryption proxy server. If manually installing the Edge Encryption proxy server, copy the ZIP file to each computer that is to run the Edge Encryption proxy server.

What to do next
After downloading the Edge Encryption installer, **Install the Edge Encryption proxy server using the interactive installer.** If installing manually, **Install the Edge Encryption proxy server using the command line installer.**

**Install the Edge Encryption proxy server using the interactive installer**
Install the Edge Encryption proxy server on a Windows or Linux computer using the interactive installer.

**Before you begin**

   **Note:** SafeNet KeySecure keystore files are not supported by the Edge Encryption installer. To use a SafeNet KeySecure keystore, **Install the Edge Encryption proxy server using the command line installer.**

The Edge Encryption plugin must be installed and activated on your instance before you start this procedure. Ensure that the latest version of Java 8 is installed on the machine running the Edge Encryption installer.

The latest version of Java 8 is Java SE 8u171/ 8u172.
- Java SE 8u171 includes important bug fixes. Oracle strongly recommends that all Java SE 8 users upgrade to this release.
- Java SE 8u172 is a patch-set update, including all of 8u171 plus additional bug fixes.

Role required:
- security_admin on your ServiceNow instance
- local or domain administrator on a Windows host
- service user with full file system access on a Linux host

About this task
After installing a new proxy server, you can run the installer again to perform tests to detect issues with an installation or modify current settings. Your options include:
- **Install New:** Install a new proxy server.
- **Verify Installation:** Perform tests to detect and fix issues in a previous installation.
- **Reinstall Existing:** Perform tests to detect and fix issues in a previous installation and view or modify existing settings.
**Note:** If installing the proxy server on a Linux machine on a privileged port (port 80 or 443), you must run the installer as a root user with full file system access. To restrict file system access after the proxy server is installed, you can use the SetUID feature in the proxy installer. To enable this feature, start the installer as root or sudo root. When prompted by the installer, provide the username and usergroup of an unprivileged user. The proxy server will install with file system privileges of the given user. You can skip this step to continue the default installation with root privileges.

Use the installer to install multiple proxies for your instance on multiple machines, ensuring that the following criteria apply:

- All proxies must have the same encryption keys and the same RSA key pair used to digitally sign encryption configurations and rules.
- The encryption key must be the default key configured on the instance.
- When a proxy database is set up as part of the installation, all proxies must use the same proxy database.

You may need a proxy database for equality-preserving encryption, order-preserving encryption, or tokenization. If you do not use any of these features, you do not need a proxy database.

To use NVDA, an Assistive Technology screen reader designed to read accessibility-enabled Java applications built for keyboard users, see Configure a Windows 64-bit host to use 32-bit NVDA with Java applications.

**What to do next**
After installing the Edge Encryption proxy server, Set the proxy server initial memory limit and upper bound memory limit.

**Install the Edge Encryption proxy server (interactive installer)**
Install the Edge Encryption proxy on a Windows or Linux computer.

**Procedure**
1. Download the Edge Encryption proxy server installer.
2. Open the Edge Encryption proxy installer.
   
   **Note:** If installing on a Windows machine, you must run the installer as Administrator.

   a. To run the installer as Administrator on a Windows machine, right-click the Command Prompt and select **Run as administrator**.
   b. From the command line, navigate to the directory that contains the downloaded .jar file.
   c. Run the following command: java -jar <file name>.jar.
3. To install a new proxy server, select **Install New**. If a proxy is already installed, you can run the installer to:
   - **Verify Installation**: Perform tests to detect and fix issues in a previous installation.
   - **Reinstall Existing**: Perform tests to detect and fix issues in a previous installation and view or modify existing settings.

4. Configure the **Installation Location** and **Target ServiceNow Instance**.
   - **a.** Click **Browse** to select an installation location or manually enter an installation path.
   - **b.** Enter the URL of the target ServiceNow instance. Include the protocol and port number.
     **Example**
     https://example.servicenow.com:443
   - **c.** Enter the user name and password for a user with the edge_encryption role on the target ServiceNow instance.

5. **Click Next.**

6. Configure the **Connection Settings** and **Proxy Settings**.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy Host</td>
<td>Fully qualified domain name of the machine on which you are installing the proxy server.</td>
</tr>
</tbody>
</table>
### Setting Description

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>HTTP Port</strong></td>
<td>Port on the proxy for HTTP communication.</td>
</tr>
<tr>
<td><strong>HTTPS Port</strong></td>
<td>Port on the proxy for HTTPS communication.</td>
</tr>
<tr>
<td><strong>Proxy Name</strong></td>
<td>Name of the proxy and the service. The proxy name must be unique.</td>
</tr>
<tr>
<td><strong>Proxy Poll Interval</strong></td>
<td>Poll interval in seconds. With the default setting, it takes 5 seconds for the proxy to learn of encryption configuration changes. Larger values cause the instance to take longer to detect proxies that have come online.</td>
</tr>
<tr>
<td><strong>Proxy Keep-Alive Ping Interval</strong></td>
<td>Time in seconds between pings issued by the proxy to the instance. Pings are issued periodically to verify connectivity between the proxy and the instance. The default value is 10. The minimum value is 5.</td>
</tr>
</tbody>
</table>

#### Note:
- Click ** Detect FQDN ** to look up the machine's fully qualified domain name and auto-populate the **Proxy Host** field.
- Along with the port, this property defines the URL used by the client to access the proxy server.

#### Note:
- Changing the default setting of the **Proxy Poll Interval** can result in detection delays when a proxy comes online.

7. Click **Install**.  
The Edge Encryption proxy server installs. The installation may take a few minutes.

### Configure CyberArk properties protection

Optionally, configure CyberArk properties protection to securely store Edge Encryption passwords in a centralized and secure digital vault.

### About this task

You must purchase and configure CyberArk AIM (Application Identity Management) before you can configure CyberArk connection parameters and protected credentials for a proxy server. As part of the installation of the AIM client, the JavaPasswordSDK.jar file is installed in the AIM client installation directory. The CyberArk vault is installed on an independent hardened server, and the AIM clients allow secure access to that server.

#### Note:
- You must install the CyberArk AIM client on every host computer where an Edge proxy is installed.

In the Edge installer, you must specify the location of the JavaPasswordSDK.jar file to set up the CyberArk connection to the Edge proxy. You must also enter other values you defined during the AIM client installation.

Setting up CyberArk password storage is optional. If you do not want to set up CyberArk password storage, click **Skip** through the CyberArk screens.
**Procedure**

1. On the CyberArk Connection page of the Edge Encryption installer, enter the CyberArk connection parameters.

   **CyberArk connection parameters**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path to PasswordSDK.jar</td>
<td>The path to the JavaPasswordSDK.jar file installed on the host Windows machine during CyberArk configuration.</td>
</tr>
<tr>
<td>App ID</td>
<td>The App ID entered during CyberArk configuration.</td>
</tr>
<tr>
<td>Safe Name</td>
<td>The Safe Name entered during CyberArk configuration.</td>
</tr>
</tbody>
</table>

2. Click Next.

3. On the CyberArk Protected Credentials page of the installer, enter the credentials to be protected by CyberArk.

   - To use a single credential name for all protected passwords, select the **Apply one Credential Name to all Credentials** check box, enter the credential name, and click **Apply**.
   - Enter the credential name for one or more of the following fields. Credential names are the usernames entered for the SSH keys during CyberArk configuration.

   **CyberArk protected credentials**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge Encryption User</td>
<td>The CyberArk credential name for an Edge Encryption user.</td>
</tr>
<tr>
<td>Signature Key Keystore</td>
<td>The CyberArk credential name for the signature key keystore.</td>
</tr>
<tr>
<td>HTTPS Cert Keystore</td>
<td>The CyberArk credential name for the HTTPS certification keystore.</td>
</tr>
<tr>
<td>Encryption Key Keystore</td>
<td>The CyberArk credential name for the encryption key keystore.</td>
</tr>
<tr>
<td>Database</td>
<td>The CyberArk credential name for the database keystore.</td>
</tr>
<tr>
<td>SafeNet HTTPS Cert Keystore</td>
<td>The CyberArk credential name for the SafeNet HTTPS certification keystore.</td>
</tr>
<tr>
<td>SafeNet Server</td>
<td>The CyberArk credential name for the SafeNet server.</td>
</tr>
<tr>
<td>Forward Proxy</td>
<td>The CyberArk credential name for the forward proxy.</td>
</tr>
</tbody>
</table>

4. Click Next.
Configure the signature key
Configure the signature key after installing the proxy server through the Edge Encryption proxy installer.

About this task
The signature key signs changes to configurations and properties made by the proxy server. The signature key must be an asymmetric RSA key pair in a JCEKS KeyStore.

Note: If installing multiple proxies, each proxy must use the same signature key.

Procedure
1. On the Signature Key page of the Edge Encryption installer, select the keystore on the host machine to store the signature key.
   - Create New Java KeyStore: Enter the directory location, name, and password for the new keystore.
   - Use Existing Keystore: Enter the keystore file location and password.
2. Click Next.
3. Select or create a signature key.
   - New Key: Create a signature key for this proxy.
   - Use Existing Key: Use an RSA key-pair from the selected keystore.
   - Import Existing Key: Import an RSA key-pair from a different keystore. Browse to the keystore file, enter the password for the keystore, and select the key alias. Provide a new alias for the key.
4. Click Next.

Configure the HTTPS certificate
To enable clients to connect to the Edge Encryption proxy server using a secure SSL connection, import the HTTPS certificate to the proxy server.

About this task
The Edge Encryption proxy provides the HTTPS certificate to clients trying to connect.

Procedure
1. On the HTTPS Certificate page of the Edge Encryption installer, select the keystore to store the certificate.
   - Create New Java KeyStore: Enter the directory location, name, and password for the new keystore.
   - Use Existing Keystore: Enter the keystore file location and password.
2. Click Next.
3. Select or import a certificate.
   The key alias is the given alias for the certificate.
   - Use Existing Certificate: Use an existing certificate in the selected keystore.
   - Import from File or KeyStore: Import a certificate from a different keystore or a .cer file. Browse to the keystore or .cer file, enter the password, and select the alias. You must provide a new alias for the certificate.
4. Click Next.
Configure the AES 128-bit encryption key

After you configure the HTTPS certificate through the Edge Encryption proxy installer, configure the AES 128-bit encryption key to encrypt your data.

About this task
The encryption key is either a plain text file inside the /keys directory or a secret key inside a keystore. If you use a keystore for your AES 128-bit and AES 256-bit encryption keys, they must both use the same keystore.

If you are updating an SSL certificate on an Edge proxy server, see Update SSL certificate.

Procedure
1. Select the encryption key location.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Store</td>
<td>Use a file to store a single encryption key. You can use an existing file in the /keys directory, or you can generate a new file. To generate a new file, enter an alias and click Generate. A file containing an encryption key is created.</td>
</tr>
<tr>
<td></td>
<td>Note: This choice designates both the storage location and the encryption key. If you select File Store, click Next and go to step 5.</td>
</tr>
<tr>
<td>Create New Java KeyStore</td>
<td>Create a keystore to store the encryption key.</td>
</tr>
<tr>
<td>Java KeyStore File</td>
<td>Store the encryption key in an existing Java KeyStore file.</td>
</tr>
</tbody>
</table>

2. Click Next.
3. Select or create the encryption key.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Key</td>
<td>Create an encryption key and alias.</td>
</tr>
<tr>
<td></td>
<td>Note: You must use lowercase letters and numbers for the alias name (key name, key alias), per Java KeyStore requirements. To find out more about the keytool utility, see the Java SE Documentation.</td>
</tr>
<tr>
<td>Use Existing Key</td>
<td>Use an existing encryption key in the selected keystore.</td>
</tr>
<tr>
<td>Import Existing Key</td>
<td>Import an encryption key from a different keystore.</td>
</tr>
</tbody>
</table>

4. Click Next.
5. Configure the key on the instance according to the requirements defined in your installer.
To configure the key on the instance, navigate to the instance and define a default key. See Configure encryption keys on the instance. Ensure that the key alias, size, and type match the requirements defined in the installer.

**Default key requirements**

<table>
<thead>
<tr>
<th>Install</th>
<th>Signature Key</th>
<th>HTTPS Key</th>
<th>128 Key</th>
<th>256 Key</th>
<th>Database</th>
<th>Launch</th>
</tr>
</thead>
</table>

**Default Encryption Key**

This step requires you to go to your instance and create a default key. Click the links below and follow the instructions. Click 'Next' when you are done setting up the default key on your instance.

- The 'Key alias' must be: aes128
- The 'Key size' must be: 128
- The 'Type' must be: Keystore

[Click here for documentation](#)
[Click here to go to your default keys](#)

6. Once the key is configured on the instance, return to the installer and click **Next**.

### Configure the AES 256-bit encryption key

After you configure the AES 128-bit key through the Edge proxy installer, you can optionally configure an AES 256-bit encryption key to encrypt your data.

**About this task**

The encryption key is either a plain text file inside the /keys directory or a secret key inside a keystore. If you use a keystore for your AES 128-bit and AES 256-bit encryption keys, both keys must use the same keystore. If you do not want to configure an AES 256-bit encryption key, click **Skip** to continue installing the proxy server.

If you are updating an SSL certificate on an Edge proxy server, see [Update SSL certificate](#).

**Procedure**

1. Select the encryption key location.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Store</td>
<td>Use a file to store a single encryption key. You can use an existing file in the /keys directory, or you can generate a new file. To generate a new file, enter an alias and click <strong>Generate</strong>. A file containing an encryption key is created.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Create New Java KeyStore</strong></td>
<td>Create a keystore to store the encryption key.</td>
</tr>
<tr>
<td>Java KeyStore File</td>
<td>Store the encryption key in an existing Java KeyStore file.</td>
</tr>
</tbody>
</table>

2. Click **Next**.

3. Select or create the encryption key.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>New Key</strong></td>
<td>Create an encryption key and alias.</td>
</tr>
<tr>
<td><strong>Use Existing Key</strong></td>
<td>Use an existing encryption key in the selected keystore.</td>
</tr>
<tr>
<td><strong>Import Existing Key</strong></td>
<td>Import an encryption key from a different keystore.</td>
</tr>
</tbody>
</table>

4. Click **Next**.

5. **Optional**: If you want to use AES 256-bit encryption, do the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Java 8 update 141 or earlier</strong></td>
<td>Install the Java Cryptography Extension (JCE) and overwrite the policy files in the Java home directory. See <a href="https://www.servicenow.com/support/articles/infrastructure-security-enable-aes-256-bit-encryption-for-java-8-update-141">Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier</a>.</td>
</tr>
<tr>
<td><strong>Java 8 update 151 or later</strong></td>
<td>Edit the java.security policy file to allow the use of unlimited strength keys. See <a href="https://www.servicenow.com/support/articles/infrastructure-security-enable-aes-256-bit-encryption-for-java-8-update-151">Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later</a>.</td>
</tr>
</tbody>
</table>

6. To use AES 256-bit encryption, you must also configure the AES 256-bit default encryption key on the instance by navigating to the instance and defining a default key.

   See [Configure encryption keys on the instance](https://www.servicenow.com/support/articles/infrastructure-security-enable-aes-256-bit-encryption-for-java-8-update-151). Ensure that the key alias, size, and type match the requirements defined in the installer.

7. After the key is configured on the instance, return to the installer and click **Next**.

**Update SSL certificate**

When updating an SSL certificate on an Edge proxy server, you must delete the old one.
Before you begin
Role required: admin

About this task
When updating the SSL certificate on the Edge proxy server, you must also delete the old certificate. If you don't, the old certificate (in the form of an alias in the KeyStore file) continues to be used even though the Edge proxy server is configured to use the new certificate.

Procedure
1. On the Edge proxy server, list the entries in the Java KeyStore:
   
   ```
   keytool -list -keystore keystore.jceks -storetype jceks -storepass MY_SUPER_PASSWORD
   ```

2. Remove the old SSL certificate:
   
   ```
   keytool -delete -alias MY_OLD_ALIAS -keystore keystore.jceks -storetype jceks -storepass MY_SUPER_PASSWORD
   ```

3. Add the new SSL certificate into the Java KeyStore.

Configure the Edge Encryption proxy database
If using order-preserving encryption types or encryption patterns, you can optionally configure the Edge Encryption proxy database properties.

About this task
To use order-preserving encryption types or encryption patterns, a MySQL database running in your network is mandatory. This task connects the proxy to the database, but it does not install or configure the database.

⚠️ Note: If using multiple proxy servers, all proxy servers must use the same proxy database. The values entered in the installer must be the same for all proxy servers.

Procedure
1. Confirm or change the database URL. This URL is the location of the proxy database.

2. In the Name field, enter the name of the proxy database. The default value is `edgeencryption`.

3. Enter the username and password for accessing the proxy database.

4. Click Next.

Launch the Edge Encryption proxy server
After an Edge Encryption proxy is installed and configured, you can start the proxy from the installer.

Procedure
1. After configuring keys on the instance and optionally configuring the proxy database, return to the Edge Encryption proxy installer and click Launch.

2. If an issue is detected, or to check the status of your proxy server, you can click Check Status to verify that the proxy is running.
A message displays the proxy status.

What to do next
After successfully installing the Edge Encryption proxy server, set the proxy server initial memory limit and upper bound memory limit.

Verify and troubleshoot the Edge Encryption proxy server installation
After your Edge Encryption proxy is installed, you can verify the installation to locate problems or start and stop the proxy.

Procedure
1. Open the Edge Encryption proxy installer.
2. Select Verify Installation.
3. Click Proxy Directory and select the proxy directory.
4. Click Run Tests.
   Test results display.
5. Click **Next**.
   
   If an issue is encountered, you can move through the installer to correct the configuration. If no issues are encountered, the installer jumps to the **Launch** page. You can check the proxy status, stop the proxy, or start the proxy from the **Launch** page.

### Install the Edge Encryption proxy server using the command line installer

Manually install multiple Edge Encryption proxy servers in your network.

**Before you begin**

Roles required: security_admin on your ServiceNow instance and local administrator on the host machine.

If order preserving encryption types or encryption patterns are to be used, set up a MySQL database on a machine in your network if not already present.

**Note:** If using Unbound Technology encryption keys with Edge Encryption, install the proxy server using the command line installer on the Unbound client machine. The Edge Encryption proxy server must run on the same machine as the Unbound technology client.

**About this task**

First, set up a single Edge Encryption proxy server. After your first proxy server is successfully running, add additional proxy servers for one instance to ensure an optimal environment. See [Sizing your Edge Encryption environment](#) to determine the number of additional proxy servers needed.

### Install the Edge Encryption proxy server (command line installer)

Install an Edge Encryption proxy on a 64-bit Windows or Linux computer.
Before you begin
Java 8 is required to run the installer.

About this task
Install the Edge Encryption proxy server on a machine in your network using the appropriate command for your target machine. If installing the Edge Encryption proxy server on a Windows machine, you must additionally install the proxy server as a Windows service.

When you upgrade the Edge Encryption proxy server, the system backs up the old proxy in the backup.dist-upgrade-<timestamp> directory under the current installation directory. The backup directory is generated during the upgrade process and stores the old proxy information.

When you run an upgrade via the command line, a dist-upgrade.log may be generated in the directory where the command runs. The dist-upgrade.log contains logs for the upgrade process.

In case of a failed upgrade, the system creates a failed-backup.dist-upgrade-<timestamp> directory. In addition, logs/wrapper.log in the original proxy directory may also contain failure information.

Procedure
1. Create the installation directory.
2. Download the Edge Encryption proxy archive file to the installation directory.
3. Open the terminal and change to the installation directory.

   Note: If installing on a Windows machine, you must start the Windows Command Prompt with administrator privileges.

4. Run this command for the target machine and change the variables according to your configuration: java -jar edgeencryption-<version>-all.jar -m install -n <ProxyName> --instancehost <host> -p <InstancePort> --protocol https

<table>
<thead>
<tr>
<th>Option</th>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>version</td>
<td>Version number of the Edge Encryption proxy being used to perform the current operation.</td>
</tr>
<tr>
<td>-m</td>
<td>mode</td>
<td>The operation or mode to run in (install or dist-upgrade).</td>
</tr>
<tr>
<td>-n</td>
<td>ProxyName</td>
<td>The name of the encryption proxy instance. Use a unique ProxyName to be able to identify specific proxy instances.</td>
</tr>
<tr>
<td>--instancehost</td>
<td>host</td>
<td>The host name of your ServiceNow instance (for example, mycompany.service-now.com).</td>
</tr>
<tr>
<td>Option</td>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>-p</td>
<td>InstancePort</td>
<td>The port of your instance. When the protocol is https, the port is normally 443.</td>
</tr>
<tr>
<td>--protocol</td>
<td>protocol</td>
<td>The protocol used to access your ServiceNow instance (typically https).</td>
</tr>
</tbody>
</table>

Note: Do not copy and paste commands from the browser. Occasionally, copy/paste operations cause unexpected characters to be pasted to the target machine and results in the command being executed incorrectly. It is best to type out the command by hand using documentation as a reference.

To see the help screen, execute this command without arguments: java -jar edgeencryption-<version>-all.jar

5. If installing on a Windows machine, install the Edge Encryption proxy as a Windows service.

a. Optionally change the name of the service. Open the conf/wrapper.conf file on the new proxy and set the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapper.ntservice.name</td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td>wrapper.ntservice.displayname</td>
<td>Edge Encryption proxy service display name.</td>
</tr>
<tr>
<td>wrapper.ntservice.description</td>
<td>Proxy server description.</td>
</tr>
</tbody>
</table>

If this step is not performed, the Edge Encryption proxy service is installed under the name Edge Encryption.

b. Save and close the file.

c. Open the Windows Command Prompt and cd to ServerName_port/bin.

d. Execute edgeencryption.bat install.

Results
The ProxyName_port directory is created in the current directory. The edgeencryption.properties file is updated with the host, port, and protocol values from the command line.

Create and configure the RSA key pair for the digital signature
Create an RSA key pair that the proxy server can use to create the digital signature for signing changes to the encryption properties and configuration.

Before you begin
To generate and validate the digital signature, an RSA key pair must be generated and stored in the JCEKS Java KeyStore and each proxy must be configured to use this key pair. Generate an encryption key pair using the keytool command.
To use the keytool utility with a proxy installed on SElinux (CentOS), you must enable loading of shared libraries from the proxy java-installation directory. To do this, run the following command as root.

```
chcon -R -t texrel_shlib_t proxy_install_dir/java/jre /lib
```

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

### Procedure

1. Change to the KeyStore directory in the proxy download directory.
2. Change the default password.
   
   The default password is `changeme`.
   
   ```
   keytool -keystore keystore.jceks -storetype jceks -storepasswd -new <newpassword>
   ```
3. Create an encryption key pair.

   **Note:** Do not enter a password for the key when the keytool utility prompts for one.

   ```
   keytool -genkeypair -alias <key alias> -keyalg rsa -keystore keystore.jceks -storetype jceks -storepass <keystore password> -keysize 2048
   ```
4. Update the encryption proxy property file (`edgeencryption.properties`).
   a. Change to the `<installation directory>/conf/` directory.
   b. Open the `edgeencryption.properties` file.
   c. Enter the properties for the *digital signature*.
      
      These properties must be the same for all proxies.
5. Save and close the `edgeencryption.properties` file.

### Import and configure the certificate for secure SSL connection

To use a secure SSL connection, import a server certificate and add it to the Java KeyStore.

**Before you begin**

You must obtain the server certificate before you can add it to the Java KeyStore.

**Procedure**

1. Add a server certificate to the Java KeyStore.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>If you have the RSA private key in the Java KeyStore and generated the certificate from that key.</strong></td>
<td>keytool -import -alias keyname -file server.cert -storetype JCEKS -keystore keystore.jceks -storepass pwd</td>
</tr>
<tr>
<td><strong>If you have a PKCS12 (.pfx) file that contains the RSA key and the certificate.</strong></td>
<td>keytool -importkeystore -destkeystore keystore.jceks -deststoretype jceks -srckeystore &lt;PKCS12 filename&gt; -srcstoretype pkcs12</td>
</tr>
</tbody>
</table>
Make sure that the private key password is the same as the Java KeyStore password.
You can run this command to change the password.
```
keytool -keypasswd -keystore keystore.jceks -alias <key alias>
```
For testing, you can use this command to generate a self-signed certificate.
```
keytool -genkeypair -alias cert -keystore keystore.jceks -storetype jceks -keyalg rsa
```

2. Update the edgeencryption.properties file.
   a. Change to the `<installation directory>/conf/` directory.
   b. Open the edgeencryption.properties file.
   c. Enter the properties for the SSL certificate.
      The certificate must be the same for all proxies connecting to the same instance.

3. Save and close the edgeencryption.properties file.

**Enable AES 256-bit encryption**

256-bit encryption is more secure than 128-bit encryption, and you can optionally configure
AES 256-bit encryption on the Edge Encryption proxy server host. How you enable AES 256-bit
encryption depends on the Java update installed on each proxy server host.

Edge Encryption supports only AES 128-bit and AES 256-bit keys.

⚠️ **Note:** Java does not automatically allow unlimited strength keys. You must specifically
enable the use of AES 256-bit encryption.

Follow the procedure for the Java version that is installed on your proxy server host:
- Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier
- Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later

**Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier**

Copy the Java Cryptography Extension (JCE) jurisdiction policy files to the Java home
directory of each Edge Encryption proxy server host to enable AES 256-bit encryption for
Java update 141 or earlier. 256-bit keys provide greater security than 128-bit keys.

**Before you begin**
Role required: admin

**About this task**
Your Java home directory includes the AES 128-bit policy files by default. To enable AES 256-bit
encryption, you must overwrite the Java home directory policy files with the AES 256-bit
policy files. You only need to download the JCE once, but you must update every Edge
Encryption proxy server host.

⚠️ **Note:** Java does not automatically allow unlimited strength keys. You must specifically
enable the use of AES 256-bit encryption.
Procedure

1. Download the JCE policy 8 ZIP file from Oracle.
2. Unzip the file.
3. On each proxy server host, copy the local_policy.jar and US_export_policy.jar files into the <Java-home-directory>/jre/lib/security folder.

Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later
Edit the java.security policy file to enable AES 256-bit encryption for Java update 151 or later. 256-bit keys provide greater security than 128-bit keys.

Before you begin
Role required: admin

About this task
Perform this task in the Java home directory of each Edge Encryption proxy server host on which you want to enable AES 256-bit encryption.

Note: Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

Procedure

1. Navigate to <jre_home>/lib/security/java.security on the proxy server host, where JRE_HOME is an environment variable for both Microsoft Windows and Linux.
2. Open the java.security policy file and find the line for the crypto.policy parameter, which is commented out by default.
3. Remove the # character from the beginning of the crypto.policy line to uncomment the line, and then save the file.

Note: If you do not uncomment the crypto.policy line, Java uses crypto.policy=limited, which restricts encryption to AES 128-bit keys.

Set up a keystore and encryption keys
Set up the keystore and encryption keys used by the Edge Encryption proxy server.

Procedure

1. Carefully determine the appropriate type of keystore to use based on your organization’s needs.

<table>
<thead>
<tr>
<th>Supported keystore</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File store</td>
<td>Keys are stored in a file in a file system accessed by the Edge Encryption proxy server. Because encryption keys stored in a file are not encrypted, it is your responsibility to protect these files.</td>
</tr>
<tr>
<td>Java KeyStore</td>
<td>A Java KeyStore:</td>
</tr>
</tbody>
</table>
## Supported keystore

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
</table>
| • Stores keys in a Java JCEKS KeyStore.  
• Is password protected and more secure than storing keys in a file in the file system.  
• Can store multiple keys. A key alias represents each key, making it easier to manage multiple keys. |

The Edge Encryption proxy ships with the Java JCEKS KeyStore file named keystore.jceks in the keystore directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.

### Enterprise Key Management (EKM)

<table>
<thead>
<tr>
<th>SafeNet KeySecure</th>
</tr>
</thead>
</table>
| Keys are stored and retrieved with SafeNet KeySecure key management.  
You must secure a license with Gemalto, download the libraries, and install the SafeNet KeySecure keystore on a host machine in your network before configuring the keystore on the Edge Encryption proxy server. |

**Unbound Technology**

The base64-encoded wrapped encryption key is stored as text file on the Edge Encryption proxy server. The Unbound Technology implementation (previously Dyadic Security) maintains control of the wrapping key. The Edge Encryption proxy server must run on the same machine as the Unbound technology client.

⚠️ **Note:** If using a keystore other than the base system Java JCEKS KeyStore, you must import the ServiceNow public key into your keystore. The public key alias is servicenow.

### 2. Set up the keystore and encryption keys in your local network.

#### Set up a Java KeyStore keystore

You can use a Java KeyStore keystore to store encryption keys.

**Before you begin**

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

**About this task**

The Edge Encryption proxy ships with the Java JCEKS KeyStore file named keystore.jceks in the keystore directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.

**Procedure**

1. Set up the keystore properties.
   a. Change to the `<installation directory>/conf/` directory.
   b. Open the edgeencryption.properties file.
   c. Enter the properties for the Java KeyStore.

2. Save and close the edgeencryption.properties file.
What to do next
After setting up the Java KeyStore, Create encryption keys using the Java KeyStore keytool.

Create encryption keys using the Java KeyStore keytool
You can use the keytool shipped with the encryption proxy distribution to create AES 128-bit and AES 256-bit encryption keys.

Before you begin
You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in <proxy install dir>/java/jre/bin/keytool.
To find out more about the keytool utility, see the Java SE Documentation.

About this task
Note: The Java KeyStore requires that the alias name (key name, key alias) use lowercase letters and numbers.

Procedure
1. Change to the keystore directory, <installation directory>/keystore/.
2. To create the encryption key, run one of the following commands.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td>keytool -genseckey -alias 128bitkey -keyalg aes -keysize 128 -keystore keystore.jceks -storetype jceks</td>
</tr>
<tr>
<td>AES 256</td>
<td>keytool -genseckey -alias 256bitkey -keyalg aes -keysize 256 -keystore keystore.jceks -storetype jceks</td>
</tr>
</tbody>
</table>

You add the alias on the instance when you assign default keys.

Note: The key password must be the same as the keystore password.

Set up a SafeNet KeySecure keystore
If you are using a SafeNet keystore, copy a set of libraries into the proxy distribution directory.

Before you begin
You must install and set up the SafeNet keystore before performing this step. Secure a license with Gemalto in order to download the libraries.

About this task
Note: On Linux, file paths use a forward slash (/).
Procedure

1. Copy these files to the `<installation directory>/lib` directory:
   - `ingrianNAE-<version>.jar`
   - `ingrianlog4j-api-<version>.jar`
   - `ingrianlog4j-core-<version>.jar`

2. Change to the `<installation directory>/conf/` directory, and open the `edgeencryption.properties` file.

3. Enter the properties for the SafeNet keystore.

   **Example**
   An example for a SafeNet keystore using username and password authentication.

   ```
   edgeencryption.nae.retries = 3
   edgeencryption.nae.enabled = true
   edgeencryption.nae.server = url
   edgeencryption.nae.port = 9000
   edgeencryption.nae.protocol = ssl
   edgeencryption.nae.keystore.path = keystore/safenet_truststore
   edgeencryption.nae.keystore.password = password
   edgeencryption.nae.user = safenet_user
   edgeencryption.nae.password = safenet_password
   ```

   **Example**
   An example for a SafeNet keystore using client certificate authentication. This authentication method eliminates the need to store the SafeNet server username and password in the properties file.

   ```
   edgeencryption.nae.retries = 3
   edgeencryption.nae.enabled = true
   edgeencryption.nae.server = url
   edgeencryption.nae.port = 9000
   edgeencryption.nae.protocol = ssl
   edgeencryption.nae.keystore.path = keystore/safenet_clientcert
   edgeencryption.nae.keystore.password = password
   edgeencryption.nae.client.certificate = cert_name
   ```

4. Add or create a key in the SafeNet keystore.
   You add the key name (alias) on the instance when you assign default keys.

   **Note:** If you have deployed Java 11 proxy or plan to upgrade proxy to Java 11, add the folder where all SafeNet jar files are located by adding the following line in the `wrapper.conf`:

   ```
   wrapper.java.classpath.1=<directory path to the directory where you copied the jar files in step 1>/*
   ```

5. Save and close the `edgeencryption.properties` file.

   **Upgrade from Kingston or lower to London or higher**

   If you use a SafeNet NAE server for key storage with Edge, before upgrading the proxy from Kingston or lower to London or higher, you must copy Gemalto SafeNet client ProtectApp JAR files and add new properties.
About this task

Note: On Linux, file paths use a forward slash (/).

Procedure

1. Copy the following files from `<installation directory>/lib` to a directory path that is completely outside of the proxy installation directory path:
   - ingrianNAE-<version>.jar
   - ingrianlog4j-api-<version>.jar
   - ingrianlog4j-core-<version>.jar

2. On the current version (not upgraded) of the proxy, update the `<installation directory>/conf/edgeencryption.properties` file by adding the following two properties:
   - edgeencryption.ekm.provider.classname = com.snc.edgeencryption.encryption.CloudEdgeNaeKeyProvider
   - edgeencryption.thirdparty.vendor.library.path = <directory path to the directory where you copied the jar files in step 1>

3. Save the changes.

4. Proceed with the upgrade to London or higher.

Set up Unbound Technology keys

To use Unbound Technology (previously Dyadic Security) keys with Edge Encryption, store the base64-encoded wrapped encryption key as text file on the Edge Encryption proxy server and provide the wrapping key alias. The Unbound Technology implementation maintains control of the wrapping key.

Before you begin

Role required: security_admin

In your Unbound Technology implementation, identify both the wrapping key and the wrapped key. Use the RSA/ECB/OAEPWITHSHA-256ANDMGF1PADDING algorithm for wrapping and padding. Export the wrapped key in base64-encoded text format. Save the file using the key alias as the name with no file extension.

Note: If using Unbound Technology encryption keys with Edge Encryption, install the proxy server using the command line installer on the Unbound client machine. The Edge Encryption proxy server must run on the same machine as the Unbound technology client.

Procedure

1. Add the wrapped encryption key in base64-encoded text format to the `<proxy-installation-directory>/keys` directory. The name of the file must be the key alias with no file extension.

2. Update the `edgeencryption.properties` file.
   a. Change to the `<proxy-installation-directory>/conf` directory.
   b. Open the `edgeencryption.properties` file.
   c. Enter the File store properties. Set the value of `edgeencryption.keyfile.directory` to `keys`. This property directs the proxy server to look for the encryption key in the `<Java-home-directory>/keys` directory.
For more information on Edge Encryption properties, see Edge Encryption proxy server properties.

d. Uncomment the properties for the Dyadic provider configuration. Set the value of edgeencryption.ekm.provider.rsa.wrapping.key.alias to the wrapping key alias in your Unbound implementation.

e. Save and close the file.

What to do next
Add the encryption key alias to the instance. The encryption key alias is the file name of the wrapped encryption key added to the <proxy-installation-directory>/keys directory. For example, if the file in the directory is named myunboundkey, add this name to the Key alias field. See Configure encryption keys on the instance.

Create an encryption key stored in a file
You can use a simple text file as a keystore. Each file holds a single encryption key.

About this task
This step creates both the key storage and the encryption key.

Note: The name of the key file must match the key alias specified in the encryption keys table in the instance. See Configure encryption keys on the instance.

Procedure
1. Create a file in the /keys folder of the proxy server installation directory.
2. Add the encryption key to the file.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td>Place the encryption key, exactly 16 bytes, into the file.</td>
</tr>
<tr>
<td>AES 256</td>
<td>Place the encryption key, exactly 32 bytes, into the file.</td>
</tr>
</tbody>
</table>

3. Update the edgeencryption.properties file.
   a. Change to the <installation directory>/conf/ directory.
   b. Open the edgeencryption.properties file.
   c. Enter the properties for the file store.
   d. Save and close the file.

Configure encryption keys on the instance
Edge Encryption provides the tools to manage encryption keys without taking the proxy offline.

Before you begin
Role required: security_admin
Before setting up new encryption keys on the instance:
1. Create the encryption key.

2. Make the new key available to all encryption proxies. Either copy the file or Java KeyStore file to each proxy, or ensure that each proxy has access to the Java KeyStore or Enterprise Key Management (EKM) device.

About this task
Key aliases must be unique. Each key alias must have the same key size and type on each proxy, or the key cannot be assigned as the default.

Procedure
1. Navigate to All > Edge Encryption Configuration > Encryption Key Configuration > Set Up Keys.

2. On the Add New Keys section of the form, complete the following steps to add a new key.

   a. Double-click in the row that says Insert a new row....

   b. In the edit box, enter a name for the key, then click the check mark.
   
      Key aliases are lowercase letters and numbers. Capital letters are changed to lowercase letters when you click Update. Key aliases must be unique.

   c. In the same row, double-click in the Key size column.

   d. In the select box, select a key size, either 128 bits or 256 bits, then click the check mark.

   e. In the same row, double-click in the Type column.

   f. In the select box, select a key type, either File, Keystore, SafeNet, or Unbound, then click the check mark.

   g. When you are done adding keys, click Next Step.
   
      You must specify an alias, key size, and key type for each key before moving on.

3. On the Keys Status section of the form, check the State of the key and ensure that it is Available. This may take a few minutes. When the key is Available, click Next Step.

   Note: If using SafeNet versioned keys, an additional column appears for the Key version. The Key version cannot be edited.
The instance tracks the status of every encryption key available to any proxy. When a key is available on all proxies, its state becomes **Available**. If the state does not change after a few minutes, check to ensure that the key is available on all proxies. If the state remains **Unavailable**, one or more of the proxies does not have the key.

### Encryption key states

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available</td>
<td>All online proxies have the key.</td>
</tr>
<tr>
<td>Unavailable</td>
<td>This is a new key and the proxies have not</td>
</tr>
<tr>
<td></td>
<td>yet loaded the key, or at least one proxy</td>
</tr>
<tr>
<td></td>
<td>failed to load the key.</td>
</tr>
</tbody>
</table>

4. On the Change Default Keys section of the form, do one of the following:
   - Type in the key alias.
   - Click the magnifying glass icon and select an alias.

   **Note:** If using SafeNet versioned keys, an additional field appears for the **Key version**. The **Key version** is grayed out and cannot be edited.

   **Note:** If using SafeNet versioned keys, choose only the most recent key version. If you choose an earlier version, the following message appears when you click **Update** or **Next Step**:

   ```plaintext
   One of the default keys chosen is not the latest version available for the key.
   Please use the latest version.
   ```

   **Note:** If using SafeNet versioned keys, and if the default keys are not the latest versions of the SafeNet keys, an **Update default keys to latest version** link appears in the Related Links. Click the link to update the default keys to use the latest version.

   Click **Next Step**.

5. On the Schedule Key Rotation section of the form, schedule a mass key rotation job or single key rotation job to encrypt existing data using the new encryption key.

   If you do not run a mass key rotation job or single key rotation job, existing data remains encrypted with the old key until the data is accessed again.

### Configure additional properties in the Edge Encryption properties file

After installing the Edge Encryption proxy server in your network and setting up your keystore and keys, configure the additional Edge Encryption properties.

**Procedure**

1. Open the `<installation directory>/conf/edgeencryption.properties` file and configure the following Edge Encryption proxy server properties:
   - Target (instance) properties
   - User account properties
   - Proxy properties
• If using order preserving encryption types or encryption patterns, configure the Proxy database properties
• Clear text and static IV properties

2. Save and close the file.

Configure a web proxy
If your network uses a web proxy, you can set up the Edge Encryption proxy to use the web proxy.

About this task
If your network does not use a web proxy, leave the web proxy properties in the configuration file commented out.

The Edge Encryption proxy server supports HTTP connection to and basic authentication with the web proxy.

Procedure
1. Change to the <installation directory>/conf/ directory.
2. Open the edgeencryption.properties file.
3. Configure the web proxy properties.
4. Save and close the edgeencryption.properties file.
5. If the web proxy is using a customer-specific server certificate, add this certificate to the JVM used by the Edge Encryption proxy server to establish trust between the web proxy and the Edge Encryption proxy server.
   a. cd to <Java home directory>/jre/lib/security/cacerts
   b. Execute the command: keytool -keystore cacerts -importcert -alias <chooseAlias> -file <certificateFile>

Set the proxy server initial memory limit and upper bound memory limit
Set the initial memory limit and upper bound memory limit to specify how much memory the proxy server can consume. Set these limits to avoid performance issues in your Edge Encryption implementation.

About this task
As a guideline, set both the initial memory limit and the upper bound memory limit to the same value. On any machine, allocate 2 GB of the physical memory to the operating system (OS). Then allocate the rest of the physical memory to the heap using the initial memory limit and upper bound memory limit properties. For example, on a machine with 8 GB of memory, allocate 2 GB to the OS, and allocate the remaining 6 GB (6144 m) to the initial and upper bound memory.

**Important:** If your Edge Encryption proxy server is running, you must stop and restart the proxy server after updating these properties.

Procedure
1. In your proxy server directory, open <install dir>/conf/wrapper.conf.
2. To set the initial memory limit, add the following line at the end of the file:

```bash
wrapper.java.additional.<number>=-Xms<min_memory_in_MB>m
```
Set `<number>` to the next available `<number>` in the sequence of `wrapper.java.additional.<number>` properties defined in the `wrapper.conf` file.

**Example**

For example, you have the following list of `wrapper.java.additional.<number>` properties:

```java
wrapper.java.additional.1=
wrapper.java.additional.2=
```

The maximum `<number>` in the above list is 2. When you add the `wrapper.java.additional.<number>=-Xms<min_memory_in_MB>m` line, set `<number>` to 3, the next available number.

**Important:** Do not leave gaps in the numbering sequence.

Set `<min_memory_in_MB>` to the number of megabytes of memory remaining after allocating 2 GB of memory to the OS.

3. Set the upper bound memory limit.

Because an upper bound memory limit is not set in the base system, the proxy server can use all available memory. If other services are running on the server, you may want to set the upper bound memory limit.

Add the following line at the end of the file:

`wrapper.java.additional.<number>=-Xmx<max_memory_in_MB>m`

Set `<number>` to the next available `<number>` in the sequence of `wrapper.java.additional.<number>` properties defined in the `wrapper.conf` file.

**Example**

For example, you have the following list of `wrapper.java.additional.<number>` properties:

```java
wrapper.java.additional.1=
wrapper.java.additional.2=
```

The maximum `<number>` in the above list is 2. When you add the `wrapper.java.additional.<number>=-Xmx<max_memory_in_MB>m` line, set `<number>` to 3, the next available number.

**Note:** Do not leave gaps in the numbering sequence.

Set `<max_memory_in_MB>` to the number of megabytes of memory remaining after allocating 2 GB of memory to the OS.

4. Save and close the file.

**Example: Example: Setting proxy server initial and upper bound memory limits**

```java
wrapper.java.additional.1 = -Djava.io.tmpdir=../tmp
wrapper.java.additional.2 = -Dcloudedge.home.dist=..
# must ensure UTF8 encoding when running on Windows
wrapper.java.additional.3 = -Dfile.encoding=UTF8
# additional properties for heap settings
wrapper.java.additional.4 = -Xms6144m
wrapper.java.additional.5 = -Xmx6144m
```

**What to do next**

Start the Edge Encryption proxy.
**Start the Edge Encryption proxy**

After an Edge Encryption proxy is installed and configured, you can start the proxy from the command line.

**Before you begin**

Before starting the encryption proxy, verify the following:

- The Edge Encryption plugin is activated on the instance.
- The edgeencryption.properties file on this machine has been configured.
- If using an order preserving encryption type or encryption patterns, the proxy database is running.

ℹ️ **Note:** The first time you set up the edgeencryption.properties file or change properties, you may not want to set the password encryption property. After you have verified that everything is working, you can set the password encryption property, shut down the proxy, and then restart the proxy.

**Procedure**

1. Run the proxy server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>On a Linux machine</strong></td>
<td>a. cd to ServerName_port&lt;br&gt;b. Execute ./startup.sh</td>
</tr>
<tr>
<td><strong>On a Windows machine</strong></td>
<td>Perform the following steps from the command line as admin:&lt;br&gt;a. cd to ServerName_port/bin&lt;br&gt;b. Execute edgeencryption.bat start</td>
</tr>
</tbody>
</table>

2. Check the log on the proxy server to verify that the proxy is running.

**Obfuscate passwords in the properties file**

You can obfuscate passwords in the edgeencryption.properties file to share the properties file without revealing clear text passwords.

**Before you begin**

Make sure that the Edge Encryption proxy server is set up and successfully running before you set this property. Before setting this property, Stop the Edge Encryption proxy.

**About this task**

Setting this property may make it difficult to debug connection and access issues during initial startup. Only set this property in production environments after the proxy has been set up and tested successfully.

**Procedure**

1. Change to the `<installation directory>/conf/` directory.

2. In the conf directory, create a text file containing a complex string or phrase that can be used as a passphrase which the proxy uses to obfuscate the passwords in the edgeencryption.properties file. This passphrase should be a random and complex phrase not related to the passwords themselves.
3. Open the `edgeencryption.properties` file.
4. Set the password encryption property.
5. Save and close the `edgeencryption.properties` file.

**What to do next**
After setting this property, you can start the Edge Encryption proxy.

**Manually add an additional proxy**
After the first Edge Encryption proxy is properly configured and tested, you can set up additional proxies on a Linux or Windows machine. Installing multiple proxies on the same machine is not recommended.

**About this task**
Add additional proxy servers on additional machines to ensure an optimal environment. See [Sizing your Edge Encryption environment](#) to determine the number of additional proxies needed.

**Note:** Make sure that all proxies have the same encryption keys and the same RSA key pair used to digitally sign encryption configuration and encryption rules. If a proxy database was set up as part of the installation, all proxies must use the same proxy database.

**Procedure**
1. Install the proxy using the appropriate command. See [Install the Edge Encryption proxy server (interactive installer)](#).
2. Copy all the encryption keys and the `edgeencryption.properties` file from the first proxy to the new proxy.
   Encryption keys may be located in the proxy keystore, in the `/keys` directory, or in a SafeNet KeySecure keystore.
3. Open the `edgeencryption.properties` file on the new proxy.
4. Change the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.proxy.name</code></td>
<td>Unique name of the proxy server</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.host</code></td>
<td>The server name, IP address, or fully-qualified domain name of the computer running the proxy.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.http.port</code></td>
<td>Port on the proxy for HTTP communication. Must be unique across all processes on the machine.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.https.port</code></td>
<td>Port on the proxy for HTTPS communication. Must be unique across processes on the machine.</td>
</tr>
</tbody>
</table>

5. If installing the proxy server on a Windows machine, you must change the name of the service. Open the `conf/wrapper.conf` file on the new proxy and add the following properties.

**Note:** You must perform this step before launching the proxy server.
### Property Description

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapper.ntservice.name</td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td>wrapper.ntservice.displayname</td>
<td>Edge Encryption proxy service display name.</td>
</tr>
<tr>
<td>wrapper.ntservice.description</td>
<td>Proxy server description.</td>
</tr>
</tbody>
</table>

### 6. Save and close the file.

### 7. Launch the proxy using the appropriate command. See [Start the Edge Encryption proxy](#).

#### Authenticate an Edge Encryption proxy server

Specify that a proxy server is a trusted source so that Edge Encryption can process requests coming from that proxy server.

### Before you begin

If a proxy server is not authenticated, the console log includes the following message:

```
WARN This Edge Encryption proxy has not yet been authenticated by the instance.
Please navigate to the matching Proxy record on your ServiceNow instance and authenticate it.
```

If you attempt to access the proxy, you receive the following message: This site can't be reached.

To maintain the proxy in an operational state during the upgrade process, authentication is not required until after the proxy update is successful.

Role required: admin

### Procedure

1. Navigate to All > Edge Encryption Configuration > Proxies.
2. Select the proxy and click Authenticate.

### Results

The proxy moves from Unauthenticated to Pending to Authenticated. The status changes from Unauthenticated to Pending when you start the authentication. When authentication is complete, the status changes from Pending to Authenticated, and you can access the proxy and Edge Encryption can accept requests from the proxy.

**Note:** If you stop and restart the proxy, the proxy remains Authenticated and restarts successfully.

### Stop the Edge Encryption proxy

You can stop an Edge Encryption proxy from the command line.

### Procedure

1. Stop the proxy server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On a Linux machine</td>
<td>Execute ./shutdown.sh</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>On a Windows machine</td>
<td>Execute edgeencryption.bat stop To remove the Windows service, execute edgeencryption.bat remove</td>
</tr>
</tbody>
</table>

2. Check the log on the proxy server to verify that the proxy has stopped.

**Uninstall the Edge Encryption proxy on Linux**

You can uninstall the Edge Encryption proxy. If you are upgrading the proxy, it is not necessary to shut down and uninstall the current version.

**Before you begin**

You must have access to the computer running the Edge Encryption proxy.

**About this task**

Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

The encryption proxy running on Linux operates as a single process. You can end this process to accommodate such tasks as redeploying the encryption proxy to another host machine, updating the proxy version, updating the Java version, or changing the unique name of the encryption proxy when deploying the encryption proxy on multiple proxy servers.

**Procedure**

1. You may want to save the edgeencryption.properties file before deleting the distribution directory.
2. Execute the shutdown.sh shell script.
3. Check the log on the proxy server to verify that the proxy server is shut down.
4. Delete the files in the distribution folder.

**Uninstall the Edge Encryption proxy on Windows**

You can uninstall the Edge Encryption proxy. If you are upgrading the proxy, it is not necessary to shut down and uninstall the current version.

**Before you begin**

You must have access to the computer running the Edge Encryption proxy.

Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

**Procedure**

1. You may want to save the edgeencryption.properties file before deleting the distribution directory.
2. Execute edgeencryption.bat stop
3. Execute edgeencryption.bat remove
4. Check the log on the proxy server to verify that the proxy server is shutdown.
5. Delete the files in the distribution folder.
Set up multiple provider SSO with Edge Encryption

If implementing multiple provider single sign-on (SSO) with Edge Encryption enabled, some users may need to log in to your instance through the Edge Encryption proxy server, while other users may not. Set up multiple provider SSO to enable logging in through the Edge Encryption proxy server URL or the instance URL.

Before you begin

- Role required: admin
- Enable the Edge Encryption plugin (com.glide.edgeencryption) and ensure that one or more proxy servers are set up in your network.
- Determine the URL for the Edge Encryption proxy server that users will log in through using multiple provider SSO. To determine the URL of an Edge Encryption proxy server, see Edge Encryption installation.

About this task

- If routing all users through the Edge Encryption proxy server, set up your identify provider record and define the proxy server URL in the ServiceNow Homepage, Entity ID / Issuer, and Audience URI fields.
- To route some users through the proxy server and some users to the instance, create two identify provider records. Both records use the same value in the Identity Provider URL field. However, one of the records routes through the proxy server, while the other routes to the instance.

Procedure

1. Enable the duplication of identity provider URLs in identity provider records. A unique constraint prevents duplication of the identity provider URL in two different identity provider records. You can enable duplication of the identity provider URL in multiple IdP records by setting a field to false.
   b. Open the definition record for the idp field of in the Identity Providers table [saml2_update1_properties].
   c. Configure the form to add the Unique field.
   d. Ensure that the value of the Unique field is set to false.
2. Navigate to Multi-Provider SSO > Identity Providers.
3. Create two identity provider records for the same identity provider: one using the instance URL and one using the Edge Encryption proxy server URL.
   To create an identity provider record, see Create an external identity provider.
   a. For the Edge Encryption proxy server URL, complete the form using these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity Provider URL</td>
<td>Imported from IdP metadata.</td>
</tr>
<tr>
<td>ServiceNow Homepage</td>
<td>The URL for your proxy server homepage. For example:</td>
</tr>
<tr>
<td></td>
<td>https://&lt;proxy hostname&gt;:&lt;port&gt;/navpage.do</td>
</tr>
</tbody>
</table>
b. Click **Submit**.

c. For the instance URL, complete the form using these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity Provider URL</td>
<td>Imported from IdP metadata.</td>
</tr>
<tr>
<td>ServiceNow Homepage</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
<tr>
<td>Entity ID / Issuer</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
<tr>
<td>Audience URI</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
</tbody>
</table>

d. Click **Submit**.

4. **Optional:** If using more than one identity provider, modify the MultiSSO installation exit.

a. Navigate to **System Definition > Installation Exits**.
   The system displays the current list of installation exits.

b. Open the **MultiSSO** installation exit.

c. Locate the following statement in the **Script** field.

```javascript
var samlResponseTxt = request.getParameter("SAMLResponse");
if (!GlideSession.get().isLoggedIn() && GlideStringUtil.notNil(samlResponseTxt)) {
    var idpRecord = this.getIdPRecord(request);
    if (idpRecord) {
        SSO_Helper.debug("IdP found based on SAML response: " +
        idpRecord.getUniqueValue());
        return new SSO_Helper(idpRecord.getUniqueValue(), false, null, true);
    }
}
```

d. Replace the statement with the following code.

```javascript
var samlResponseTxt = request.getParameter("SAMLResponse");
if (!GlideSession.get().isLoggedIn() && GlideStringUtil.notNil(samlResponseTxt)) {
    /* // You have two profiles that use the same IdP entity id it cannot use
    // the IdP issuer / entity id from the response otherwise it may result in the
    // wrong IdP profile. IdP initiated login will not work
    var idpRecord = this.getIdPRecord(request);
    if (idpRecord) {
        SSO_Helper.debug("IdP found based on SAML response: " +
        idpRecord.getUniqueValue());
        return new SSO_Helper(idpRecord.getUniqueValue(), false, null, true);
    }*/
    return new SSO_Helper(null, true);
}
```
**Note:** IdP initiated login does not work in this configuration.

e. Click Update.

5. Optional: If using more than one company, Configure users for Multi-Provider SSO. Update the sys_id of the identity provider record depending on the user.
   - To configure a user to log in through the Edge Encryption proxy server, use the sys_id of the identity provider record that uses the Edge Encryption proxy server URL.
   - To configure a user to log in to the instance, use the sys_id of the identity provider record that uses the instance URL.

### Login URLs

<table>
<thead>
<tr>
<th>URL</th>
<th>Login destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>https://&lt;instance name&gt;.service-now.com/login_with_sso.do?glide_sso_id=&lt;sys_id of IdP record for the instance URL&gt;</td>
<td>Logs in through the instance.</td>
</tr>
</tbody>
</table>

### Edge Encryption proxy server properties

The edgeencryption.properties configuration file located in the <installation directory>/conf/ folder contains properties used to configure your environment.

You must restart the proxy server after making changes to any proxy server properties. Changes on the instance and changes to the log4j.properties do not require a proxy restart.

#### Target (instance) properties

- **edgeencryption.target.host**
  Host name for the instance. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed. For example, instancename.servicenow.com

- **edgeencryption.target.port**
  Instance port. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed.

- **edgeencryption.target.protocol**
  Instance protocol. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed. Options include:
  - http
  - https

#### User account properties

- **edgeencryption.target.username**
  User name that the proxy uses to log in to the instance. The user must have the edge_encryption role. See Set up an Edge Encryption user account.

- **edgeencryption.target.password**
Password that the proxy uses to log in to the instance.

Proxy properties

**edgeencryption.proxy.host**
Server name, IP address, or fully qualified domain name of the computer running the proxy. Along with the port, this property defines the URL used by the client to access the proxy server.

**edgeencryption.proxy.name**
Proxy name. Must be unique for each proxy.

**edgeencryption.proxy.http.port**
Port on the proxy for HTTP communication.

**edgeencryption.proxy.https.port**
Port on the proxy for HTTPS communication.

SSL certificate properties

Restart your proxy if you change the value of any SSL certificate property. The system uses the HTTPS keypair on startup to establish the proxy server connection and determine how the proxy answers client requests.

**edgeencryption.proxy.https.cert.alias**
Alias of the certificate provided by the proxy server to connecting clients.

**edgeencryption.proxy.https.keystore.path**
Path to the keystore that contains the HTTPS certificate.

**edgeencryption.proxy.https.keystore.password**
Password for the keystore that contains the HTTPS certificate.

Proxy configuration locked property

**edgeencryption.proxy.locked**
When true, the proxy does not accept encryption configuration changes or encryption rule changes from the instance. Set this property on the production instance after all encryption configurations and rules are final.

Proxy database properties

**edgeencryption.db.url**
Proxy database location. Must be the same for all encryption proxies connecting to the same instance.

**edgeencryption.db.user**
User name for accessing the proxy database. Must be the same for all encryption proxies connecting to the same instance.

**edgeencryption.db.password**
Password to access the proxy database. Must be the same for all encryption proxies connecting to the same instance.

**edgeencryption.db.name**
Proxy database name. Must be the same for all encryption proxies connecting to the same instance.

- Default value: edgeencryption
edgeencryption.db.bootstrap.file

Bootstrap file for the proxy database. The file is relative to the sql/ directory. Must be the same for all encryption proxies connecting to the same instance.

⚠️ Warning: Under normal circumstances, do not change this parameter.

Digital signature properties

edgeencryption.proxy.signature.keystore.path

Path and Java KeyStore file name.

edgeencryption.proxy.signature.keystore.password

Password. The default password is <changeme>. Change the password after installing the Java KeyStore.

edgeencryption.proxy.signature.keystore.keyalias

The key alias given as the -alias argument when the RSA key pair is generated.

NAE device keystore properties

edgeencryption.nae.retries

Number of retries to make.

edgeencryption.nae.enabled

Setting indicates whether an NAE device is available.

edgeencryption.nae.server

Name of the NAE server.

edgeencryption.nae.port

Port used by the NAE server.

edgeencryption.nae.protocol

Protocol used by the NAE server.

edgeencryption.nae.keystore.path

Path to the keystore on the NAE server.

edgeencryption.nae.keystore.password

NAE keystore password.

edgeencryption.nae.username

User name to use to authenticate with the NAE device.

edgeencryption.nae.password

Password to use to authenticate with the NAE device.

edgeencryption.nae.client.certificate

Certificate located in the keystore on the NAE server. Set this property to authenticate using a certificate instead of a username and password.

Clear text and static IV properties

edgeencryption.customer.assigned.known.cleartext

Clear text to let the instance verify that all proxies are using the same keys. At startup, the proxy encrypts the clear text and sends the encrypted text to the instance. The instance does not know the clear text, nor are keys sent to the instance. This property must be the same for all proxies.
edgeencryption.encrypter.static.iv

Static IV (initialization vector) used in equality-preserving and order-preserving encryption. This property must be the same for all proxies and must be exactly 16 bytes (16 ASCII characters).

Password property

edgeencryption.encrypter.properties.password

Name of the file in the conf folder that contains a string used within a secure process to obfuscate passwords in the edgeencryption.properties file.

If this property is not set, passwords in your properties file appear in clear text. Leave this property blank until after the proxy configuration has been set up and tested.

Web proxy properties

edgeencryption.webproxy.host

Web proxy name or IP address.

edgeencryption.webproxy.port

Port on the web proxy.

edgeencryption.webproxy.user

User name used to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.

edgeencryption.webproxy.password

Password to use to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.

Java KeyStore properties

edgeencryption.keystore.path

Path to the Java KeyStore. If using a file store or a SafeNet KeySecure keystore, leave this property commented out.

Example:

edgeencryption.keystore.path = keystore/keystore.jceks

edgeencryption.keystore.password

Password the proxy uses to connect to the Java KeyStore. If using a file store or a SafeNet KeySecure keystore, leave this property commented out.

File store property

edgeencryption.keyfile.directory

The directory specifies where key files are stored. If using the Java KeyStore or a SafeNet KeySecure keystore, leave this property commented out.

Example:

edgeencryption.keyfile.directory=keys

If using Unbound Technology keys, uncomment this property and set the value to the keys directory.

Unbound Technology provider properties

edgeencryption.ekm.provider.classname
Internal class name for the implementation.

⚠️ Warning: Do not change this property.

**edgeencryption.thirdparty.vendor.library.path**

Path to the Unbound API JAR file on the Unbound client machine.

**edgeencryption.ekm.provider.rsa.wrapping.key.alias**

Wrapping key alias in the Unbound Technology implementation. Must be the same for all proxies.

**General configuration properties**

**edgeencryption.config.poll.interval**

Poll interval in seconds. The default setting means that it takes 5 seconds for the proxy to learn of encryption configuration changes. Larger values cause the instance to take longer to detect an offline proxy.

⚠️ Warning: Do not change this property. Changing the default setting of the Proxy Poll Interval can result in detection delays when a proxy comes online.

**edgeencryption.rules.dir**

Folder where the encryption rules are stored on the proxy.

**edgeencryption.encryption.order_preserving.cache.enable**

Setting determines whether caching is used to support order-preserving encryption types.

**edgeencryption.encryption.order_preserving.cache.size**

Maximum cache size, in bytes.

**edgeencryption.jobs.concurrency**

Maximum number of mass encryption jobs that can run concurrently on this proxy.

**edgeencryption.jobs.requests_per_second**

Number of http job requests per second that can be sent to the instance by this proxy.

**edgeencryption.attachments.request.timeout.seconds**

Attachment upload request timeout in seconds.

**edgeencryption.request.buffer.size**

Size of an encryption request. If an encryption request is larger than this size, the excess is saved to disk.

⚠️ Warning: Do not change this property.

**edgeencryption.httpclient.request.buffer.size**

Size of the client request. If the client request is larger than this size, the excess is saved to disk.

⚠️ Warning: Do not change this property.

**edgeencryption.httpclient.header.size**

Size of the request/response header.
• Minimum value: 8K
• Maximum value: 32K

⚠️ Warning: Do not change this property.

`edgeencryption.proxy.idle.timeout`
Time in seconds after which a transaction times out.
• Default value: 300 (seconds)

`edgeencryption.proxy.keepalive.interval`
Time in seconds between pings issued by the proxy to the instance. Pings are issued periodically to verify connectivity between the proxy and the instance.
• Default value: 10 (seconds)
• Minimum value: 5 (seconds)

`edgeencryption.register.retry.count`
Maximum number of times the proxy pings the instance to try to register.
• Default value: 0 (no limit)

`edgeencryption.tokenization.exclusion.list`
Encryption patterns cannot tokenize strings found in these fields.

Proxy server performance properties
Proxy server performance properties are not present in the configuration file by default. To change the default values, you must add the properties and restart the proxy server. For more information, see [Edge Encryption diagnostics and performance](#).

`edgeencryption.stat.collection.enabled`
Enables the collection of statistics used by the Edge Encryption proxy server performance dashboard.
• Default value: true

Add this property and set the value to false to disable the collection of statistics used by the Edge Encryption proxy server performance dashboard.

`edgeencryption.stat.collection.interval`
Interval length in seconds during which the Edge Encryption proxy server collects statistics. The value cannot be less than 30 seconds.
• Default value: 30 (seconds)

Deprecated proxy encryption properties
`edgeencryption.encrypter.default.key128`
Specifies the name of the current AES 128 key. An AES 128 key must be available even if it is not used. Must be the same for all proxies.
Perform maintenance of these keys on the instance.

`edgeencryption.encrypter.default.key256`
Specifies the name of the current AES 256 key. Must be the same for all proxies.
Perform maintenance of these keys on the instance.
edgeencryption.encrypter.key

Specifies the key name for each key and is used to specify the default keys. This is the key alias integrated with the metadata that is included with each encrypted item and, therefore, is stored on the instance. The key name must use lowercase letters.

eedgeencryption.encrypter.type

Specifies the type of encryption keystore system.

eedgeencryption.encrypter.file

Specifies the path and file name of the text file associated with the key.

eedgeencryption.encrypter.password

Specifies the password for accessing the keystore.

**CyberArk integration with the Edge proxy server**

Use CyberArk to store passwords in a centralized and secure digital vault to secure passwords that were previously stored in clear text and secured by file access, or that were previously encrypted via a second file.

CyberArk AIM (Application Identity Management) prevents unauthorized access by eliminating hard-coded and visible passwords. AIM stores passwords in a digital vault on an independent hardened server, where the passwords are represented as digital credentials. The AIM clients (the Edge proxy servers) use CyberArk digital credentials and access the independent server to retrieve the secured passwords. No passwords are stored on the Edge proxy servers or in the instance.

**CyberArk digital vault credentials**

You must purchase and configure CyberArk before you can set up CyberArk integration with the Edge proxy server.

To add a credential to CyberArk (which is read by the Edge proxy), set the Platform Name of the credential to **Unix via SSH** and make sure you either create a Custom credential Name or write down the Auto-generated credential Name. When you configure the Edge proxy to use this credential, the proxy server matches this credential Name to the setting in the proxy.

![Add SSH Key](image-url)
Each credential entry holds a **Password** that is being secured, as well as a credential **Name** used by an application to access that password.

**Note:** CyberArk credentials are not encryption keys.

**Adding CyberArk during an Edge proxy installation**

The proxy installer includes a new configuration page for a CyberArk integration. This page is optional if you do not want to include CyberArk when installing your proxy with the proxy installer. You can also manually set up and configure CyberArk integration in the configuration file.

The proxy installer also includes a new page for CyberArk protected credentials. This page allows configurations of different properties using a single credential name or multiple credential names. This page is optional if you do not want to include CyberArk when installing your proxy with the proxy installer.
CyberArk password protection

Any password field in the Edge proxy installer that has a CyberArk credential configured in the CyberArk vault and specified on the CyberArk Protected Credentials page of the installer is grayed out and contains the message Protected by CyberArk.
Using a load balancer with the Edge proxy server

You can use a load balancer to balance the load across the proxy servers in your Edge Encryption proxy setup. If the load balancer and proxy servers are using different ports, specify the host name and HTTPS port of the load balancer to enable users to view responses on their browser.

ℹ️ Important: All production environments should include at least two Edge Encryption proxy servers for redundancy.

Edge request processing without a load balancer

If you are not using a load balancer, a request is processed as described below.

1. The user issues a request from a browser.
2. The browser sends the request to the Edge proxy server.
3. The proxy server sends the request to the ServiceNow instance.
4. The ServiceNow instance returns the response to the proxy server.
5. The proxy server adds its own port number in the response header before returning the response to the user's browser.

The request is completed successfully because the user can view the response from the proxy server at the port number specified in the response header.

Edge request processing with a load balancer

However, if you are using a load balancer, the user's browser communicates directly with the load balancer, not with the proxy server. A request is processed as described below.

⚠️ Note: The following example uses 1025 as the proxy server port number.

1. The user issues a request from a browser.
2. The browser sends the request to a load balancer Virtual IP (VIP), also known as a Virtual Server.
3. The VIP is configured to point to the proxy server (for example, 10.2.200.148:1025), so the load balancer forwards the request to the proxy server.
4. The proxy server sends the request to the ServiceNow instance.
5. The ServiceNow instance returns the response to the proxy server.
6. The proxy server rewrites the location header in the response with values configured in the properties for risk-servicenow.dev.echonet:1025.
   - Host: edgencryption.proxy.host
   - HTTP port: edgeencryption.proxy.http.port
   - HTTPS port: edgeencryption.proxy.https.port
7. The proxy server forwards the response to the load balancer with the location header pointing to the proxy server port.

The outcome depends on whether the load balancer and proxy servers are using the same port.
If the load balancer and proxy servers are using the same port, the request succeeds because the user receives the response from the same port identified in the response header.

If the load balancer and proxy servers are using different ports, the request fails because the user's browser communicates only with the load balancer, but the response is on the proxy server.

Solution

You could resolve the issue by simply using the load balancer and all Edge proxy servers on the same port, but this is not an ideal solution. A better solution is to enable the system to know which port the load balancer uses.

The following properties enable the Edge proxy server to reroute response messages to the load balancer if the proxy server and load balancer are using different ports.

- `edgeencryption.proxy rewrite.location.host` specifies the host name used to access ServiceNow through the load balancer.
- `edgeencryption.proxy rewrite.location.https.port` specifies the HTTPS port used to access ServiceNow through the load balancer.

Configure the load balancer

If the load balancer and proxy servers are using different ports, specify the host name and HTTPS port of the load balancer to enable users to view responses on their browser.

Before you begin

Roles required:

- local or domain administrator on a Windows host
- service user with full file system access on a Linux host

Procedure

1. Login to the proxy server host as admin, domain admin, or a service user.
2. Navigate to the installation directory for the Edge proxy and select `conf/edgeencryption.properties`.
3. Set the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.proxy rewrite.location.host</code></td>
<td>If your Edge configuration includes a load balancer to balance the load among proxy servers, rewrites responses to the load balancer so requests can be completed.</td>
</tr>
<tr>
<td></td>
<td>• If there is a load balancer in the proxy setup, specify the host name used to access ServiceNow through the load balancer.</td>
</tr>
<tr>
<td></td>
<td>• Optional: If there is no load balancer in the proxy setup, can be set to the host name used by the proxy server.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy rewrite.location.https.port</code></td>
<td>If your Edge configuration includes a load balancer to balance the load among</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| proxy servers | specifies the HTTPS port used to access ServiceNow through the load balancer.  
  • If there is a load balancer in the configuration, specify the HTTPS port used to access ServiceNow through the load balancer.  
  • **Optional**: If there is no load balancer in the configuration, can be set to the HTTPS port used by the proxy server. |

4. Save the file.

**Results**
Requests can be completed because users can now view responses on their browser.

**Edge Encryption upgrades**
Both instance upgrades and proxy server upgrades require special consideration in an Edge Encryption environment.

**Instance upgrades**
Instance upgrades in an Edge Encryption environment require caution to ensure that Edge controls work properly after the instance upgrade.

During an instance upgrade, you should not add, edit, or delete the following:

• Edge Encryption configurations  
• Edge Encryption rules  
• Edge Encryption tokenization patterns  
• Edge Encryption scheduled jobs  
• Edge Encryption key configurations  
• Edge Encryption scheduled upgrades  
• Edge Encryption denylist IP configurations

Any scheduled job running during the instance upgrade will not complete. To complete the interrupted job, rerun the job once the instance is upgraded. When you reschedule the job, the processing that occurred before the instance upgrade is not lost, and the job continues to process only the data that has not yet been processed.

**Proxy server upgrades**
Schedule a proxy upgrade to enable the instance to upgrade the Edge Encryption proxy server, or manually upgrade the proxy server at any time.

⚠️ **Warning:** For an upgrade on Windows, you may encounter file lock issues and the upgrade may fail. For the upgrade to succeed, you should not have any files open under the installation directory. Also, there should be no existing shell in the installation directory. In particular, if you start the proxy from the command line (via `bin\edgeencryption.bat install/start`) while in the installation directory, you should close that shell or move it out of the installation directory afterward. No files under the installation directory should be opened by an editor or by any other application.
**Third party libraries**

Third party libraries, such as Gemalto, are lost during instance and proxy server upgrades if they are kept in the same directory. You can perform the following to prevent the loss of third party libraries during upgrades:

1. Manually add the following property to edgeencryption.properties:
   ```
   edgeencryption.ekm.provider.classname = com.snc.edgeencryption.encryption.CloudEdgeNaeKeyProvider
   ```

2. Add the `edgeencryption.thirdparty.vendor.library.path` vendor library location property and set it to `/path/to/jars`.
   For example:
   ```
   edgeencryption.thirdparty.vendor.library.path = /app/servicenow/libs
   ```

3. Copy the SafeNet JARs into that path.

After you install the third party libraries outside of the Edge Encryption installation, they are no longer lost during upgrades.

**Scheduled upgrades**

**Important:** During ServiceNow Instance upgrades, also upgrade your proxy server version to align with your Instance version and reduce the chance of compatibility issues.

Schedule an upgrade to allow the instance to upgrade the proxy server at the scheduled time. This functionality is available by default after upgrading. A scheduled upgrade includes these events:

1. The proxy server checks with the instance to see if there is a new version available for upgrade. New versions generally become available when the instance is upgraded.

2. The administrator receives a notification upon logging in when a new version of the proxy server is available.

3. The administrator can **Schedule an Edge Encryption proxy server upgrade** for each proxy server.

   **Note:** Only users with the security_admin role can create an upgrade schedule through the proxy server.

4. Once the upgrade is scheduled, the proxy server automatically upgrades at the scheduled time. During the upgrade, the proxy server is offline for only a short time.

   **Note:** Because the proxy server restarts during the upgrade, it is offline for a short time. The amount of time is determined by your environment and how long it takes to stop and restart the proxy service.

5. During the scheduled upgrade, a new proxy directory is created and your configuration files are copied to the new directory. New properties are written to your existing properties file. The following files or directories in your old proxy directory are copied to the new proxy directory:
   - `/conf` directory
   - `/keys` directory
   - `/keystore` directory
   - `java/jre/lib/security/cacerts` file
As a result, your keys, keystores, settings, and certificates are preserved.

**Note:** Only the above files are copied to the new proxy directory. Any other customized files in the proxy server directory are not preserved during a scheduled upgrade. The upgrade log file can be found in the original proxy directory in the following folder: `<original-proxy-directory>/tmp/upgrade-wrapper/bin`.

**Prerequisites for scheduled upgrades**

Before scheduling an upgrade for an Edge Encryption proxy, ensure the following:

1. The `JAVA_HOME` environment variable points to a java installation on the machine that is outside the Edge Encryption proxy’s directory structure.

2. The `JAVA_HOME` environment variable points to a java installation that is at version 1.8_u144 or higher.

3. The `-Djava.io.tmpdir` parameter in the wrapper.conf file of the Edge Encryption proxy points to a directory that is OUTSIDE the Edge Encryption proxy’s directory structure, and the proxy has read/write/execute permissions on the directory. Optionally, you could comment out the parameter entirely so that Java uses its default tmp location.

**Manual upgrades**

Instead of creating an upgrade schedule, you can manually upgrade each proxy server through the command line. See [Manually upgrade an Edge Encryption proxy server running on Linux](#) or [Manually upgrade an Edge Encryption proxy server running on Windows](#).

**Proxy build status**

You can easily identify whether a proxy server is out of date by navigating to **Edge Encryption Configuration > Proxies > All**. The status of your proxy build is indicated in the **Proxy build** column by the following colors:

- **Green**
  
  Your proxy server is up-to-date.

- **Yellow**
  
  Your proxy server is out-of-date and an upgrade is needed.

- **Orange**
  
  Upgrade failed. Your proxy server reverts to the old version to ensure that there is no downtime.

**Troubleshoot a failed scheduled proxy upgrade**

When a scheduled proxy upgrade fails, the proxy server reverts to the version you are upgrading from. All original data, keys, and configuration files are preserved. This process may take several minutes. Contact Customer Service and Support to ensure a successful upgrade.
To determine the reason for the failure, you can check the **Failure Reason** in the upgrade schedule. In addition, the installation directory for the failed upgrade is maintained so that log files are available for troubleshooting.

**Note:** Before deleting any extra proxy directories, always confirm which directory is current by reviewing the log files. If the log files have recent activity, the proxy might be connected to your instance.

If a scheduled proxy upgrade fails repeatedly, you can manually upgrade your proxy server. See [Manually upgrade an Edge Encryption proxy server running on Linux](#) and [Manually upgrade an Edge Encryption proxy server running on Windows](#).

**Java minimum requirements**
The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

- Java 8 update 121 (8u121)
- Java 8 update 141 (8u141)
- Java 8 update 151 (8u151) or later

**Note:** Java 8 update 131 (8u131) is not supported.
- Java 11.0.6 or later

**Note:** Before installing the Edge Encryption proxy server, check that the `$JAVA_HOME` variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the `$JAVA_HOME` variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see [Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower](#).

**Mixed proxy-version environments**
Although an environment running old versions of the proxy server with up-to-date versions of the proxy server is not recommended, it is supported if all proxy servers are within the same version family as your instance. For example, if you have an instance on the San Diego release, your environment supports proxy servers from any San Diego patch or hot fix. However, the following limitations apply.

- If one proxy server supports functionality that another proxy does not support, you will see inconsistent behavior, depending on which proxy server is used.
- If a proxy server is out-of-date, it may not include recent security enhancements.

If a proxy server from a previous release is registered with a newer release of the instance, you will receive regular notifications that the proxy server is out-of-date. To ensure an optimal and secure environment, ServiceNow recommends always upgrading your proxy server to the most recent version of the software supported by your instance.
Schedule an Edge Encryption proxy server upgrade

Create an upgrade schedule to enable the instance to upgrade an out-of-date proxy server.

Before you begin

To schedule an upgrade, you must be logged in to your instance through the proxy server. If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower.

Role required: security_admin

About this task

Once the upgrade is scheduled, the proxy server automatically upgrades at the scheduled time. During the upgrade, the proxy server is offline for only a short time.

⚠️ **Note:** Because the proxy server restarts during the upgrade, it is offline for a short time. The amount of time is determined by your environment and how long it takes to stop and restart the proxy service.

During the scheduled upgrade, a new proxy directory is created and your configuration files are copied to the new directory. New properties are written to your existing properties file. The following files or directories in your old proxy directory are copied to the new proxy directory.

- `/conf` directory
- `/keys` directory
- `/keystore` directory
- `java/jre/lib/security/cacerts` file

As a result, your keys, keystores, settings, and certificates are preserved.

⚠️ **Note:** Only the above files are copied to the new proxy directory. Any other customized files in the proxy server directory will not be preserved during a scheduled upgrade. The upgrade log file can be found in the original proxy directory in the following folder: `<original-proxy-directory>/tmp/upgrade-wrapper/bin`.

If multiple proxy servers are out-of-date, you must schedule an upgrade for each proxy server individually.

⚠️ **Note:** Avoid hosting multiple proxy servers on the same machine. However, if your environment includes this configuration, do not schedule upgrades to multiple proxies on the same machine at the same time.

Procedure

1. Navigate to All > Edge Encryption Configuration > Proxies > Upgrade Schedules.
2. Click New.
3. Complete the form.
### Edge Encryption Proxy Upgrade Schedule form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy server</td>
<td>Proxy server being upgraded.</td>
</tr>
<tr>
<td>Target version</td>
<td>Version to which you are upgrading your proxy server. This value is read-only and set to the most up-to-date proxy version available for your instance.</td>
</tr>
<tr>
<td>Scheduled Start Time</td>
<td>Date and time on which to start the upgrade.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the scheduled upgrade is active. If this field is not selected, the upgrade will not perform on the scheduled date and time.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the upgrade. This value is read-only. Possible statuses include:</td>
</tr>
<tr>
<td></td>
<td>• Pending</td>
</tr>
<tr>
<td></td>
<td>• Running</td>
</tr>
<tr>
<td></td>
<td>• Complete</td>
</tr>
<tr>
<td></td>
<td>• Failed</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

### What to do next

After an upgrade is executed, you can review the upgrade details to learn more about it. If your upgrade failed, review the **Failure Reason** to determine next steps.

### Upgrade details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Version</td>
<td>The version that the server was upgraded from.</td>
</tr>
<tr>
<td>To Version</td>
<td>The version that the server was upgraded to.</td>
</tr>
<tr>
<td>Actual Start Time</td>
<td>Time that the upgrade began.</td>
</tr>
<tr>
<td>End Time</td>
<td>Time that the upgrade ended.</td>
</tr>
<tr>
<td>Failure Reason</td>
<td>Reason that the upgrade failed.</td>
</tr>
</tbody>
</table>

### Manually upgrade an Edge Encryption proxy server running on Linux

Update a proxy running on Linux.

**Before you begin**

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see [Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower](#).
Role required: security_admin or local administrator on the host machine

**Procedure**

1. Copy the Edge Encryption update-archive file to the installation directory.
2. Change to the installation directory.
3. Run the following command:
   ```
   java -jar edgeencryption-dist-<version>-linux-x86-64.jar -m dist-upgrade -c <proxy directory>
   ```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy directory</td>
<td>The directory in the installation directory where the proxy was initially installed. This directory is created by the install.</td>
</tr>
</tbody>
</table>

If you want to see the help screen, execute this command without arguments:
```java
java -jar edgeencryption-dist-<version>-linux-x86-64.jar
```

A new proxy directory is created with a current timestamp. A backup of the old proxy directory is maintained as backup.dist-upgrade_timestamp in the new proxy installation directory. The old proxy shuts down and the new proxy starts up. Any open connections/transactions on the old proxy server are terminated.

4. Check the proxy log in the new directory and the instance to verify that the new proxy is running.

**Manually upgrade an Edge Encryption proxy server running on Windows**

Update a proxy running on Windows.

**Before you begin**

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see [Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower](#).

Role required: security_admin or local administrator on the host machine

**Procedure**

1. Download the Edge Encryption proxy-update archive file to the installation directory.
2. Start the Windows cmd terminal program with administrator privileges.
3. Change to the installation directory.
4. Run the following command:
   ```
   java -jar edgeencryption-dist-<version>-all.jar -m dist-upgrade -c <proxy directory>
   ```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy directory</td>
<td>The directory in the installation directory where the proxy was initially installed. This directory is created by the install.</td>
</tr>
</tbody>
</table>

If you want to see the help screen, execute this command without arguments:
```java
java -jar edgeencryption-dist-<version>-all.jar
```
A new proxy directory is created with a current timestamp. A backup of the old proxy directory is maintained as backup.dist-upgrade_timestamp in the new proxy installation directory. The old proxy shuts down and the new proxy starts up. Any open connections/transactions on the old proxy server are terminated.

5. Check the proxy log in the new directory and the instance to verify that the proxy has been updated and is running.

Roll back an Edge Encryption proxy server upgrade

If a proxy upgrade is unsuccessful, you can go back to the earlier version.

About this task

If an upgrade fails when using the scheduled upgrade feature in the San Diego release, the proxy server will automatically roll back to the old version. The old proxy server is stored unmodified in a backup directory.

If you would like to roll back a manual upgrade, you can follow these steps.

Procedure

1. Shut down the proxy.
2. Delete the new proxy directory.
3. Rename the backup directory to the proxy name.
   - The backup directory is in the proxy installation directory with the name <proxy name>_backup
4. Start the proxy.
5. Check the proxy log and the instance to verify that the proxy is online.

Edge Encryption configuration

After the Edge Encryption proxy server is installed and running, manage Edge Encryption through the proxy server.

You must complete all the steps in Edge Encryption installation before creating encryption configurations and encryption patterns on the instance.

Note: To access the Edge Encryption configuration, you must log in through the proxy server and elevate to the security_admin role.

Rotate encryption keys

Perform encryption key rotation from the instance. Add a new key, change the default key assignment, and then schedule a mass key rotation or a single key rotation.

Before setting an encryption key as the default key, make the key available to each proxy. This ensures that the proxies have the key to encrypt data when the key is assigned as the default key. All proxies must have access to a key before that key can be assigned as the default key.

Warning: Before deleting a key from the proxy, set up and run a mass key rotation job to ensure that no data on the instance uses the key. If any information is still encrypted with that key, you cannot decrypt the information after you delete the key.
**Edge filtering and sorting behavior**
Whenever you change default keys, be sure to perform a key rotation (either mass or single key rotation). Otherwise, you may receive unexpected results when sorting and filtering records. For example, consider the following scenario:

1. You create encrypted records using one encryption key.
2. You create a new key and set it as default.
3. You create a new set of encrypted records using the new encryption key.

If you filter by any encrypted field when connected through the Edge proxy, all records may not be filtered out correctly, or records may appear unexpectedly. The filter works only for records encrypted using the current default key. The records encrypted using the previous default key still appear in the list view.

If you sort by any encrypted field when connected through the Edge proxy, you see two groups of records with the same human readable text in the encrypted field.

**Schedule a single key rotation job**
Schedule a job to find data encrypted using a specified key alias and then re-encrypt the data with the current default encryption key. The data is decrypted before it is re-encrypted with the default key.

**Before you begin**
Role required: security_admin
Before scheduling this job, update the default key in [Edge Encryption Configuration > Encryption Key Configuration > Set Default Keys].

**Procedure**
1. Navigate to [Edge Encryption Configuration > Maintenance > Schedule Single Key Rotation].
2. Fill in the fields on the form as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Single Key Rotation</strong>.</td>
</tr>
<tr>
<td>Key</td>
<td>Enter the key to be retired. Verify that this key is no longer the default key in [Edge Encryption Configuration &gt; Encryption Key Configuration &gt; Set Default Keys].</td>
</tr>
<tr>
<td>Estimate record count</td>
<td>Total estimated number of records to process. Not available when running a single key rotation.</td>
</tr>
<tr>
<td>Process Historical</td>
<td>Select to process historical records in the Audit table if the field is audited. Records</td>
</tr>
<tr>
<td>Records</td>
<td>When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. This field is read only and active.</td>
</tr>
<tr>
<td></td>
<td>To learn more about audited fields, see [Auditing].</td>
</tr>
<tr>
<td>Estimate Maximum Audit</td>
<td>Estimated maximum number of audited records to process. Not available when running a single key rotation.</td>
</tr>
<tr>
<td>Record Count</td>
<td></td>
</tr>
</tbody>
</table>
Schedule a mass key rotation job

Schedule a job to find data encrypted with any previous key, and then re-encrypt the data with the current default encryption keys. The data is decrypted before it is re-encrypted with the current default key.

**Before you begin**
Role required: security_admin

**Procedure**

1. Navigate to All > Edge Encryption Configuration > Maintenance > Schedule Mass Key Rotation.
2. Fill in the fields on the form as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Mass Key Rotation</strong>.</td>
</tr>
<tr>
<td>Estimate record count</td>
<td>Total estimated number of records to process. Not available when running a mass key rotation.</td>
</tr>
<tr>
<td>Process Historical Records</td>
<td>Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. This field is read only and active. To learn more about audited fields, see Auditing.</td>
</tr>
<tr>
<td>Estimate Maximum Audit Record Count</td>
<td>Estimated maximum number of audited records to process. Not available when running a mass key rotation.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**. **Estimate Record Count** is not supported when processing audited fields.
Schedule an attachment key rotation job
Schedule a job to find attachments encrypted using a specified key alias, and then re-encrypt the attachments with the current default encryption key. The attachment is decrypted before it is re-encrypted with the default key.

Before you begin
Role required: security_admin

Procedure
1. Navigate to All > Edge Encryption Configuration > Maintenance > Schedule Attachment Key Rotation.
2. Fill in the fields on the form as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Attachment Key Rotation.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear the check mark if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select Save.
4. To see an estimated count of records to be updated, click Estimated Record Count.
5. To run the job immediately, click Execute Now.

Encrypt fields using encryption configurations
Encrypt fields by creating encryption configurations.
To configure Edge Encryption, you must be connected to the instance through the proxy. Test all changes on a non-production instance before making the changes to the production instance.

Define encryption keys
After setting up one or more proxies and configuring a default encryption key, the instance verifies that the keys are available to all proxies. You cannot make an encryption key the default key unless all proxies have the key. Once a default key is defined, you can create encryption configurations.

Assign fields and attachments to be encrypted
Assigning fields and attachments to be encrypted means assigning an encryption type to the field or attachment. Before marking a field as encrypted, evaluate these issues.

• Determine what system features might be impacted.
• Examine all scripts for use of the field.
• Make any desired adjustments to the field size. After a field has been configured for encryption, the field size cannot be changed.
Marking a field to be encrypted expands the field size to store the encrypted data. The process of expanding the field size can take a long time, depending on the number of records in the table.

Create an encryption configuration
Select the fields to be encrypted and identify the encryption type.

Before you begin
Role required: security_admin

Procedure
1. Navigate to All > Edge Encryption Configuration > Edge Encryption Configurations > Create New.
2. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table that contains the field to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table. Select Column.</td>
</tr>
<tr>
<td>Column</td>
<td>The field to be encrypted. Appears only when the Type is Column. Only String, Date, Date/Time, Journal, Journal Input, and URL fields are supported.</td>
</tr>
<tr>
<td></td>
<td>• String and URL fields: You can add an encryption configuration to either a parent table or a child table.</td>
</tr>
<tr>
<td></td>
<td>• Date and Date/Time fields: You can add an encryption configuration to a parent table only. You cannot add a new encryption configuration to a child table.</td>
</tr>
<tr>
<td>Encryption type</td>
<td>The encryption type to use.</td>
</tr>
</tbody>
</table>

Note: Depending on the number of records affected by the Date and Date/Time fields you are encrypting, it may take up to a few minutes to create the encryption configuration. Make sure that you create the encryption configuration for Date and Date/Time fields when transaction volume on the instance is low.

3. Click Submit.

What to do next
After you add the encryption configuration record, you can create an encryption job to encrypt existing data. If you do not run an encryption job, Edge encrypts the existing data the next time the data changes.

Deactivate an encryption configuration
After configuring a field or a table’s attachments to be encrypted, you can stop encryption by deactivating the encryption configuration. After deactivating encryption, you can run

Note: A specific table and field combination can have only one active configuration at a time.
a Decryption job for fields or an Attachment Decryption job for attachments to remove the
encrypted data from the instance.

**Before you begin**
Role required: security_admin

**About this task**

**Warning:** Deactivating an encryption configuration does not delete the encryption
record and the encryption type cannot be changed.

**Procedure**

1. Navigate to **Edge Encryption Configuration > Edge Encryption Configurations > All.**
   The **Edge Encryption Configurations** list is shown.
2. Click on the encryption configuration to be deactivated.
   The **Edge Encryption Configuration** form is shown.
3. Click on the **Active** box.
   The **Active** box is clear.
4. Click **Update.**
   The **Edge Encryption Configurations** list is shown.

**What to do next**

You can run a Decryption or Attachment Decryption job to decrypt data on the instance. If
you do not run a job, the encrypted data is decrypted the next time it is changed.

**Schedule an encryption job**

You can schedule a job to find and encrypt any unencrypted data in a specified field, using
the default encryption key configured for the field. If you do not create an encryption job
after configuring a field for encryption, only new values are encrypted.

**Before you begin**
Role required: security_admin

**Procedure**

1. Navigate to **Edge Encryption Configuration > Encryption Configurations > All.**
2. Click the field that you want to schedule an encryption job for.
3. Under **Related Links,** click **Schedule Mass Encryption Job.**
   The **Scheduled Encryption Job** form is shown with all fields populated. The bottom of the
   form shows records for any previous job executions.
4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Encryption.</strong></td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
</tbody>
</table>
### Estimated record count
Total estimated number of records to process. Populates after selecting **Estimate Record Count**.

### Process Historical Records
Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. To learn more about audited fields, see **Auditing**.

### Estimate Maximum Audit Record Count
Estimated maximum number of audited records to process. Populates after selecting **Estimate Record Count**. This field is only visible when **Process Historical Records** is selected.

**Note:** The estimate may be larger than the actual number of records processed.

### Run
Select the period between job executions.

### Starting
Enter the date and time to run the job for the first time.

---

5. Click the menu icon in the form header and select **Save**.

6. To see an estimated count of records to be updated, click **Estimate Record Count**.

7. To run the job immediately, click **Execute Now**.

---

**Schedule a decryption job**
You can schedule a job to decrypt data in an encrypted field, to store clear data in the instance.

**Before you begin**

**Note:** You must mark the encryption record for the field as inactive (clear the **Active** box) in order to run the decryption job.

Role required: security_admin

**Procedure**

1. Navigate to **Edge Encryption Configuration > Encryption Configurations > All**.

2. Click the field that you want to decrypt.

3. Under **Related Links**, click **Schedule Mass Decryption Job**.

   The **Scheduled Encryption Job** form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Decryption</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Field</td>

</tr>
<tr>
<td>Estimated record count</td>
<td>Total estimated number of records to process. Populates after selecting <strong>Estimate Record Count</strong>.</td>
</tr>
<tr>
<td>Process Historical Records</td>
<td>Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. To learn more about audited fields, see <strong>Auditing</strong>.</td>
</tr>
<tr>
<td>Estimate Maximum Audit Record Count</td>
<td>Estimated maximum number of audited records to process. Populates after selecting <strong>Estimate Record Count</strong>. This field is only visible when <strong>Process Historical Records</strong> is selected. <strong>Note:</strong> The estimate may be larger than the actual number of records processed.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select **Save**.

6. To see an estimated count of records to be updated, click **Estimate Record Count**.

7. To run the job immediately, click **Execute Now**.

**Encrypt attachments using standard encryption**

You can encrypt attachments for specific tables.

All attachments to a table use the same encryption type. Encrypted attachments are not searched when performing a text search. Only the standard encryption types are allowed for attachments. The order preserving or equality preserving encryption types are not allowed.

For a session bypassing the Edge Encryption proxy:

- On a record with attachment encryption activated:
  - The user can see that there are attachments and the attachment names.
  - The user cannot add new attachments.

- On a record without attachment encryption activated:
  - The user can open and download existing attachments.
  - The user can add new attachments.

For a session using the encryption proxy, the user can open and download existing attachments and add new attachments.

**Configure attachment encryption**

Select the tables whose attachments are to be encrypted and identify the encryption type.

**Before you begin**

Role required: security_admin
Procedure
1. Navigate to All > Edge Encryption Configuration > Edge Encryption Configurations > Create New.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table whose attachments are to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table. Select Attachment.</td>
</tr>
<tr>
<td>Column</td>
<td>The table field to be encrypted. This field appears when the Type is Column, and not when Type is Attachment.</td>
</tr>
<tr>
<td>Encryption type</td>
<td>The encryption type to use. For attachments, only Standard AES128 and Standard AES256 are allowed.</td>
</tr>
</tbody>
</table>

3. Click Submit.

What to do next
After the encryption record has been added, you can create an attachment encryption job to encrypt existing attachments. If you do not run an attachment encryption job, the system encrypts new attachments when you attach them.

Schedule an attachment encryption job
You can schedule a job to find and encrypt any unencrypted attachments for a specified table, using the default encryption key configured for the table.

Before you begin
Role required: security_admin

Procedure
1. Navigate to Edge Encryption Configuration > Encryption Configurations > All.
2. Click the table you want to schedule an encryption job for.
   The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for previous job executions.
4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Attachment Encryption.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
</tbody>
</table>
Schedule an attachment decryption job

You can schedule a job to decrypt any encrypted attachments for a specified table, to store clear attachments in the instance.

Before you begin

Note: You must mark the encryption record for the table as inactive (clear the Active box) before the decryption job runs, otherwise, nothing happens.

Role required: security_admin

Procedure

1. Navigate to Edge Encryption Configuration > Encryption Configurations > All.
2. Click the table with the attachments that you want to decrypt.
   - The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for previous job executions.
4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Attachment Decryption.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear the check mark if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select Save.
6. To see an estimated count of records to be updated, click Estimate Record Count.
7. To run the job immediately, click Execute Now.

Change a field or attachment's encryption type

You can change a field or attachment’s encryption type by selecting a new encryption type in the existing encryption configuration record. A specific table and field combination can only have one active configuration at a time.

Before you begin

Role required: security_admin
Procedure
1. Navigate to **Edge Encryption Configuration** > **Encryption Configurations** > **All**. The **Edge Encryption Configurations** list is shown.

2. Open the record for the encryption configuration to be changed.

3. Click the **Encryption type** dropdown and select a new encryption type.

   **Note:** For attachments, only Standard AES128 and Standard AES256 are allowed.

4. If needed, run an **encryption** or **attachment encryption** job.

   It is not necessary to run an encryption job. If you do not run an encryption job, the field or attachment is encrypted using the new encryption type the next time the field or attachment is changed.

**Tokenize strings using encryption patterns**

You can replace string patterns with tokens before they are sent to and stored in the instance.

**Before you begin**

To use encryption patterns, you must install and set up a MySQL database in your network. This is the same database used for order-preserving encryption. To create or edit encryption patterns, you must be connected to the instance through the proxy.

Role required: security_admin

**About this task**

You can use base system patterns, or create your own patterns. Base system patterns are advanced patterns. Encryption patterns include the following limitations.

- A pattern of all alpha characters is not allowed.
- The minimum pattern size is five characters. You can change this setting using a system property.
- The * and + quantifiers are forbidden in encryption patterns.
- Encryption patterns match complete words, not parts of strings embedded in a larger string. Words are defined by spaces and characters not available for inclusion in a pattern.
- If the same string is sent to the instance multiple times, it is replaced with the same token.
- Text search on exact matches is supported. The query string is exchanged with a token when sent to the instance, the search is performed on tokens, and when the search results are returned to the proxy server, the tokens are replaced with the clear text. Features such as stemming are not supported.

When using patterns, the clear text never leaves your network. When the proxy server matches a pattern in a request going to the instance, the proxy replaces the string with a token of the same size. The token is sent to instance instead of the clear text string. When the response is sent from the instance to the proxy server, the proxy replaces the token with the string. When viewed through the proxy server, the string displays as clear text.

   **Note:** Encrypted fields are not checked for encryption patterns.

**Procedure**
1. Navigate to **All** > **Edge Encryption Configuration** > **Encryption Patterns** > **Create New**. Alternatively, you can navigate to **Advanced Patterns** to activate or edit a preconfigured pattern.
2. Enter the pattern name.
3. Define the **Edge pattern input type**.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic</td>
<td>A series of character types. In the Basic Pattern Input tab, click Add and select a character type. The Sample pattern displays the pattern as characters are added. Click New Block to move the next character to the next line. This enables you to group characters in a long pattern. Click X to delete the last character in the pattern.</td>
</tr>
<tr>
<td>Advanced</td>
<td>A Java RegEx expression. If advanced is selected, you cannot change the input type back to basic. In the Sample match field, enter a sample pattern to test the RegEx expression. In the Pattern field, enter a Java RegEx expression. Click Validate to verify that the expression matches the sample pattern.</td>
</tr>
</tbody>
</table>

The input type defines how you are going to enter the pattern. It does not impact how the pattern is used.

4. Click Submit.

**Repair or recover order-preserving encrypted data**

If you have the security-admin role, you can schedule jobs performed by the Edge Encryption proxy to repair or recover fields that use order preserving encryption. You can schedule jobs to:

- Repair order tokens.
- Recreate the proxy database.

Running these jobs can be a time-consuming operation which might impact the performance of the Edge Encryption proxy. Schedule these jobs at a time when no users or a minimum set of users are using the system, such as midnight on the weekend.

**Schedule an order token repair job**

You can schedule a job to find and repair fields where the order token is missing.

**Before you begin**

Role required: security_admin

**About this task**

Use these jobs to repair individual fields in a table or to repair all fields using order preserving encryption. Run this job when the proxy database has been offline while the instance has been running, which results in order preserving fields that are missing order tokens.
Procedure

1. Navigate to All > Edge Encryption Configuration > Maintenance > Schedule Order Token Repair.

2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Order Token Repair.</td>
</tr>
<tr>
<td>All fields</td>
<td>Select this check box to repair all tables.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select Save.

4. To see an estimated count of records to be updated, click Estimated Record Count.

Schedule a proxy-database recovery job

Run this job when the proxy database has lost data. This job finds all records that have been encrypted with a token (order preserving encryption type) and sends them to the proxy so that the proxy database can be rebuilt.

Before you begin

Role required: security_admin

Procedure

1. Navigate to All > Edge Encryption Configuration > Maintenance > Schedule Database Recovery.

2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Database Recovery.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run this job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select Save.

4. To see an estimated count of records to be updated, click Estimate Record Count.
Prevent an IP address in your network from sending requests to your instance

Because the Edge Encryption proxy server resides in your network, it may be subject to vulnerability scans by your network software. To prevent IP scanner or other requests from being forwarded to your ServiceNow instance, you can add IP addresses, IP ranges, or network masks to a deny list. Any connection to the proxy server from a deny listed address is terminated and is not forwarded to your instance.

Before you begin
Role required: security_admin
To place an IP address on a deny list, you must be logged in to your instance through the proxy server.

Important: Ensure that you understand your network topology before adding IP addresses in your network to a deny list. If an IP address is added to the deny list, any user with that IP address will be blocked from accessing the Edge Encryption proxy server.

Procedure
1. Navigate to All > Edge Encryption Configuration > Maintenance > Denylist IP Addresses.
   The Encryption Proxy IP Denylists [edge_encryption_ip_blacklist] list view opens.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy server</td>
<td>The Edge Encryption proxy server that is prevented from forwarding requests from addresses on the deny list.</td>
</tr>
<tr>
<td>IP, IP range, or net-mask</td>
<td>Requests from this IP address, range, or network mask are not forwarded to your ServiceNow instance. Example values include:</td>
</tr>
<tr>
<td></td>
<td>• IP address: 10.10.10.5</td>
</tr>
<tr>
<td></td>
<td>• IP range: 10.10.10.1-15</td>
</tr>
<tr>
<td></td>
<td>• Network mask: 10.10.10.0/24</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the record is active. Only IP addresses from active records are prevented from sending requests to the instance.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the deny list record.</td>
</tr>
</tbody>
</table>

4. Click Submit.
5. Repeat these steps for all other proxies for which an IP address should be denied.

Results
The Edge Encryption proxy server terminates any connection from IP addresses, ranges, or network masks on the deny list and cannot forward the request to the instance.

Encrypt data from a record producer
Record producers allow end users to create task-based records, such as incident records, from the Service Catalog and Service Portal. If a record producer attempts to insert data into a field marked for encryption, an invalid insert message displays and the data is not saved to the field. To configure your Edge Encryption proxy server to allow inserts from a record producer, create encryption rules from the record producer record.
Before you begin
Role required: security_admin
Encrypting data from a record producer requires an encryption configuration defined for the target field. Check that you have created an encryption configuration for the target field and table before creating an encryption rule from a record producer. See Create an encryption configuration. To encrypt attachments from a record producer, Configure attachment encryption.

Procedure
1. Log in to your instance through the Edge Encryption proxy server.
2. Navigate to Service Catalog > Catalog Definitions > Record Producers.
3. Create a record producer record or open an existing record producer record.
   Two inactive encryption rules are automatically created to encrypt data sent from the record producer to the field marked for encryption.

<table>
<thead>
<tr>
<th>Encryption rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;RecordProducerName&gt;</td>
<td>Rule created to process POST parameters from the Service Catalog and map variables to fields in the instance.</td>
</tr>
<tr>
<td>&lt;RecordProducerName&gt;Json</td>
<td>Rule created to process a JSON payload from the Service Portal and map variables to fields in the instance.</td>
</tr>
</tbody>
</table>

5. Activate the necessary encryption rules created by the record producer.
   a. Navigate to Edge Encryption Configuration > Rules > All.
   b. Depending on where the record producer will be used, open the associated encryption rule created by the record producer and select the Active flag.

   If using the record producer in the Service Catalog, activate the <RecordProducerName> encryption rule. If using the record producer in the Service Portal, activate the <RecordProducerName>Json encryption rule.

6. Optional: Examine the Encryption rule Action field and add any necessary field names or statements.

   (Optional) If a record producer directly maps a variable to a field in a table, the encryption rule automatically maps the variable to the correct field. However, if a variable is indirectly mapped through various scripts on the platform, you may need to update the rules to map each variable to the correct field.

Example

(Conditional) The below encryption rule was created from the Report Outage record producer and processes POST parameters from the Service Catalog to map variables to fields in the instance. Replace 'FILL ME IN' with the target field.
The below encryption rule was created from the Report Outage record producer and processes a JSON payload from the Service Portal to map variables to fields in the instance. Add additional statements to map any scripted variables to the target fields.

When the payload from the record producer is examined, the error_message element contains the value for the short_description field. By adding the following statement, you can map the scripted variable error_message to the short_description field.

```javascript
if (jsonElement.getName() == 'error_message')
    jsonElement.valueFor(tableName, 'short_description');
```

The value of the Action field becomes:

```javascript
function ReportOutageJsonAction(request) {
    var tableName = 'incident';
    // Some fields are set in script, additional parameter lines may need to be added
    // current.comments is accessed via script from notes; // assignment to current.comments does NOT replace existing values
    // current.short_description is accessed via script from short_description;
    // current.description is accessed via script from current.short_description;
    // current.caller_id is accessed via script from gs.getUserID();
    var jsonContent = request.getAsJsonContent();
```

2341
for (var jsonElementItr = jsonContent.getIterator('variables');
jsonElementItr.hasNext();) {
    var jsonElement = jsonElementItr.next();
    if (jsonElement.getName() == 'error_message')
        jsonElement.valueFor(tableName, 'short_description');
    } else {
        jsonElement.valueFor(tableName, jsonElement.getName());
    }
}

Results
The two encryption rules enable the record producer to insert values into fields marked for encryption from either the Service Catalog or Service Portal.

Define a custom encryption rule
It may be necessary to identify and encrypt sensitive information in HTTP requests on the way to your instance. You can write encryption rules to identify, interpret, and encrypt data in such requests, mapping fields in the request to table-field names on your instance.

What is an encryption rule
Encryption rules are scripts executed on the Edge Encryption proxy server to map fields in a request to fields in a table on your ServiceNow instance. An encryption rule tells the Edge Encryption proxy server how to encrypt data in custom payloads.

Note: Encryption rules only support ECMAScript 3 and below.

When to use custom rules
A set of encryption rules is included as part of the Edge Encryption plugin. These rules handle core platform use cases such as editing a field from the list edit form, updating a record from the record form, managing direct web services, and processing data from the REST API. Applications created using standard forms and lists should work without custom encryption rules.

If you develop scripted processors, scripted web services, scripted REST APIs, UIs, or Ajax scripts that contain data that should be encrypted, you must write encryption rules to find and map the data to Glide table-field names.

Format of an encryption rule
Rules include three parts:

- **Condition**: Identifies the type of request.
- **Action**: Maps fields in the request to fields in a table, encrypting values that map to fields with encryption configurations defined.
- **Order**: Priority of the rule. The lowest priority rule with a satisfied condition is the only rule that runs. Like business rules, rules run from lowest to highest.

Except for attachment requests, when an HTTP request hits the Edge Encryption proxy server, the Edge Encryption proxy server evaluates all encryption rule conditions in priority order until either all conditions return false, or one condition returns true. When a condition returns true, the action is executed on the request and the result is forwarded to the instance. No other conditions are evaluated. As a result, encryption rule conditions should be as specific as possible. A generic rule might evaluate as true for a request meant to be processed by another rule, causing the request to be processed by the wrong action. If a generic condition is unavoidable, the rule should be marked with a high-order value so that more specific rules are evaluated first.
Guidelines for creating encryption rules

Creating efficient, optimized encryption rules can reduce processing time for script validation.

**Overall guideline:** When rules get very long, do your best to minimize the number of blocks and break the rules apart whenever possible. Ideally, custom rules should apply to specific use cases, rather than encompassing several cases, with if statements or switch statements in the action script.

1. Split rules whenever possible. For example,
   - Create different rules for different tables and ensure that each rule runs only on its respective table.
   - Create different rules for each record producer you are targeting, or at least for each subset of record producers. Instead of one rule targeting dozens of sys_ids, you could create several different rules targeting smaller subsets of record producers, or even create one rule per sys_id.

   **Note:** Creating multiple rules requires more maintenance. The trade-off is that multiple, simpler rules can be validated more efficiently than longer, more complex rules.

2. Minimize the number of blocks. Because the processing engine scans each block while evaluating scripts, a large number of blocks causes delays in validation. For example,
   - Replace all if blocks with an array lookup, and replace all blocks in the array lookup with just one if block.
   - Combine if blocks whenever it is possible to group them.

**Encryption rule APIs**

Encryption rules are written in JavaScript and utilize Edge Encryption APIs to locate and encrypt sensitive information in the body of a request. The API uses expressions similar to xPath to navigate through both JSON and XML content.

Edge Encryption APIs process the request off the stream as it is being written to the output stream. Stream parsing allows encryption rules to be network performant. However, fetching and parsing content from the body multiple times could lead to unexpected results. To account for this, requests should be processed by the action in a single pass.

When creating encryption rules, you cannot use Glide APIs, script includes, business rules, or any global parameters such as current. Because the rules are created for HTTP objects, a global request object is available.

When creating encryption rules, you cannot use APIs from the allow list manager or scoped applications.

**Error handling**

If an encryption rule condition or action throws an exception, check the proxy log for troubleshooting information.

**Inspect the client request**

Before creating a custom encryption rule, you must determine the format of the client request entering the Edge Encryption proxy server.

**About this task**

Because encryption rules iterate over client requests and determine what, if anything, needs to be encrypted, you must understand the type of request you are creating a rule for.
format of the client request determines the structure of your encryption rule and the APIs available for use in the rule.

**Procedure**

1. Inspect the client request.

   Depending on the source of the request, the following tools are available to inspect the request and determine the format.

<table>
<thead>
<tr>
<th>Source of request</th>
<th>Available tools</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client browser</td>
<td>Use the developer console in your browser to inspect the client request. Useful tools include:</td>
</tr>
<tr>
<td></td>
<td>• Firefox Network Monitor</td>
</tr>
<tr>
<td></td>
<td>• Chrome Network Panel</td>
</tr>
<tr>
<td>Third-party/external source</td>
<td>Use an HTTP protocol analyzer to inspect the request. Useful tools include:</td>
</tr>
<tr>
<td></td>
<td>• Wireshark</td>
</tr>
<tr>
<td></td>
<td>• HTTP Scoop</td>
</tr>
</tbody>
</table>

   Alternatively, you can often use documentation for the external source to determine the format of the request.

2. From the client request, inspect the packet and determine:
   - The client request method
   - The URL path of the request
   - The URL parameters
   - The POST parameters, if any
   - The format of the request body, if included

**Example**

Results

Inspecting the request provides an understanding of the fields you need to filter for and iterate over in your encryption rule. To understand the fields in the request object, see request.

**Create an encryption rule**

Encryption rules are used by the proxy to find content in HTTP requests that should be encrypted.
Before you begin
Role required: security_admin
Before creating an encryption rule, you must inspect the client request to determine the format.

About this task
To create or edit encryption rules, you must be connected to the instance through an encryption proxy.

Procedure
1. Navigate to All > Edge Encryption Configuration > Rules > Create New.
2. In the Name box, enter a name.
3. In the Request Type, select an HTTP method.
   • HTTP Post
   • HTTP Get
   • HTTP Put
   • HTTP Patch
   • HTTP Delete

   Note: Pre-Jakarta instances allow only HTTP Get and HTTP Post methods.
4. In the Condition box, enter a JavaScript statement defining when the rule should run.
5. In the Action box, enter a JavaScript function to be executed when the condition is true.
6. In the Order box, enter the relative priority of the rule.
7. Click Submit, or save the form.

Encryption rule conditions
Encryption rule conditions determine if the rule should be executed.

An encryption rule condition must return true if the rule is to handle the HTTP request; otherwise, it must return false.

As you build your condition, keep in mind that only one rule is executed per request. As a result, the condition must be as general or specific as needed to run under the intended circumstances.

Note: Be careful when performing checks on content in the condition. Excessive checks can be expensive for the proxy server and may cause increased latency when handling complex requests.

The condition can use the method type, content type, URL path, or any URL query string parameters to determine if the rule should handle the request. The condition has access to these fields via the request object. Be sure that, prior to creating an encryption rule condition, you have inspected the client request and understand the conditions needed to trigger the rule.

Note: To build efficient rules, consider easy ways to rule out requests that you do not want to be evaluated by a rule. Build your condition to return false for those requests first. This method increases performance and quickly routes the request to the correct rule faster.

Encryption rule objects and APIs are available to encryption rule conditions.
Example using path and postParams

```javascript
/*This condition checks if the request coming in has a path ending in
"/sample_processor.do" and if a post parameter exists in that request called myPostParam*/

function SampleCondition(request) {
  if (endsWith(request.path, "/sample_processor.do") && request.postParams.myPostParam) {
    return true;
  }
  return false;
}
```

Example using urlParams and contentType

```javascript
/* This condition checks if a url parameter exists in the query called
myUrlParam and if the content type contains 'xml'
(if so, you can expect the body to be an XML payload). Then, it checks if the xml payload contains myXmlTag */

function SampleCondition2(request) {
  if (request.urlParams.myUrlParam && request.contentType.indexOf('xml') > -1 &&
      request.xmlContains('myXmlTag')) {
    return true;
  }
  return false;
}
```

Encryption rule actions

An encryption rule maps fields in a client request to fields in a table on your instance and identifies fields marked for encryption.

An encryption rule action only runs when the encryption rule condition returns true. An encryption rule identifies the data to be encrypted in your request payload. Because the rule iterates over the content in the request object, you must understand the form and structure of your request body and determine what in the request needs to be encrypted. The data to be encrypted might be located within:

- A POST or URL parameter.
- JSON or XML content within a POST or URL parameter.
- A JSON payload.
- An XML payload.

Before writing an encryption rule action, be sure to:

- Inspect the client request.
- Identify where the sensitive data is located in the request object.
- Determine the field and table name to insert data into, or understand how to dynamically pull this from the request.

Encryption rule objects and APIs are available to encryption rule actions and conditions.
Encryption rule objects and APIs

Use encryption rule APIs to parse and encrypt values in requests moving through the Edge Encryption proxy server to the instance.

The APIs available for your encryption rule depend on the format of the request object. For example, if the contentType parameter of the request object is XML, you can use the XML APIs to parse and encrypt values in the payload. After you determine the type of object in your request, you can build an encryption rule using the available APIs.

Encryption rule APIs are available in both encryption rule condition and action scripts.

request

The request object is a global object available in Edge Encryption rule action and condition scripts.

The request object is a JavaScript object that represents the client request coming in to the Edge Encryption proxy server. You must build your encryption rule to parse the request object, map request object values to fields in a table on the instance, and encrypt any sensitive data in the request object.

The request object includes the following attributes and data from the client request:

Request object fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The path portion of the URL.</td>
</tr>
<tr>
<td>requestMethod</td>
<td>GET, POST, PUT, PATCH, DELETE.</td>
</tr>
<tr>
<td>contentType</td>
<td>The Content-Type header field.</td>
</tr>
<tr>
<td>urlParams</td>
<td>The parameters in the query string. This can also be evaluated to a String.</td>
</tr>
<tr>
<td>postParams</td>
<td>If this is a form post, this contains the post parameters.</td>
</tr>
</tbody>
</table>

request - getAsJsonContent()

Returns the request as an iterable object of type JsonNode.

This method is available only in an Edge Encryption rule if the request body is a valid JSON payload. If you are not sure what format the request body includes, check the contentType field on the request object.

Once the request is returned as a JsonNode object, you can use the JSON APIs to iterate over the object and encrypt fields.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The request as an iterable JsonNode.</td>
</tr>
</tbody>
</table>
request - getAsXmlContent()

Returns the request content as an iterable object of type XMLContent.

This method is available only in an Edge Encryption rule if the request body is a valid XML payload. If you are not sure what format the request body includes, check the contentType field on the request object.

Once the request is returned as an XMLContent object, you can use the XML APIs to iterate over the object and encrypt fields.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request as an iterable object of type XMLContent.</td>
</tr>
</tbody>
</table>

request - XMLContains(String path)

Returns true if the given path exists in the XML DOM.

This method is available only if the request body is a valid XML payload. If you are not sure what format the request body includes, check the contentType field on the request object.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>String</td>
<td>XPath statement you are searching for.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the given path exists in the XML DOM.</td>
</tr>
</tbody>
</table>

POST and URL parameter APIs

POST and URL parameters can be accessed as properties of the request object using request.postParams and request.urlParams.

Any single parameter can be accessed as a property of the postParams and urlParams parent objects by calling request.postParams.myParam. Any parameter accessed this way is an object of the underlying class ParameterValue. Any APIs in this class can be called on any parameter.

After inspecting the client request, it may be necessary to access and encrypt parameter values from the request object. Depending on the data in the client request, you can encrypt values and map them to fields on the instance in multiple ways.
Encrypt the value of a known table and field

If you know the name of the instance table and field that will hold the encrypted data, you can explicitly define them in the encryption rule. For example, you may know that the request will be processed on the instance to create an incident and you want to encrypt the text parameter in the description field. In this case, you can create the following action.

```javascript
function SampleAction1() {
  request.postParams.text.valueFor('incident', 'description');
}
```

Encrypt the value of a dynamically defined table and field

If, conversely, you do not know the name of the field that the encrypted data will populate, you can dynamically define them using `tableName` and `fieldName`.

The below example processes a generic request that might store data in different task tables (such as incident, problem, and change_request) on the instance.

```javascript
function SampleAction2() {
  var tableName = request.urlParams.table;
  for (var parameter in request.postParams) {
    var currentParam = request.postParams[parameter];
    var fieldName = currentParam.toString();
    if (fieldName == 'text') {
      currentParam.valueFor(tableName, 'description')
    } else {
      currentParam.valueFor(tableName, fieldName);
    }
  }
}
```

This action:

• Gets the destination table from the URL parameters.
• Iterates over the URL parameters.
• Asks the Edge Encryption proxy server to encrypt any URL parameter with a name that matches a field marked for encryption.
• Looks for a specific parameter called text and asks the Edge Encryption proxy to encrypt the value based on the encryption configuration for the description field on the incident table.

In this example, the `valueFor()` method is not actually performing any encryption. Rather, the method asks the Edge Encryption proxy server to check whether the table/field pair in the request object is marked for encryption with an encryption configuration and, if applicable, encrypt it.

Encrypt JSON or XML within a parameter

A POST or URL parameter might include JSON or XML content. In this case, you can process the content within the parameter, iterate over the values, and encrypt required fields. In this example, the `tableName` is still accessed from a POST parameter, but the value of the field is the JSON object `data`.

```javascript
function SampleAction3() {
  var tableName = request.postParams.table;
  var data = request.postParams.data;
  var dataIterator = data.getAsJsonContent().iterator();
  while (dataIterator.hasNext()) {
    // Process each field within the JSON content...
  }
}
```
An example of an encryption rule action that processes XML within a POST parameter.

```javascript
function SampleAction4() {
    var tableName = request.postParams.table;
    var data = request.postParams.data;
    var dataIterator = data.getAsXmlContent().getIteratorOverAllChildren();
    while (dataIterator.hasNext()) {
        var jsonElement = dataIterator.next();
        var fieldName = jsonElement.getName();
        if (fieldName == 'text') {
            jsonElement.valueFor(tableName, 'description');
        } else {
            jsonElement.valueFor(tableName, fieldName);
        }
    }
}
```

**Encrypt a query**

You might encounter an encoded query within a parameter in the client request that contains sensitive data. To match a field in a query to an encrypted value in the instance database, you must create an encryption rule that asks the proxy to check whether a field in the query is marked for encryption. The `encodedQueryFor()` method parses an encoded query on a given table, and checks if any fields in the query have encryption configurations.

In this example, the rule iterates over the parameters looking for the `filter` parameter, which is expected to be a Glide encoded query.

```javascript
function SampleAction5() {
    var tableName = request.urlParams.table;
    for (var parameter in request.postParams) {
        var currentParam = request.postParams[parameter];
        var fieldName = currentParam.toString();
        if (fieldName == 'filter') {
            currentParam.encodedQueryFor(tableName);
        } else {
            currentParam.valueFor(tableName, fieldName);
        }
    }
}
```

For example, if the value of `filter` is: `short_description=My sensitive information^number=INC000056^category=Outage`, the query would become `short_description=<Encrypted(My sensitive information)>^number=INC000056^category=Outage` on the instance.

**ParameterValue - toString()**

Converts the POST or URL parameter value to a string.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The parameter value as a string.</td>
</tr>
</tbody>
</table>

**ParameterValue - getAsJsonContent()**

Returns the request as an iterable object of type JsonNode.

This method is available only in an Edge Encryption rule if the request body is a valid JSON payload. If you are not sure what format the request body includes, check the contentType field on the request object.

Once the request is returned as a JsonNode object, you can use the JSON APIs to iterate over the object and encrypt fields.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The request as an iterable JsonNode.</td>
</tr>
</tbody>
</table>

**ParameterValue - getAsXmlContent()**

Returns the request content as an iterable object of type XMLContent.

This method is available only in an Edge Encryption rule. This method assumes that the request body is a valid XML payload. You can check the contentType to make sure.

Once the request is returned as an XMLContent object, you can use the XML APIs to iterate over the object and encrypt fields.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request as an iterable object of type XMLContent.</td>
</tr>
</tbody>
</table>
ParameterValue - encodedQueryFor(String tableName)

Specifies that the value of the element is an encoded query on the specified table.

Calling this function on a parameter tells the proxy that the value of the parameter is an encoded query for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that must be encrypted.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

ParameterValue - valueFor(String tableName, String fieldName)

Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

XML APIs

XML APIs can be used after calling getAsXmlContent() on either the request object or a ParameterValue property.

When using XML APIs to write your encryption rule, you can follow a general format:

1. Call getAsXmlContent() on the request object or ParameterValue property. This returns an iterable object of the XMLContent underlying class.
2. Call getIterator() or getIterator(String xPath) on the XMLContent object. This returns an XMLElementIterator object that can be used to iterate over XML elements.
3. Call the hasNext() method on the XMLElementIterator object to determine whether another element is available.
4. Call `next()` on the `XMLElementIterator` object to return the next XML element. You cannot call `next()` without first calling `hasNext()`.

5. Call `valueFor(String tableName, String fieldName)` on the XML element. This method tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted.

**Note:** To determine if you want to call `valueFor(String tableName, String fieldName)` on an XML element, you can use the `getName()` method to return the name of the element.

**Mapping to a known table-field on the instance**

In this example, the XML payload will be processed on the instance to insert records in the incident table. The description field will populate `short_description` on the incident.

```xml
<data>
  <record>
    <name>'Test Record 1'</name>
    <description>'Test Record 1 Description'</description>
    <tag>critical</tag>
  </record>
  <record>
    <name>'Test Record 2'</name>
    <description>'Test Record 2 Description'</description>
    <tag>security</tag>
  </record>
</data>
```

The following encryption rule action can apply:

```javascript
function sampleXmlAction1() {
  var xmlContent = request.getAsXmlContent();
  // This loop iterates over all description tags that match the given path
  var xmlElementIterator = xmlContent.getIterator('data/record/description');
  while (xmlElementIterator.hasNext()) {
    var xmlElement = xmlElementIterator.next();
    xmlElement.valueFor('incident', 'short_description');
  }
}
```

This action iterates through the `description` tags and asks the proxy server to encrypt the values and insert them into `incident.short_description` on the instance.

**Note:** This rule finds all `description` tags within all `record` tags in the XML payload. If there is only one occurrence of a tag to encrypt, the rule still uses the xPath and iterator structure. However, it iterates only once in the loop.

**Mapping to an unknown table-field on the instance**

In this example, the rule iterates over the `record` tags, but does not know what tags to expect within the `record` tag. The only known is that the tags within the `record` tags match the names of the columns specified in the table URL parameter.

The rule also specifies that, if the table is incident, then the data in the `description` tag should be encrypted and stored in the `short_description` field on the instance.

```javascript
function sampleXmlAction2() {
  var xmlContent = request.getAsXmlContent();
  var tableName = request.urlParam.table;
  // This loop iterates over all description tags that match the given path
  var xmlElementIterator = xmlContent.getIterator('data/record/description');
  while (xmlElementIterator.hasNext()) {
    var xmlElement = xmlElementIterator.next();
    xmlElement.valueFor('incident', 'short_description');
  }
}
```
In the `encryptFieldsInRecord()` function, the `valueFor()` method is called on a table and a field that are dynamically assigned based on the request. Even though the table and field names can change, the rule asks the proxy to check whether the field in the table must be encrypted based on the encryption configurations defined.

If the field is not configured for encryption, or if the tag does not match a field in the table, the proxy skips that tag. If the tag matches a field marked for encryption, then the Edge Encryption proxy server encrypts the value.

**Using an encoded query**

In this example, all tags have the `filter` attribute, which indicates whether the tag contains an encoded query.

```xml
<data>
  <record>
    <name filter="false">'Test Record 1'</name>
    <description filter="false">'Test Record 1 Description'</description>
    <query filter="true">category=1^name=edge</query>
  </record>
  <record>
    <name filter="false">'Test Record 2'</name>
    <description filter="false">'Test Record 2 Description'</description>
    <query filter="true">category=2^severity=3</query>
  </record>
</data>
```

The following encryption rule action can apply:

```javascript
function sampleXmlAction3() {
  var xmlContent = request.getAsXmlContent();
  var tableName = request.urlParam.table;
  var xmlElementIterator = xmlContent.getIterator('data/record');
  while (xmlElementIterator.hasNext()) {
    encryptFieldsInRecord(xmlElementIterator.next());
  }
}
```
function encryptFieldsInRecord(xmlElement) {
    //this time we want to iterate over all tags representing fields in the table
    var fieldIterator = xmlElement.getIteratorOverAllChildren();
    while (fieldIterator.hasNext()) {
        var field = fieldIterator.next();
        var fieldName = childElement.getName();
        //let's look at the filter attribute, if true, then encrypt as encoded query
        if (field.getAttributeValue('filter') == 'true') {
            field.encodedQueryFor(tableName);
        } else {
            //if it is false then check if the field should be encrypted
            field.valueFor(tableName, fieldName);
        }
    }
}

If the `filter` attribute value is true, the rule asks the proxy server to encrypt the values in the encoded query. If false, the rule asks the proxy to check whether the field should be encrypted.

**XMLContent**

A global object that provides methods to iterate over the XML content.

You can access an XMLContent object by calling `getAsXmlContent()` on a request object.

You access XML data in a POST or URL parameter by calling `request.postParams.<parameter name>.getAsXmlContent()` or `request.urlParams.<parameter name>.getAsXmlContent()`.

**XMLContent - getIterator()**

Returns an XMLElementIterator object for the XML content.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLContent object.</td>
</tr>
</tbody>
</table>

**XMLContent - getIterator(String xPath)**

Returns an XMLElementIterator object for the XML content based on the specified parameter.
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath-like expression that specifies where in the XMLContent object to start.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLContent object.</td>
</tr>
</tbody>
</table>

**XMLElementIterator**

Provides methods for iterating over XML elements.

You get an XMLElementIterator object by calling the `getIterator()` method of the XMLContent class.

**XMLElementIterator - hasNext()**

Determines if there is another element available.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>-------</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another element is available.</td>
</tr>
</tbody>
</table>

**XMLElementIterator - next()**

Returns the next element in the iterator.

You cannot call `next()` without first calling `hasNext()`.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>-------</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElement</td>
<td>The next XML element.</td>
</tr>
</tbody>
</table>
XMLElement
Provides methods for iterating through XML elements and mapping values to fields in a table.
You get an XMLElement object by calling the next() method of an XMLElementIterator object.

XMLElement - getIterator(String xPath)
Returns an XMLElementIterator object for the XML element based on the specified parameter.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath-like expression that specifies where in the XMLElement object to start.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLElement object.</td>
</tr>
</tbody>
</table>

XMLElement - getIteratorOverAllChildren()
Returns an XMLElementIterator object that includes all sub-elements for the XML element based on the specified parameter.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLElement object.</td>
</tr>
</tbody>
</table>

XMLElement - valueFor(String tableName, String fieldName)
Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted. If the table and field names are unknown, you can call the valueFor() method on a table and a field that are dynamically assigned based on the request.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

`XMLElement - encodedQueryFor(String tableName)`

Specifies that the value of the element is an encoded query for the specified table.

Calling this function on an element tells the proxy that the value of the element is an encoded query for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that must be encrypted.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

`XMLElement - getName()`

Returns the element name.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The element name.</td>
</tr>
</tbody>
</table>

`XMLElement - getAttributeValue(String attribute)`

Returns the value of the specified attribute.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>String</td>
<td>Attribute name.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The attribute value.</td>
</tr>
</tbody>
</table>

JSON APIs

JSON APIs can be used after calling `getAsJsonContent()` on either the request object or a ParameterValue property.

When using JSON APIs to write your encryption rule, you can follow a general format:

1. Call `getAsJsonContent()` on the request object. This returns an iterable object of the JsonNode underlying class.
2. Call `getIterator()` or `getIterator(String xPath)` on the JsonNode object. This returns a JsonNodeIterator object that can be used to iterate over nodes in the JSON object.
3. Call the `hasNext()` method on the JsonNodeIterator object to determine whether another element is available.
4. Call `next()` on the JsonNodeIterator object to return the next JSON element. You cannot call `next()` without first calling `hasNext()`.
5. Call `valueFor(String tableName, String fieldName)` on the JSON element. This method tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks whether the field must be encrypted.

**Note:** To determine if you want to call `valueFor(String tableName, String fieldName)` on a JSON element, you can use the `getName()` method to return the name of the element.

Mapping to a known table-field on the instance

In this example, the JSON payload is processed on the instance to insert records in the incident table. The description field populates short_description on the incident.

```json
{
  data: {
    records: [
      {
        "name": "Test Record 1",
        "description": "Test Record 1 Description",
        "tag": "security"
      },
      {
        "name": "Test Record 1",
        "description": "Test Record 1 Description",
        "tag": "security"
      }
    ],
    "query": "assigned_to=3D4860165813e63a00d00abd322244b092^category=vulnerability"
  }
}
```
The following rule can apply:

```javascript
function sampleJsonAction1() {
    var jsonContent = request.getAsJsonContent();
    // This loop iterates over all description elements in the records array
    var jsonNodeIterator = jsonContent.getIterator('/data/records/description');
    while (jsonNodeIterator.hasNext()) {
        var jsonNode = jsonNodeIterator.next();
        jsonNode.valueFor('incident', 'short_description');
    }
}
```

This action iterates through the `description` nodes and asks the proxy server to encrypt the values and insert them into `incident.short_description` on the instance.

**Note:** This rule finds all `description` nodes within the JSON payload. If there is only one occurrence of a node to encrypt, the rule still uses the xPath and iterator structure. However, it iterates only once in the loop.

**Mapping to an unknown table-field on the instance**

In this example, the rule iterates over `records`, but is not sure what nodes to expect. The only known is that for each object within `records`, the nodes match the names of the columns specified in the table URL parameter.

The rule also specifies that, if the table is incident, then the data in the `description` node should be encrypted and stored in the `short_description` field on the instance.

```javascript
function sampleJsonAction2() {
    var jsonContent = request.getAsJsonContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var jsonNodeIterator = jsonContent.getIterator('data/records');
    while (jsonNodeIterator.hasNext()) {
        encryptFieldsInRecord(jsonNodeIterator.next());
    }
}

function encryptFieldsInRecord(jsonNode) {
    // this time we want to iterate over all nodes
    var fieldIterator = jsonNode.iterator();
    while (fieldIterator.hasNext()) {
        var field = fieldIterator.next();
        var fieldName = childElement.getName();
        if (fieldName == 'description') {
            field.valueFor(tableName, 'short_description');
        } else {
            field.valueFor(tableName, fieldName);
        }
    }
}
```

In the `encryptFieldsInRecord()` function, the `valueFor()` method is called on a table and a field that are dynamically assigned based on the request. Even though the table and field names can change, the rule asks the proxy to check whether the field in the table must be encrypted based on the encryption configurations defined.
If the field is not configured for encryption, or if the node name does not match a field in the table, the proxy skips that node. If the node name matches a field marked for encryption, then the proxy encrypts the value.

Using an encoded query

```javascript
function sampleJsonAction3() {
    var jsonContent = request.getAsJsonContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var jsonNodeIterator = jsonContent.getIterator('data');
    while (jsonNodeIterator.hasNext()) {
        var jsonNode = jsonNodeIterator.next();
        if (jsonNode.getName() == 'records')
            encryptRecords(jsonNodeIterator.next());
        else if (jsonNode.getName() == 'query')
            jsonNode.encodedQueryFor(tableName);
    }
}
function encryptRecords(jsonNode) {
    // we iterate over all fields in the node
    var recordIterator = jsonNode.iterator();
    while (recordIterator.hasNext()) {
        encryptFieldsInRecord(recordIterator.next());
    }
}
function encryptFieldsInRecord(jsonNode) {
    // this time we want to iterate over all nodes
    var fieldIterator = jsonNode.iterator();
    while (fieldIterator.hasNext()) {
        var field = fieldIterator.next();
        var fieldName = childElement.getName();
        field.valueFor(tableName, fieldName);
    }
}
```

In this example, the rule iterates over `data`. As it finds `records`, it performs the same logic as in the second example, iterating over fields in each node. When it finds the `query` node, it calls `encodedQueryFor()` to encrypt values that should be encrypted in the query.

**JsonNode**

A global object that provides methods to iterate over the JSON content.

You can access a `JsonNode` object by calling `getAsJsonContent()` on a request object.

You access JSON content from a POST or URL parameter by calling `request.postParms.<parameter name>.getAsJsonContent()` or `request.urlParms.<parameter name>.getAsJsonContent()`.

**JsonNode - getIterator(String xPath)**

Returns a `JsonNodeIterator` object for the JSON content.

This method can only be used on the root node, but can be used to traverse deep into the JSON object. Subsequent traversals must use the `iterator()` method.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath expression.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNodeIterator</td>
<td>An object that can iterate over nodes in the JSON object.</td>
</tr>
</tbody>
</table>

### JsonNode - iterator()

Returns a `JsonNodeIterator` object that iterates over all child nodes of the current node.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNodeIterator</td>
<td>An object that can iterate over nodes in the JSON object.</td>
</tr>
</tbody>
</table>

### JsonNode - getAsString()

Returns the current node value as a string.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The current node value.</td>
</tr>
</tbody>
</table>

### JsonNode - getAsString(String propertyName)

Returns the string value of the specified property.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propertyName</td>
<td>String</td>
<td>Name of the property.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The property value.</td>
</tr>
</tbody>
</table>

JsonNode - getName()

Returns the name of the current JSON node.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

JsonNode - valueFor(String tableName, String fieldName)

Specifies that the JSON property maps to the specified field in the specified table.

Calling this method on a JSON property tells the proxy that the value for this property maps to the specified field in the specified table. The proxy then decides if the field must be encrypted. If the table and field names are unknown, you can call the valueFor() method on a table and a field that are dynamically assigned based on the request.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

JsonNode - encodedQueryFor(String tableName)

Specifies that the value of the JSON property is an encoded query for the specified table.

Calling this function on a JSON node tells the proxy that the value is an encoded query for the specified table. The proxy parses the encoded query and encrypts the values for fields in the encoded query that must be encrypted.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

#### JsonNodeIterator

You get a `JsonNodeIterator` object by calling the `getIterator()` or `iterator()` methods of the `JsonNode` class.

#### JsonNodeIterator - hasNext()

Determines if there is another property available.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another property is available.</td>
</tr>
</tbody>
</table>

#### JsonNodeIterator - next()

Returns the next property in the iterator.

You cannot call `next()` without first calling `hasNext()`.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The next JsonNode.</td>
</tr>
</tbody>
</table>

#### print(String message)

Prints a message to the wrapper log file: `<proxy server directory>/logs/wrapper_<date>.log`.

This method is available only in an Edge Encryption rule action script.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The message to be written to the wrapper log file.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Prohibited keywords

The Edge Encryption proxy validates encryption rule scripts before saving the rule. Many JavaScript keywords are not allowed in encryption rule scripts.

Prohibited keywords

<table>
<thead>
<tr>
<th>Keyword</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DIR</strong></td>
</tr>
<tr>
<td><strong>FILE</strong></td>
</tr>
<tr>
<td><strong>LINE</strong></td>
</tr>
<tr>
<td><strong>parent</strong></td>
</tr>
<tr>
<td><strong>proto</strong></td>
</tr>
<tr>
<td>Error</td>
</tr>
<tr>
<td>eval</td>
</tr>
<tr>
<td>getClass</td>
</tr>
<tr>
<td>getPrototypeOf</td>
</tr>
<tr>

</tr>
<tr>
<td>prototype</td>
</tr>
<tr>
<td>RegExp</td>
</tr>
<tr>
<td>setPrototypeOf</td>
</tr>
<tr>
<td>this</td>
</tr>
</tbody>
</table>
Edge Encryption dictionary attributes

You can add Edge Encryption dictionary attributes to tables and fields.

To set an Edge Encryption dictionary attribute to true, you must enter `attribute=true` in the Attributes field. To add a dictionary attribute to a record, see Dictionary attributes.

**Edge Encryption Excluded [edge_encryption_excluded]**

When set to true, the field or table cannot be encrypted.

- Value: true/false
- Target element: field or table
- Default value: false

**Edge Encryption Enabled [edge_encryption_enabled]**

When set to true, the field is eligible for encryption through an encryption configuration. Because this attribute is used by the system and cannot be modified, it is not always displayed to the user.

⚠️ Note: This attribute does not indicate that a field is encrypted, nor does it trigger any encryption logic on the field. Rather, the attribute determines the possibility of the field being encrypted by a user.

- Value: true/false
- Target element: field
- Default value: true for String fields

**Edge Encryption Clear Text Allowed [edge_encryption_clear_text_allowed]**

When set to true, allows server-side scripts to append non-encrypted data to an encrypted string within the field for user actions performed through the proxy server, or any server-side automated scripts, such as scheduled jobs.

- Value: true/false
- Target element: field
- Default value: false

Domain separation and Edge Encryption

Domain separation is unsupported in Edge Encryption. This application provides the ability to encrypt data from within the customer’s environment through the use of specific configurations, rules, and keys defined on the Edge Encryption proxy. The Edge Encryption proxy is not domain aware and cannot support domain-specific settings. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.
Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

How domain separation works in Edge Encryption

Edge Encryption can be used where domain-specific keys, configurations, and rules are not required.

⚠️ Note:

It is not recommended to install Edge Encryption on domain instances at all even for internal service provider usage.

Domain separation for service providers

Data integration with Edge Encryption

To integrate third-party data with an instance using Edge Encryption, you must route the data through the Edge Encryption proxy server using supported integrations. Supported integrations use base system encryption rules that map data in each payload to fields in a table.

Upload data to fields marked for encryption

Edge Encryption does not support importing data from or exporting data to Excel, CSV, XML, or other file types to or from fields with encryption configurations defined.

ODBC driver

Encrypt requests and query data through the Edge Encryption proxy server using the ODBC driver.

Learn more: Edge Encryption ODBC driver integration

MID Server

You can configure the MID Server to route data through an Edge Encryption proxy server. However, some restrictions apply.

Learn more: Edge Encryption MID Server integration

REST/SOAP web services

Use REST/SOAP web services to update or retrieve record data through the Edge Encryption proxy server.

Learn more: Web services

JSONv2 web service

Use JSONv2 web service APIs to update or retrieve record data through the Edge Encryption proxy server. Base system encryption rules support data retrieval and data modification APIs.
To insert a single record using the data modification API, use the `insert()` or `insertMultiple()` methods.

To insert multiple records using the data modification API, use the `insertMultiple()` method.

Learn more: JSONv2 Web Service

To encrypt data from custom third-party integrations not listed above, create custom encryption rules. See Define a custom encryption rule.

**Upload attachments to records marked for encryption**

Attachments can be uploaded to tables with attachment encryption configured using REST and SOAP web services.

**Edge Encryption ODBC driver integration**

Configure your ODBC driver to query data encrypted by Edge Encryption. The Edge Encryption proxy server encrypts ODBC driver requests to the ServiceNow instance when Edge Encryption is integrated with the ODBC driver.

Encrypted responses from the instance are decrypted through the Edge Encryption proxy server before passing to the ODBC driver in your network.

For a successful integration, the ODBC driver must trust the Edge Encryption proxy server certificate. If the Edge Encryption proxy server certificate is signed by a Certificate Authority trusted by the ODBC driver, the Edge Encryption proxy server is automatically trusted. However, if a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import the self-signed certificate to the ODBC truststore.

**Import a self-signed certificate to the ODBC truststore**

If a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import a self-signed certificate to the ODBC truststore. You can export the certificate from the Edge Encryption proxy server and import it into the ODBC truststore.

**Before you begin**

To determine whether a Certificate Authority trusted by the ODBC driver has signed the Edge Encryption proxy server certificate, run the following command in the keystore directory in the proxy home directory to view a list of Certificate Authorities trusted by the ODBC driver:

```
keytool -keystore "<ODBC directory>\ip\Java\jre\lib\security\cacerts" -list
```
**Procedure**

1. Change to the keystore directory in the proxy home directory.

2. Check the keystore for the self-signed certificate.

   a. To check the keystore for the certificate, you can run the following command to list all the items in the keystore.

   ```
   keytool -list -keystore keystore.jceks -storetype jceks -v
   ```

   b. Locate the key alias in the list of items.

3. Using the key alias, export the certificate to a .cer file.

   ```
   keytool -export -alias <key alias> -keystore keystore.jceks -storetype jceks -rfc -file <file name>.cer
   ```

4. Change to your ODBC truststore directory: ODBC\ip\Java\jre\lib\security\cacerts.

5. Import the certificate to your ODBC truststore.

   ```
   keytool -keystore cacerts -importcert -alias $<key alias> -file <file name>.cer
   ```

**Set the ODBC driver properties**

Set the ODBC driver properties to route requests through the Edge Encryption proxy server.

**Procedure**

1. In Windows, navigate to **Start > Programs > ServiceNow ODBC Management Console**.

2. Expand the console tree root to: **ServiceNow ODBC Manager\Manager\<installation location>\Services\ServiceNow_ODBC\Data Source Settings\ServiceNow\IP Parameters**.

3. Double-click the **DataSourceIPProperties** attribute.

4. Change the **Value** to the URL of your Edge Encryption proxy server, such as https://<IP address>:<port>
5. Click OK.

What to do next
The ODBC driver is now configured to route requests to the instance through the Edge Encryption proxy server.

Edge Encryption MID Server integration
Configure the MID Server to route data through an Edge Encryption proxy server.

When integrated with the MID Server, the Edge Encryption proxy server acts as the MID Server's endpoint. The Edge Encryption proxy server then encrypts and decrypts data passing between the ServiceNow instance and the MID Server.

Limitations when integrating with the MID Server
When MID Server data is configured to pass through the Edge Encryption proxy server, the following limitations apply:

- Encryption of ECC Queue fields is not supported.
- Encrypted data cannot be used with Discovery or Service Mapping.

Point the MID Server to the Edge Encryption proxy server
To pass data from the MID Server through the Edge Encryption proxy server, update the MID Server configuration file to point the MID Server to the Edge Encryption proxy server.

About this task
When configuring the MID Server to pass through the Edge Encryption proxy server, you cannot use the web proxy properties in the MID Server configuration file to route traffic through the Edge Encryption proxy server to your instance. Instead, you must set the Edge Encryption proxy server as the MID Server's endpoint.
Procedure

1. Navigate to your local MID Server directory and open the config.xml file.

2. Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value property to the URL of your Edge Encryption proxy server. For example, `http://hostname.mycompany.com:8081`. This step directs the MID Server to pass traffic to the Edge Encryption proxy server instead of the instance. The Edge Encryption proxy server in turn encrypts any necessary fields and passes the payload to the instance.

3. Save and close the file.

4. If running, restart the MID Server.

Edge Encryption diagnostics and performance

Monitor Edge Encryption proxy server performance trends and drill into errors generated by the Edge Encryption proxy server.

Edge proxy performance

View key Edge Encryption proxy server performance trends using the Edge Proxy graph set on the ServiceNow Performance homepage. Monitored trends include:

- Maximum and average response times between the client, proxy server, and instance.
- CPU, disk space, and memory usage of the host machine.
- Maximum and average network latency between the proxy server and the ServiceNow instance.

⚠️ Note: Edge Encryption proxy servers with duplicate names do not report performance trends.
Edge Processing (Max and Average)

Maximum and average time in milliseconds to process a request. These data points are general trends over time.

- **Total Time**: Time for the proxy server to receive a request from a client and send a response. This data point is the sum of the subsequent data points.
- **Proxy Response**: Time for the proxy server to process a response from the instance.
• **Proxy-Instance Round Trip**: Time for the proxy server to send a request to the instance and receive a response. Includes network latency between the proxy server and the instance and time spent by the instance to process the request.

• **Rules**: Time for the proxy server to evaluate a request using defined encryption rules.

• **Proxy Request**: Time for the proxy server to process a client request and forward it to the instance.

**Edge Proxy Performance (Max and Average)**

Maximum and average percentage of resources used on the host machine.

- CPU Usage
- Memory Usage
- Disk Usage

**Edge Proxy Latency**

Maximum and average network latency in milliseconds at a given point in time. Latency is determined by round-trip time for a proxy server to send a simple ping to the instance and receive a response.

**Proxy Error Reports**

Navigate to **Edge Encryption Configuration > Diagnostics and Troubleshooting > Proxy Error Reports** to view all proxy server errors collected over the past seven days.

Errors are collected over a one-minute period. Each minute, an error report is generated. The vertical axis displays the number of error reports over the last seven days that include each error. For example, even if the DEFAULT_ERROR_CODE error is thrown multiple times over a one-minute report period, the DEFAULT_ERROR_CODE bar will only reach one on the **Number of Error Reports** axis.

From this view, you can:

- Click each proxy error code bar to see the report on a single error for each proxy server. From this view, you can click the bar again to view the error text in the Edge Encryption Proxy Stat table [edge_encryption_stat]. Follow links in the error text to see more information and possible remediation steps.
- Click **Other** to see page two of the error report.
**Note:** If you have more than one proxy server with the same name, a single DUPLICATE_PROXY_NAME error appears in the Proxy Error Report. No other errors are reported for proxy servers with duplicate names. If you encounter this error, make sure that all proxy servers have unique names.

**Additional monitoring resources**

The instance tracks all encryption proxies. Each Edge Encryption proxy server registers when it starts up. The instance is notified when:

- A new Edge Encryption proxy server starts up.
- An Edge Encryption proxy server is intentionally shut down.

If an Edge Encryption proxy server attempts to register with an instance that does not have Edge Encryption installed, the proxy does not start.

All encryption configuration files are audited. Deleted records are audited on all encryption configuration files. Audit records are put in the `sys_audit` table. To view the history of a specific configuration record, view the record, and click **History > List** in the menu. The Mass Encryption Job is not audited.

Use the following additional resources to monitor your proxy servers.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invalid Insert Attempts</td>
<td>List of attempts to save the following data to encrypted fields:</td>
</tr>
<tr>
<td></td>
<td>• Unencrypted data.</td>
</tr>
<tr>
<td></td>
<td>• Data that did not come from an Edge Encryption proxy.</td>
</tr>
<tr>
<td>[sys_edge_encryption_invalid_insert_log]</td>
<td>The instance rejects and then logs any attempts to save this data.</td>
</tr>
<tr>
<td></td>
<td>If you have the security-admin role, you can view the logs in the Invalid</td>
</tr>
<tr>
<td></td>
<td>Insert Attempts list.</td>
</tr>
<tr>
<td>Job Failures</td>
<td>A list of jobs that did not execute successfully.</td>
</tr>
<tr>
<td>[sys_encryption_job_execution]</td>
<td></td>
</tr>
<tr>
<td>System logs</td>
<td>The instance periodically checks for messages from each registered proxy</td>
</tr>
<tr>
<td></td>
<td>server. If a proxy server has not sent a message in the required time frame,</td>
</tr>
<tr>
<td></td>
<td>an error is logged. The log message contains information about the encryption</td>
</tr>
<tr>
<td></td>
<td>proxy and the last time the proxy pinged the instance.</td>
</tr>
<tr>
<td></td>
<td>If the instance determines that none of the encryption proxies are online,</td>
</tr>
<tr>
<td></td>
<td>it logs a message. These messages are added to the system log.</td>
</tr>
</tbody>
</table>

**Disable or reduce Edge Proxy statistic collection**

Prevent the Edge Encryption proxy server from sending Edge Proxy Graph Set statistics to the ServiceNow Performance homepage, or reduce the frequency of statistic collection.

**Before you begin**

Role required: admin or security_admin

**About this task**

By adding properties in the edgeencryption.properties configuration file, you can:
• Disable the Edge Proxy graph set.
• Change the interval during which statistics are collected by the Edge Encryption proxy server. By default, statistics are collected every 30 seconds.

Procedure
1. In your proxy server installation directory, open the edgeencryption.properties configuration file located in the <installation directory>/conf/ folder.
2. Add one of the Edge Encryption proxy server properties.
3. Restart the proxy server.

Data Classification
Group data by type, using pre-defined or user-defined data classifications. If you have an assigned data classification administrator or auditor role, you can administer different data classes or visually analyze the current state of different types of data within the instance.

Data Classification enables support for:
• Visibility into the types of data hosted on a Now Platform instances.
• Compliance with privacy laws, and meeting regulation requirements for industries such as financial services and medical device manufacturing.

Data classifications
Data classification is a standalone process in which you manually apply data classifications to existing dictionary entries in any table.
• You classify data as you find appropriate for your business and you can alter the available data classes as necessary.
• When you classify data, you can use the pre-defined data classifications, or create your own. Although use of pre-defined data classifications is optional, it is advisable do so as a starting point. These pre-defined data classifications are included in demo data that you can install in your instance. To learn more, see Install Data Classification plugin demo data and Components installed with Data Classification demo data.
• If you create your own data classifications, you can also design a tiered hierarchical system with parent and child data classifications.

Overview dashboard
Use the Overview dashboard to understand how your current data tables map to different data classifications. You can also analyze how your global, regional, international users may require different approaches to data classification, regarding the use or access to data. You can also customize the Overview dashboard content and layout to fit your needs.

To learn how to use the available scripted and REST APIs to apply the classification metadata within existing processes, workflows, and applications, see the following:
• Data Classification - REST API
• DCManager - Global
• ScopedDCManager - Scoped

Note: Data Classification supports domain separation, and the data_classification table itself is process separated.
Use cases

General Data Protection Regulation (GDPR) is a European Union regulation whose purpose is to provide individuals with control over their own personal data. You can use data classifications, such as Personally Identifiable Information, to identify where personal data is being stored in your instance. By applying the appropriate security mechanisms to protect that personal data from leaking out, your organization satisfies GDPR requirements.

If you store customer information in the Now Platform, use the Personally Identifiable Information (PII) classification code where needed to track data subject to regulation by local privacy laws. When you install demo data, it automatically applies this classification code to certain security-sensitive fields in the User [sys_user] table. To learn more, see:

• Components installed with Data Classification demo data
• Assign data classifications to dictionary entries

You can apply a Restricted data classification to Employee table columns that store sensitive employee information such as Social Security Numbers (SSN). Administrators and auditors can then use the Overview dashboard to confirm that you have assigned data classifications to the correct columns. They can also view the classification details for restricted types of information.

Install Data Classification plugin demo data

When you upgrade to or install San Diego (and above), the Data Classification (com.glide.data_classification) plugin is automatically activated. However, you should manually install the demo data that comes with the plugin. It includes several important pre-defined data classifications, and it also assigns one of them to specific User [sys_user] table columns in your instance.

Before you begin
Role required: admin

About this task
Regardless of whether you install demo data, the activated Data Classification plugin adds the following user roles in your instance:

• data_classification_admin: Can administer all aspects of the Data Classification application, including data classification setup and assignment.

• data_classification_auditor: Can audit Data Classification code assignments made to user tables and columns.

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the Data Classification plugin using the filter criteria and search bar. An Installed message appears after you locate the plugin.
3. Click the icon with three vertical dots, then select Repair to access the Activate Plugin dialog.

The following dialog box appears:
4. Select **Load demo data**, and then click **Repair**.

**Components installed with Data Classification demo data**

When you install the demo data included in the Data Classification (com.glide.data_classification) plugin, several types of components are installed in your instance. These components include pre-defined data classifications and code assignments for specific User [sys_user] columns.

**Data Classifications installed**

<table>
<thead>
<tr>
<th>data classification</th>
<th>Description</th>
</tr>

</tbody>
</table>

### Create data classifications

Create your own user-defined data classifications in the Data Classification [data_classification] table that you can then assign to specific columns in specific tables.

### Before you begin
**Role required:** data_classification_admin, admin

### Procedure
1. Navigate to All > System Security > Data classification > Data classes.
2. Fill in the fields on the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification Name</td>
<td>Name of the data classification.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the data classification.</td>
</tr>
<tr>
<td>Parent</td>
<td>Name of the parent data classification that this data classification is subordinate to. Leave the field empty if this data classification is not a parent to child data classifications.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for this data classification.</td>
</tr>
</tbody>
</table>

3. If this data classification should be a parent to child data classifications, click **New**. If you do not want to create child data classifications, skip this step.
4. Fill in the fields on the form.

<table>
<thead>
<tr>
<th>Title</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>Classification Name</td>
<td>Name of the child data classification.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the child data classification.</td>
</tr>
<tr>
<td>Parent</td>
<td>Name of the parent data classification that this data classification is subordinate to. Leave the field empty if this data classification is not a parent to child data classifications.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>---------------------------------------------------------------</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for this child data classification.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Assign data classifications to dictionary entries**

Assign data classifications to specific table columns in the Dictionary [sys_dictionary] table. When you assign data classifications, it creates entries in the Dictionary-Data Class [m2m_dictionary_dataclass] table, which you can then review in the Overview dashboard.

**Before you begin**

Role required: data_classification_admin, admin

**Procedure**

1. In the Navigator pane, type `sys_dictionary.list`.
2. In Dictionary Entries, select each of the elements you want to assign specific data classifications to.
3. After selecting the elements, click **Actions on selected rows**, and then select **Classify**.

⚠ **Note:** To clear previously assigned data classifications for selected dictionary elements, you can select **Clear classification**.

4. When the Assign to data class dialog appears, select the data classifications you want to assign to your selected dictionary elements, then click **Classify**.

You can select multiple data classifications as needed.

**Analyze data classifications using the Overview dashboard**

The Overview dashboard reports the current state of data classifications within your instance, and how your users are distributed by location. If you have a data classification administrator or auditor role, you can visualize the current sensitivity of instance data, which helps increase security and compliance with privacy laws. By using the Location field in user records, administrators map users across different regions that have differing privacy regulations.
### Users tab

<table>
<thead>
<tr>
<th>Number of locations</th>
<th>Number of users</th>
</tr>
</thead>
<tbody>
<tr>
<td>49</td>
<td>616</td>
</tr>
</tbody>
</table>

### Users by country

<table>
<thead>
<tr>
<th>World</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
</tbody>
</table>
**Required Now Platform roles**

- `data_classification_admin`: Administers all aspects of the Data Classification application, including data classification setup, and assignment.
- `data_classification_auditor`: Audits Data Classification code assignments.

**Use cases**

For additional examples of how different people in your organization would use this dashboard, see Use Cases in Data Classification.

<table>
<thead>
<tr>
<th>User</th>
<th>Dashboard use</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>data_classification_admin</code></td>
<td>Confirm that you have assigned data classifications to the correct fields in your instance.</td>
</tr>
<tr>
<td><code>data_classification_auditor</code></td>
<td>Audit the senility and security of data in your instance.</td>
</tr>
</tbody>
</table>

**Reports**

<td>sys_dictionary</td>
<td>Total number of locations in your instance.</td>
</tr>
</tbody>
</table>
## Domain separation and Data Classification

Domain separation is supported for Data Classification. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

### Support level: Enhanced

- Includes Basic and Standard levels
- Data-driven process enables service provider customers to modify business logic that is based on defined use cases. These configurations are UI-based and fail-safe so that configurations by one customer cannot affect another.
- Tenants of the instance must be able to configure minimum viable product (MVP) business logic and data parameters for themselves. This logic and parameters would be expected for the application’s normal function.

Sample use case: Tenant-customers of a shared environment must be able to modify the impact, urgency, or priority matrix to set priority within their domain.

For more information on support levels, see Application support for domain separation.

### How domain separation works in Data Classification

For domain separation, the application uses process separation for the Data Classification [sys_data_classification] table. For the Dictionary-Data Class [m2m_dictionary_dataclass] table, it uses data separation. For learn more about data and process separation, see Domain separation explained.

### Related information

- Domain separation for service providers

## Auditing

Track record changes on auditing-enabled tables. By default, the system tracks changes to the incident, change, and problem tables, among others.

Enabling auditing tracks the creation, update, and deletion of all records in the table. If you want to audit individual fields in a table, you can hide fields you do not want to track using a dictionary attribute.

Auditing information is kept in these tables:
- The Audit table.
- The History sets table.
**Warning:** Auditing system tables that receive a large amount of traffic, such as Workflow Contexts [wf_context] or Event Management Alerts [em_alert], can impact performance. For this reason, you cannot audit the em_alert table as a whole. Instead, audit selected fields of interest. Set audit=true on both the em_alert table and the selected fields. Try to audit as few fields as possible.

**Auditing parent and child tables**
Tables do not derive the audit flags from parent or child audited tables.

- For example, if you enable auditing for the cmdb_ci table, only CIs stored in that base table are audited.
- Likewise, if you enable auditing for the cmdb_ci_computer table, only the computer CI records are audited, including any fields on the cmdb_ci_computer table that are derived from the cmdb_ci table.

**Auditing system tables**
By default, the system does not audit the deletion of a record from system tables. To audit a system table, add it to the list of tables in the glide.ui.audit_deleted_tables property list.

**Auditing deletions from a form or list**
By default, the system audits deletions of individual records from a form. To prevent auditing, set the table's dictionary attribute no_audit_delete.

The system audits deletions from a list when audit is selected on the table dictionary, and the table is not listed in the glide.db.audit.ignore.delete property.

**Note:** By default, the glide.db.audit.ignore.delete property is not present in the System Property [sys_properties] table. To change the property, and its associated values, you must first manually add it. However, when manually added, it overwrites the following default values:

```plaintext
glide.db.audit.ignore.delete =
  sys_mutex,sys_db_cache,sys_lucene_block,sys_lucene_file,sys_lucene_directory,sys_user_preference,sys_audit,
  cmdb_ci_windows_service, cmdb_sam_sw_install, cmdb_software_instance,
  cmdb_sam_sw_usage, sam_sw_counter_detail
```

To learn more about adding system properties, see [Add a system property](#).

**Information audited**
Auditing tracks the following record changes:

- Unique Record Identifier (sys_id) of the record that changed
- Field that changed
- New field value
- Old field value
- Number of times this record and field have been updated
- Date and time when the change occurred
- User who made the change
- Reason for the change (if any reason is associated with the change)
- Internal checkpoint ID for the record, if the record has multiple versions.
Information exempted from auditing
Some updates are not audited despite enabling auditing on a table. It is why you may see 132 updates in a record’s history, but only seven audited ones. Auditing excludes the following information:

• Updates made by an upgrade.
• Updates made through import sets.
• Records in parent or child tables.
• Fields with the no_audit dictionary attribute.
• System tables not listed in the glide.ui.audit_deleted_tables property list.
• Fields that begin with the sys_ prefix (system fields), except the sys_class_name and sys_domain_id columns.
• UI Pages can sometimes trigger updates to a record without creating an audit log.
• Anytime an inactivity monitor touches a record. It prevents you seeing possibly hundreds of updates listed against an incident, with the noise drowning out the useful data.
• Manual changes to Performance Analytics scores.

Auditing a table
For instructions on how to audit a table, see Enable auditing for a table. By default, the system tracks all fields in an audited table. You can audit a subset of fields in a table in one of two ways:

• You can enable auditing for the entire table, then exclude those fields you do not want to include. It is appropriate when you want to audit most, but not all, fields, and is referred to as an exclusion listing. For more information, see Exclude a field from being audited (exclusion listing).
• You can enable auditing for the table, but only for specified fields. It is appropriate when you want to audit only a small number of the table’s fields and is referred to as inclusion listing. For information on how to include a field using inclusion listing, see Include a table field in auditing (inclusion listing).

Sys Audit and Audit Relationship Change tables
The Now Platform tracks inserts and updates to audited records in the Sys Audit (sys_audit) and Audit Relationship Change (sys_audit_relation) tables.

The Now Platform tracks audit tables. To track tables, select the Audit check box in the dictionary record to set the value to true. By default, it does not audit records from system tables, such as update sets tables.

Note: To prevent performance issues and infinite loops, the system skips any business rule or workflow triggered by inserts to the Sys Audit table.

Sys audit table columns
The following columns appear in the sys_audit table records:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table name</td>
<td>Table that the audit record is for (for example, &quot;incident&quot;)</td>
</tr>
<tr>
<td>Field name</td>
<td>Column in the table that the audit record is for (for example, &quot;assigned_to&quot;)</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Document key</strong></td>
<td>Sys_id (Unique Record Identifier) for the originating record associated with the audit record.</td>
</tr>
<tr>
<td><strong>Old value</strong></td>
<td>Old value of the field change represented by this sys_audit record.</td>
</tr>
<tr>
<td></td>
<td>• Reference fields: Unique sys_id value of the changed record.</td>
</tr>
<tr>
<td></td>
<td>• Date and time fields: Value in Coordinated Universal Time (UTC) as stored in the database.</td>
</tr>
<tr>
<td><strong>New value</strong></td>
<td>New value of the field change represented by this sys_audit record.</td>
</tr>
<tr>
<td></td>
<td>• Reference fields: Unique sys_id value of the changed record.</td>
</tr>
<tr>
<td></td>
<td>• Date and time fields: Value in Coordinated Universal Time (UTC) as stored in the database.</td>
</tr>
</tbody>
</table>

### How the Audit Relationship Change (sys_audit_relation) table works

The Sys Audit [sys_audit] table tracks activity in tables that are flagged for auditing. This activity includes journal field entries and history sets. The Audit Relationship Change [sys_audit_relation] table tracks relationship changes between sys_audit table records and the source tables that the audited records originate from. It also tracks when a record might have been deleted.

- Whenever you audit any record in a table, a relationship is created between the various originating tables to the store that records data. This relationship information is saved in the sys_history_set, sys_history_line, and sys_journal tables.
- If you delete a field that is related to an audited table record, the sys_audit_relation table records the deletion. In other words, anytime you change an audited record, it first deletes past elements, and then creates a relationship in the sys_audit_relation table with new document IDs.

### Enable auditing for a table

You can enable table auditing to track changes to all or some of the table's fields.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **All > System Definition > Dictionary**.
   - The system displays the list of dictionary entries. The list includes a row for each table as well as a row for each column (field) in the table.
2. In the list of dictionary entries, find the row corresponding to the table you want to audit, for example cmdb_ci_computer. You can distinguish the row for the table itself – versus a row for a column in the table – by finding the row with the correct table name, an empty entry for **Column** name, and a **Type** of **Collection**.
3. Select the dictionary entry for the table.
   - The system displays the dictionary entry form.
4. Check the **Audit** check box.
5. Click **Update**.
What to do next
If you want to audit only a few fields in the table, enable inclusion list auditing for a table. If you want to audit most – but exclude some – fields, exclude a field from being audited (exclusion listing).

Enable inclusion list auditing for a table
Enable a table to audit only those fields you explicitly designate. This is useful when you want to audit only a small number of fields in an audited table.

Before you begin
Role required: admin
The table must be enabled for auditing.

Procedure
1. Navigate to All > System Definition > Dictionary.
   The system displays the list of dictionary entries. The list includes a row for each table as well as a row for each column (field) in the table.
2. If necessary, customize the list view to show the Attributes column.
3. In the list of dictionary entries, find the row corresponding to the table you want to audit, for example cmdb_ci_computer. You can distinguish the row for the table itself – versus a row for a column in the table – by finding the row with the correct table name, an empty entry for Column name, and a type of collection.
4. In the Attributes field for that row, enter audit_type=whitelist.

What to do next
Designate which fields you want to audit in this table.

Exclude a field from being audited (exclusion listing)
Prevent the Now Platform from tracking a subset of fields in an audited table by excluding those fields from an audit.

Before you begin
Role required: admin
To exclude a field in a table from being audited, you must have first enabled auditing for that table.

About this task
Add a set of fields to an exclusion list when you want to audit most of the fields in an auditable table. If you want to audit only a few fields, follow the inclusion listing procedure instead.

Note: Disabling auditing on journal-based fields can impact the functionality of features, such as the Activity Formatter. For more information, see KB0743142.

Procedure
1. Navigate to All > System Definition > Dictionary.
2. If necessary, customize the list view to show the Attributes column.
3. Navigate to the row corresponding to the table and field (column) you want to exclude from auditing.
4. In the Attributes column for that row, enter no_audit.
Include a table field in auditing (inclusion listing)

Track a subset of fields in an audited table by add those fields to an inclusion listing.

**Before you begin**

Role required: admin

To add fields in a table to an inclusion list, you must have first enabled auditing for that table and enabled inclusion list auditing for that table.

**About this task**

Add a set of fields to an inclusion list when you want to audit only a small number of an audited table’s fields. If you need to audit most fields, and exclude only a few, follow the exclusion list procedure instead.

**Procedure**

1. Navigate to **All > System Definition > Dictionary**.
2. If necessary, customize the list view to include showing the **Attributes** column.
3. Navigate to the table and field (column) you want to the inclusion list.
4. In the **Attributes** field, enter **audit=true**.

Enable auditing for a system table

Deletions from tables with a sys_ prefix are not audited by default. To track deletions from these tables, add the table name to the glide.ui.audit_deleted_tables property. Enabling the Restore Deleted Records plugin adds several default values to this property.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **All > System Properties > UI Properties**.
2. Locate the **List of system tables (beginning with "sys_", comma separated) that will have the delete audited property**.
3. Add or remove table names. Table names should be separated by commas, without any spaces.
4. Click **Save**.

ℹ️ **Note:** For more information about auditing, see [Understanding the sys audit Table](#).

History sets

The system automatically generates History Set records as needed from the Audit table when a user either creates a record or views its history.

If a record is in an audited table, its history set is generated when the record is inserted or when a user views the record.

ℹ️ **Note:** Do not use history sets to generate reports.

Several fields of information are captured in the History Set record, displayed in the list view.
List View Record Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>Document ID for the record whose history is being recorded.</td>
</tr>
<tr>
<td>Table</td>
<td>Audited table for the record whose history is being recorded.</td>
</tr>
<tr>
<td>Load Time</td>
<td>Amount of time it took to generate the history set.</td>
</tr>
</tbody>
</table>

Audit History Record Fields

<table>
<thead>
<tr>

<tr>
<td>New</td>
<td>Value after the change.</td>
</tr>
<tr>
<td>Type</td>
<td>Indicates if the entry is for a normal field, an email record, or a relationship change record.</td>
</tr>
<tr>
<td>Update Number</td>
<td>Number of times this field has been changed. A value of -1 indicates when the record was created or deleted.</td>
</tr>
<tr>
<td>Update Time</td>
<td>Date and time of the change.</td>
</tr>
</tbody>
</table>

Note: The Update time for auto-generated history lines does not match the Created or the Updated time for a record in a specific processing situation. When you view a history set of a record for the first time, an initial set of history line records is auto-generated. Since file changes in an upgrade are not audited, this date mismatch occurs when:

- You view a history set after a change is made to a record, but
- Before another change is made to it in a future upgrade.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name</td>
<td>Name of the user who created the change.</td>
</tr>
</tbody>
</table>

History Sets in a Calendar View

Once History Sets are active, the History context menu choice populates using information from the history set, rather than from the sys_audit table. From the user’s perspective, the same historical data is available in the same user interface, but how the information is stored is different.

Since the History view includes a calendar view, but does not use the normal list interface to filter and interact with the history records, it allows:

- Searching and filtering historic data.
- Exporting historic data.

Viewing history sets

There are two ways of viewing the history set, accessible through the Context Menu action History.
Differences Between Audit and History Sets

The Audit [sys_audit], History Sets [sys_history_set], and History [sys_history_line] tables store the same data, but they serve different purposes and manage data differently.

Audit [sys_audit] table

The Audit [sys_audit] table is where the system stores historical information for all records. These records are intended to be kept forever so that administrators can always track the history of audited records. As the number of auditing records grows over time, it becomes more inefficient to directly query the Audit table for historical information. It is much more efficient to run queries only on the smaller subset records you actually want to view historical information for.

History Set [sys_history_set] table

The History Set [sys_history_set] table identifies which particular records from an audited table have historical information. The History [sys_history_line] table stores the actual changes to field values that occurred.

- The system automatically generates History Set and History records as needed from the Audit table when a user either creates a record or requests its history.
- Rather than containing a complete history of all changes in the system, History Set and History records only contain a recent subset of historical information for records where users have created or requested such information.
- In addition to audit data, history sets also include the information that is set during record insert, including journal field entries. Journal field entries you create before creating a record are handled in the same manner as journal entries created at the time of record creation. These journal entries appear in history sets with the same creation time and created by data as the associated record itself.

The system limits History Set and History records by:

- Having the table cleaner delete History Set records that have not been updated in 30 days.
- Using table rotation to rotate between four History tables every seven days. The system drops History records that are older than 28 days.

Should someone need historical information again at a later date, the system can regenerate it from auditing source records.

After the system generates History Set records, the context menu choice History uses the History Set rather than Audit records. From the user's perspective, the same historical data is available in the same user interface, but the way the information is stored is different.

Control access to history

You can give a role access to view audit history by setting a system property.

Before you begin

Role required: admin

Procedure

1. Navigate to All > System Properties > System.
2. In the property List of roles (comma-separated) that can access the history of a record, enter the user roles you want to access history.
3. Click Save.
Results
Any changes to a field are omitted if a user without read-access views the history of a record.

Change the number of history entries
By default, the history displays a maximum of 250 history entries, but you can change this value.

Before you begin
Role required: admin

Procedure
1. Navigate to All > System Properties > System.
2. In the property Maximum number of field entries displayed in record history, default is 250, enter a new maximum number of entries.

History List
The history list displays each change as its own row in the change list.

Click on a row item to view additional details about the change.
Requirements

To view a history list, the following requirements must be met.

- **Auditing**: Auditing for the table must be enabled to view a history list.
- **ACLs**: By default, the List history option is only available to users with the admin user role. To enable this option to non-admins, create a custom ACL rule granting read access to the Record History [sys_history_set] table.
- **Roles**: At least one of the roles that the user has must be included in the glide.history.role property, which includes the itil role by default.

History Calendar

The history calendar shows you the days where the record was changed, who made the change, and when.

The History Calendar is sorted by update number. Each user is assigned a color so you can tell at a glance how many times a record was changed by a specific user. For example:

- **Changes made by system administrator**
  - 5
  - Created by System Administrator at 17:42:29

- **Changes made by ITIL user**
  - 15
  - Updated by ITIL User at 12:56:25

To highlight changes to a particular field, select the field from the Highlight changes to field selection box. Picking a field from this selection box changes the calendar to highlight the
times that field was changed. Hover over the text of one of a highlighted change to see the change in value.

If you hover over the icon within an entry, a popup displays all the value changes. This is the same information that is displayed in the top part of the form.
You can click on the day number to get a view of the changes for that day. You can also click on the week number to the left to get a the week view. You can scroll to and from month to month to see changes.

**History Timeline**

You can view a timeline of changes for a CI and for its related records, relationships, baselines, and proposed changes for the CI. Timelines are available for CIs in the Configuration Item [cmdb_ci] table or a descendant of this table, if auditing is enabled for the tables.

Role required: The ACL for this view is based on the roles defined in the glide.history.role system property, which by default is set to itil. Also, the user must have read access to the History Set [sys_history_set] table, which by default is granted to admin.

You can open a timeline when you view the history of a CI. You can specify the time period, time range, and properties that are displayed in the timeline. You can view either what has changed in a particular change set, or view the entire CI to better troubleshoot any issues. You can also display a timeline of changes to the CI's related records, and export and compare snapshots of the CI at any point in time.

CI changes are represented by bubbles in different shapes and colors along the timeline. The shape of each bubble represents a different type of change and the color of each bubble specifies whether the change is valid or invalid. CI baselines are represented by black circles.
that you can hover over to display more details. Click the ? icon to display bubble shape and color definitions, and point to a bubble to display details about the change set.

A change to a relationship is considered valid only if it was applied through change management. If the change was applied via the Proposed Changes framework, it is valid. For additional validation steps, see Create or edit a planned validation script.

History Timeline view

Timeline bubbles

Note: Proposed changes that do not have a planned start date are placed at future points of time.

Timeline navigator

Use the handles on both ends of the timeline navigator to extend or to shorten the time period that is shown.

You can scroll to a different period of time by clicking on the bottom part of the timeline navigator and then dragging the navigator to the left or right.

Zoom

By default, the timeline for the last month is shown. Next to the Zoom label above the timeline, you can select another time interval. You can select intervals from a minute to the entire period of data.

If there are many changes of the CI during the time period, the bubbles displayed might get too crowded. You can zoom in or out to spread the bubbles in either method:

- Change the time interval on the timeline. As you shorten the time interval, you zoom in, and as you lengthen the time interval, you zoom out.
- Select the section of the timeline that you want to zoom into.

Property filter

You can filter the bubbles that are displayed. By default, all bubbles are displayed, representing changes to all of the CI’s properties. You can limit the view to display only the bubbles in which selected properties have changed and exclude bubbles in which only unselected properties changed.

The Detail and Summary views highlight properties within your filter scope that have changed. The changed properties are highlighted in light blue.
In the **Summary** view, you can choose to include all the properties of the CI, or only properties that have changed. If you choose to display all properties in the summary view, then changed properties are listed before unchanged properties.

**Summary view**

The **Summary** view displays snapshots of the CI's represented by each bubble. Each snapshot displays the changes to the CI's fields and relationships according to the change set. It displays old and new values before and after the change, and any relationships that were added or deleted.

Use the > and < buttons on both sides of the snapshot display to scroll through the next and previous change set records in a chronological order.

**Detail view**

The **Detail** view displays snapshots of the CI that correspond with the bubbles. Each snapshot includes the fields that are within the property filter scope, displaying the properties that have changed with a light blue background. Click on a bubble to display its corresponding snapshot of the CI. The data that is displayed is read-only.

Use the > and < buttons on both sides to scroll through the next and previous change set records in a chronological order.

**View timeline of changes to related records**

On the timeline of changes for a CI record, you can also view a timeline of changes for the CI's related records.

**Before you begin**

- Role required: admin
- Target table: the CI record must be in the Configuration Item [cmdb_ci] table or a descendant of this table.
- Auditing: must be enabled for the table containing the CI.

**Procedure**

1. Open the timeline for the CI.
2. Click the **Related Records** icon and select related records from the **List of Related Records** to view. Click the Related Records icon again to display the related records timeline.

**Results**

The timeline of changes to the CI's related records is displayed right above the CI's timeline. If you uncheck all related records, the related records timeline is hidden.

**What to do next**

Hover over a change bubble on the related records timeline to display details about the change, such as date and number of changed properties. As you change the time interval in focus, or zoom in or out, it affects both the CI timeline and the related records timeline simultaneously.

**Export a snapshot of a CI**

You can export a snapshot of a CI from its timeline.

**Before you begin**

The CI must be in the Configuration Item [cmdb_ci] table or a descendant of this table. Auditing must be enabled for the table containing the CI.
Role required: admin

**About this task**
You can export a snapshot of the CI to an XML, PDF (Portal), or PDF (Landscape) format.

**Procedure**
1. Open the timeline for the CI.
2. Select the bubble representing the time for which you want to export a snapshot of the CI.
3. Click the export icon (出口).
4. Select the file format to use for the export.
   You can download the file to your system for viewing.

**Compare CI snapshots**
You can compare the properties and relationships of a CI at two different points in its timeline.

**Before you begin**
The CI must be in the Configuration Item [cmdb_ci] table or a descendant of this table. Auditing must be enabled for the table containing the CI.
Role required: admin

**Procedure**
1. Open the timeline for the CI.
2. Click Compare.
3. Select a **Start** date and an **End** date.
4. Click **Compare**.

**Tracking changes to reference fields**
Administrators can track changes to reference field display values.
Since reference fields only store an ID value, the system can normally only audit changes when the ID value changes. By default, the system does not audit changes when a reference field display value changes.
Consider the following situation. A user changes her name from Jane Smith to Jane Miller. Since the user name is the display value for the User table, any previous reference to Jane Smith instead refers to Jane Miller. If the administrator just updates the name of the existing user record, audit and history records will only display the new name Jane Miller. By default, the system does not provide a way to distinguish between changes made under the original user name versus those made with the new user name.
If your auditing policy requires tracking user name changes, you can:
- Create a new user record for the new name and deactivate the previous user record. The system preserves audit records for the old user name and creates future audit records with the new user name.
- Create custom fields and a business rule to save the previous name and the date of the name change. The system can use this information to construct the proper names in audit and history records.
Tracking inserts

By default, the system does not create Audit records for inserts because in a typical instance, inserts can account for over 80% of the size of the Audit table.

Not tracking inserts allows for better performance and a much smaller Audit table. Administrators can enable auditing of inserts by setting the glide.sys.audit_inserts property to true.

Tracking CI Relationships

Changes to a CI relationship (CI Relations, CI/User Relations, or CI/Group Relations) appear in the history of the items on both sides of the changed relationship regardless of whether the change was manual or a result of Discovery.

For example, if the computer alpha has a used by CI Relation with the computer beta, then the history for alpha has a record of when the relationship with beta was established, and likewise, the history for beta has a record of when the relationship with alpha was established. This example illustrates the history displayed when some CI Relations are established, and then one of the relations is removed:

<table>
<thead>
<tr>
<th>CI Relationship History</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="CI Relationship History" /></td>
</tr>
</tbody>
</table>

The created bullet indicates the date that the CI, user, or group was created. The last activity bullet refers to when the relationships were last changed. If you don’t want to show CI relationship history for any or all CI relationship types, you can turn it off by disabling auditing on the CI relationship tables (CI Relationship [cmdb_rel_ci], CI/User Relationship Type [cmdb_rel_user_type], or Group Relationship [cmdb_rel_group]).

System logs

The System Logs module provides a variety of logs that you can use to troubleshoot and debug transactions and events that take place within the instance.

Access the following logs from the System Logs module:

<table>
<thead>
<tr>
<th>Log</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transactions</td>
<td>All application activity for an instance.</td>
</tr>
<tr>
<td>Log</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Email and Push</td>
<td>All email notifications and Push messages sent from all instances within the system.</td>
</tr>
<tr>
<td>Events</td>
<td>All system events that occur within the system.</td>
</tr>
<tr>
<td>Import</td>
<td>Data import activity within the platform.</td>
</tr>
<tr>
<td>Table Changes</td>
<td>Changes made to all tables in the system.</td>
</tr>
<tr>
<td>Outbound HTTP Requests</td>
<td>All outbound web services requests such as REST and SOAP requests.</td>
</tr>
<tr>
<td>Signature Images</td>
<td>Electronic signatures for the HR signature pad.</td>
</tr>
<tr>
<td>System</td>
<td>Warnings and errors for instance processes, records, and non-critical events, such as memory usage on the server machine.</td>
</tr>
</tbody>
</table>

Use the Log File Browser to search and download logs. You can also search archived logs in the log history.

**Other logs**

Your instance offers other logs in addition to those in the System Logs module. For example, the System Diagnostics module provides upgrade history and slow query logs, which you can use to gain insight into how queries are affecting platform performance. The Customer Updates table records every change that is made in the system.

**System log**

View warnings and errors for instance processes, records, and non-critical events, such as memory usage on the server machine.

The following information is tracked in the system log:

- Workflows
- Configuration
- Chats sessions
- Transactions for each view of each page in the system, including load times for network, server, and browser
- Inbound and outbound email
- Events triggered in the system
- Imports and integrations
- System warnings, errors, and script logs
- Upgrade information for any plugin activations, update sets, or system upgrades

Log entries appear for the current day only. To view other log files, use the log file browser. This log provides the following information for all occurrences:
System log

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date and time of the logging activity for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Level</td>
<td>Type of message. The levels are Debug, Error, Warning, and Information.</td>
</tr>
<tr>
<td></td>
<td>• A warning is an error that has been handled and recovered.</td>
</tr>
<tr>
<td></td>
<td>• An error is something that must be fixed.</td>
</tr>
<tr>
<td>Message</td>
<td>System-generated message regarding the nature of the occurrence.</td>
</tr>
<tr>
<td>Source</td>
<td>Name of the process or area affected by the occurrence. For example, the source of the occurrence might be EMAIL or Memory.</td>
</tr>
<tr>
<td>Source</td>
<td>Package Name of the application package associated with the occurrence. Click on the name to view the Store Application [sys_store_app] record for this package.</td>
</tr>
</tbody>
</table>

Workflow logging

• Each activity executed, including:
  ◦ Date and time started
  ◦ Date and time ended
  ◦ State, for example, Finished, Cancelled, Timed Out, Error
  ◦ Result
  ◦ Fault description, if there was an error
• Transition history, including:
  ◦ Time of transition
  ◦ Activity transitioned from
  ◦ Activity transitioned to
  ◦ Which transition was triggered
• Workflow log, including any log statements added to the workflow

Configuration information

• Action taken, including insert, update, and delete
• Category of change
• Comments recorded with the change
• Name of the change
• XML difference of the change
• Update set the change is associated to
• Date and time of the change
• User who made the change
• Table where the change was made
• Name of the object being changed
• Type of object being changed  
• View the change was made in, for changes to forms or lists

Transaction logs

The transaction log records all browser activity for an instance. To aid in debugging of system issues, you can filter transaction logs by application scope, limiting transactions that appear to only those transactions originating in specific scopes.

The transaction log provides the following information for all activities.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date and time of the application action for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of recorded transaction.</td>
</tr>
<tr>
<td>Created by</td>
<td>User who created this activity.</td>
</tr>
<tr>
<td>Origin application</td>
<td>Application scope the transaction originated in. Global appears if the transaction originated in the global scope.</td>
</tr>
<tr>
<td>Response time</td>
<td>Round trip response time for the application request, in milliseconds.</td>
</tr>
<tr>
<td>Network time</td>
<td>Latency time of the network response after the application request is made, in milliseconds.</td>
</tr>
<tr>
<td>Output length</td>
<td>Size of the output string sent by the instance to the application, in bytes.</td>
</tr>
<tr>
<td>SQL count</td>
<td>Number of SQL server commands executed for this activity.</td>
</tr>
<tr>
<td>Business rule count</td>
<td>Number of business rules executed for this activity.</td>
</tr>
<tr>
<td>Business rule time</td>
<td>Elapsed time for the execution of the business rules for this activity.</td>
</tr>
<tr>
<td>URL</td>
<td>Application or module connected to by the client application.</td>
</tr>
<tr>
<td>System ID</td>
<td>System generated identifier of the client instance making the request. This ID is used for cluster environments in which several instances (nodes) communicate with the database.</td>
</tr>
<tr>
<td>IP address</td>
<td>IP address of the client making the request.</td>
</tr>
<tr>
<td>GZipped</td>
<td>Indication of whether a compressed Web page was requested by the application.</td>
</tr>
<tr>
<td>Protocol</td>
<td>HTTP protocol used by the application for this instance.</td>
</tr>
</tbody>
</table>

Client transaction timings

The Client Transaction Timings plugin enhances the system logs by providing additional information about the durations of transactions taking place between the client and the server.
You can track down performance issues to their source by viewing where the time is being consumed, and how time was spent during a transaction.

This plugin requires the **Response Time Indicator** to be enabled, and collects information from the following browsers:

- Firefox
- Internet Explorer
- Chrome

**Client Transactions Information**

Installing the plugin adds the **Client Transactions** module to the System Logs application. It provides a list of every logged transaction between client and server within the last day:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Moment the transaction was recorded.</td>
</tr>
<tr>
<td>Response Time</td>
<td>Number of ms spent by the server in fulfilling the transaction.</td>
</tr>
<tr>
<td>Business Rule Time</td>
<td>Number of ms spent by business rules triggered by the transaction.</td>
</tr>
<tr>
<td>SQL Time</td>
<td>Number of ms spent by the SQL database.</td>
</tr>
<tr>
<td>Client Response Time</td>
<td>(Load_completion_time) - (start_time). It is inclusive of server time.</td>
</tr>
<tr>
<td>Client Network Time</td>
<td>Number of ms spent by the network the client is connecting through.</td>
</tr>
<tr>
<td>Browser Time</td>
<td>Number of ms spent by the browser during the transaction.</td>
</tr>
<tr>
<td>Client Script Time</td>
<td>The number of ms spent executing client scripts.</td>
</tr>
<tr>
<td>UI Policy Time</td>
<td>Number of ms spent executing ui policy.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of transaction:</td>
</tr>
<tr>
<td></td>
<td>• Form</td>
</tr>
<tr>
<td></td>
<td>• List</td>
</tr>
<tr>
<td></td>
<td>• Other</td>
</tr>
<tr>
<td>Table</td>
<td>Name of table that appeared. For example, incident, change_request.</td>
</tr>
<tr>
<td>View</td>
<td>View for this form/list.</td>
</tr>
</tbody>
</table>

**Client Detailed Information**

A more detailed breakdown of the client timings for all Form rendering (but not list rendering) is also tracked. To see details, drill into a particular client transaction record and observe the related list at the base of the screen:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Order during the load in which this operation occurred.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of operation.</td>
</tr>
</tbody>
</table>
Client Detailed Information (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of this particular operation</td>
</tr>
<tr>
<td>Duration</td>
<td>Number of ms this operation took to complete.</td>
</tr>
</tbody>
</table>

**Push logs**

Consult the push log to track the status of push notifications that are queued to send from your system.

To view the push log, navigate to System Logs > Push Notifications. Users are required to have the push_admin or admin role to view the push log.

**Push log fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claim</td>
<td>Identification number that is generated by the scheduled job that sends the push notification. This number is applied to the Claim field to ensure consistency across multiple push scheduled jobs.</td>
</tr>
<tr>
<td>Payload</td>
<td>Content of the push notification.</td>
</tr>
<tr>
<td>Queue count</td>
<td>Number of times that the system tried to send the push notification. The status of the push notification relates to its queue count.</td>
</tr>
<tr>
<td></td>
<td>• If the queue count is 0 for longer than expected, then there are no scheduled jobs that are trying to send the push notification.</td>
</tr>
<tr>
<td></td>
<td>• If the queue count is greater than 0 and the Type is success, then you can infer that this is how many times the system tried to send the push notification before finally sending.</td>
</tr>
<tr>
<td></td>
<td>• If the queue count reaches 10, the system stops trying to send the push notification. The Type changes to failure.</td>
</tr>
<tr>
<td>Request ID</td>
<td>Unique identification number for the push notification. Similar to the message ID for an email, the request ID is used as a correlation token for the push notification.</td>
</tr>
<tr>
<td>Type</td>
<td>Status to indicate whether the push notification has been sent. The Type column can have these values:</td>
</tr>
<tr>
<td></td>
<td>• failure: The message could not be sent.</td>
</tr>
<tr>
<td></td>
<td>• pending: The message is queued for processing.</td>
</tr>
<tr>
<td></td>
<td>• success: The message was successfully sent, although not necessarily received by the mobile device.</td>
</tr>
</tbody>
</table>

**Related information**

Scheduled jobs

**System email log and mailboxes**

The system email log records all emails that the instance creates or receives. System mailboxes are filtered views of this log.
Every notification email that the instance creates or receives is recorded in an Email [sys_email] record. You can navigate to a log of these records at System Logs > Emails.

The System Mailboxes are filtered views of the Emails [sys_email] table. The instance assigns an email record to a system mailbox depending on the values of the Type and State fields. For more information, see System mailboxes.

The following fields can be included in the layout of the system log and any of the system mailboxes:

### Email log

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mailbox</td>
<td>The system mailbox that lists this email record. The instance sets the value of this field according to the values of the Type and State fields.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the email (Error, Ignored, Processed, or Ready).</td>
</tr>
<tr>
<td>Receive type</td>
<td>The type of inbound email (None, Forward, New, or Reply).</td>
</tr>
<tr>
<td>Type</td>
<td>The status of the email. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• received: The server received this email.</td>
</tr>
<tr>
<td></td>
<td>• received - ignored: The server received this email, but it was ignored by the instance for inbound email action purposes. Typically, these emails are either spam or auto-replies. See the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - failed: The server has attempted to send the email and failed. See the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - ignored: The server skipped sending this email. Typically, this is for an email which was generated but lacked a recipient email address or is a duplicate email. See the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - ready: The email is ready to be sent, but has not been sent out by the mail server. Typically, an email remains in this state for only a short time.</td>
</tr>
<tr>
<td></td>
<td>• sent: The email was sent by the instance without any errors or issues.</td>
</tr>
<tr>
<td>Target</td>
<td>A Document ID reference to the record if the email is generated by an insert, update, or delete of a particular record.</td>
</tr>
<tr>
<td>User</td>
<td>The name of the user, from the user record, of the instance from which the email notification was sent.</td>
</tr>
<tr>
<td></td>
<td>⚠ Note: This is a string field.</td>
</tr>
<tr>
<td>Notification Type</td>
<td>The type of notification. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• None</td>
</tr>
<tr>
<td></td>
<td>• SMS</td>
</tr>
<tr>
<td></td>
<td>• SMTP</td>
</tr>
<tr>
<td>UID</td>
<td>The unique ID of the email stored on the server.</td>
</tr>
<tr>
<td>Created</td>
<td>The date and time of the email activity for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Deleted</td>
<td>For inbound email, indicates whether the email was deleted from the email server.</td>
</tr>
</tbody>
</table>
### Email log (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weight</td>
<td>The weight of the email, which determines the sending priority relative to other notifications on the same table.</td>
</tr>
<tr>
<td>Importance</td>
<td>An indication that the email was sent with a changed level of importance, such as Urgent.</td>
</tr>
<tr>
<td>Originating Event and Notification</td>
<td>For emails generated by notifications, an embedded list that stores the event and notification that created the email.</td>
</tr>
<tr>
<td>Subject</td>
<td>The email subject. For notifications, you create the subject text in System Notification &gt; Email &gt; Notifications.</td>
</tr>
<tr>
<td>Error String</td>
<td>The error string captured from the email server to determine why the email was not sent. This is logged only if the email is send-failed.</td>
</tr>
<tr>
<td>Recipients</td>
<td>The email addresses of the recipients.</td>
</tr>
<tr>
<td>Body</td>
<td>The body of the email, displayed in raw HTML markup. Use the related link Preview HTML Body to see the body text as rendered HTML.</td>
</tr>
<tr>
<td>Content type</td>
<td>The email content type.</td>
</tr>
<tr>
<td>Headers</td>
<td>Any headers embedded in the email.</td>
</tr>
</tbody>
</table>

### Event logs

The event log records all system events that occur within the Now Platform.

This log provides the following information for all events that occur:

#### Event log

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date and time of the event for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the event as listed in the Event Registry.</td>
</tr>
<tr>
<td>URI</td>
<td>HTTP query that generated the event.</td>
</tr>
<tr>
<td>Parm1</td>
<td>Event-specific value that depends on the event and the recipient.</td>
</tr>
<tr>
<td>Parm2</td>
<td>Event-specific value that depends on the event and the recipient.</td>
</tr>
<tr>
<td>Table</td>
<td>Database table acted on for this event.</td>
</tr>
<tr>
<td>Processed</td>
<td>Date and time the event was processed This time reflects the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Processing time</td>
<td>Time taken to process this event, in milliseconds.</td>
</tr>
<tr>
<td>Queue</td>
<td>Processor queue name.</td>
</tr>
</tbody>
</table>
**Import logs**

The import log displays information in a verbose format about any data import activity within the platform.

For a more detailed view of the import sets that produced a particular log, see **Import Sets > Transform History**.

This log provides the following information for all imports:

### Import log

<table>
<thead>
<tr>

**System Diagnostics module**

The System Diagnostics application provides logs that relate to the platform.

These logs are available:

- **Upgrade History**: tracks every upgrade to an instance.
- **Slow Queries**: provides insight into how queries affect platform performance. See **Slow Query Logs**.

**Customer Updates table**

Changes made in the system are recorded on the Customer Updates [sys_update_xml] table chronologically. There are a few exceptions, as noted below.

To navigate to this table, enter `sys_update_xml.list` into the navigation filter. For information about update sets, see **System update sets**.

The following information is stored about each update:

### Customer Updates table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name that identifies the updated record.</td>
</tr>
<tr>
<td>Created</td>
<td>The date and time the Customer Update record was created.</td>
</tr>
<tr>
<td>Created By</td>
<td>The user who performed the change.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of the update.</td>
</tr>
<tr>
<td>Updated</td>
<td>The date and time the Customer Update record was updated.</td>
</tr>
<tr>
<td>Updated By</td>
<td>The user who performed the update.</td>
</tr>
<tr>
<td>Updates</td>
<td>The number of times the record has been updated.</td>
</tr>
<tr>
<td>Target Name</td>
<td>The name of the element that was altered.</td>
</tr>
</tbody>
</table>
Customer Updates table (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>The view of the form that was altered if it was a form layout change.</td>
</tr>
<tr>
<td>Payload</td>
<td>The XML contents of the record after the change.</td>
</tr>
<tr>
<td>Remote Update Set</td>
<td>A reference to that update set if the change was performed by a remote update set.</td>
</tr>
<tr>
<td>Local Update Set</td>
<td>The update set the change is associated with.</td>
</tr>
</tbody>
</table>

**Note:** Some application changes are not represented by Customer Update records (sys_update_xml) Examples:

- Types of metadata where updateSynch = false
- Cascading changes to tables and fields such as display name changes
- Unresolved metadata references from other applications (resulting in no "display value" on the element)
- sys_id changes for coalescing files
- Changes to Flow/Flow Actions that may generate sys_documentation
- ua_table_license_config records generated on table creation
- Jobs running in the background such as natural language processing
- Cases where sys_update_xml is manually modified or removed

To learn more, see Commit changes.

Log history

The system uses table rotation and table extension to archive older logs.

By default, the system uses the following schedule to archive common logs:

### Common log archive schedule

<table>
<thead>
<tr>
<th>Table</th>
<th>Archive schedule</th>
<th>Rotations</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event [ecc_event]</td>
<td>Every day</td>
<td>7</td>
<td>Rotation</td>
</tr>
<tr>
<td>Queue [ecc_queue]</td>
<td>Every day</td>
<td>7</td>
<td>Rotation</td>
</tr>
<tr>
<td>Event [sysevent]</td>
<td>Every day</td>
<td>7</td>
<td>Rotation</td>
</tr>
<tr>
<td>Log [syslog]</td>
<td>Every week</td>
<td>8</td>
<td>Rotation</td>
</tr>
<tr>
<td>Transaction Log [syslog_transaction]</td>
<td>Every week</td>
<td>8</td>
<td>Rotation</td>
</tr>
<tr>
<td>Email [sys_email]</td>
<td>Every 30 days</td>
<td>8</td>
<td>Extension</td>
</tr>
</tbody>
</table>

**Use the log file browser**

The instance provides the utilities log file browser and log file download.
Use System Logs > Utilities > Node Log File Browser to view any system log entry. You can search for log files by using the following filters:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start time</td>
<td>Start date and time of the range you want to search, for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Session ID</td>
<td>System-generated hexadecimal string that identifies the session that generated the log entry.</td>
</tr>
<tr>
<td>End time</td>
<td>End date and time of the range you want to search, for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Message</td>
<td>System-generated description of the occurrence.</td>
</tr>
<tr>
<td>Level</td>
<td>Type of message displayed. The levels are Debug, Error, Warning, and Information. A warning is an error that has been handled and recovered. An error is something that must be fixed.</td>
</tr>
<tr>
<td>Thread name</td>
<td>System-generated identifier of the thread that created the log file.</td>
</tr>
<tr>
<td>Max rows</td>
<td>Maximum number of records returned for a particular filter.</td>
</tr>
</tbody>
</table>

The instance creates compressed archives of system logs every two days and purges log archives after 21 days. You can download log file archives and view them with System Logs > Utilities > Node Log File Download. Select a log archive from the list, and then click Download log under Related Links to open or save the archive.

⚠️ Note: Log files are only available for the node you are currently logged into. To see the currently logged into node, navigate to System Diagnostics > Stats.

Antivirus Scanning

Use Antivirus Scanning to help protect your instance against virus infections that can be introduced by file attachments to your system records, such as incidents, problems, and stories.

Security scan

Antivirus Scanning scans file attachments stored in your attachment [sys_attachment] table to help protect users from uploading and downloading infected files. All the document types supported by the Platform are scanned by Antivirus Scanning.

The Antivirus Protection plugin (com.glide.snap) is activated and enabled by default on your instance. As an administrator, you can deactivate and reactivate the Antivirus Scanning feature across your instance at the switch of a toggle, set configuration options, and review antivirus activity on the instance.
Note:

- Antivirus Scanning is also available for customers in the Government Community Cloud (GCC) and commercial environment. Users must set the (com.glide.snap.fed_enable_scan) property to True to start using the feature.
- Edge-encrypted files are excluded from this scan.
- Any file above 100 MB file size is not scanned.
- Inbound emails are scanned for viruses by system email filters, not by Antivirus Scanning.

Scanning scenarios

Review these upload and download scenarios to understand how the system identifies potential security threats from files attached to your records.

Scenario 1 - Upload a file

1. A user unknowingly uploads an infected file to a record.
2. The system scans the file and moves it to quarantine.
3. The file appears in the Attachments window, where it is marked as unavailable.
4. The user selects the file and this error message appears: The file Infected_testing.txt did not pass the security scan. Please remove the file from record INC0000059 and try again.
5. The system sends an email notification to the user and the antivirus administrator.
6. The user closes the Attachments window and is returned to the record, where the infected file displays as unavailable.

Scenario 2 - Download a file

1. A user opens a record to download a file that is attached to it.
2. Unaware that the file is infected, the user selects it for download.
3. The system scans the file, moves it to quarantine, and displays this message.
4. The user closes the message and the screen refreshes showing that the file is unavailable.
5. The system sends an email notification to the user and the antivirus administrator.
Scenario 3 - Download a ZIP file

1. A user opens a record and downloads a ZIP file that is attached to it.
2. The system scans the ZIP files individually.
3. One file does not pass the security scan and is marked as unavailable. The remaining files are zipped and downloaded successfully.
4. The user opens the ZIP file and sees an “error.txt” file in addition to the successfully downloaded file. This file contains an error message specifying which file did not pass scanning and was therefore not included in the ZIP.
5. The user opens the record again, and sees that the unavailable file has been moved into the **Potential security risks** section in the Attachments window and cannot be downloaded.

Configure Antivirus Scanning

Configure Antivirus Scanning across your instance and at the table level.

**Before you begin**
Role required: antivirus_admin or admin

**About this task**
Antivirus Scanning is active by default in your instance, where it automatically scans attachments to identify any files that are infected by viruses. You can also deactivate it in your instance if required. Configure the feature by ensuring the scan is enabled across your instance, and by identifying any tables that you want to exclude from the scan.

**Procedure**
1. Navigate to **All > Antivirus > Configuration**.
2. As you configure the feature, consider the following.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Antivirus scanning</td>
<td>As antivirus scanning is active and enabled on your instance by default, its toggle is set to the on position and appears green in color. To disable the scanning across your in-</td>
</tr>
</tbody>
</table>
Option | Description
--- | ---
**Allow attachments to be downloaded when Antivirus scanner is unavailable** | If this option is set to the on position, antivirus scanning is bypassed if the scanner times out and a response cannot be obtained. In this situation, the file download proceeds without completing the scan. If the option is set to off, the file download is prohibited until the scan can complete successfully.

**List of Tables Excluded** | Any file attachments associated with a table in this list are excluded from antivirus scanning. Proceed to Step 4 if you want to define the tables the system excludes from scanning.

3. Click **Save**.
4. Exclude tables from the Antivirus scan by adding them to the **List of Tables Excluded**.
   a. Navigate to **System Definition → Dictionary**
   b. Search for the table you want to exclude from the scan and select the table with **Type** set to **collection**.
   c. In the **Attributes** tab, click **New**.
   d. Add **Exclude_from_antivirus_scan** in the Attributes field and enter **True** in the **Value** field.
   e. Click **Submit**.

**Results**
Antivirus Scanning is enabled in your instance, and the **List of Tables Excluded** on the Antivirus Configuration page is populated with all of the tables that you excluded from the scan.

**Dictionary attributes for Antivirus Scanning**
Dictionary attributes alter the behavior of the table or element that the dictionary record describes. As an administrator, you can set the values of dictionary attributes to modify the behavior of the default Antivirus Scanning configuration.

**Dictionary attributes for Antivirus Scanning**

<table>
<thead>
<tr>

## Review quarantined files

Review quarantined file attachments and take further action as needed.

### Before you begin

Role required: antivirus_admin or admin

### About this task

Monitor your quarantined file entries in the Antivirus Quarantine page at regular intervals to perform any of the following actions.

### Procedure

1. Navigate to All > Antivirus > Quarantine.
2. Select the Actions on selected rows check box next to each quarantined entry on which you want to perform any of these actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete</td>
<td>Select this action to delete the quarantined file if it is not required any more by users.</td>
</tr>
<tr>
<td>Restore</td>
<td>Select this action to restore the file based on your assessment of its status or on the user request. However, scan the file with your third-party antivirus product before you restore it to mitigate any virus threats. Once restored, the file is available for download to the user.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Download</td>
<td>Select this action to download the file to your local system for further scanning and analysis, if desired.</td>
</tr>
</tbody>
</table>

### Results
The system asks for confirmation and performs the selected action per your input.

### Review antivirus activity
Review the Antivirus Activities log that tracks all activities that occur on potentially-infected files from the point that they are discovered and placed into quarantine.

### Before you begin
Role required: antivirus_admin or admin

### About this task
This log functions as a report that captures antivirus activity, such as discovery, deletion, and other possible quarantined file events.

### Procedure
1. Navigate to **All > Antivirus > Activity**.
2. Review the log of quarantined files.
You can view the actions performed (highlighted in red) on each quarantined file.

**What to do next**
Determine which records you want to delete, restore, download, or keep in the log. See Review quarantined files

**Virtual Private Network (VPN)**

Use a virtual private network (VPN) to integrate your instance with external data sources over the Internet.

When configuring an integration that uses an encrypted protocol, such as Lightweight Directory Access Protocol (LDAP) or HTTPS, it is good practice to use the Internet as a transport mechanism.

However, there may be security or network architecture requirements that dictate the use of a site-to-site Internet Protocol Security (IPSEC) Virtual Private Network (VPN) connection between the datacenters and your business networks. The VPN supports the necessary encrypted communication between the instance and your network.

This video describes how to locate the IP addresses for each of your company’s instances.

**My IP Information**

**VPN connections**

The ServiceNow VPN infrastructure uses pairs of Cisco adaptive security appliance (ASA) devices that serve as VPN termination points.

The VPN between the instance and your network utilizes your existing networking hardware to support communications. It is not necessary to install a piece of hardware. Because each customer has a unique configuration, the instance has a flexible VPN solution. The instance has built tunnels to Checkpoint, Juniper, Nortel, and other IPSEC VPN-capable devices.

The VPN connections between the instance and your network are created to support the encrypted flow of traffic into your network. Frequently, integrations that use the VPN do not have encryption as part of the underlying protocol. For example, LDAP over the VPN versus LDAPS over the Internet and HTTP over the VPN versus HTTPS over the Internet.

The network does not allow any inbound-to-ServiceNow integration or end-user-to-ServiceNow traffic to traverse a VPN connection. This restricted communication includes end-user access to the platform, administration of the platform, web services integrations, and other integrations that are configured to use a MID Server. All such inbound communication to the instance must be performed over the Internet using HTTPS. This configuration provides
an encrypted communication channel. The encryption channel, along with IP access control, meets the security requirements for this traffic flow.

### VPN Diagram

**Addresses for VPN communication**

To prevent conflict or overlap with internal ServiceNow networks or with another internal IP address schemes in your network, all tunneled traffic in the encryption domain must use non-RFC-1918 addresses on both sides of the tunnel.

ServiceNow provides a single IP address for the source of queries into your network. You must provide Network Address Translation (NAT), non-RFC-1918 addresses for each host that is integrating with your instance. These public addresses need to be owned by your organization. Third-party addresses cannot be used inside tunnels. Additionally, the encryption domain must not contain the IP address of the VPN peer.

### Redundant tunnels

There are two ways to build redundancy for your tunnels:

- Using the same encryption domain behind both of your peers. This is the preferred method.
- Using a different encryption domain behind each peer.

With the first method, you need to provide the same NAT address behind each of your peers to create a connection path using that address to your server. The path to your server could be the same physical machine or a mirror which provides identical services. With this method, your instance would use the same IP address to connect to your servers regardless of whether your primary or secondary tunnel is active. If you have more than one server, follow this same scheme for your additional servers. This method provides the most transparency to your users and is recommended.

The second method requires configuration in your instance to provide the redundancy. When the tunnel is used for LDAP, for example, you could provide redundant LDAP servers.
in your instance. Note that this method requires the connection to the first configured LDAP server to timeout before the instance attempts to connect to the secondary server. Because of this additional time delay, this solution should only be implemented if the first option is unattainable. Also note that not all services can be configured for redundantly in your instance. If you are using a VPN tunnel for something other than LDAP and redundancy is required, check that your configuration can support multiple addresses, or see the first option above.

Alternatives to using a VPN

These alternatives provide a simpler way to connect your instance to the resources in the ServiceNow data centers and provide better encryption. Additionally, you can avoid any issues that VPN downtime might cause, such as making your instance unavailable to users if there is an issue with the VPN tunnel.

Single sign-on and MID server

Consider using a combination of Single Sign-On (SSO) for authentication and the MID Server for user data synchronization, rather than using a VPN to connect your LDAP server to your instance. For integrations other than LDAP, consider using certificate-based encryption.

You can use the LDAP listener on a MID server to synchronize your user table in near real time.

The advantage of this approach is that there are no firewall holes, routes, VPN tunnels, or other special network settings to configure and maintain. The SSO/MID-Server solution is the most flexible, secure, and cost-effective method to achieve the complete LDAP integration.

LDAP over SSL

Another alternative to using a VPN tunnel is to configure LDAP Over SSL (LDAPS) directly over the Internet. You can configure a read-only domain controller and lock the instance down in your DMZ using only the instance's source addresses and the destination ports of your choice. Since the ports for LDAP are configurable in your instance, you can perform a port address translation (PAT) if desired. With LDAPS, you control the certificate that is uploaded over an encrypted channel to the instance, (see Upload a certificate to an instance). The packets cannot be encrypted or decrypted without the certificate.

The advantage of this approach is that it provides a stronger encryption and decryption mechanism. A VPN can only encrypt and decrypt the traffic between the two peers sitting on the Internet with a coordinated pre-shared key, similar to a password. LDAPS provides a longer encrypted path, end-to-end, at the application layer and with a certificate that is far more complicated than a pre-shared key that the IPSec tunnel uses.

VPN setup

From the time that a VPN request is submitted, it typically takes one week or less to complete the VPN build. To support the redundancy requirements of your instance and your organization, a minimum of two and a maximum of four VPNs are provisioned (from the active site to your active site or the active site to your DR site, and so on).

It is good practice for the encryption domain to be as specific as possible. Ideally, the encryption domain would include only the specific hosts that are required for the integrations. A large encryption domain can create opportunities for routing discrepancies (VPN versus Internet).

To create the VPN, the instance does the following:
1. Provides the VPN peer and host addresses from each data center.

2. Builds the necessary VPN connectivity from two data centers into your network. To support redundancy and disaster recovery (DR) requirements, the VPNs can be provisioned from two data centers into two networks.

The instance does not support building multiple VPN tunnels into a customer network for the purpose of connecting to multiple geographic regions or subsidiaries. You should perform any inter-site routing, traffic distribution, or traffic shaping within your own internal network, rather than having multiple VPN tunnels.

**Request a VPN service**

For all VPN requests, including provisioning, modifications, or general questions, use the Service Catalog VPN Request form.

**Procedure**

1. Open HI.

2. Navigate to **Self-Service > Service Requests > VPN Requests**.

3. Select the appropriate VPN request type.

4. Answer the questions.
   - Questions vary depending on the request type selected.

5. Click **Submit**.

**Results**

Once your request is submitted, ServiceNow will work with your network engineer(s) to test and validate that the VPN is successfully passing traffic. To ensure that your questions are answered in a timely manner, please address VPN-related questions during this process.

**Create an address for VPN communication**

To prevent conflict or overlap with internal ServiceNow networks or with another customer’s internal IP address schemes, the instance requires that all tunneled traffic in the encryption domain use non-RFC-1918 addresses on both sides of the tunnel.

**About this task**

The instance provides a single IP address for the source of queries into your network.

**Procedure**

Provide Network Address Translation (NAT), non-RFC-1918 addresses for each host that is integrating with the instance.

**Domain separation for service providers**

With the ServiceNow Platform, service providers (SPs) can provide their customers with faster onboarding, meet compliance, and protect their data using domain separation. You can separate client data, processes, and reports into logical groupings called domains. SPs control who sees and accesses what content.

Watch this short video for an overview of domain separation.

Understanding domain separation

With domain separation you can separate data, processes, and administrative tasks into logically defined domains.

Domain separation is best for those customers who:

- Need to enforce absolute data segregation between business entities (data separation).
- Customize business process definitions and user interfaces for each domain (delegated administration).
- Maintain some global processes and global reporting in a single instance.
- Separate data between service providers, customers, partners, or sub-organizations.
- Have minor or moderate process differences among customers.

Domain separation compared to separate instances

While domain separation provides multi-tenancy support, multi-tenancy is still contained within a single instance. Some global properties, data, and processes are shared across all domains. For example, having the system Remember me on the login page of the system is global and cannot be specified per domain.

If you need complete and total separation of all system properties and do not require global reporting or global processes, then separate instances are the best option.

Data separation

Members of a domain see only the data contained within their domain or the child domains that are lower in the domain hierarchy. By default, all users and all records are members of the global domain unless an administrator assigns them to a particular domain. Once you assign a user or a record to a domain, the instance compares the user's domain to the record's domain to determine whether the user can view the record.
ServiceNow applications are defined with the following incremental support levels. These levels are based on the perspective of actual use cases and personas.

**Data Separation**: Tenants see only data that they have permissions to see. Tenants can be granted access to other tenant data, but cannot query tenant data if they don't have access.

**UI Separation**: Supports a tenant-specific experience for UI elements such as views, lists, labels, and so on.

**Business Logic Separation**: You can create tenant-specific system policies such as email notifications, business rules, client scripts, UI policy, and UI actions.

**Hierarchical Modeling**: Nested-multi-tenancy so parent tenants can access child tenant resources. Business logic for parent tenants runs automatically for child tenants, and can be overridden at any level.

**Cross-Tenant Intelligence (Domain Scope)**: Handles automatically the data, metadata, business logic, and processing context for tenants that have access to additional tenant data.

In general, data defined at a higher level in the domain hierarchy is not visible at lower levels in the hierarchy.

**Domain path migration**
Domain paths are used for all customers. Domain numbering is not used. Customer Service and Support can assist in the upgrade.

**Alternatives to domain separation**
Separate instances are a common alternative to domain separation. This provides a great degree of flexibility in meeting the requirements for customers and stakeholders with little to no impact on others.
Warning: Before activating domain separation, consult your representative to verify that it is suitable for your environment. Domain separation adds a level of administration overhead. Although it can be disabled, it cannot be removed from an instance.

Configuration and administration for service provider customers
Domain separation is designed to give ServiceNow® service providers (SPs) the ability to configure the services they offer to their customers. It is not designed to enable their customers to administer those services themselves, except in a few areas that this topic details.

Overview
It is safe for SP customers, on their own, to manage data contained within their domain that does not affect licensing or other customers. For example, it is safe for a customer to create new reports or manage configuration items, but it's not safe for them to customize fields, choices, business rules, and other processes where they can impact other customers on the same instance.

The ServiceNow base system administrative roles and their access controls on the ServiceNow platform are designed for a single admin team per instance. For example, the domain_admin role is granted to one of the SP’s resources to manage all domain setting for the instance, and to create new domains. For any domain-specific admin tasks, the SP should create new “customer admin” roles and access controls as needed to grant specific access to their customers.

The following image is an overview of common admin functions in varying categories of what is safe for a customer to do.
What access can I give to a customer?

### Can Give Access

**Administer domain-separated data:**
- CMDB / CI Mgt
- Reporting
- Updates: existing user data/new users
- Updates: existing core data records

**Proceed with caution (with customization and governance (no 100% baseable):**
- Catalog Builder – domain separation catalog items (separate plugin)
- Product Model data
- User Management (customer licensed with potential to elevate access) – with customization
- Using Flow Designer to modify at domain level
  - E.g.: Change, Incidents, processes, and so on

**Should Not Give Access (with any platform or application-wide settings):**
- Change forms, choice lists, scripts, business rules
- Downstream impacts such as adding a choice field that could impact all fields across instances

### Can give access

**Examples:**
- CI data management in the CMDB
- Report creation
- Updates to existing user data, or new users without roles
- Updates to existing core data records such as department, group, location, cost center, or new groups without roles, and new departments/cost centers/location.

### Proceed with caution

**Examples:**
- Catalog Items: To create customer-specific catalog items that can be updated by the customer, two capabilities can be used together: Domain separation for catalog items (Domain separation and Service Catalog) enables the instance owner to create items in the customer’s domain. The instance owner can create a role to allow customers to update safe fields such as price, description, and images. The Catalog Builder (new in the Quebec release), gives the SP admin team the ability to create item templates that are safe to distribute to customers to create new items within their domain from within a prescriptive UI experience.
- User/Group Management: It’s safe to create a “customer admin” role that can create and modify user records, but adding and removing roles can affect security and licensing. There is no way in the base system to subdivide roles that are safe for a customer to be able to grant them. The same goes for the creation and modification of groups. While the group itself can be modified, the addition or subtraction of roles should be controlled.
- Flow Designer: ServiceNow Flow Designer is the building tool used to create process (workflow) for tables. The flow_designer role gives customers script-free access to build flows. They can read and clone every flow in domains above them in the hierarchy. They can create and modify flows in their domain. This cannot happen in a silo, however. Anyone who can affect process must be added to the global admin team for governance so processes do not cancel out each other or cause other conflicts.

### Do not give access

Understanding how choice fields work is helpful to understand why only the SP admin team should be managing them.
• Structure of a choice field: Choice field values are stored in the sys_choice table and grouped based on: Table, Domain, and Language.

For example, the **State** field in a Task is available to every table that extends a Task. That means that each table can have its own values, those values can be multiplied by domain, and the domain values can be multiplied by language.

All of the values for **State** across all tables, domains and languages are considered the values for the **State** field.

• How changes to choice fields work: When a choice field is updated, a payload is created with all values for that field (Tables, Domains, Languages). When you install this payload on an instance, all existing values for the field are deleted and the new values are loaded. This ensures that there are no duplicate entries or leftover values that are no longer valid.

For this reason, it’s impossible to give a customer in a domain-separated instance the ability to update choice fields directly because that would affect the entire instance. In addition, you can’t update choices directly in a production instance because any imported update sets that affect that field would overwrite the existing choices. In some cases, choice fields can drive processes themselves, which would break if a customer were to change those fields.

• How to create roles  
• Create an ACL rule  
• Service Provider Learning Path on NowLearning  
• Domain separation for service providers  
• Service Provider Concepts  
• Application Support for domain separation  
• Domain separation release notes

**Domain assignment**

By default, domain separation adds a domain field to tables and their extensions.

You can also extend domain separation to any new tables you create by adding a *sys_domain* field to the table’s dictionary definition. By default, the system only domain-separates platform and baseline application tables where appropriate.

⚠️ **Warning:** ServiceNow does not recommend domain-separating platform tables (any table with the *sys_* prefix such as the Dictionary Entry [sys_dictionary] and Dictionary Entry Override [sys_dictionary_override] tables) because it can produce unexpected results.

Each record is assigned a single domain. That domain is stored in the **sys_domain** field. Several tables, by default, have the **sys_domain** column and are already domain separated.

The value of the **sys_domain** field contains the domain assigned to the record by any of the following:

• Company to which the user belongs  
• Business rule when creating record  
• Module used when creating record  
• Form template used when creating record
• Domain of the parent record
• Domain assigned to User record
• Domain of the user who creates it

The system prevents the following tables from being domain separated:

• Access Control [sys_security_acl]
• Script Include [sys_script_include]
• System Property [sys_properties]
• Security Exclusion/Inclusion List Entities [sys_security_restricted_list]
• Dictionary Entry [sys_dictionary]
• Dictionary Entry Override [sys_dictionary_override]

Assigning users to companies
Administrators can quickly assign users to a domain by assigning them to a company. After users are assigned to a domain, records automatically inherit the user’s domain.

For example, assigning Bow Ruggeri to the ACME company automatically assigns him to the ACME domain. Assigning Don Goodliffe to the Initech company automatically assigns him to the Initech domain. Any records they create are automatically added to the appropriate domain.

Using business rules to assign domains
Administrators can use a business rule to automatically set a domain value when creating a record. The business rule must set a value in the sys_domain field. Administrators must ensure there is a sys_domain column available for the record’s table. To learn more see Domain separation recommended practices for service providers.

Using modules to assign domains
Administrators can use the sysparm_domain URL parameter to automatically assign new records to a particular domain from a module. Administrators must create a module with an Argument value of: sysparm_domain=sys_ID of domain.

Using form templates to assign domains
Administrators can use a form template to automatically assign new records to a particular domain. Administrators must add the sys_domain field to the form and select a domain value. For example, setting the sys_domain field to TOP/ACME domain automatically assigns all records from this template to the TOP/ACME domain.

Domain inheritance on tables
By default, related records inherit the domain of the parent record. For example:
• A change task record inherits the domain of the parent change request record.
• A problem record inherits the domain of the parent incident record.

**Automatic domain assignment based on user domains**

If no other domain conditions apply, a record automatically inherits the domain of the user who creates it.

**Visibility domains and Contains domains**

Visibility domains control what a specific user or group of users can see. "Contains" domains control what an entire domain of users can see.

**Visibility domains**

The "Visibility domains" element determines whether users from one domain can access records from another domain. Associate this element with User [sys_user] and Group [sys_user_group] records in related lists on those records. Groups grant their members the visibility domains of the group. When a user leaves a group, they lose the group's visibility domains. Granting users a visibility domain grants all the rights to the records in that domain based on ACL (access control list) rules.

A visibility domain:

• Is a user-to-domain relationship and is explicitly granted.
• Is not a child domain.
• Is not controlled by the selection in the domain picker. Users with access to a visibility domain always see data in that domain and its child domains.

⚠️ **Note:** Using visibility domains excessively is not recommended. Although visibility is one method to allow users to access records, it's best to use contains domains for more robust control.

**Contains domains**

Normally parent-child relationships define the domain hierarchy. A contains domain lets you relate domains on an as-needed basis, independent of parent-child relationships. However, contains domains grant visibility only to domain data. Processes remain unaffected by contains relationships.

A contains domain:

• Is a many-to-many, domain-to-domain relationship.
• May have child domains. When a domain is selected, you can see the data from that domain and its children.
• Is controlled by the selection in the domain picker.
**Note:** When you open the domain record, the scope is set to that record's domain, so you can see only child domains. Choose **Toggle Domain Scope** from the menu to populate the related list.

Contains domain example

When a user's home domain is A, and the A domain contains domains B and C, they all become peer domains. That means the user sees data from domains A, B, and C while in their home domain A. If users change domains with the domain picker to Domain B, they see only data in Domain B. When users interact with a record from Domain B or Domain C directly, they see only data for that domain.

Visibility domain example

Using domain visibility, if Don Goodliffe is in the Database domain, and Bow Ruggeri is in the Network domain, and no incidents are in the global domain, then Don cannot access Bow's incidents because of data separation.

Inheriting visibility domains based on group membership

If you set the domain table to the Group [sys_user_group] table, users can inherit visibility domains based on their group membership.

**Related reference**
- Domain separation recommended practices for service providers

**Related information**
- Contains queries and domain access

**Domain scope**

Domain scope defines what users can and cannot access.

Every user has two domain scopes when establishing a session in a domain-separated instance.
• Session scope is set upon session establishment to the domain listed in the user’s user record. Users can manually change their session domain scope from the domain picker.

• Record scope uses the domain of the record and is active when viewing the form of any record.

By default, the record scope takes precedence over the session scope so that users in higher level domains adhere to each record’s data and process constraints. However, these users can choose to expand or collapse the domain scope to show or hide data from other domains. For example, a user in the Service Provider (SP) domain also has visibility into child domains such as the ACME domain. When looking at an incident record from the ACME domain, the user can choose to expand the domain scope to show values from the SP domain or collapse the domain scope to show only record values that match the record’s ACME domain.

⚠️ **Note:** Users always have access to data from domains that have been explicitly granted to them by domain visibility.

Users with the domain_expand_scope user role can select the domain scope from the **Toggle Domain Scope** UI action on the form. When record scope is in effect, click the UI action to expand to session scope and display all data available based to the user’s domain and child domains. When session scope is in effect, click the UI action to collapse to record scope and display only data that matches the current record’s domain.

⚠️ **Note:** A record does not display the UI action to toggle the domain scope if the record is in the global domain or if the user’s domain matches the record’s domain.

**Record value selection from other domains**

Users who can see multiple domains have the option to select record values from a domain that is different than the record’s domain.

For example, service desk agents working for a service provider might want to assign certain incidents to themselves to resolve issues on behalf of their customers. When they do this, the incident *Assigned to* field might contain a user from the SP domain, even though the incident record itself is associated with a child domain such as ACME.

Selecting a record value from another domain does not change the record’s domain. The record retains its original domain. When a user views a record with values from multiple domains, the user’s domain visibility determines what they see.

**Record value selection**

<table>
<thead>
<tr>
<th>When these conditions are met</th>
<th>The user has access to these UI elements</th>
</tr>
</thead>
<tbody>
<tr>
<td>The user has access to the domain of the current record referenced in a field.</td>
<td>The user can:</td>
</tr>
<tr>
<td></td>
<td>• See reference field display value. For example, sees the user name in the <em>Assigned to</em> field.</td>
</tr>
<tr>
<td></td>
<td>• See the related record from reference icon. For example, sees the user record for the user in the <em>Assigned to</em> field.</td>
</tr>
<tr>
<td></td>
<td>• Select values from any visible domain. For example, can select users from either the SP and ACME domains.</td>
</tr>

</tr>
</thead>
<tbody>
<tr>
<td>current record referenced in a field.</td>
<td>• Not see reference field display values. (This is the case if domain separation was activated in Madrid or later releases and the user doesn’t have access to the domain of that record.)</td>
</tr>
<tr>
<td></td>
<td>• Only select values from the record’s domain. For example, can only select users from the ACME domain.</td>
</tr>
</tbody>
</table>

Domains and associated companies

With domain separation you can cascade changes you make to a company record to the domain and other records associated to the company.

By default, the system automatically assigns users to the same domain as their company. For example, all users of the ACME company automatically become members of the TOP/ACME domain.

⚠️ **Note:** Users with the admin role can change their own user records and therefore change domains. Service Providers may want to either disable delegated administration or set up an approval process to verify that the user needs the admin role.

When you change a company’s domain, the instance automatically changes the domain of the following associated records to match the company’s new domain.

- Locations
- Departments
- Groups
- Users

⚠️ **Note:** The instance does not automatically change the domain of any record where you have selected the Managed domain checkbox.

Domain deactivation and associated companies

When you deactivate a domain, the instance also automatically completes the following actions.

- Deactivates all companies in the domain.
- Prevents all users assigned to the inactive company from logging in.

⚠️ **Note:** When a user from an inactive company attempts to log in, the user sees an error message.

For example, if you deactivate the ACME domain from the sample data, the instance also deactivates the ACME company, and the three sample users are locked out.
Concepts for service providers

These concepts work with the existing ServiceNow platform capabilities to help you solve for common use cases.

Global queue v.2

The global queue concept provides a single virtual view of tasks that reside in multiple instances. The concept creates a custom application using remote tables to provide a fulfiller view of work that resides in multiple instances without having to replicate tasks or data. The concept can also be used to create a single view of an employee’s requests in multi-instance environments.

Overview

Service Providers with agents working on tasks from multiple systems tend to integrate the data back to a central instance, or a “swivel chair” between instances. While this method might be appropriate in some cases, it can be expensive and time-consuming to build and maintain. This method also opens the provider up to potential auditing and data requirement considerations such as General Data Protection Regulation (GDPR) in all of the instances where the data now lives.

Global queue v.2 is an alternative: With this method, agents can see data assigned to them from a single instance without sovereign data persisting on the instance they are logged into. For example, in cases where clients have data residency requirements, but allow access by agents from other countries, the provider could use a “follow-the-sun” Help Desk using global queue v.2.

Learn more about the Global Queue v.2 Proof of Concept on the ServiceNow Knowledge site.

Note: In the Quebec release forward, the Global Queue Proof of Concept has been upgraded to Global Queue v.2.
Service provider connector

The service provider connector application is a reference design for creating a ServiceNow Store application for your customers to use to integrate with your systems. Service provider applications help you speed on-boarding and create standardized integrations.

Benefits of service connectors

When service providers (vendors, suppliers, partners) publish connectors, customer on-boarding is faster, which means faster billing. Integrated instances increase productivity, greater visibility in the ServiceNow ecosystem, and partner program benefits. Specific benefits are:

- Eliminates custom integrations, including the cost of services required to deliver and maintain them.
- Services are provider-defined within their ServiceNow instances and remove the need for the complexity and cost of custom integrations.
- Workflows and catalog requests can be synchronized, with the customer’s processes and approvals preceding the provider’s processes, so customers can follow their own processes.
- Any data created or modified (e.g. CIs) for the customer on the provider’s instance can be synchronized back into the customer’s instance for their visibility and use in processes.

Key features

User Interface

A service connector should include the following UI components at a minimum:

- Reports/Dashboards – Reports and dashboards pre-defined by persona help with visibility.
- Menu and modules – The customer should be able to find the application via descriptive Menu Provider XYZ Services.
• Roles – Every connector requires user and admin roles to ensure access can be controlled by the customer. For example, “x_snc_xyz_user” or “x_snc_xyz_admin”.

• On-boarding – Rapid on-boarding is essential to a good customer experience and should be included via playbook, guided setup, or catalog item in such a way that no professional services are required for the customer to go live. (Professional services are available, but on-boarding can be achieved without it).

• Configuration – Data points should be built into processes to account for most of the normal process configuration a customer needs to achieve. This eliminates professional services as much as possible.

• Documentation – Thorough documentation increases customer satisfaction and ease of use.

• Support integration or contact info – The customer needs an easy way to stay in contact with the service provider for any issues, questions, or requests.

Tasks

• The eBonding of tasks such as incidents, case, changes, problems, and so on, should be predefined in the connector. These integrations are built using Flow Designer and Integration Hub to ensure the highest level of resiliency and performance.

CMDB

• Core data synchronize such as the CIs required for proper ITIL processes should be kept in sync between provider and customer instances.

Workflows

• All workflows should be designed in Flow Designer to ensure resiliency and performance.

Catalogs

• The provider’s catalog that the customer requests from should be included in the application as a record-producing catalog. The request generated by the item in the customer’s instance should be eBonded with the provider’s instances. The provider’s workflows keep the request updated and synchronize back to the customer’s instance.

Customer Processes

• Any mechanisms for syncing requests with the provider’s instance should allow for customer processes to interact with the requests before they are sent to the provider’s instance. During provider processing, approvals can be sent to the customer’s instance as needed.

Integration

• Integrations should be built using Flow Designer and Integration Hub to ensure the highest level of resiliency and performance.

Possible components you can include in a Service Connector

Instance data replication (IDR): when replication is the goal

• Can be used for process integration, but can be too rigid depending on the complexity integration logic based on state transition

• To learn more, see Instance Data Replication

IntegrationHub: When process integration is the goal
• Easier to inject in the middle of a process, as part of complex or conditional step in the middle of a flow
• To learn more, see IntegrationHub

**Global Work Queue (Virtual):** when task federation is the goal, and storing data externally is not acceptable
• Used where agents are working across multiple ServiceNow instances and need to see all open work assigned to them
• Rows returned should be limited to less than 1000
• To learn more, see Global work queue

**Remote Tables:** when external data usage without storage is the goal
• Used to connect an instance to third-party sources, or to another instance, to retrieve external data and optionally cache it in the memory. The data is treated as a table in the instance for read-only purposes such as group, sort, aggregate, and filter.
• To learn more, see Retrieving external data using remote tables and scripts

**Flow Designer:** when process design is the goal
• Used for automating processes in a single design environment. Process owners can use natural language to automate approvals, tasks, notifications, and record operations without coding.
• To learn more, see Flow Designer

### Related reference

- Domain separation recommended practices for service providers

### Application support for domain separation

Many ServiceNow applications support domain separation in the base system but not all. Some supported applications include limitations on the data and administrative settings that can be domain-separated. These definitions delineate the domain separation support levels from the perspective of actual use cases and the people who use them.

### Domain separation support levels

ServiceNow applications that support domain separation may support the separation of data and data routing only, have advanced business logic separation, or support tenant (customer) level administration of the application. ServiceNow applications are defined with the following incremental support levels.

<table>
<thead>
<tr>
<th>Basic</th>
<th>Standard</th>
<th>Enhanced</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Data is domain-separated</td>
<td>• Application properties are domain-aware as needed</td>
<td>• Data-driven process enables failsafe configuration by tenants through the UI to drive business logic</td>
</tr>
<tr>
<td>• Logic exists to ensure proper data routing, caching, rollups, and aggregations</td>
<td>• Business logic can be domain-separated by the instance owner per tenant</td>
<td></td>
</tr>
<tr>
<td>• Global configuration operational for multiple tenants</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### No support

- The domain field may exist on data tables, but no logic exists to manage data.
- This level is not considered domain-separated.

### Basic

- Business logic: Ensure data goes into the proper domain for the application’s service provider (SP) use cases.
- In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all use domain at production run time.
- The owner of the instance needs to be able to set up the application to function across multiple tenants.

Sample use case: When an SP uses chat to respond to a tenant-customer’s message, the client must be able to see the SP’s response.
Standard

- Includes **Basic** level support.
- Business logic: Processes can be created or modified per customer by the service provider (SP). The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The owner of the instance needs to be able to configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin needs to be able to make comments mandatory when a record closes for one tenant but not for another.

**Enhanced**

- Includes **Basic** and **Standard** levels
- Data-driven process enables service provider customers to modify business logic that is based on defined use cases. These configurations are UI-based and fail-safe so that configurations by one customer cannot affect another.
- Tenants of the instance need to be able to configure minimum viable product (MVP) business logic and data parameters for themselves. This logic and parameters would be expected for the application's normal function.

Sample use case: Tenant-customers of a shared environment need to be able to make changes to the impact, urgency, or priority matrix to set priority within their domain.

ℹ️ **Note:** **Effective Domain (*)**

- In some cases, a platform feature or application may effectively support SP use cases even without the domain framework. If so, the use cases must detail its support of domain separation. An asterisk (*) after the support level indicates this kind of configuration

**Domain separation recommended practices for service providers**

You can create, implement, and maintain domain separation for your applications and services.

**Domain basics**

With domain separation (also known as ServiceNow Multitenant Platform Architecture), you can segregate the application data, user interface, and business logic in a single customer instance that supports hierarchical modeling with cross-tenant intelligence. Business logic describes how the domain separation is configured and what rules are affecting the configuration.

Before you set off on the domain separation journey, here are some good practices to follow. Select topics as you want or follow them in order by clicking the links below the image.
Domain separation explained

With domain separation, you can segregate application data, UI, and business logic, such as rules or workflows, in a single customer instance. Separating these elements into logically defined domains supports specific hierarchies for all customers using your applications.

Domain basics

Domain separation, also known as ServiceNow multitenant platform architecture, adds considerable overhead to the management of an instance. If you use domain separation correctly though, it can improve efficiency, add greater security, and increase the performance of your customers’ instances.

You can’t separate some global standards and properties, such as system properties and table schema, per tenant.

Before you start separating domains, read the following guidelines.

What you can do with domain separation

• Data separation: Enables tenants of the domain to see only data that they have permissions to see. Tenants can be granted access to other tenant data but can’t query tenant data that they don’t have access to.
  ◦ When you update data records, they do not generate Update Set records.
  ◦ Users, including the customer accounts that are used for integrations, see only the data in the domains they have permission to access.
  ◦ Customers, agents, and fulfillers see data that pertains to the customers and organizations that they support.

• UI separation: Supports a tenant-specific experience for UI elements such as views, lists, labels, and so on.
  ◦ You can override the browser-based user interface, including application menus, lists, forms, and dashboards. You can also customize them for a specific domain or set of domains while preserving your basic process logic.
  ◦ Service providers can alter the displayed branding and UI elements to meet individual customer needs.
• Business logic separation: Creates tenant-specific system policies such as email notifications, business rules, client scripts, UI policy, and UI actions.

• Hierarchical modeling: Nests your multiple tenants so that parent tenants can access child tenant resources. Business logic for parent tenants runs automatically for child tenants, which you can override at any level.

• Cross-tenant intelligence: Automatically handles data, metadata, business logic, and processing context for tenants with access to additional tenant data.

Domain separation at a glance
The following graphic shows the division of data, process, and UI separation. These concepts are discussed in depth in the Recommended Practices section.

Data Separation
Process Separation
UI Separation

Global Standards, Centralized Administration, and Reporting

Domain architecture
User records are assigned a domain value that represents the user’s home domain. Users have no access to data in parent domains, peer domains, or domains in other branches of the hierarchy.

See Contains queries and domain access for advanced options to grant additional domain visibility.

The following diagram shows how the architecture process flows down to the child domains.
Domain separation value proposition

With domain separation, service providers can have a multitenant instance architecture that delivers offerings efficiently and securely to their clients. Strong universal process standards, data-driven process design, strict governance, and centralized administration help to maximize these benefits.

Benefits of domain separation

The tenants of a domain benefit from a quick return on investment, lower administrative overhead, and leverage of business services provided by instance owners.

Here is an quick view of these benefits.
## Definition of domain separation

With domain separation (also known as the ServiceNow® Multitenant Platform Architecture), you can segregate application data, UI, and business logic in a single customer instance that supports hierarchical modeling with cross-tenant (customer) intelligence.

### Properties of domain separation

Domain-separated ServiceNow applications are defined with the following properties:

- **Data separation**
  - Enables customers to see only the data that they have permissions to see.
  - Customers can be granted access to other customer data but cannot query customer data if they don't have access.

- **UI separation**
  - Supports a customer-specific experience for UI elements such as views, lists, labels, and so on.

- **Business logic separation**
  - Supports customer-specific system policies such as email notifications, business rules, client scripts, UI policy, and UI actions.

- **Hierarchical modeling**
  - Supports nested-multitenancy so parent tenants (customers) can access child customer resources. The business logic for parent customers runs automatically for child customers and can be overridden at any level.

- **Cross-customer intelligence (domain scope)**
  - Handles automatically the data, metadata, business logic, and processing context for tenants that have access to additional tenant data.

### How domain separation works

A common analogy for understanding how domain separation works is by looking at a comparison of a single-family home (single-tenant) versus an apartment complex (domain-separated).

### Single-family home vs. apartment complex

With a house, you pay more but you get more control. You can knock down walls, paint, add a room or pool, and so on.

With an apartment complex, someone else decides all of those things for you. Sometimes, you can't even paint the walls that you live within.

Single versus multiple tenants

Single-tenant instance

You're a ServiceNow customer, you bought the licenses, and it's up to you to decide what services you want. You can upgrade when you want, see previews of all the great new features, and configure your instance right away. Being a single tenant has these benefits and restrictions:

• You have higher upfront costs and administrative overhead, but you have more freedom to remodel and expand.

• You have higher costs to obtain and maintain the instance and supply administration staff. Although you are free to build out the environment as required, you must comply with the ServiceNow recommended practices and standards.

Multiple-tenant instance

Someone else owns the instance, possibly a service provider with multiple customers. They upgrade when they want and put new services on the instance when they want. If you are a customer of a service provider, you are most likely on their instance because you wanted what they offer. Multiple tenants have these benefits and restrictions:

• A centralized staff administers configurations, integrations, and upgrades.

• The instance owner provides added services.

• Domain tenants have lower upfront costs to use the ServiceNow platform, have lower monthly costs because they are sharing it with many tenants, and do not have to employ a staff to administer the environment.

• Benefits shared from requests or changes that are initiated by other tenants.

Domain separation hierarchies

Create a hierarchy when defining a domain architecture to track your processes and workflows.
Sample domain separation hierarchies

The following diagram is a good starting point for defining domain architecture. It demonstrates the relationship between the TOP and lower domains and how the process, data, and business rules impact parent and child domains.

- In the following example, TOP is a process domain. It should never contain users. Rather, TOP should contain the new processes that instance owners develop and the overrides to these processes from the global domain.

- Only the service provider (SP) has access to the default domain. This domain never contains active users. It contains only the "lost" data that you need to reassign to the correct domain.

⚠️ Note: When data is not assigned to a specific domain, it moves to the default domain. It is temporarily "lost" and needs to be assigned to its correct domain.

- Tasks and users without a domain are placed in the default domain automatically when you create or update domains. You can override that action by either clearing the Default option on this record or selecting the Default option on another domain record. If you have not set a default domain yet, tasks and users with no domain move to the global domain.
  - Don’t move data between domains while you are using the instance.
  - If any data ends up in the default domain, that means you have a configuration or procedural problem to address.

You don’t see the word "Global" in this diagram because there is no global domain. Remember that "global" is the absence of a domain on a record.

For example, a table that has no domain field means that the table contains all global records. A table that has a domain field means that any record without a domain is a global domain.

The word "global" is in the domain field. It is placed there automatically when the record has no domain.

Global records are available to all users of the instance unless they are restricted by security configurations.

- Use the default domain to make sure that records do not end up in the global domain on tables that should never have global records.

- Instance owners must then triage the records in the default domain and move them to the correct domain.
Domain hierarchies

- **Parent/child**: Process and data affected
  - Design that is based on a process flow. Remember that the parent domains can access all data in the child domains.

- **"Contains" domain**: Only data is affected. For example, making SP in the diagram contain TOP does not make processes in SP run in the TOP domain and downward.
  - Grants data access rights to individuals in groups that require dedicated access to certain domains.
  - Contains causes or conditions to be added to database queries that can cause performance issues with large domain and data sets.

- **Visibility**: Hierarchy that is always visible to users once you provide access. Only the data is affected, not the processes.
  - Grants data access of a domain to another domain that did not have that access when the parent-and-child hierarchy was built.
  - Enables users to see all the data in the domains that they have visibility access for, all the time, regardless of the record they are working on.

**Note**: Use sparingly, as Visibility can allow complete access that you may not intend.

Basic principles of defining a domain hierarchy

Unrestricted and restricted use cases for domain separation

Many SPs have customers who implicitly state that access to their domains must be tightly regulated, which constrains the use of the "contains" function at the TOP domain. The following diagram explains how to mitigate that regulation by dividing domains into Restricted and Unrestricted domains.
1. Customers exist in a specific “vertical” of the domain separation hierarchy. This means they only consume processes defined in their domain and all parent domains above theirs in the hierarchy. Any processes defined in domains that are not in their linear parent-child hierarchy do not apply.

- Customers or “tenants” are entities that are segregated from each other completely, not like departments or business units that share resources with each other.

2. Super verticals (restricted, manager services, and so on) are allowed as long as the customers only ever belong to one of them.

3. Services, products, or offerings that need to be horizontally available to all customers are not defined within separate domain hierarchies.

Here are some sample use cases:
• Under TOP, you might create two domains, Unrestricted and Restricted.
  ◦ Place customers and their domains that don’t have SP visibility restraints under Unrestricted.
  ◦ Place customers and their domains that do have that requirement under Restricted.
• System admins can then use “contains” and “visibility” functions in an efficient, targeted manner.
  ◦ Apply “contains” to Unrestricted, so a single “contains” can grant visibility to most customers.
  ◦ Apply domain visibility using “domain visibility groups” to specific domains as needed.

**Customer Decision Trees**
The following diagram delineates how to choose which hierarchy model is right for you. You can choose separate hierarchies, hybrid, or shared hierarchies depending on which processes and functionality you want in your domain structures.
To learn more about hierarchy architecture, see Service provider reference architecture.

**Context and domain separation**

The context of a user's session determines the processes, data, and user interface (UI) as the user browses through list views, home pages, reports, and knowledge articles. The context is determined by the processes that you create, the business rules that you set, your workflows, and other factors.

**User session context**

Many factors determine the context of a user session, such as user profiles, groups, company criteria, and so on. In the following diagram, you see that the incidents that a company has created are part of the context.

The user in this example has a home domain of Cloud Dimensions.
1. The branding reflects the settings in the Cloud Dimensions domain and company record.

2. The application navigator shows the items that are inherited from higher-level domains as well as the modules that are defined in the Cloud Dimensions domain.

3. The home pages and list data reflect the data that is visible to the user. This data is based on the user’s session context. In this case, the user in the Cloud Dimensions domain can see the data in Cloud Dimensions, child domains, and the global domain.

**User session context starts in the home domain**

In the following diagram, you can see the elements of the context.

The system administrator sets users' home domains on their user records. Typically, a user’s home domain is set to the same domain as their company’s domain. When the user logs in, the domain picker sets automatically to the user’s home domain. Users can return to their home domain at any time by clicking the arrow icon on the domain picker.

The domain picker’s list includes domains within the user’s session context. Users may further limit their session context by selecting child domains with the picker.

The context of the user session includes the user’s home domain and any child domains. This set of domains in the user’s session context is appended automatically to every query that is sent to the database. That way, the results are limited to just the data in these domains and global data. This process is embedded in the compiled code that is not accessible.

Service accounts that are used for integrations also have user session context. There is user context and records context, each with its own data in its own domain. These contexts affect the integrations. Database queries (records) are limited in the same way as interactive users (users), meaning that they work as normal but are limited by whatever constraints the developer has configured.

You can learn about additional ways to add domains to a user’s session context in Service provider reference architecture.

**Record context**

As a user drills into individual records, record context is activated. The record context determines the UI elements and processes to apply to the record.

A record’s domain dictates the process, data, and the availability of UI elements within the record.

ℹ️ **Note:**

- Record context persists even if the user’s domain changes.
- Users can view records concurrently in multiple browser tabs, while maintaining their own record context.
Segregating and securing data with domain separation

You can segregate and secure data on the ServiceNow platform in multiple ways, depending on your customer's needs.

Segregating data in multiple ways

The following diagram shows four ways that you can segregate data. You can use separate instances, domain separation, contextual security and business rules, and the reference architecture itself as ways to segregate data.

You can segregate data in these four ways:

1. Customizing the reference architecture with qualifiers and filters so that departments and groups within a company can focus on their own work. By segregating the data between these departments or groups, a department or group can't see another department or group's records.

2. Adding contextual security and Before Query business rules as additional layers of security to guard against data breaches. See Context and domain separation and Before Query business rules to learn more about domain separation and business rules.
3. Adding another level of security in a company by using domain separation. The data from every database query is limited to the data that is visible in a domain before contextual security and business rules are executed.

4. Using separate instances to segregate the data at the database and application layer.

Separate instances, domain separation, contextual security and business rules, and the reference architecture are ways to segregate data. These four ways relate to each other as indicated by the Comprehensiveness of need arrow in the diagram. How each layer interacts with the other layers depends on how you set up your domain separation configuration.

Not all organizations require domain separation. You might find other alternatives, such as separate instances or a single instance without a domain. To learn more about these alternatives, see Evaluating the need for domain separation.

**Alternatives to domain separation**

You can use a separate instance as an alternative to domain separation for your customers. A separate instance allows you the flexibility to meet the requirements for data separation within the groups and departments in an organization with little to no impact on others.

**Separate instances**

<table>
<thead>
<tr>
<th>Separate instance</th>
<th>Single instance - without domain</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pros</strong></td>
<td><strong>Pros</strong></td>
</tr>
<tr>
<td>Built to suit each customer/organization</td>
<td>May address simple scenarios</td>
</tr>
<tr>
<td>Minimize impact of customization on others</td>
<td>Cost</td>
</tr>
<tr>
<td>Release schedule coordination</td>
<td>Cons</td>
</tr>
<tr>
<td>Clean separation</td>
<td>Extensive modifications to baseline code</td>
</tr>
<tr>
<td>Choose DATACENTER region</td>
<td>Modified base system code skipped during upgrades</td>
</tr>
<tr>
<td><strong>Cons</strong></td>
<td><strong>Cons</strong></td>
</tr>
<tr>
<td>Must address all secondary and supporting tables as well</td>
<td>Extensive testing required</td>
</tr>
<tr>
<td>Cost</td>
<td>No ServiceNow product team to evolve your custom code</td>
</tr>
<tr>
<td>Alignment of instances</td>
<td>Testing effort for upgrades</td>
</tr>
<tr>
<td>Duplication of effort</td>
<td>Integrations required</td>
</tr>
</tbody>
</table>

You can time upgrades and releases separately for each instance. However, if you choose to use separate instances, you need to do a lot of coordination with other people who are administering instances. By configuring an instance with contextual security, form views, reference qualifiers, filters, and robust conditions, you don't have to use domain separation in your company.
With a separate instance, you may address data and process separation but your instance owners must maintain and keep up with the extensive customizations that is required for separate instances.

- Service provider reference architecture

**Related information**
- Context and domain separation

**Evaluating the need for domain separation**
You may find that domain separation doesn't always work for your customers' organizations. It's best that you base your decision to go with domain separation by looking at your customers' needs.

**Reasons for domain separation**
These factors may help you decide to choose domain separation for your customers’ organizations:

- Your customers have moderate alignment of processes and general platform requirements.
- Your customers plan to work on tasks as fulfillers rather than as requesters.
- Your customers have a contractual agreement that requires that data records be isolated, but your instance owner has determined that the requirement may be addressed somewhere else in the configuration.
- Your company’s instance owners have entire entities that operate as physically separate organizations and do not share data, but full reporting is still required. Separate domains would allow data visibility when configured correctly.

**Reasons for no domain separation**
These factors can point to reasons why your customers' organizations might not want to set up domain separation:

- Your customers want to administer their environment, have full ownership of it, and set the roadmap for expansion.
- Your customers require that the data and process at the physical or database level be completely isolated.

⚠️ **Note:**

Domain-separated instances contain a shared database so this undermines the isolation requirement.
- Departments in your customers' organization want to isolate records. (Access controls may suffice.)
- Your customers all want their own processes, business rules, and workflows.
- The corporate culture is one of non-collaboration between your customers' organizations.
- Your customers interact with the platform as end users only.
Benefits of domain separation

Domain separation may work better for your customers’ organizations than any other method for separating the data between groups and departments.

**Domain separation benefits at a glance**

You can enable domain separation with a ServiceNow plugin that has functionality built into the core platform. The separate domains configuration is managed by a product manager who is supported by a development team. Enhancements and fixes for domain separation functionality are included with ServiceNow releases and ready to be used by customers.

For assistance with domain separation, your instance owners can use Customer Service and Support resources, such as the Service Portal.

**How a database query works with domain separation**

Using database queries with domain separation in your customers' applications help them protect their data. These queries then speed up the configuration and build processes.
How domain separation protects data

In the following figure, the Incident table [incident] has a domain field that is inherited from the incident's task. When you see this domain field, you know that the records in the table can have domain assignments.

When users log in, their home domain appears with the set of domains they may access. This is known as the user's session context. For more information about session contexts, see Context and domain separation.

Database query with domain separation

1. In a browser, the user from one of the companies, Acme, selects the Open Incidents module to view all incidents where active=true.
2. The active=true filter is submitted to the application.
3. The application then sends a query to the database by appending a WHERE clause to active=true. The WHERE clause limits the incident records that are returned to those records that are in the user's domain or the domains that the user may access. Only the records in these domains are returned to the application for processing.
4. Contextual security is applied, further limiting the data that is returned to the user. The incident records appear in the Open Incidents list.

**Note:**

When you apply contextual security, you create limits to the data that are returned to the user. These limits protect other content that you may not want users to see.

To learn more about contextual security, see Context and domain separation.

**Note:** This processing logic applies for all queries to the database, including those queries that are triggered using integrations.

Domain separation levels of support

You can choose from three high-level categorizations for domain separation of an application for your customers' organizations. Applications that support domain separation may support the separation of data and data routing only, have advanced business logic separation, or support tenant (customer) level administration of the application. These
definitions delineate the support levels from the perspective of actual use cases and the people who implement them.

**Incremental ServiceNow support levels**

<table>
<thead>
<tr>
<th>Level</th>
<th>Type</th>
<th>Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>No support</td>
<td></td>
<td>• The domain field may exist on data tables, but no business logic exists to manage the data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• This level is not considered domain-separated.</td>
</tr>
<tr>
<td>Basic</td>
<td>Customer data management</td>
<td>• Business logic: Ensures that data goes into the proper domain for the application’s service provider use cases.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In the application, user interface, cache keys, reporting, rollups, aggregations, and so on, all consider the properties of the domain at run time.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Your instance owners need to be able to set up the application to function normally across multiple tenants.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Use case: When a service provider uses chat to respond to a customer’s message, the client must be able to see the response.</td>
</tr>
<tr>
<td>Standard</td>
<td>Customer process management</td>
<td>• Includes the Basic level</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Business logic: Processes can be created or modified per customer by the service provider. The use cases reflect how the application is used by multiple service provider customers in a single instance.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Your instance owners need to be able to configure minimum viable product (MVP) business logic and data parameters per customer for the specific application.</td>
</tr>
</tbody>
</table>
## Level | Type | Summary
--- | --- | ---
  |  | Use case: Admin needs to be able to make comments required when a record closes for one customer, but not for another customer.
Enhanced | Customer self-managed configuration | • Includes Basic and Standard levels
• Enables service provider customers to modify business logic that is based on defined use cases. These configurations are UI-based and fail-safe so that configurations by one customer cannot affect another customer.
• The instance customers need to be able to configure MVP business logic and data parameters themselves.

Use case: Customer of a shared environment needs to be able to make changes according to impact, urgency, or priority within a domain.

Effective domain* |  | In some cases, a platform feature or application may support service provider use cases even if the domain framework is not being used. The use cases must be detailed to support domain separation. An asterisk (*) after the support level indicates this kind of configuration.

Use case: Before the New York release, Service Catalog had no domain support but the instance owners could configure separate catalogs and items for each tenant in a domain-separated instance by using user criteria. The result was that each tenant could use Service Catalog at a Standard level.

To view all applications listed by their support level see Application support for domain separation.

## Summary
Domain separation is a framework that you must use to make your applications aware of its customers.

Consider the domain framework capabilities, your applications' business use cases, what the personas are, and how they use the application before you can use the framework to make your application supportable.

**Service provider reference architecture**

Your customers can access service provider (SP) services by using a portal that is designed for them to reach their domain-separated instance.
Basic attributes of service provider reference architecture

• You do not assign fulfillers to a domain. Instead, you share them across domains. This makes it harder to audit how many fulfillers you have per domain.

• You can share and leverage domain administration. This means that there is no overhead and you can optimize licenses.

• The number of users on the instance can change when you get a new customer. A new customer can result in tens or even hundreds of thousands of new users on the system. The number of total users is virtually unlimited in one shared environment.

The portal for SP services is dedicated or shared to the SP shared instance. Service providers use ServiceNow shared instances to manage their service delivery.

<td>Large customer; transactions or data amount stored cause for multiple nodes or dedicated hardware.</td>
<td>Global governance &amp; admin for business use case &amp; process can be developed &amp; maintained on the instance. Best when used w/ minor-to-moderate process differences among customers or sub-entities.</td>
<td>Lower administration, transaction, &amp; onboarding costs, &amp; ongoing operational costs for resources &amp; licensing. Faster onboarding &amp; more revenue.</td>
<td>Standardized re-usable services, procedures, processes, &amp; resources delivered on a single ServiceNow instance to multiple Customers.</td>
<td>Services for sole use of customer, offerings specific to industry or vertical solutions, government, or regulatory requirements, applications that do not support Domain Separation.</td>
<td>Multiple best in class Service providers for individual services, bringing together tooling, reporting, SLAs, strategy, &amp; design for unified customer experience.</td>
<td>Unified governance across all providers to ensure organization requirements are met &amp; that all providers cooperate on behalf of the customer.</td>
</tr>
</tbody>
</table>

Service provider reference architecture decision trees

You can use decision trees and a comparison chart to determine if a new customer should be added to a shared instance or to their own dedicated instance.

Decision trees
Use these decision trees to help your customers decide whether to use a managed or dedicated instance.

Customer decision tree

NOW Partner - Customer Decision Tree

Partner Sales uses tree to determine if a new customer should directly interact with managed instance or dedicated instance

Customer installs the service providers CONNECTOR directly off the Store which allows customer to connect to the service providers managed instance for consumption of services.

Customer wants NOW for reasons other than the provider's services

Provider resells NOW licenses, sells/sources professional services, and deploys CONNECTOR on the customer's instance.

Provider sells fully managed service delivered in domain-separated instance. Customer doesn't want ServiceNow platform, but does want its user experience for service(s) purchased.

See Dedicated vs. Shared tree for detail on this step.

<td>Lower administration, transaction, &amp; onboarding costs, &amp; ongoing operational costs for resources &amp; licensing. Faster onboarding = more revenue.</td>
</tr>
</tbody>
</table>

Service provider reference architecture for dedicated instances

Service provider (SP) customers can access SP services by using a portal to a dedicated instance. SPs use these dedicated instances to manage their service delivery.
Dedicated instances

Attributes

• Dedicated instances require that you have separate administration and dedicated teams. You need multiple licenses for the administrators and developers who log in to multiple instances.

• Each instance has a finite number of requesters and fulfillers. When you get a new customer, you must procure an instance that is based on the size and scale of your customer's company.
Dedicated vs. shared instance

SP reference architecture comparison

Service provider reference architecture for hybrid

Use the hybrid service provider (SP) reference architecture for a customized solution. Your customers require a dedicated instance for a specific service. They can still use the shared SP instance for other services, but it requires integration of each instance.

Hybrid architecture

Your customer may be responsible for delivering this additional service directly. You’ll need to build a hybrid solution of several attributes for your customer to provide.
Attributes

- You can share and leverage the administration of the instance. This means that there is no overhead, and you can optimize licenses.

- If there is a new instance for a decentralized environment, the program team is responsible and funded accordingly as dedicated administrator users for that instance. In a centralized environment where all instances stem from a blueprint, you'll need duplicate administration licenses.

- You do not assign fulfillers to a domain. Instead, you can share them across domains.

- If a customer is sharing both a shared environment and a dedicated environment, they require a fuller in both environments. This means more work for each team because the processes for shared and dedicated instances require different work for each instance.

- The number of users on the instance can change when you get a new customer. A new customer can result in tens or even hundreds of thousands of new users on the system. The number of total users is virtually unlimited in one shared environment.

- Each instance has a finite number of requesters and fulfillers. When you get a new customer, you must procure an instance that is based on the size and scale of your customer's company.

Service provider reference architecture for Service Integration Management (SIAM)

The Service Integration Management (SIAM) for service provider (SP) architecture integrates services for a unified customer experience.

Attributes of SIAM architecture

- Customers access SP services on a dedicated or shared portal to the SP shared instance.
- SPs use ServiceNow shared instances to manage their service delivery.

SIAM architecture at a glance

SP Reference Architecture – SIAM

Domain separation terms

With a ServiceNow instance, you can improve efficiency, add greater security, and increase performance for your customer organizations. It’s helpful to understand some of the most common terms as you create your configurations.

Managed domain

In a managed domain, the Managed domain field allows domain administrators to manually select a domain for the user, group, department, location, or CI record, rather than using the domain that is assigned automatically from the company record.
If you want to change those properties, you can override them to further customize the functions of the applications in each of your domains.

### Manual override switch

*Common Use Cases*
- Set admins to ‘global’
- Set support groups to ‘global’

*UI Policy shows Domain when Managed domain = true*

### Process tables

In process tables, if you see a value in the **Overrides [sys_overrides]** field, a process override record exists. That means that delegated administration, which is how administrators can set domain-specific policies, is in effect. Admins in the global domain can use the **Expand/Collapse Domain Scope** related link to see override records.

**Note:** Reports are separated into domains and contain an **Overrides** field. To view all reports from the global domain, use the **Expand Domain Scope** related link.

When you view process tables from a domain, you see only the relevant process records for the selected domain. When you view a process table from the global domain, the **Expand Domain Scope** related link is displayed to let you see all process records, including overrides. To view only the relevant process records for global again, use the **Collapse Domain Scope** related link.

The domain scope feature is used only for process tables and causes the visibility of data on the table to shift in the opposite direction. For example, a record in the parent domain can be seen in the child, but a parent cannot see a child record. This allows the process to flow down to child domains.
Types of domains

Different types of domains can help you organize your processes and data and how they function in the application or feature.

Customer Domain

In the customer's domain is the user interface, as well as the process that controls how the data is used.

The ACME domain in the following image is a customer domain.

Process Domain

You create processes for how the data is used and what it does in the domain. These processes must have these attributes:

- Specific processes and UI settings for a set of domains
- No core data of any kind (such as specific user data).
- The TOP domain in the following image is a process domain.

Data Domain

The data domain holds data that is relevant to multiple customers. That data can be shared without sharing the actual customer domains. Each customer has its own data domain and can access it.

Note:

This kind of domain is not common and can cause performance issues if overused. Consult with an SP architect before use.

Example: The domain may hold tasks that ACME, Cisco, and the SP all need to interact with.

The Default domain in the following image is a data domain.

User Data

User record data never belongs in the global domain or any of the process domains. Users are primarily created in customer domains and can on occasion be created in data domains.
Admin accounts are special as they should not be used as everyday users of the instance and should be in the global domain to facilitate administrative functions.

Lists, admin, global process

Lists

From the global domain, if you right-click any choice field’s label, select Configure Choices, and then add a new choice, the choice pushes automatically to all domain-specific lists for that field. If the new option is marked as Selected, it is added as active. If the new option is marked as Available, it is added as inactive.

Instance Administration

The instance owner's administrators must handle all normal process creation, modification, and maintenance in a domain-separated instance. Individual domain managers can maintain some parts of data-driven processes. The types of domain managers maintain user administration, support group memberships, and locations, or manage applications that are designed with tenant administration in mind.

Global process/parameters

You can create and maintain the process that affect the global domain as well as set the parameters. These properties are common for all users of a domain-separated instance.

Examples: System properties, dictionary overrides, sys_documentation (field labels), the data model (classes, CI types, and so on), tables and fields [sys_dictionary] (access can be restricted), indexing (text indexes as well as database), ACLs, installation exits, inbound actions, public pages, and interceptors.

Domain-separate a custom table

You may need to create custom tables in separate domains. This topic covers both the procedure and the concept behind domain-separating a custom table.

1. Create a sys_domain field

If a system table or a table has not been domain-separated by the Domain Separation plugin, it's best not to domain-separate it. Use these points as a guideline.
• Create a new field and leave it as a string.
  ◦ Column Name: sys_domain
  ◦ Other attributes: Defined automatically
• The Sys_domain_path is created automatically.

The column name **sys_domain** is reserved in the ServiceNow platform, which means that the system recognizes it and automatically applies the appropriate field type and attributes for you. This automatic configuration also creates a corresponding **sys_domain_path** field.

⚠️ Note:

• Set the column name to **sys_domain** rather than using the label.
• Domain separation is not appropriate for every table. In general, if a table is part of the base instance and that table does not have a **sys_domain** field, you should leave it that way.

A **sys_domain** field is created automatically when you create a string field with the name “sys_domain.”

2. Add a business rule to set the domain

Without business rules

• The domain is set to the current domain of the user who creates the record.

With business rules

• The domain is assigned using scripted logic, typically based on the Company field.

In addition to a **sys_domain** field, custom tables need a business rule similar to **Domain - Set Domain – Task** to set the value of the domain field. In addition, you will need **Domain – Default – Task**, which moves records without a domain to the default domain if the first rule fails to assign a domain.

On the task table, review the business rules for Domain. Pay particular attention to the Order field.
The first rule that runs, **Domain – Set Domain – Task**, attempts to set the domain of the record based on the record’s Company’s Domain.

If the first rule fails to find an appropriate domain, the second rule, **Domain – Default – Task**, executes. This rule sets the domain of the record to the default domain.

Finally, if the domain of a task record changes, the **Domain – Cascade Domain – Task** business rule changes the domain on all records related to the task, such as workflows, metrics, SLAs, and attachments.

<table>
<thead>
<tr>
<th>Name:</th>
<th>Domain – Set Domain</th>
<th>Order: 100</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Business Rule executes before an insert or update on the Task [task] table.</td>
<td></td>
</tr>
<tr>
<td>Condition:</td>
<td>current.company.changes() &amp;&amp; !current.company.nil()</td>
<td></td>
</tr>
<tr>
<td>Script:</td>
<td>current.sys_domain = current.company.sys_domain;</td>
<td></td>
</tr>
</tbody>
</table>

### 3. Add a business rule if Step 2 failed

If the initial business rule fails to set a domain and the domain is still empty or global, a second business rule runs. This rule examines the task_for field that is based on the caller or requested_for field. This rule is checking to see if you can set the domain of the record based on the user’s domain. If not, the business rule sets the domain to the default domain.

<table>
<thead>
<tr>
<th>Name:</th>
<th>Domain – Set Domain - Default</th>
<th>Order: 9,000</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Business Rule executes AFTER Domain – Set Domain – Task.</td>
<td></td>
</tr>
<tr>
<td>Condition:</td>
<td>current.sys_domain == 'global'</td>
<td></td>
</tr>
<tr>
<td>Script:</td>
<td>/* essentially</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If (task_for is set)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>set the domain to the user’s domain</td>
<td></td>
</tr>
<tr>
<td></td>
<td>ELSE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>set the domain to the default domain</td>
<td></td>
</tr>
<tr>
<td></td>
<td>*/</td>
<td></td>
</tr>
</tbody>
</table>

### 4. Domain – cascade domain – task

Tasks can have many related tables that work together for business objectives. These related records include workflow, SLA, approvals, attachments, and email. If the domain of a task changes, the related records domain must change, too, so they remain visible to users in the new domain.

This Cascade rule is commonly triggered when you clear records out of the default domain.
Customizing domain properties and themes
You can customize your customers’ company properties and themes within the domains that you have configured. Customization makes their instances fit in with their companies’ overall look and feel.

Customizing company themes and logos
On the company record, you can customize specific design themes and logos for each company.

Customize the domain
By default, when you have the service provider plugin installed, the standard business rules contained in the core tables cause the record’s domain to be set to the domain of the company that is associated with the record. The company can control the tables such as Task, User, Group, Location, Department, and so on.

With all of these tables, except the Task table, you can override the domain that a record is created in. This gives you more customization options.

Managing domain separation for specific uses
You can set up separate domains for email notifications and customize the properties of catalog, tables, users, groups, and views. This enables you to provide more specific behavior in each domain, giving your customers more flexibility.

Emails
You can use separate domains for email notifications and overrides. When you use separate domains for notifications, you can do an override that is based on the domain of just the attached record, not the user’s whole domain.

Service Catalog
The Service Catalog is now domain-separated so that your customers can see and access the catalog. Items are processed as OR conditions when multiple items are used. Service providers should administer the categories and Items themselves so they fit their own criteria specifically.

Users and groups
Only use admin accounts in the global domain because admins need access to all domains. Do all your application testing from an actual domain, not in the global domain. Overrides don’t process properly in the global domain. Admins should also be given user accounts in production if they are to use the application.
Working with fields
There are several points to consider when you work with fields. Pay close attention to these fields because they can have many variations that affect your configurations.

Lists
There are personal, global, and domain lists, as well as multiple views of each.

Forms
There are global and domain lists as well as multiple views of each.

One database
Any fields that you create exist for all users, in one database. Consider the global impact before you create one.

• ACL scripts cannot keep a field from being viewed in a list because they do not run. You can add a READ ACL to hide a field from users if the ACL is only role-based.

Creating tables
When you create a table, you should add a `sys_domain` or an `sysOverrides` field. Any table that contains data that your instance users need to access, needs the `sys_domain` field. Tables that extend or support processes and that need to flow down to children domains also need the `sys_domain` field.

Configuring domain separation with the domain picker
Use the domain picker wisely, and remember the 80/15/5 approach so that you do not customize too much and impact the performance of your instance.

Verify your domain before making changes
The domain picker gathers all the domains into a list for you to choose from.

If your session times out and even if you don’t get logged out, your session falls back to the domain on your user record. You also lose any elevated roles at the same time. In this case, your domain picker could still show the last domain that you selected if the top frame of the
list hasn't been reloaded. For this reason, you should reload your list completely if you have been away from the instance for any time.

**Configuring at the TOP domain or the global domain**

Domain separation works best when you are providing services to customers that are mostly standard in their configuration and user and group definition. The more that you customize and create "one-off" solutions, the more you create a margin for error. When you create your processes and business logic, any variations should be in properties that work automatically for each customer. While processes can still be adjusted as needed, use great care when you decide when, and to what degree, to create a unique configuration for a single customer.

You'll need to use an "80-15-5" approach in configuring your domains to avoid too large a margin for customization, and therefore error.

- **Recommended approach for configuration:**
  - 80% or more **Standard**
  - 15% or more **Parametric**
  - Less than 5% **Configuration**

- **Determine if a suggested change should be a global or a configurable property.**
- **Do not overbuild by adding more and more customization that needs to be managed.** Instead, do the following:
  - Start with the base system features and verify any gaps before you make any changes.
  - Look for no-code solutions.
  - Use server-side scripts, build modular APIs, and build in domain-separated properties.
  - If you must use client scripting, use only ServiceNow APIs. Limit "synchronous" calls (those that go back and forth from client to server, also called AJAX).
  - Write all scripts logically to keep them simple and effective. Enforce peer reviews of code changes and make sure everyone is following the Domain separation recommended practices for service providers in this section.

**Domain separation performance considerations**

As you configure domain separation in your application and services, make sure that you consider the number and properties of domains you create. Too many property-heavy domains can impact the performance of your instance.

**Limiting property-heavy domains**

You can create as many domains as needed, but make sure that you don't create unnecessary domains on the instance. Weighing too many domains on the instance with a lot of properties can impact the performance of your instance.

The number of domains is not what impacts performance but rather what's in them. Too many properties can slow down the domain picker, which then slows down the overall user experience of your customers. If you are loading the domain picker and already have a large number of domains with a lot of properties, the domain picker has to load all the domains before it gives you control in the session. This process could lead to an outage where you can't access anything on the instance until the domain picker finishes. Before you create new domains, navigate to the domain hierarchy under Domain Admin > Domain Map and make sure that you actually need to create a new domain or whether an existing domain hierarchy can work.
Using the UI16 domain picker

The domain reference picker is available in UI16. With the reference picker, you do not load all the domains at once, but rather the domain is searched as you begin to enter the name of your domain into the domain picker.

Enable the domain reference picker in UI16 by following these steps:

1. In the application navigator, enter `sys_properties.list`.
2. Set the `glide.ui.domain_reference_picker.enabled` property to true.
3. Refresh the browser.

⚠️ **Note:** Do not upload a large number of domains (over 30) via integration or import sets without doing some testing first or you might bring down your instance.

Setting up domain hierarchies

You can avoid slowdowns and performance impacts in your instance by knowing how domain hierarchies work and by setting them up properly.

Based on the domain hierarchy, users have access to the data in their home domain and any child domains. The process flows down to the child domains and the data rises up.

Make changes to the existing domain hierarchy only when needed. When you update the parent of a domain, the system re-establishes the parent domain with all its child domains that change the domain hierarchy. When the domain hierarchy updates, the system triggers a cascade update on all tables that relate to domains for the records that are created on that domain. As a result, a large number of supporting tables have to be updated too.

For the same reasons, even if you must change the domain hierarchy, never do a mass update. Imagine the number of queries that the system has to run to change the domain hierarchy. Always do an update in small batches. Before you start the next batch of updates, make sure that Domain Work Request (DWR) records are processed. DWRs are reports that display whether there are errors after you've changed the domain hierarchy.

Tracking DWR records

In the syslog_domain table, look for an information entry for **DWR execution completed** to confirm that DWR is completed.

Checking domain logs for errors and warnings

Check the domain logs to find errors or warnings in your domain path processes and hierarchy configurations.

You can find the domain logs in the Domain Log [syslog_domain] table. When the domain hierarchy updates, the system triggers a scheduled job to recalculate the domain paths. The domain logs table captures the results.

Look for any errors and warnings in this table. After reviewing this table, you need to resolve these errors and run the domain path validator again.
In this example of a log, the system has detected ten orphan records in the sys_ui_list table. The errors in these records must be fixed before the domain path can run successfully.

To learn more about domain-separation errors, see Troubleshoot domain separation errors.

**Importance of the Default domain**

Organizing your domains is a crucial part of the domain separation process. If you don't set a default domain, new tasks and user records go to the global domain. Anyone can see the records in the global domain, which means that data can be seen when it isn't supposed to. When you set the default domain, its records are not visible to any user other than an admin.

You should always set one default domain for the domain records on your instance. The default domain is where the system automatically assigns task and user records that are not already assigned to a domain.

When you create a default domain from the Domain Administration screen, add the name Default in the Name field to differentiate it from other domains. Check the Default option as follows:

Maintain regularly the records that you create in the default domain and move them to the correct domains. If records show up often in the default domain, you may need to investigate why. Ideally, you should make sure that all records are created in their appropriate domains (not global or default domains).

**Contains queries and domain access**

Use a "contains" query only in special cases, such as when users or groups need to see data from a domain that they don't have access to, but you don't want to move those users to a domain. Creating domain "contains" and user or group access for a domain should be an exception, only when absolutely needed.

"Contains" is a domain-to-domain relationship that is many-to-many, and has no effect on the flow of process. If you create a large number of domain "contains" relationships or provide broad access, you will generate queries with too many OR conditions. OR conditions are slow and impact the performance of your instance. Instead of using too many "contains" relationships, set up your domain hierarchy as follows:

**Sample query**

```
SELECT ... FROM task80 ignore index(number) WHERE task80.'sys_class_name' = 'Incident' AND (task80.'sys_domain_path' = '/' OR task80.'sys_domain_path' LIKE '!!$/!!$/!!%') ORDER BY task 0.'number' DESC limit 0,20
```
Before you move users to a domain, make sure that they really should have access to that domain. Weigh the benefits and limitations. The query above is for just one contains relationship. If you have a domain that contains another domain, and that domain is the parent of a number of other domains, you will have many more OR conditions. Be careful when you create a domain map so that you do not impact the performance of your instance.

**Domain paths query method**

You can create effective queries with domain paths.

Use domain paths instead of domain spooling (sys_domain) or domain numbering. Queries that use domain paths are much faster than spooling or numbering.

Domain paths is the default query method for instances that have enabled domain separation.

If you want to verify the query method on your instance, look for the following system properties in the admin dashboard:

- If domain path is enabled: In the System Properties table, you see `glide.sys.domain.provider=domain_paths` and `glide.sys.domain.paths.installed=true`.
- If domain path is not enabled: In the System Properties table, you see `glide.sys.domain.provider != domain_paths`, `glide.sys.domain.paths.installed=false`.

**Slow queries and SQL debugging**

Debugging SQL and slow queries can help you resolve slowness issues in an instance.

When you debug an instance, you can either enable SQL debugging to look for slow queries or you can look for slow queries by checking the Slow Queries [sys_query_pattern] table by navigating to **System Diagnostics > Stats > Slow Queries**. This table stores all the slow queries in the instance.

When you search the table, look for queries that contain `domain_path` to determine if any slow queries are due to the domain path in your instance.

If you do find slow queries, try to analyze why they are slow.

**Common reasons for slow queries**

- A query has too many OR conditions (for more information, see Contains queries and domain access). In the domain hierarchy, place the user or a domain at a hierarchy level where contains or visibility is not needed.
• The query method is not the domain path query method (for more information, see Domain paths query method): If you are not using the domain path query method, contact Customer Service and Support.

• A query needs a database to be indexed so you can see what is in the database quickly. If you can identify the slow query, run the "explain plan" to see if there are options for indexing available. The "explain plan" is a function of SQL that shows the query and what is going on with it.

Before Query business rules

You can use a Before Query business rule to help support data segregation on an instance. ServiceNow applications that support domain separation may support the separation of data and data routing only, have advanced business logic separation, or support tenant (customer) level administration of the application.

A Before Query business rule is supplementary code that you use to support data segregation within domain-separated environments.

⚠️ Warning: Do not use the Before Query business rule in place of the Domain Separation plugin. This business rule does not prevent data leakage as securely as the plugin.

Using the Before Query business rule for data segregation

You can use the Before Query business rule with data segregation in these situations:

• When domain separation is not supported by a ServiceNow application and you must grant or restrict table or row access to one or more non-internal customers outside of the service provider organization.

⚠️ Note: Before you begin developing, contact ServiceNow Customer Support about the application roadmap for that product; domain support improvements may be planned for upcoming releases.

• When a table is domain-separated but access to its rows must be granted or restricted based on certain conditions that apply only to a set of domains in the system.
  ◦ For example, a customer in the X domain has multiple vendors supporting that domain and those vendors are granted access to see only the records that are assigned to them

Points to consider before creating Before Query business rules

You can script Before Query business rules to prevent parent and child table access based on a combination of user information, group memberships, companies, roles, or record-specific field conditions.

• Before Query business rules are put into separate domains and created to apply globally, to a specific branch of a domain hierarchy.
  ◦ Where you can, create Before Query business rules at the lowest possible part of the domain hierarchy so that the rule runs only for users that it applies to.

  ◦ Know that there are scenarios in the system where business rules may not run or where a user-triggered interaction may not trigger a business rule to run. For example, a business rule won’t run when you have transform maps with Run business rules turned off, or you have scripts with the workflow disabled.

  ◦ Always populate the condition field to specify when the rule runs. For example, you can specify if the business rule applies only to certain vendors in a domain.
Warning: When designing and coding business rules (especially Query business rules), limit OR clauses and searches in non-indexed fields. Too many OR clauses and searches in non-indexed fields can slow queries or affect how your instance performs.

- Use Before Query business rules only when necessary. Too many Before Query rules can affect how your instance performs.

- Before Query business rules run before access control lists (ACLs) and perform better in general. This is true especially when you limit the returned results to those users in service provider (SP) environments who have access to several domains in the system.

- Filtering the data is transparent (unlike with ACLs) to users who do not see the message Data Security restricts... when interacting with data.

When not to use Before Query business rules and ACLs

Be careful when you use Before Query business rules and ACLs to segregate customer data. By using both business rules and ACLs, you create customizations that you then must maintain. Customizations can potentially cause performance issues. Your development teams should create processes to make sure that they don’t break the system.

Domain separation provides both scalability and governance with the current domain path query method (v3), which is a widely supported framework. The ServiceNow Platform and App teams are responsible for maintaining the framework, taking the burden off the customer.

For companies with many customers in many instances, excessive use of Before queries and ACLs may cause the database queries not to perform well.

How domain separation is enabled

You can enable domain separation with a ServiceNow plugin. A product manager, supported by a development team, manages the functionality. Enhancements and fixes for domain separation functionality are included with ServiceNow releases. Instance owners can consult Customer Service and Support resources, such as the Service Portal, at https://support.servicenow.com for assistance with domain separation.

Avoiding domain path in scripts

Domain paths can cause the values of your script to change or even break, so don’t use them in scripts.

Your script should not depend on the domain path because if you ever change the domain hierarchy, the domain path recalculates and its value changes. When this happens, your scripts are useless or can throw errors or break. The best strategy is not to write your scripts based on domain paths.

Use the sys_domain field in your scripts rather than depending on the domain path. If you ever change the domain hierarchy, the domain path recalculates and its value changes, which can cause your scripts to be useless, throw errors, or break. Look for base system business rules, which use the sys_domain field, to get some ideas before creating your own scripts.

The ServiceNow platform does not capture the sys_domain_path values in an update set in order to avoid issues with differences in the domain hierarchy for each instance. Therefore, you should validate the domain hierarchy after you import an update set to ensure that the domain path values for your records are correct.

To learn more about domain path, see Request domain separation and Domain Separation Center.
Domain assignments
How you assign a domain impacts the value of the `sys_domain` field. The assignments contain designs and business properties that affect how the application functions in each domain.

Value of the `sys_domain` field
The value of the `sys_domain` field contains the domain that is assigned to the record by any of the following:

- Company to which the user belongs
- Business rule that is used when creating the record
- Module that is used when creating the record
- Form template that is used when creating the record
- Domain of the parent record
- Domain that is assigned to the User record
- Domain of the user who creates it

Make sure that your domain assignment strategies and designs are well documented and tested so that you are creating records as those strategies and designs are inserted into the correct domain. That way you can see that the properties of each domain should you need to duplicate or modify them.

Domain separation and the Customer Service Management (CSM) plugin
For the best outcome, be aware of how the properties in the CSM plugin work. When the plugin is enabled, you can see the status of your records in your domains.

Instance owners should contact Customer Service and Support to enable this property:

- `csm_auto_account_domain_generation`

**Note:** This base system property is located in the system properties table and is available after CSM plugins are enabled.

**What the property does**
Whenever a new account in the Customer Service application is created, a domain is created and placed under the TOP domain. If the parent field on the account form is populated, and a new record is inserted, it creates that account as a subdomain of the parent.

**What happens if this property is not true and the domain is enabled**
New account records in a domain-separated environment are automatically placed in the default domain.

In the following image, you can see the status of the records with the plugin enabled.
Domain separation setup and administration

Setting up domain separation involves requesting activation of a plugin, setting options, and assigning users and records to domains.

Do the following to set up domain separation:

1. Request domain separation
2. Create a domain
3. Add a domain field to a table

You can also perform these basic administrative tasks on domains:

- Enable or disable a domain
- View domain relationships
- Expand domain scope
- Create a domain-specific choice list

See Advanced domain separation administration for a list of tasks to perform after you set up domain separation and perform basic administration.

Configuration and administration for service provider customers

Domain separation is designed to give ServiceNow® service providers (SPs) the ability to configure the services they offer to their customers. It is not designed to enable their customers to administer those services themselves, except in a few areas that this topic details.

Overview

It is safe for SP customers, on their own, to manage data contained within their domain that does not affect licensing or other customers. For example, it is safe for a customer to create new reports or manage configuration items, but it’s not safe for them to customize fields, choices, business rules, and other processes where they can impact other customers on the same instance.

The ServiceNow base system administrative roles and their access controls on the ServiceNow platform are designed for a single admin team per instance. For example, the domain_admin role is granted to one of the SP’s resources to manage all domain settings for the instance, and to create new domains. For any domain-specific admin tasks, the SP should create new “customer admin” roles and access controls as needed to grant specific access to their customers.

The following image is an overview of common admin functions in varying categories of what is safe for a customer to do.
### Can give access

Examples:

- CI data management in the CMDB
- Report creation
- Updates to existing user data, or new users without roles
- Updates to existing core data records such as department, group, location, cost center, or new groups without roles, and new departments/cost centers/location.

### Proceed with caution

Examples:

- **Catalog Items:** To create customer-specific catalog items that can be updated by the customer, two capabilities can be used together: Domain separation for catalog items (Domain separation and Service Catalog) enables the instance owner to create items in the customer’s domain. The instance owner can create a role to allow customers to update safe fields such as price, description, and images. The **Catalog Builder** (new in the Quebec release), gives the SP admin team the ability to create item templates that are safe to distribute to customers to create new items within their domain from within a prescriptive UI experience.

- **User/Group Management:** It’s safe to create a “customer admin” role that can create and modify user records, but adding and removing roles can affect security and licensing. There is no way in the base system to subdivide roles that are safe for a customer to be able to grant them. The same goes for the creation and modification of groups. While the group itself can be modified, the addition or subtraction of roles should be controlled.

- **Flow Designer:** ServiceNow Flow Designer is the building tool used to create process (workflow) for tables. The flow_designer role gives customers script-free access to build flows. They can read and clone every flow in domains above them in the hierarchy. They can create and modify flows in their domain. This cannot happen in a silo, however. Anyone who can affect process must be added to the global admin team for governance so processes do not cancel out each other or cause other conflicts.

### Do not give access

Understanding how choice fields work is helpful to understand why only the SP admin team should be managing them.
• Structure of a choice field: Choice field values are stored in the sys_choice table and grouped based on: Table, Domain, and Language.

For example, the State field in a Task is available to every table that extends a Task. That means that each table can have its own values, those values can be multiplied by domain, and the domain values can be multiplied by language.

All of the values for State across all tables, domains, and languages are considered the values for the State field.

• How changes to choice fields work: When a choice field is updated, a payload is created with all values for that field (Tables, Domains, Languages). When you install this payload on an instance, all existing values for the field are deleted and the new values are loaded. This ensures that there are no duplicate entries or leftover values that are no longer valid.

For this reason, it’s impossible to give a customer in a domain-separated instance the ability to update choice fields directly because that would affect the entire instance. In addition, you can’t update choices directly in a production instance because any imported update sets that affect that field would overwrite the existing choices. In some cases, choice fields can drive processes themselves, which would break if a customer were to change those fields.

Request domain separation

All domain support features are activated with a plugin called Domain Support - Domain Extensions Installer. Administrators can request activation of this plugin.

Before you begin

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: admin

About this task

If the Domain Support - Domain Extensions Installer plugin is already active, content in the Domain Support - Domain Extensions Installer plugin will not be installed to avoid potential conflict with an existing implementation.

Domain separation replaces Company Separation. Starting with the Helsinki release, the Company Separation plugin can no longer be activated. However, if company separation is already active when you activate domain separation, both plugins are active at the same time. You can control the company separation activation status with the glide.db.separation.field property.
Note: Domain paths are used for all customers on Helsinki and later. Domain numbering is no longer used. Customer Service and Support can assist in the upgrade.

Procedure
1. Navigate to All > System Applications > All Available Applications > All.
2. On the All Applications page, select Request Plugin to open the Request form on HI.

3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. Select your instance.
5. Select Actions > Activate Plugin.
6. On the form, fill in the fields.

Activate Plugin request form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like</td>
<td>The date and time must be at least two business days</td>
</tr>
<tr>
<td>this plugin to be enabled</td>
<td>from the current time.</td>
</tr>
</tbody>
</table>

Note: Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.</td>
</tr>
</tbody>
</table>

7. Select **Submit**.

**Results**

Activating the Domain Extension Installer plugin enables these features:

- Domain separation is based on the Domain [sys_domain] table.
- Delegated administration lets each domain have separate policy.
- All records are part of the global domain.
- The current user’s domain determines the domain to use when viewing or operating on a record in a different domain.

**Related information**

- [Domain separation plugin](#)

**Domain separation plugin**

The Domain Support - Domain Extensions Installer plugin activates several domain separation features and properties at once. This plugin is typically referred to as the Domain Separation plugin.

**Recommended practice for activating the Domain Separation plugin**

As part of domain separation development, administrators must request activation of this plugin. For best results, activate the Domain Separation plugin at the start of the development process, preferably before any other plugin is enabled.

If you enable the plugin towards the end of ServiceNow implementation or once an instance has gone live, your application is at risk in both performance and process. On established instances, depending on how things were structured in development, the risk to the platform and its usability could be high. To learn more about domain separation process, see [Understanding domain separation](#).

One risk can happen with the Task table: When the Domain Separation plugin is enabled, the Domain (sys_domain) column is added to the table and every existing record is automatically placed in `global`. The instance owner would need to script all these records into the correct domains, which mean there would have to be an established parent/child hierarchy. These types of scripted actions risk data corruption or loss, and possible production down time as large amounts of data would have to be moved. Much of the platform’s code such as business rules, client scripts, form views, workflows, and so on, would be placed into `global` and affected as well.

While that might be acceptable in the ServiceNow base system, if a customer creates code or modifies ServiceNow code, there is risk to platform performance and usability. This is like trying to rewire the main power poles fed into a house while the power is still turned on. Instance owners could severely delay their implementation or experience lengthy downtimes in the aftermath of this type of approach.

**Features of the Domain Separation plugin**

These features are enabled when you activate the plugin:
• Domain separation is based on the Domain [sys_domain] table.
• Delegated administration lets each domain have separate policy.
• All records are part of the global domain.
• The current user’s domain determines the domain to use when viewing or operating on a record in a different domain.

**Related reference**

Domain separation recommended practices for service providers

**Domain system properties and user preferences**

Administrators have access to properties and user preferences that control domain scope.

**Properties**

New activations of domain separation automatically restrict domain scope to the record’s domain for all related data or processes. When the user views a record in a form, the record’s related data (such as reference picker and related list data) and applied processes (such as business rules and client scripts) are restricted to the record’s domain scope. If there are records in multiple tabs, each tab has its own domain scope based on the record opened within that tab. The following properties restrict domain scope to either the record’s domain and the user’s current session domain.

**Domain system properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.sys.domain.use_record_domain_for_processes</td>
<td>Restricts domain scope to the record’s domain for all processes. This property does not apply to business rules. Business rules are always processed from the domain record.  &lt;ul&gt;&lt;li&gt;Type: true</td>
</tr>
<tr>
<td>glide.sys.domain.use_record_domain_for_data</td>
<td>Restricts domain scope to the record’s domain for all data.  &lt;ul&gt;&lt;li&gt;Type: true</td>
</tr>
</tbody>
</table>

When either the `glide.sys.domain.use_record_domain_for_processes` or the `glide.sys.domain.use_record_domain_for_data` property is set to **true**, the following properties are not used, regardless of their setting:
• glide.sys.domain.use_record_domain
• glide.sys.domain.use_record_domain_for_client_scripts
• glide.sys.domain.domain_change_notify
• glide.sys.domain.no_change_roles

For a full list of properties see Available system properties.

**Domain scope for business rules executed on the domain table**

In new activations of domain separation starting with the Jakarta release, the session domain determines the business rules executed on the domain table. In previous versions, business rules executed on the domain table were set based on the newly created domain’s hierarchy. This behavior is modified by the `glide.sys.domain.skip_domain_insert_businessrules` property. Setting this property to true significantly improves domain insert performance.

**Domain scope properties for business rules executed on the domain table**

<table>
<thead>
<tr>
<th>Property</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.sys.domain.skip_domain_insert_businessrules</td>
<td>Specifies the domain scope for business rules executed on the domain table. In new activations of domain separation, the property default is true and business rules are determined by the session domain. In existing implementations, the property default is false and the business rules are determined by the newly created domain’s hierarchy.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: True in new domain activations starting with Jakarta. False in existing implementations.</td>
</tr>
<tr>
<td>glide.sys.domain.skip_non_global_businessrule_if_nodomain</td>
<td>Ensures that only bus.rules from global domain are executed when using queryNoDomain() or when table is not domain-separated, so you can skip any other business rules</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Setting the property to false restores the old behavior and doesn’t align with ServiceNow® recommended practices.</td>
</tr>
<tr>
<td></td>
<td>• Recommended: Domain-separate your tables;</td>
</tr>
</tbody>
</table>
Domain scope properties for business rules executed on the domain table (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>always try to use the record’s domain rather than the session domain.</td>
<td></td>
</tr>
</tbody>
</table>

User preferences

In addition, user administrators can set the following user preference globally or on a per-user basis:

### Domain scope user preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Category</th>
<th>Updated By</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.domain.session_scope</td>
<td>Domain</td>
<td>Admin Only</td>
<td>When true, sets the default scope to the user’s session domain rather than the record’s domain. When false, the default scope is the record’s domain. Users with the domain_expand_scope user role can still change the domain scope as needed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>Default value</strong>: false</td>
</tr>
<tr>
<td>glide.domain.session_scope_notification</td>
<td>Domain</td>
<td>Admin Only</td>
<td>When true, displays a visual cue that record values include an expanded domain scope. When false, the notification is hidden.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>Default value</strong>: true</td>
</tr>
</tbody>
</table>

Domain separation application properties

Create a domain

You can create a domain by creating a record in the [domain] table.

Before you begin

Role required: admin

About this task

When creating a new domain, keep the following in mind:

- Only one domain can be the default domain.
- Only one domain can be the primary domain.
Procedure
1. Navigate to All > Domain Admin > Domains.
2. Click New.
3. Fill in the necessary fields (see table).
4. Click Submit.

```
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the domain.</td>
</tr>
<tr>
<td>Type</td>
<td>Select a domain type that describes the domain. By default the domain types are Vendor, Customer, and MSP. You can also add your own choices.</td>
</tr>
<tr>
<td>Primary</td>
<td>Select the check box if this domain is to be the top-level domain in the hierarchy. The top-level domain only has child domains and no parent domains.</td>
</tr>
<tr>
<td>Default</td>
<td>Select if this domain is to be the default domain for your hierarchy.</td>
</tr>
<tr>
<td>Parent</td>
<td>Select the name of the domain higher in the hierarchy that contains this domain. This field must have a value for the domain to appear in the domain map.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to make the domain available for use. You must select this option for this domain to appear in the domain map.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for the domain.</td>
</tr>
</tbody>
</table>
```

Each domain record can also have several related records:

- Companies
- Contains Domains
- Contained By

What to do next
To change the domain hierarchy, go to the Contains Domains related list and select the domain records that is the child (contained) domains of the contains relationship.

Make a domain the default
The default domain is the domain to which the system automatically assigns task and user records that are not already assigned to a domain.
Before you begin
Role required: admin

Procedure
1. Navigate to All > Domain Admin > Domains.
2. Open the domain you want to be the default domain. For example, Default.
3. Configure the form layout to add the Default field.
4. Select the Default check box.
5. Click Update.

Note: If you do not set a default domain, then new tasks and user records are placed in the global domain.

Manually manage the domain for particular records
By default, the system automatically assigns a domain based on the user's company record. In some cases, however, domain administrators want to manually manage which domain a particular record belongs to.

Before you begin
Role required: admin

About this task
The Managed domain field allows domain administrators to manually select a domain for the user, group, department, location, or CI record, rather than using the domain assigned automatically from the company record. The Managed domain field is available on these record types.

- User records
- Group records
- Department records
- Location records
- CI records
Procedure
1. Navigate to the record you want to manually manage.
2. Select the Managed domain check box.
3. From the Domain field, select the domain for the record.
4. Click Update.

Clearing the Managed domain check box hides Domain field and the record uses the domain value from the record's company.

Domain separation recommended practices for service providers

Domain Separated Tables
You can see at a glance which tables are domain-separated in your instance with the Domain Separated Tables feature.

Overview
Use the Domain Separated Tables feature to see which tables are domain-separated. You must activate the Domain separation plugin (Domain Support - Domain Extensions Installer), which requires the "maint" role. Start typing "domain" to see the feature appear in the left navigation pane.
You can filter this view to display or remove column names to look for certain properties or attributes that are included in your tables. There are two table types that display on the list:

- Tables that have an explicit `sys_domain` column present, where the **Column** name displays `sys_domain` value in the list.
- Tables that are using the `domain_master` attribute to derive domain separation from a referenced table, where the **Attributes** column includes the `domain_master=ref-table` value.

When you use the Show Matching or Filter Out selections on the Column name menu, you can view these two types of tables.

### Domain Override Viewer

With the Domain Override Viewer, you can see and manage all your process overrides at once across the entire instance.

### Overview

Rather than creating an elaborate search for overrides in your scripts, you can use the Domain Override Viewer to find them quickly.

To launch this feature, begin typing its name in the navigation pane.

The table selector in the Domain Override Viewer displays a list of only the tables that contain record overrides, along with a count of overrides in that table. After you select a table, a list of all parent records with overrides is returned. You can quickly view all **parent records**, the **domain** of the parent record, and a **count** of overrides for each record.

Selecting **View Overrides** loads a new tab where all overrides, including the parent record, display in the standard list view.
To learn more, see Create domain-separated property overrides.

Enable or disable a domain
When you activate or deactivate a domain, the activation status cascades to companies within the domain.

Before you begin
Role required: admin

About this task
When you activate a company record, domain separation automatically activates the company's associated domain. For example, if you activate the ACME company, then you also activate the TOP/ACME domain.

Procedure
1. Navigate to the domain record.
2. Clear or select the Active check box.
3. Click Update.

⚠️ Warning: Do not delete domains. Deactivate domains that you no longer need instead of deleting them.

Add a domain field to a table
Administrators can domain-separate a custom table by adding a sys_domain field to it. However, it is not recommended to add domains to base system tables.
Before you begin
Role required: admin

Procedure
1. Navigate to the table’s list view. For example, type <table name>.list in the navigation filter.
2. Right-click the list header and select Configure > List Layout.
3. In the Create new field section, enter sys_domain as the Name and Domain ID as the Type.
4. Click Add.
5. Click Save.

† Note: Any other means of creating a field adds a u_ prefix to the column name. But with the domain field, the system automatically creates the field without the u_ prefix. You can use the following functionality as a shortcut: Whenever you create a sys_domain field, name it sys_domain and leave the field type as is. The system automatically sets the field type to Domain ID and the field label to Domain, saving you a few clicks.

Adding domains to base system tables requires prohibitively thorough testing, updates and adding new logic. In addition in many cases, the source code is not accessible to the customer.

View domain relationships
The domain map offers domain administrators a read-only representation of the active domains on the instance and how they relate to each other.

Before you begin
Role required: admin

About this task
All domain maps must have one domain set as the primary domain. In addition, each domain in the domain map must meet these criteria:

• The Parent field must be filled in (the primary domain is the only exception to this).
• The Active check box must be selected.

The domain map does not draw domain relationships for domains that fail to meet the mapping criteria.

Procedure
1. Navigate to All > Domain Admin > Domain Map.
2. Click the plus (+) or minus (-) icons on the domain headers to show or hide sub domains.

Select a primary domain
The primary domain indicates the top-level domain in the domain map.

Before you begin
Role required: admin
About this task
The primary domain cannot have a parent domain and must have at least one child
domain. There can only be one primary domain at a time. If you select another domain as
the primary domain, it overrides the previous primary domain.

Procedure
1. Navigate to All > Domain Admin > Domains.
2. Select the domain you want to be the primary domain. For example, TOP.
3. Select the Primary check box.
4. Click Update.

Create Contains relationships between domains
Creating a "contains" relationship between domains changes the domain hierarchy.

Before you begin
Role required: admin

About this task
Domains in a contains relationship inherit the settings of the containing domain. The
containing domain allows users to see data in the contained domain as well as any of its
children. Processes are unaffected by a contains relationship.
**Procedure**

1. Navigate to the domain table.
2. Select the domain record that is the parent (container) domain of the new contains relationship.
3. Toggle the domain scope to switch between the session scope and record scope, if necessary.
4. From the Contains Domains related list, click **Edit**.
5. Select the domain records that is the child (contained) domains of the contains relationship. Only child domains appear by default when the domain picker is set to Global. Toggle the domain scope to see all domains in slushbucket.
6. Click **Save**, and then click **Update**.

![Contains Domains](image)

**Related reference**

**Domain separation recommended practices for service providers**

**Expand domain scope**

By default, when a user in the global domain views a table containing a `sys_overrides` column, the user sees records from only the global domain. When an admin in the global domain views a process table, that admin sees only records that are in that process table.

**Before you begin**

Role required: admin

**Procedure**

1. Change the `glide.sys.restrict_global_domain_processes` property to **true**.
2. To view records from all domains, click **Expand Domain Scope** under Related Links.
3. To return to viewing records from the global domain only, click **Collapse Domain Scope**.

**Add domains to a visibility domains list**

Adding a visibility domain allows a user or group to see and potentially edit records from another domain regardless of the user or group's normal domain membership.

**Before you begin**

Role required: admin

**About this task**

Assigning visibility domains to all members of a group is preferred over granting them to individual users.

**Note:** Adding a visibility domain does not change a table or record's access control rule requirements.
Procedure
1. Navigate to the group table.
2. Select the group you want to provide with visibility domains.
3. Add the Visibility domains related list to the form.
4. From the Visibility domains related list, click Edit.
5. Select the domain records you want the group or domain to see.
6. Click Save, and then click Update.

Grant visibility domains to an individual user
While it is possible to add visibility domains for specific users on the User form, it's best to add them only via groups. This controls permissions and access should individuals change departments or leave the company.

Before you begin
Role required: admin

Procedure
1. Navigate to All > User Administration > User.
2. Select the user you want to provide with visibility domains.
3. Add the Visibility domains related list to the form.
4. From the Visibility Domains related list, click Edit.
5. Select the domains whose records you want the user to see.
6. Click Save, and then click Update.

The Visibility domain embedded list contains the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td>Domain that is visible to the group or user.</td>
</tr>
<tr>
<td>Inherited</td>
<td>Domain is inherited from domain visibility or a parent domain.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Granted By</td>
<td>Name of the group that granted domain visibility.</td>
</tr>
<tr>
<td>Parent visibility</td>
<td>Name of the parent domain and used for grouping records. If the parent record is deleted, then all records with the same parent are deleted as well.</td>
</tr>
</tbody>
</table>

Create a domain-specific choice list
Administrators can configure choice lists to contain entries specific to a particular domain.

Before you begin
Role required: admin

Procedure
1. Select the domain from domain picker where the choice should be added.
2. Right-click the choice field you want to customize and select **Configure Choices**.
3. Update or add choices.
4. Push changes through the normal change process such as update sets.

⚠️ Note: Administrators should ensure that choices are unique across domains to prevent administrative confusion in the global domain.

If an administrator adds a new choice from the global domain, then users from domains lower in the hierarchy see the new choice at the end of their current choice lists. If the new choice is not active at the global level, then it is available to the domain users via **Configure Choices** but does not show as an active choice.

Advanced domain separation administration
Administrators can view information about domain separation, identify potential issues, and change configuration settings.
You can perform these advanced administrative tasks on domains:
- Use domain selection menus
- View domain relationships

Use domain selection menus
The instance offers domain selection via two menu formats.
- Domain selector: provides a simple drop-down list of available domains.
- Domain reference picker: enables a reference field that offers filtering and an auto-complete, type-ahead entry feature. Use this format for longer lists.

The placement of these pickers and the procedure to show or hide them differ depending on the user interface version.

Enable domain selection menus in UI16
Displaying the domain picker in UI16 enables the domain selector by default. After enabling the domain selector, you can add a system property to enable the domain reference picker.
Before you begin
Role required: admin

About this task

Procedure
1. Click the gear icon in the header.
2. On the General tab, click the Show domain picker in header switch.
   The domain selector appears in the UI16 header.
3. Optional: Enable the domain reference picker.
   
   Note: Enabling the domain reference picker removes the global option from the list. To return to your home domain, click the return arrow next to the reference field. Admin users can click the return arrow to return to the global domain.

   a. Enter sys_properties.list in the application navigator.
   b. If not already present, add the glide.ui.domain_reference_picker.enabled property and set the value to true.
   c. Refresh the browser.
   The domain reference picker appears in the UI16 header.

Restrict access to the domain picker
Use a system property to restrict access to the domain picker in UI16 and Next Experience.

Before you begin
Role required: admin

About this task
By default, users with the ITIL role, and roles that include the ITIL role (such as the administrator), can access the domain picker in Next Experience. You can grant other roles access by adding them to the property or restrict roles by removing them. It is recommended to restrict the role to admins only.
Admins can grant access to users by creating a system property in the sys_properties table.
Procedure
2. Add this property: glide.ui.polaris.domain_picker.role
3. Configure the property value as a comma-separated list of roles: admin, itil.
   To learn more, see Configure Next Experience pickers

View domain relationships
The domain map offers domain administrators a read-only representation of the active domains on the instance and how they relate to each other.

Before you begin
Role required: admin

About this task
All domain maps must have one domain set as the primary domain. In addition, each domain in the domain map must meet these criteria:

• The Parent field must be filled in (the primary domain is the only exception to this).
• The Active check box must be selected.

The domain map does not draw domain relationships for domains that fail to meet the mapping criteria.

Procedure
1. Navigate to All > Domain Admin > Domain Map.
2. Click the plus (+) or minus (-) icons on the domain headers to show or hide sub domains.
Domain separation application properties

The Domain Separation plugin has two new tables to give service providers more flexibility in customizing their applications that use domain separation. These tables are the System Application Property table [sys_application_property] and the System Application Property Value table [sys_application_property_value].

New tables offer more options

With service provider (SP) applications, certain actions can vary depending on the domain. However, the ServiceNow® base system System Properties [sys_properties] table is not domain-separated, so it doesn’t satisfy the requirements for applications that use domain separation.

Each SP customer may want to customize their applications differently. Previously, features that could be customized were defined as only one global value. Application developers need a more flexible table. Now you can modify your application without having to create code every time you want to add or change the functionality.

How overrides work in the new tables

Developers typically use the ServiceNow System Property [sys_properties] table to create various functions in applications. If you wanted to develop an application to behave differently in different domains, you’d have to customize it yourself.

In the Paris release, the new Application Property [sys_application_property] table simplifies that customization. Instead of going directly to the System Property table for a value, the application property table goes to the System Application table first. This new table now stores the logic that you require to configure your application. If it finds a property in the new table, it uses that content. If there is no information in that table, it moves on to the base system properties table.

When you configure support for domain separation, you can add domain logic to this new Application Properties table. This table can contain properties that don't exist in the System Properties table. Or you can add properties to the configuration table that can override any property that you select in the System Properties table.

For example, let's say that you want to configure an application with a First day of the week feature. Sometimes, you might want the first day of the week to be Sunday. In other cases, you might want the first day of the week to be Monday. In the base system table, there might be only one Day 1 option, which is Sunday. With the new table, you can store another property, making Day 1, Sunday, and a child domain, Monday.
This figure shows how the system draws properties from the Application Property table before going to the System Property [sys_properties] table.

How scoped apps work in the new table

The new Application Properties table is supported from scoped applications. The application property name, similar to the system property name, is unique, which means that it is prefixed with the scope name if it is not global. The scope of an application impacts your configuration. The scope may determine which Day 1 is defined as Sunday and which as Monday. You can use the same property but customize it so that Day 1, Sunday is the parent domain and Day 1, Monday is the child domain. In the new table, there is both a domain column and a scope column, so you can set these properties for each.

You can use the Expand Domain Scope view in the sys_application_property_value table to show all overrides, as shown in the following image.
Note:
If those tables are not available, make sure that you have activated the Domain Extension Installer (com.glide.domain.msp_extensionsinstaller) plugin.

New application property tables
The new System Application Property [sys_application_property] table contains these fields:

- **sys_application_property table**
  - name
  - description
  - type (choice of string, true | false, integer, time zone, color, and so on)
  - default_value
  - property (ref to sys_properties)
  - usage_notes
  - read_roles
  - write_roles
  - unique key: (name)

The new System Application Property Value [sys_application_property_value] table contains these fields:

- **sys_application_property_value table**
  - sys_application_property (ref to sys_application_property)
  - sys_domain
  - sys_overrides
  - value
  - unique key: (sys_application_property, sys_domain)

New APIs
The new APIs are also supported in scoped apps. Domain-separated application properties have distinct APIs. The GlideApplicationProperty API has two new scriptable methods, available in both global and scoped applications. See GlideApplicationProperty - Scoped, Global to learn more about these new APIs.

Domain separation recommended practices for service providers

Domain Migration Tool
Use the Domain Migration Tool to move a customer from a domain-separated environment to their own dedicated instance. After migration, the new instance is not domain separated.

Domain Migration Tool plugin
The Domain Migration Tool plugin (com.glide.domain.migration_tool) simplifies the task of moving a customer from a domain-separated environment to a more flexible dedicated instance. Customers may want to migrate to a separate instance to take greater advantage of the Now Platform capabilities.
**Note:** You must request a cloned instance and request activation of the Domain Migration Tool plugin before you can use it.

The Domain Migration Tool runs only if both data and process separation are enabled in the domain-separated instance:

- The `glide.sys.domain.partitioning` data property must be set to **true**.
- The `glide.sys.comain.delegated_administration` process property must be set to **true**.

**What the migration tool does**

- Automates much of the migration process, especially cleaning up data
- Migrates the domain-separated instance to a new non-domain-separated instance
- Deletes data from the non-domain-separated instance

**Note:** The tool doesn’t delete data that is global, in the target domain, or in additional data domains (if specified).

- Collapses process data, or if unable to collapse, deletes process data
- Keeps process records that are visible to the target domain
- Updates the `sys_choice`, `sys_ui_list`, and `sys_ui_related_list` special tables
- Cleans up records added by domain separation plugins:
  - Business rules
  - UI actions
  - Scheduled jobs
  - Installation exits
  - Navigation modules
- Disables domain separation and removes domains from the cloned instance:
  - Sets these properties to **false** in the cloned instance:
    - `glide.sys.domain.partitioning`
    - `glide.sys.domain.delegated_administration`
    - `glide.sys.domain.enabled`
  - Deletes all domains except the target domain and any additional specified data domains
- Updates the **Status** field in the `domain_migration_tool_status` table
  - The **Status** is **Finished** when the tool completes the process.
- Logs progress and status to `syslog_domain`
  - The source is **MigrationTool** for all log entries associated with migration.
  - Logs each data table and how many data tables remain
  - Logs each process table and which domain’s records are currently being inactivated or deleted

**What the migration tool doesn’t do**

- Clone the instance
- Create another domain-separated instance
• Manage data in the source domain-separated instance
• Migrate records (data or process) if either data or process separation properties are disabled before you run the tool
• Alter any data on the source instance
• Work on instances with records higher than 60K
• Delete data that is global, in the target domain, or in additional data domains (if specified)

What you must do after running the tool

The Domain Migration Tool automates the removal of data outside the desired domains (the target domain, any additional data domains, and the global domain). You must evaluate all the remaining configurations to ensure that they are appropriate and work for your non-domain-separated instance. For example, if you had a business rule that set the domain field on records, you might want to disable this business rule, since it no longer serves a purpose.

Migrate a domain-separated instance to a dedicated instance

Move a customer from a domain-separated environment into their own dedicated instance environment.

Before you begin
Role required: admin

Procedure
1. Navigate to All > domain_migration_tool_status.list.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target domain</td>
<td>Specify the domain you want to migrate. This is the domain used for both process and data. Only the target domain is retained, not any of its children, unless specified in the Additional data domains field.</td>
</tr>
<tr>
<td>Additional data domains</td>
<td>Optionally, specify any additional data domains you want to migrate. If you want to migrate the target domain and all of its children, you must specify all children.</td>
</tr>
</tbody>
</table>

4. Click Submit.
5. Open the form you just submitted.
6. Click Start Migration.
7. The Status is updated as the tool performs its functions. The Status is Finished when the migration is complete.

Process administration

Process administration allows administrators to set domain-specific policies.

The policies set lower in the domain hierarchy override policies set higher in the domain hierarchy. While in a domain, administrators can set domain-specific versions of these global policies and settings:
• Client scripts
• System policies
• Application and module names
• Application roles
• Module filters

⚠️ **Warning:** All users with the admin role have special access to all system features, functions, and data because administrators can override ACL rules and pass all role checks. Grant this privilege carefully.

When users have the admin role, then all policies in the instance are available to them regardless of the assigned domain. They can enter a specific domain, and then only policies in that domain or higher are visible and processed during a relevant transaction. When an administrator modifies a policy that is in a higher domain or the global domain, the system automatically creates a new record for that administrator's current domain. It does not modify the original policy, application, or module record. This new record overrides the original.

To make changes to a policy in a lower-level domain, go into that domain and modify the policy. This approach creates the new policy record in your domain that overrides the original, higher-level policy record.

Do not make changes on the higher-level policy and then change the Domain field on that policy. This approach does not create a policy record in your lower-level domain, nor does it keep the policy record for the higher-level domain.

The sys_overrides field indicates that a policy, application, or module at a lower level in the hierarchy overrides a record at a higher level. The system automatically sets this field when an administrator attempts to modify a policy, application, or module that belongs to another domain higher in the hierarchy. Again, rather than actually changing the higher level record, the attempted update is changed into an insert, and the sys_overrides field is set to indicate the higher level policy, application, or module that is being overridden. Later when the records for a relevant transaction are loaded, the overriding domain-specific policy, application, or module is used instead of the original.

### Domains for process administration

By default, process administration always uses the record's domain to determine what policies to apply.

The record's domain takes precedence over the user's domain. If there are no policies in the record's domain, delegated administration checks for policies in the next highest level of the domain hierarchy. The search for domain policies continues up the domain hierarchy until reaching the global domain. If there are no domain policies lower in the domain hierarchy, processes administration uses the policies for the global domain.

For example, Fred Luddy is a user in the Acme domain who can see records in the child domains of Acme: Atlanta, Acme: San Diego, and Acme: NY child domains. When he opens a record in the Acme: San Diego domain, process administration first checks for policies in the Acme: San Diego domain. If there are no policies at this level of the domain hierarchy, process administration checks for policies from the Acme domain. If there are no policies in the Acme domain, process administration uses the global domain policies as there are no other domains higher in the domain hierarchy.

### Sample process administration with domain specific applications

The following example illustrates process administration with domain-specific applications and modules.
As the administrator of the Oceanic domain, David Loo decides to customize the Configuration application. To start with, David reviews the modules available in the Configuration application module.

### Starting view of the Configuration application

![Starting view of the Configuration application](image)

David decides to rename the Configuration application to CMDB and to allow the inventory_admin role to see the application.

### Sample domain-specific changes to the Configuration application

![Sample domain-specific changes to the Configuration application](image)

Next, David decides to change the Incident application by activating the **Open - in "New" State** module and adding a new filter item to show open incidents in the Oceanic category.
Sample domain-specific changes to the Open - "New" State module

This creates a new module entry in the application rather than overwriting the existing module in the global domain.

Domain-specific view of the Incident application

If another administrator from another domain, such as Fred Luddy, logs in and looks at the Configuration application, the settings from the global domain appear.
Enable verbose domain logging and debug messages
Domain log and debug messages allow you to troubleshoot domain configuration errors.

Before you begin
Role required: admin
Make sure you are the latest instance for best performance.

Procedure
1. In the Domain Separation Center, navigate to Domain Admin.
2. Click Configure Domain Center.
3. For Enable verbose domain logging, select the Yes check box.
4. Click Update.
View a real-time domain message

You can view real-time domain messages from the system logs.

Before you begin
Role required: admin

Procedure
1. Enable verbose domain logging: Navigate to All > Domain Admin > Domain Separation Center > Configure Domain Center > Enables detail domain logging > Yes (or set property glide.sys.domain.verbose to True).
2. Navigate to System Diagnostics > Session Debug > Enable All. Because this is a real time review, there is no need to let the debug session run for a time before checking the log files.
4. Search for the text Query against table.

This query finds log messages in this format:

```
08:36:43.974: [Domain Paths] Query against table incident restricted by domain values
[Database Atlanta[db53580b0a0a0a6501aa37c294a2ba6b],
Database[287ee6fe9fe198100ada7950d0b5b73],
Database San Diego[db53a9290a0a650091aebecf833c6], global, NY
DB[5f74727dc0a8010e01efe33a251993f9]`
```

In this example, the user viewing the Incident table only saw records that matched the Database Atlanta, Database, Database San Diego, global, and NY DB domains.

View a historical domain message

You can view historical domain messages in the log file to troubleshoot domain separation issues.

Before you begin
Role required: admin

Procedure
1. Enable verbose domain logging: Navigate to All > Domain Admin > Domain Separation Center > Configure Domain Center > Enables detail domain logging > Yes (or set property glide.sys.domain.verbose to True).
2. Navigate to System Diagnostics > Session Debug > Enable All.
3. Let the debug session run for a time period, such as a day, before checking the log files.
5. Open the record for the day you want to view. Log files use the naming format localhost_log.<yyy-mm-dd>.txt.
6. Click the Download log related link.
7. Open the downloaded log file in a text editor and search for log messages with the following format:
Query against table incident restricted by domain values [global, Software[8a4dde73c6112278017a6a4baf547aa7]]

In this example, a user only saw records from the Incident table that matched the global and Software domains.

Troubleshoot domain separation errors

If you encounter domain separation issues, review this list of solutions.

<table>
<thead>
<tr>
<th>Error or symptom</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>A domain sys_id points to a non-existent domain</td>
<td>This error occurs when a data record, such as a user or task record, has a sys_domain column value whose sys_id does not exist in the current domain table. The domain sys_id could have been accidentally deleted or it could refer to a previous domain table if you changed the domain table. To fix the error, open a list for the table containing the error, filter on the invalid sys_domain value. Then, either manually enter the correct sys_domain value or remove it.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can have invalid domain sys_ids in any table that references the domain table. For example, invalid domain IDs can occur in the User Visibility Domain [sys_user_visibility], Group Visibility Domain [sys_user_group_visibility], and Contained Domain [domain_contains] tables.</td>
</tr>
<tr>
<td>A domain path or domain number sys_id points to the wrong domain</td>
<td>This error occurs when a domain number or domain path query is out of sync with the actual domain name. This error can occur with domain numbers when adding domains requires renumbering or during the conversion from domain numbers to domain paths. To fix the error, check the results in the Domain Separation Center. If the error persists, you can manually edit the value for the sys_domain_path or sys_domain_number columns to point to the proper domain.</td>
</tr>
<tr>
<td>The domain tree structure is corrupt</td>
<td>This error occurs if there is a series of domain contains relationships that create an infinite loop among domains. To fix the error, open a list for the domain table and manually edit the domain contains values to not form a loop.</td>
</tr>
</tbody>
</table>

Domain Separation Center

Audit your domains regularly to reveal problems.

What is the Domain Separation Center?

The Domain Separation Center is a dashboard where you can schedule and configure audits for all of the domains stored in your domain_audit_definition table. The dashboard enables you to review audit results and dig deeper into domain errors and warnings. You can find the Domain Separation Center dashboard at <ServiceNow-instance-name>/domaincenter.

The Domain Separation Center provides many audits. You cannot create your own. You can, however, configure how often they run. Audits run on all of the domains stored in the domain_audit_definition table.
Configure audits
You can configure whether an audit is active and how frequently it runs.

1. In the Domain Separation Center, click **Configure Audits**.
   
The **Configure Audits** page displays.

2. Configure each audit you want to be active. Audits are inactive by default.
   
   a. Click an audit.
   
   b. Click the **Active** box to activate the audit.
   
   c. Specify how often the audit runs in the **Frequency** field.
      
The Domain Separation Center runs all audits marked with the same frequency at the same time. Do not select **Daily** for audits run on large tables.
   
   d. Repeat these steps for each audit you want to activate.

3. Click **Save**.

Schedule audits
You configured one or more audits to run daily, weekly, or monthly. The scheduler specifies what days and times to run those audits. All audits with the same scheduling frequency run sequentially staring at the time you configure.

1. In the Domain Separation Center, click **Audit Schedules**.
   
The **Audit Schedule** page displays.

2. Configure the audit schedules.
a. Click a schedule name.

b. Specify the time of day to run the audit.
   Time units are 24 hour clocks, that is, 14 equals 2 PM.

c. For weekly schedules, select the day of the week to run the audit, where 1 is Sunday.

d. For monthly schedules, select the day of the month to run the audit.

e. Repeat the procedure for the other schedules.

3. Click Save to save the configuration changes.

4. Click Execute Now to run all of the audits scheduled to run at the frequency shown at the top of the right pane, for example, if the pane title is, Domain Audit Schedule - Daily, all of the audits that run daily are run.

To see the status of a running audit, in the Domain Separation Center, click the number in the Running Audits box.

**Execute audits immediately**
Audits typically run as scheduled. You can, however run all audits on command.

1. In the Domain Separation Center, click Audit Schedules.
   The Audit Schedule page displays.

2. Click the name of the audit schedule you want to run, for example, daily, weekly, or monthly.

3. Click Execute Now.

To see the status of a running audit, in the Domain Separation Center, click the number in the Running Audits box.

**Configure the Domain Separation Center**

1. In the Domain Separation Center, click Configure Domain Center.

2. On the Configure Domain Center page, for Enables detail domain logging, select Yes to store detailed logs that help diagnose domain-related issues. Detailed logging might cause performance issues.
   These logs refer to server-side logs in the syslog_domain table. For information about viewing the logs, see View audits with warnings and failures.

3. In the slushbucket, move into the Selected column all of your large tables.
   Daily audits should not run on large tables. Grayed-out table names in the Selected column are large and cannot be moved to the Available column.

4. Click Update.

**View audits with warnings and failures**
On the dashboard, Errors and Warnings provide detailed information about audits that encountered problems. Logs related to domain separation reside on your server in the syslog_domain table.

1. In the Domain Separation Center, click the number in the Errors or Warnings box.
   The Errors or Warnings page displays, respectively.

2. Click one of the audits in the list.
The page displays detailed information about problems with the audit you selected. The messages in **Audit Result Details** refer to values in the syslog_domain table for table audits that revealed errors or warnings.

3. To see the logs on the server that provide information about warning or error audits:
   a. Copy the **Detail ID** value in the left panel of a warning or error.
   b. In the Filter Navigator of HI, enter `syslog_domain.do`.
      The Domain Log page displays.
   c. In the **Source** search field, enter `=<Detail-ID>` (no space after the equals sign), for example, `=f6a00fd29a85b300a9503a81b9169678`.
      The Domain Log page displays only the logs related to the audit with the Detail ID you specified. Each row in the table specifies a different record the audit found problems in. Notice that the **Message** field on this page matches the values displayed in the Domain Service Center's **Message** column. The format of the message matches the audit type.

4. Click:
   - **Rerun Audit**—Rerun an audit to see if it still encounters a warning or error.
   - **Deactivate Audit**—Inactivate an audit.
   - **Copy Details**—Copy audit details to the clipboard.

**View running and pending audits**
Active audits periodically run or are queued to run, as scheduled. You can view their status as they run.
1. Click the number in the **Running Audits** box to view audits that are currently running or pending running.
   The **Running Audits** page displays.
2. Click an audit for more information about it.

**View inactive audits**
1. Click the number in the **Inactive Audits** box.
   The **Inactive Audits** page displays all of the audits that are currently deactivated.
2. Click one of the audits to display more information about it.
3. To activate an audit, click the **Active** box and use the **Frequency** field to specify how often the audit runs.
4. Click **Update**.

**Configure the Domain Separation Center**
Specify which tables in domains are large and whether you want detailed logging.

**Before you begin**
Role required: admin

**About this task**
You can schedule audits to run on a daily, weekly, or monthly basis. Audits run on very large tables can take a significant amount of time. For that reason, we advise you not to run audits daily on large tables. Starting a new audit on one that is taking more than a day to run can have negative consequences.

Detailed logging can provide greater insights into problems found during audits. Detailed logging, however, may hurt performance.
Procedure

1. In the Domain Separation Center, click Configure Domain Center.
   The Configure Domain Center page appears.

2. For Enables detail domain logging, select Yes to store detailed logs that help diagnose domain-related issues. Detailed logging might cause performance issues. These logs refer to server-side logs in the syslog_domain table. For information about viewing the logs, see the View audits with warnings and failures section below.

3. In the slushbucket, move all of your large tables into the Selected column.
   Daily audits should not run on large tables. Grayed-out table names in the Selected column are large and cannot be moved to the Available column.

4. Click Update.

5. If you have very large tables that should never be audited, set the com.glide.domain.audit.big_tables.additional system property to a comma-separated list of those table names.

Configure audits
You can configure whether an audit is active and how frequently it runs.

Before you begin
Role required: admin

Procedure

1. In the Domain Separation Center, click Configure Audits.
   The Configure Audits page appears.

2. Configure each audit you want to be active. Audits are inactive by default.

   a. Click an audit.

   b. Click the Active check box to activate the audit.

   c. Specify how often the audit runs in the Frequency field.
      The Domain Separation Center runs all audits marked with the same frequency at the same time. Do not select Daily for audits run on large tables.

   d. Repeat steps a-c for each audit you want to activate.

3. Click Save.

Schedule audits
Specify the time and day that audits are run.

Before you begin
Role required: admin

About this task
You configured one or more audits to run daily, weekly, or monthly. The scheduler specifies what days and times to run those audits. All audits with the same scheduling frequency run sequentially starting at the time you configure.
Procedure
1. In the Domain Separation Center, click **Audit Schedules**. The Audit Schedule page appears.

2. Configure the audit schedules.
   a. Click a schedule name.
   b. Specify the time of day to run the audit. Time units use the 24-hour clock (that is, 14 equals 2 PM).
   c. For weekly schedules, select the day of the week to run the audit, where 1 is Sunday.
   d. For monthly schedules, select the day of the month to run the audit.
   e. Repeat the procedure for the other schedules.

3. Click **Save** to save the configuration changes.

4. Optional: Click **Execute Now** to run all the audits scheduled to run at the frequency shown at the top of the right pane. For example, if the pane title is **Domain Audit Schedule - Daily**, **Execute Now** immediately runs all the audits that are scheduled to run daily.

What to do next
To see the status of a running audit, in the Domain Separation Center, click the number in the **Running Audits** box.

Execute audits immediately
Audits typically run as scheduled. You can, however, run all audits on command.

Before you begin
Role required: admin

About this task
You cannot run individual audits manually. You can, however, run all audits that are configured with the same scheduling frequency. For example, you can run all audits that are configured to run daily.

Procedure
1. In the Domain Separation Center, click **Audit Schedules**.

2. Click the name of the audit schedule you want to run (for example, daily, weekly, or monthly).

3. Click **Execute Now**.

What to do next
To see the status of a running audit, in the Domain Separation Center, click the number in the **Running Audits** box.

View audits with warnings and errors
The Domain Separation Center provides details about audit errors and warnings.

Before you begin
Role required: admin
About this task
On the Service Domain Center dashboard, **Errors** and **Warnings** provide detailed information about audits that encountered problems. Logs related to domain separation reside on your server in the syslog_domain table. Errors are issues that require immediate attention. Warnings do not lead to failures but present best practices, for example, not making the domain name too long.

Procedure
1. In the Domain Separation Center, click the number in the **Errors** or **Warnings** box. The **Errors** or **Warnings** page appears.
2. Click one of the audits in the list. The page displays detailed information about problems with the audit you selected. The messages in **Audit Result Details** refer to values in the syslog_domain table on the server for table audits that revealed errors or warnings.
3. To see the logs on the server that provide information about warning or error audits:
   a. Copy the **Detail ID** value in the left panel of a warning or error.
   b. On the instance running the Domain Separation Center, in the **Filter navigator**, enter **syslog_domain.list**. The Domain Log page appears.
   c. In the search field of the **Source** column, enter \=\{Detail-ID\} (no space after the equals sign), for example, \=f6a00fd29a85b300a9503a81b9169678. The Domain Log page displays only the logs related to the audit with the Detail ID you specified. Each row in the table specifies a different record the audit found problems in. Notice that the **Message** field on this page matches the values displayed in the **Message** column of the Domain Service Center. The information included in the message matches the audit type.
4. Optionally, click:
   - **Rerun Audit** — Rerun an audit to see if it still encounters a warning or error.
   - **Deactivate Audit** — Inactivate an audit.
   - **Copy Details** — Copy audit details to the clipboard.

View running and pending results
You can view running and pending audits to see their status.

Before you begin
Role required: admin

About this task
Active audits periodically run or are queued to run, as scheduled. You can view their status as they run.

Procedure
1. Click the number in the **Running Audits** box to view audits that are currently running or pending running. The Running Audits page appears.
2. Click a running or pending audit to see information about it.
View inactive audits
You can view all inactive audits in one place and optionally activate them.

Before you begin
Role required: admin

Procedure
1. Click the number in the Inactive Audits box. The Inactive Audits page displays all the audits that are currently deactivated.
2. Click one of the audits to display more information about it.
3. Optional: Activate an audit by clicking the Active box and specifying how often the audit runs in the Frequency field.
4. Click Update.

Upgrades and conversions
The ServiceNow platform includes tools to help you during and after an upgrade, and also allows you to convert a ServiceNow Express instance to a ServiceNow Service Management enterprise platform.

See also
Upgrade to San Diego
The upgrade process moves your instance to a new ServiceNow release version. Understand the difference between upgrading and patching, release definitions, rollback and backup options, and how to test your non-production and production instance upgrades.

Upgrade History module: Track every upgrade
The Upgrade History module tracks every upgrade made to an instance. Administrators can use the module to resolve upgrade conflicts and optionally to revert customizations to base system versions to take advantage of new features.

An upgrade history record is created for each upgrade that is run. To view an upgrade history record, navigate to System Diagnostics > Upgrade History and click the upgrade.

Nota: Debug Upgrade provides detailed debugging output for transactions containing artifacts affected by the most recent upgrade, and is designed to assist in upgrade error resolution. See Debug upgrade.

Nota: The Payload and Payload Hash fields have been removed from the Upgrade History record in a previous release.

Upgrade History record

### Review Skipped Records form section

The Skipped Changes to Review related list displays each record that was skipped during the upgrade process. Use the list to review the reason for each skipped record in the list and then either merge your customization or revert your customization to the base system.
Skipped Changes to Review related list

To prevent your customizations from being overwritten during system upgrades, the upgrade process skips (does not apply the update to) objects that have been customized. To assist you in tracking and resolving skipped update records that need review, Skipped Changes to Review lists all updates skipped during the upgrade process.

By default, the list is filtered by Disposition Skipped Error, Disposition Skipped Manual Merge, Disposition Skipped, or Disposition Skipped (second pass), and the resolution status is either empty or not reviewed.

Navigate to System Diagnostics > Upgrade History to view the Skipped Changes to Review related list.

**Resolve a skipped update and set a resolution status**

To prevent your customizations from being overwritten during system upgrades, the upgrade process skips (does not apply the update to) objects that have been customized. One of your responsibilities as the administrator is to resolve each skipped update after an upgrade.

**Before you begin**

Role required: admin

**About this task**

You resolve an update by either retaining the customization or (when the software upgrade contains a feature that you would like to implement) by merging or overwriting the customization with the base system update.

**Note:** Objects that are customized and that did not change in the base system since the last upgrade require no action on your part.

When an object is customized, the system adds a corresponding record to the Customer Updates [sys_update_xml] table and then maintains current version information for all customized objects. The upgrade process skips changes to objects that have a current version in the Customer Updates table. When you follow the procedure, you perform one of the following actions:
• Retain (keep) a customization with no changes
• Retain a customization by merging changes from the updated object
• Revert a customized object to the updated version (that is, overwrite the customization)
• Review the skip and perform no action on the object

Procedure
1. Navigate to All > System Diagnostics > Upgrade History.
2. Select the desired software version.
3. In the Skipped Changes to Review related list, select the update record to resolve.

💡 Note: By default, the list displays records with disposition of Skipped and resolution status of Not Reviewed.

4. Review the list of changes. For text fields, you can click in the field to open the Diff/Merge tool. Review the differences. Click a text box to view and edit the detailed differences.
5. Perform one of the following actions. You have the option to add a Comment to any record, for example, to explain the action to future reviewers.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retain the customized record as is and do not update it.</td>
<td>After reviewing the changes, set Resolution Status to Reviewed and Retained. The record moves from the Skipped Changes to Review to Skipped Changes Reviewed related list.</td>
</tr>
</tbody>
</table>
| Retain the customization by merging changes from the updated object. | a. Click Resolve Conflicts to navigate to the Resolve Conflicts form.  
b. Review the differences.  
c. To merge a field:  
• Click the right-arrow button for the field.  
• Click a text box to view and edit the detailed differences.  
• When you have merged all appropriate fields, click Merge.  
After merging the customization changes:  
• The Resolution Status changes to Reviewed and Merged.  
• The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list. |
| Discard the customization and update the record to match the base system for this upgrade. | After reviewing the changes, click Revert to Base System.  
• The Disposition changes from Skipped to Reverted.  
• The Resolution Status changes to Reviewed and Reverted. |
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• The system creates a Customer Update record.</td>
<td></td>
</tr>
<tr>
<td>• The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list.</td>
<td></td>
</tr>
</tbody>
</table>

Note: At any time after you revert a customization, you can click Reapply Changes to reapply the customization (undo the revert).

Review the skip and perform no action on the object.

After reviewing the changes, set Resolution Status to Reviewed. The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list.

Leave on the skipped list for a later decision, and note that you have not reviewed the record.

From the Resolution list, choose Not Reviewed to defer the decision on how to handle this conflict. The record stays on the Skipped Changes to Review related list.

6. Click Update. Repeat the process to resolve each update record in the list.

Results
Only skipped updates with a Resolution Status of Not Reviewed or without a resolution set appear in the Skipped Changes to Review related list. Any action you take that changes the Resolution Status to a value other than Not Reviewed or --None-- removes the skipped update from list and moves it to the Skipped Changes Reviewed related list.

**Revert a customization**

To prevent customizations from being overwritten by system upgrades, the upgrade process automatically skips changes to objects that have been customized. You may want to overwrite your customizations when a software upgrade contains a feature that you would like to implement.

**Before you begin**

Role required: admin

**About this task**

To identify customized objects, the system adds a corresponding record in the Customer Updates [sys_update_xml] table. The table maintains the current version information for all objects that have been customized. The upgrade process skips changes to objects that have entries in the table. The upgrade process does not skip objects if only excluded fields have changed.

**Procedure**

1. Navigate to All > System Diagnostics > Upgrade History.
2. Select the desired software version.
3. Filter the Upgrade Details related list by Disposition is Skipped.
4. Optional: Add another filter condition for Changed is True to return only the objects that have changed since the last upgrade.
5. Select the update record to implement.
   The File differences field displays a side-by-side comparison of the customization and the default version. Deletions are highlighted in red, additions in green, and modifications in yellow.
6. Click **Revert to base system** to overwrite your customized object with the system default version.
   - The **Disposition** changes from **Skipped** to **Reverted**.
   - After you revert a customization, you have the option to click **Reapply Changes** to reapply your customizations (undo the revert).

Update set administration

**Changes Applied related list**

Changes Applied lists all changes that were applied in this upgrade.

This list is ordered by priority and displays Upgrade Detail records for this upgrade that have a disposition of **Updated**, **Updated (second pass)**, **Inserted**, **Inserted (second pass)**, **Deleted**, **Deleted (second pass)**, and for which the changed flag is true for all of the dispositions.

Navigate to **System Diagnostics > Upgrade History** to view the Changes Applied related list.

### Claimed Outcomes to Review related list

During system upgrades, the Claim Status tab displays outcomes to review and resolve. See the Claim Status field in the table below.

By default, the list is filtered by Disposition Skipped Error, Disposition Skipped Manual Merge, Disposition Skipped, or Disposition Skipped (second pass), and the resolution status is either empty or not reviewed.

Navigate to **System Diagnostics > Upgrade History** to view the Claimed Outcomes to Review related list.

<table>
<thead>

#### Resolution

| Records which have not been reviewed                                                   |                                                                                                                                       |
| Records which have been reviewed                                                       |                                                                                                                                 |
| Records which have been reviewed and have both the old and new changes                 |                                                                                                                                 |
| Records which have been reviewed and have retained the updates from the latest upgrade |                                                                                                                                 |
| Records which have been reviewed and have reverted changes to the base system           |                                                                                                                                 |

#### Comment

During the process of resolving a skipped update, you have the option to add a **Comment** to any record. For example, the comment might explain the action that you took to future reviewers.

#### Target name

Name of the record corresponding to the current file.

#### Plugin

Plugin that contains the record.

#### Type

Current file type (such as Business Rule or UI Policy).

#### Table

Table that contains the record.
Upgrade Details related list

Upgrade Details lists all Upgrade Details records for this upgrade.

Navigate to **System Diagnostics > Upgrade History** to view the Upgrade Details related list.

<table>
<thead>
<tr>

Upgrade Monitor overview

The Upgrade Monitor helps you upgrade an individual instance. You can monitor the progress of an upgrade and resolve conflicts between the upgrade and customizations.

Set up for the Upgrade Monitor

In San Diego, the Upgrade Monitor is installed by default.
If you log in with the admin role while an upgrade is underway, the system automatically displays the Upgrade Progress screen. If no upgrade is in progress, you can navigate to System Diagnostics > Upgrade Monitor.

How the Upgrade Monitor fits into the upgrade process

Note: For detailed information about the upgrade process, see Upgrade your instance.

The Upgrade Monitor concerns only part of the larger upgrade process:

1. Clone the production instance to a test instance and a non-production instance.
2. Apply the upgrade to the non-production instance.
3. On the upgraded non-production instance, process the skipped list.
4. Test the non-production instance to confirm that the instance still works and performs adequately. Compare to benchmark data from pre-upgrade production instance.
5. Apply the upgrade to the test instance. Import the update sets created on the non-production instance when you processed the skipped list. Repeat the testing to make sure that the process is working.
6. Apply the upgrade to the production instance. Import the update sets created on the non-production instance when you processed the skipped list. Test to confirm that the instance works and performs adequately.

Within this larger process, the Upgrade Monitor helps you upgrade individual instances:

- during the upgrade, it shows where in the process the system is
- after the upgrade, it reports what the upgrade did and for how long
- as you upgrade the first non-production instance, it helps you resolve conflicts between customizations and changes that are part of the upgrade
- on non-production instances, it provides information that can help you estimate how long the upgrade takes on the production instance.

Note: Debug Upgrade provides detailed debugging output for transactions containing artifacts affected by the most recent upgrade, and is designed to assist in upgrade error resolution. See Debug upgrade.

Monitoring an individual instance as it upgrades

While the upgrade is in progress the Upgrade Progress shows what the upgrade process has done, what it is doing, and what remains to be done.

When the upgrade completes, the system displays the Upgrade Summary Report. The Upgrade Summary Report provides information about conflicts between customizations versus the upgrade and provides a link to reconcile these conflicts. For information about understanding and resolving these conflicts, see Process the skipped records list.

When you upgrade a non-production instance, the Upgrade Summary Report can help you estimate how long the same upgrade takes on a production instance. For details about the elements on this report and how to use this information, see Upgrade Details form.

Resolving conflicts

To prevent losing customizations, the system skips upgrading records you have customized and provides you with a list of these skipped records.
As you upgrade your first non-production instance, go through the Skiped Changes to Review related list and resolve these conflicts. The system records the changes you make during this process in update sets.

You do not need to reconcile the skipped list on any instances you later upgrade. Instead, you can apply the upgrade then import the update sets containing your changes.

For details on reconciling conflicts, see Process the skipped records list.

**Factors affecting upgrade duration**

Various factors affect how long the system takes to perform an upgrade. The Upgrade Monitor can help you understand those factors and estimate how long the upgrade to your production instance takes.

Many factors can affect the duration of the upgrade process:

- The number of records in the database
- The number of customizations in the database
- The number of nodes in the instance
- The size of tables in the instance that require a schema-change in the instance.
- The number of fix scripts required and the size of the tables those fix scripts manipulate.

Upgrading a non-production instance can help you estimate how long the upgrade takes on production, but differences between the instances can significantly affect the duration:

- When you cloned the production instance to the non-production instance, you may have clone-excluded some tables. This reduces the size of the database and makes the non-production instance upgrade faster than the production instance.
- The production instance may have more memory and processing power.
- The production instance may have more nodes than the non-production instance.

After upgrading the first non-production instance, examine the Upgrade Summary Report for data to help estimate the impact of these factors.

**i Note:** The performance of the upgrade engine is significantly enhanced and optimized for all types of upgrades (in-family, and family-to-family) in Madrid and later releases.

**Upgrade Monitor**

When an upgrade is not running, the Upgrade Monitor displays information about the next check for an available upgrade.

The Upgrade Monitor displays the next date and time when the system will check for an available upgrade.
To check immediately for an available upgrade, click **Check Now**.

If one or both of the triggers for upgrading the system (‘Check distribution for possible upgrade’ and ‘Check database for possible upgrade’) have been customized or are missing, the Upgrade Monitor displays a warning and provides a button for resolving the issues.

**Note:** If your instance is self-hosted (not hosted by ServiceNow) this message may not necessarily indicate a problem. If you have customized or disabled the upgrade job and want to keep that customization or disabled state, do not click the button to fix the upgrade issue.

To resolve the issues with the upgrade jobs, click **Fix Upgrade Jobs**. This action reverts both upgrade triggers (‘Check distribution for possible upgrade’ and ‘Check database for possible upgrade’) to their base versions.

**Note:** ‘Upgrade’ job has been renamed to ‘Check distribution for possible upgrade’ starting Paris. ‘Check Upgrade Script’ job has been renamed to ‘Check database for possible upgrade’ starting Paris.
Monitor an upgrade to an instance

While the system is upgrading an instance, you can monitor its progress with the Upgrade Monitor. When the upgrade is done, you can view a summary of the results on the Upgrade Summary Report.

Procedure

1. If necessary, navigate to **System Diagnostics > Upgrade Monitor**.
   When an upgrade is in progress, the Upgrade Progress page shows its status.

2. Monitor the progress of the upgrade.
   When the system finishes the upgrade, it displays the Upgrade Summary Report.

What to do next

From the Upgrade Summary Report, **resolve any conflicts** that prevented the system from upgrading records.

Upgrade Progress

When an upgrade is underway, Upgrade Progress displays progress bars and other information to help monitor the process.

Screen elements

These are the number of records the system did not upgrade because of conflicts between customizations and the upgrade.</td>
</tr>
<tr>
<td></td>
<td>• <strong>7016 Changes</strong> - Total number of file changes in the distribution since the last upgrade of the instance, plus all inserts and deletes.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The manner in which upgrade records are counted was changed in the Jakarta release, which may render different record counts than in previous releases.</td>
</tr>
<tr>
<td>Review Skipped Updates</td>
<td>Click to reconcile conflicts that caused the system to skip some updates</td>
</tr>
</tbody>
</table>
Node Upgrades

Upgrade Summary Report: Node Upgrades

The Node Upgrades section shows the status of the upgrade for each node in the instance. The color of the icon denotes the status, as illustrated by the legend (key) and to the right of the node icons. To see details about a node, position the cursor above the icon for that node. An arrow points to the node selected, and the information below the icons pertains to that node.

Schema Changes to Clone-excluded Tables

Upgrade Summary Report: Schema Changes to Clone-excluded tables

The Schema Changes to Clone-excluded Tables section shows a list of tables affected by the upgrade that were clone-excluded when you cloned the production instance to this instance. Because clone-excluded tables are empty, upgrading them takes less time than upgrading those same tables on the production instance. To estimate how much longer the production upgrade takes, note the size of the clone-excluded tables on the production instance.
Top 10 Fix Scripts by Duration

Upgrade Summary Report: Top 10 Fix Scripts by Duration

The Top 10 Fix Scripts by Duration helps you understand which fix scripts required the most time.

The Top 10 Schema Changes by Duration helps you understand which schema changes required the most time.

Process the skipped records list

If you customized or altered a record affected by this upgrade, such as a business rule or script, the upgrade generates a skip log record. You must resolve the differences between the upgraded and customized versions of the record by processing the skipped record list, or, in other terms, just processing the skipped list.

Before you begin

Role required: admin
About this task
Review the changes you made to baseline records, such as business rules and scripts, that appear on the skipped records list and revert to the baseline version if appropriate. Post-upgrade, thoroughly test all changes you made to these records.

Procedure
1. If necessary, navigate to System Diagnostics > Upgrade Monitor. If the upgrade is still in progress, the system displays the Upgrade Progress screen. When the upgrade finishes, the system displays the Upgrade Summary Report.
2. After the system displays the Upgrade Summary Report, click the Click here link in the Skipped box. The system displays the System Upgrades form.
4. Click the row for the first record you want to reconcile. The system displays the Upgrade Details form for that record.
5. Evaluate how you want to resolve the conflict for this record and take the appropriate action:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retain the customized record as is and do not update it.</td>
<td>After reviewing the changes, set Resolution Status to Reviewed and Retained. The record moves from the Skipped Changes to Review to Skipped Changes Reviewed related list.</td>
</tr>
</tbody>
</table>
| Retain the customization by merging changes from the updated object. | a. Click Resolve Conflicts to navigate to the Resolve Conflicts form.  
b. Review the differences.  
c. To merge a field:  
  • Click the right-arrow button for the field.  
  • Click a text box to view and edit the detailed differences.  
  • When you have merged all appropriate fields, click Merge.  
  After merging the customization changes:  
  • The Disposition changes from Skipped to Merged.  
  • The Resolution Status changes to Reviewed and Merged.  
  • The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list. |
<p>| Discard the customization and update the record to match the base system for this upgrade. | After reviewing the changes, click Revert to Base System. |</p>
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Review the skip and perform no action on the object.</td>
<td>After reviewing the changes, set <strong>Resolution Status</strong> to <strong>Reviewed</strong>. The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list.</td>
</tr>
<tr>
<td>Leave on the skipped list for a later decision, and note that you have not reviewed the record.</td>
<td>From the <strong>Resolution</strong> list, choose <strong>Not Reviewed</strong> to defer the decision on how to handle this conflict. The record stays on the Skipped Changes to Review related list.</td>
</tr>
</tbody>
</table>

**Note:** At any time after you revert a customization, you can click **Reapply Changes** to reapply the customization (undo the revert).

6. In the **Comment** field, write the reasons for making your decision and other information you want to document.

7. Click **Update**.
   Post-upgrade, thoroughly test all changes you made to the records on the skipped record list.

**Resolve conflicts for an individual record**

Reconcile differences between your customized record and the changes associated with the upgrade.
Before you begin
Role required: admin

Procedure
1. From the Upgrade Details form for the record you are reconciling, click Resolve Conflicts. The system displays the Resolve Conflicts form, which highlights differences between the two versions of the record. The form displays information about the base system record on the left and the customized record on the right.

2. Compare the base system with the customized record for each field on this form. For non-script fields, edit the customized record on the right-hand side to include what you want from the base system and the customization.

3. If this record contains a script, check it for conflicts and resolve.
   a. Click inside the Script field. The system displays the Resolve Conflicts - Script form highlighting areas where the two versions of the script differ.
   b. Edit the right-hand side so that the script contains whichever content you want. To move a block of code from the left to right side, click the small arrows corresponding to that block in the middle column.
   c. Click OK. The system returns to the Resolve Conflicts form.

4. To save your changes to the record, click Save Merge. The system sets the Resolution for this record to Reviewed and Merged.

| Plugin | The plugin containing this record. |
| Table | The table containing this record. |

Resolve Conflicts form

The Resolve Conflicts form you compare to the base system version with the customized version of a record and reconcile the differences.

Resolve Conflicts form
**Fields**
The fields this form displays depend on the type of record you are reconciling.
The left column shows the records fields in the base system, including the proposed changes that are part of the upgrade. The right column shows the fields for your customized record.

**Debug upgrade**
Diagnose and resolve issues you suspect may have resulted from the most recent upgrade by enabling upgrade debugging during a user session. Each transaction lists whether an artifact was skipped, customized by the customer, or modified by ServiceNow during the last family-to-family or patch version upgrade.

Administrators and technical personnel can use this output as an adjunct to the Upgrade History and Upgrade Monitor modules. Debug Upgrade is a component of standard ServiceNow session debugging. You enable Debug Upgrade, process a transaction (for example, load a form), then analyze the reported upgrade information. See Session debug.

**Reported debug information**
Debug Upgrade includes several expandable sections:
- Skipped During Last Upgrade
- Customer Customized
- ServiceNow Modified During Last Upgrade

These sections serve as a starting point for diagnosing when a function or artifact does not operate as expected after an upgrade. Each listing sorts by the dates the artifacts were processed, with the most recent appearing first. Expand the appropriate section, and click the name of a listed artifact to view the underlying artifact record. These records include update version history, which represents the state of a customizable object at specific times. See Version records.
The listed artifacts may require some kind of possible user intervention or action. Using underlying artifact detail, you can determine:
- what artifacts have changed?
- what artifacts have not been changed that would or should have?
- what changed artifacts were missed?
- what artifacts operate differently than expected (if referencing something that has changed during last upgrade)?

Depending on the answers to these questions, you may have to modify the selected artifact so it works in the way you expect. Conversely, you might simply accept the new updates made to the artifact, and its changed functionality.

**Skipped during last upgrade**
Lists artifact records that were skipped during the last upgrade that also ran during the last transaction. These records are standard objects that missed changes from ServiceNow because they were modified at some point by a user. See Resolve conflicts for an individual record.

**Customer customized**
Lists all artifact records that were customized at some point by users that also ran during the last transaction. This listing is not strictly related to the actual activities performed during the
last upgrade session. The listing does include the records that appear under Skipped During Last Upgrade. However, not all records that appear in the Customer Customized list are included in Skipped During Last Upgrade.

**Note:** Customizations that you designate for replacement during upgrades, by setting the Replace on Upgrade field in the customization record to true, do not appear on the Customer Customized section list.

While this listing is not directly related to the activities performed during the last upgrade, it may be worthwhile to look at individual customization records listed on it. Some of the listed customization records may be referencing other records changed or skipped during upgrade. The activities performed during the last upgrade may have an impact on, or affect these relationships.

**ServiceNow modified during last upgrade**

Lists all standard (non-customized) artifact records modified by ServiceNow during the last upgrade that also ran during the last transaction.

**Related reference**
- Upgrade Monitor module: Upgrade an individual instance

**Related information**
- Upgrade History module: Track every upgrade

**Enable and use debug upgrade**

Enable Debug Upgrade to analyze post-upgrade issues that may require follow up, then disable it when finished with the upgrade debugging session.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to All > System Diagnostics > Session Debug.
2. Select Debug Upgrade to enable the upgrade debugger.
3. Process a transaction (for example, load a form).
4. Click the Skipped During Last Upgrade, Customer Customized, or ServiceNow Modified During Last Upgrade header to view the appropriate list.

**Upgrade Transaction List**

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>
Field | Description
---|---
**Policies that enforce data consistency. See Data policy**
**Script include**
Script includes that store JavaScript run on the server. See Script includes
**UI action**
Buttons, links, and context menu items on forms and lists. See UI actions
**UI macro**
Discrete scripted components added to the user interface. See UI macros
**UI page**
Pages used to create and display forms, dialogs, lists, and other UI components. See UI pages
**UI policy**
Policies that change the behavior of information on a form and control custom process flows for tasks. See UI policies

**Note:** These are the only types of artifacts logged by the Upgrade Debugger.

| Last Modified | Date and time the record was last modified. |
---|---

5. The ten most recent artifacts appear in the selected list. Click **Show more** to view all remaining artifacts.

6. Click the name of a listed artifact to view the underlying artifact record. For example, if you click a Script Include artifact, the underlying Script Include record appears.

7. To turn off Debug Upgrade and all session debugging after completing your session:
   - **Navigate to** System Diagnostics > Session Debug.
   - **Select** Disable All to disable the upgrade debugger.

**Upgrade Center**

Use ServiceNow® Upgrade Center to plan and manage your upgrades. Use the Upgrade Preview module to explore different release versions available to you and gain insights about the experience of an upgrade without actually upgrading your instance. You can also monitor the status of any ongoing upgrade and view the summary of your latest upgrade with the new Upgrade Monitor module. The Upgrade Center also features an Upgrade visual task board (VTB) to manage post-upgrade skips. A separate Upgrade History module can be used to view all your past upgrades.

**Key features**

**One-stop experience**

You can see all the details that are related to an upgrade.
Preview your upgrade

Use the Upgrade Preview module to have an unprecedented insight to an instance prior to an actual or a scheduled upgrade.

You can see the estimated time required to complete an upgrade. The estimated time is calculated from previous upgrades.

⚠️ Note: If this is your first upgrade, Estimated upgrade duration doesn’t show up.

Reduce post-upgrade review time by previewing the records that have been customized and are different from the upgrade version being previewed and might get skipped due to your customizations in the instance. You can then prioritize your work depending on the records listed in the skip list.

Monitor an upgrade

Use the Upgrade Monitor module to schedule and view the status of an ongoing upgrade. You can also reschedule the upgrade by clicking Reschedule upgrade. To check for an immediately available upgrade, click Check for upgrade.
If an upgrade is in progress, the user is automatically directed to the upgrade in progress page.

**Review previous upgrade detail**

Use the Upgrade History module to view the complete report of any upgrade made to an instance.

You can also view the resolution status of any previous upgrade with skipped records using the visual task board (VTB) view.

**Get started**

Select the tile to get started.

---

**Exploring Upgrade Center**

Get an overview of Upgrade Center so you can plan your upgrade ahead. Upgrade Center helps you plan and manage your upgrades.
• **Previewing an upgrade**: Use the Upgrade Preview module to have an insight about the experience of an upgrade prior to the actual upgrade.

• **Scheduling and monitoring an upgrade**: Use the Upgrade Monitor module to schedule and monitor an upgrade in your instance.

• **Reviewing upgrade history**: Use the Upgrade History module to view reports of completed upgrades in your instance.

### Upgrade Preview module

The Upgrade Preview module enables you to have an unprecedented insight to an instance prior to an actual upgrade. You can explore and preview upgrades to different ServiceNow release versions and see how your instance might be impacted with your current configurations. The Upgrade Preview utility helps you to plan, schedule, and prepare for an upgrade.

![Upgrade Preview module interface](image)

**Find out what's new and changed in Paris Patch 2**

Based on your release version, we've provided a list of fixed problems that may be relevant to you. You can also visit the ServiceNow product documentation site to generate personalized release notes, or you can review a list of open known issues on the Known Issue Portal.

- View fixed problems in your upgrade
- Generate personalized release notes
- Visit the Known Issue Portal

**Skipped list predictions for an upgrade to Paris Patch 2**

When you upgrade to a newer release version, the upgrade can include new features and bug fixes. If customizations are detected during the upgrade, these files are skipped to make sure the upgrade doesn't overwrite any customizations. Here are some predicted skipped records for an upgrade to the selected release version. Review these predicted skipped records to decide which version of the files you'd like to keep. Before you upgrade, you may also choose to revert some of your customizations to the base version which will send them through the upgrade without getting skipped.

**Prepare for your upgrade**

Before you upgrade, use the tools below to test a baseline for testing. If you've executed some Automated Test Framework (ATF) tests recently, the most recent results are shown here.

**Automated Test Framework (ATF) results**

83% Tests passed

![Automated Test Framework results](image)

**Note**: Depending on the eligibility of your instance, the list of available target versions for preview varies. Only versions that are allowed for a particular instance to be upgraded to, show up on the list. If your instance is not eligible to be upgraded to any version, the drop-down menu is empty.

The following cards show up with more information.
<table>
<thead>
<tr>
<th>Card names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current version</td>
<td>Name of the current version.</td>
</tr>
<tr>
<td></td>
<td>• Upgraded on: Date on which the instance got upgraded to the current version</td>

</tr>
<tr>
<td>Note: The products sorted under the Other category don’t have any specific product family.</td>
<td></td>
</tr>
</tbody>
</table>

**Upgrade Monitor module**

Schedule an upgrade and monitor the status of an ongoing upgrade using the Upgrade Monitor module. You can also view the upgrade summary and the list of records causing conflicts in your instance once the upgrade is complete.

**Access Upgrade Monitor**

If you log in with the admin role while an upgrade is underway, the system automatically displays the Upgrade Progress screen. If no upgrade is in progress, you can navigate to **Upgrade Center > Upgrade Monitor**.

**How the Upgrade Monitor fits into the upgrade process**

Note: For detailed information about the upgrade process, see **Upgrade your instance**.

The Upgrade Monitor concerns only part of the larger upgrade process:

1. Clone the production instance to a test instance and a non-production instance.
2. Apply the upgrade to the non-production instance.
3. On the upgraded non-production instance, process the skipped list.
4. Test the non-production instance to confirm that the instance still works and performs adequately. Compare to benchmark data from pre-upgrade production instance.

5. Apply the upgrade to the test instance. Import the update sets created on the non-production instance when you processed the skipped list. Repeat the testing to make sure that the process is working.

6. Apply the upgrade to the production instance. Import the update sets created on the non-production instance when you processed the skipped list. Test to confirm that the instance works and performs adequately.

Within this larger process, the Upgrade Monitor helps you upgrade individual instances:

• During the upgrade, it shows where in the process the system is
• After the upgrade, it reports what the upgrade did and for how long
• As you upgrade the first non-production instance, it helps you resolve conflicts between customizations and changes that are part of the upgrade
• On non-production instances, it provides information that can help you estimate how long the upgrade might take on the production instance

Note: Debug Upgrade provides detailed debugging output for transactions containing artifacts affected by the most recent upgrade, and is designed to assist in upgrade error resolution.

Monitoring an individual instance as it upgrades

While the upgrade is in progress the Upgrade Progress shows what the upgrade process has done, what it is doing, and what remains to be done.

When the upgrade completes, the system displays the Upgrade Summary Report. The Upgrade Summary Report provides information about conflicts between customizations versus changes in the upgrade and provides a link to reconcile these conflicts. For information about understanding and resolving these conflicts, see Process the skipped records list.

When you upgrade a non-production instance, the Upgrade Summary Report can help you estimate how long the same upgrade might take on a production instance. For details about the elements on this report and how to use this information, see Upgrade Details form.

Resolving conflicts

To prevent losing customizations, the system skips upgrading records you have customized and provides you with a list of these skipped records.

As you upgrade your first non-production instance, go through the Skipped Changes to Review related list and resolve these conflicts. The system records the changes you make during this process in update sets. See Review skipped records using related lists, for more information.

You do not need to reconcile the skipped list on any instances you later upgrade. Instead, you can apply the upgrade then import the update sets containing your changes.

For details on reconciling conflicts, see Process the skipped records list.

Factors affecting upgrade duration

Various factors affect how long the system takes to perform an upgrade. The Upgrade Monitor on non-production instance can help you understand those factors and estimate how long the upgrade to your production instance takes.

Many factors can affect the duration of the upgrade process:
• The number of records in the database
• The number of customizations in the database
• The number of nodes in the instance
• The size of tables in the instance that require a schema-change in the instance
• The number of fix scripts required and the size of the tables those fix scripts manipulate

Upgrading a non-production instance can help you estimate how long the upgrade takes on production, but differences between the instances can significantly affect the duration:

• When you cloned the production instance to the non-production instance, you may have clone-excluded some tables. This reduces the size of the database and makes the non-production instance upgrade faster than the production instance.
• The production instance may have more memory and processing power.
• The production instance may have more nodes than the non-production instance.

After upgrading the first non-production instance, examine the Upgrade Summary Report for data to help estimate the impact of these factors.

**Upgrade Monitor schedule states**

When an upgrade is scheduled, the Upgrade Monitor displays information about the next scheduled upgrade. It displays the date and time when the next scheduled upgrade will start. If there is no upgrade scheduled, the Upgrade Monitor displays **Status: No upgrade detected**.

**No upgrade scheduled**

There is no upgrade that has been scheduled currently.

You can also schedule an upgrade by clicking **Schedule upgrade**. To check for an immediately available upgrade, click **Check for upgrade**. It also shows the current version of your upgrade and the date it was upgraded on.
Upgrade scheduled

There is an upgrade that has been scheduled to start at a given time.

You can also reschedule the upgrade by clicking Reschedule upgrade. To check for an immediately available upgrade, click Check for upgrade. By clicking either Reschedule upgrade or Schedule upgrade, you will be directed to HI Upgrade Wizard.

Upgrade monitor with issue detected

If one or both of the triggers for upgrading the system ('Check distribution for possible upgrade' and 'Check database for possible upgrade') have been customized or are missing, the Upgrade Monitor displays a warning and provides a button for resolving the issues.

Note: If your instance is self-hosted (not hosted by ServiceNow) this message may not necessarily indicate a problem. If you have customized or disabled the upgrade job and want to keep that customization or disabled state, do not click the button to fix the upgrade issue.

To resolve the issues with the upgrade jobs, click the link in the message. This action reverts both upgrade triggers ('Check distribution for possible upgrade' and 'Check database for possible upgrade') to their base versions.

Note: 'Upgrade' job has been renamed to 'Check distribution for possible upgrade' starting Paris. 'Check Upgrade Script' job has been renamed to 'Check database for possible upgrade' starting Paris.

Upgrade History module

The Upgrade History module tracks every upgrade made to an instance. You can also view the complete report of an old upgrade or a recently completed upgrade version using this module.

To view an upgrade history record, navigate to Upgrade Center > Upgrade History and select an upgrade from the list. On selecting an upgrade from the list, the System Upgrades form appears.

</tbody>
</table>

Click Skipped Record VTB related link to view and manage skipped records over VTB. See Skipped Records visual task board (VTB) for more information.

Click View Upgrade Summary Report related link to view the summary of an older upgrade over Upgrade Monitor module.

See Review skipped records using related lists for more information about related lists.

Previewing an upgrade

Use the Upgrade Preview module to have an insight about the experience of an upgrade prior to the actual upgrade. You can explore and preview upgrades to different ServiceNow release versions and see how your instance might be impacted with your current configurations.

- **Preview predicted changes**: Preview the changes that have been predicted to occur after an upgrade.
- **Upgrade Preview form**: Alternate view of a previewed upgrade.
View previewed upgrade

Use the Upgrade Preview form to have an alternate view of a previewed upgrade.

Before you begin
Role required: admin

Procedure
1. Navigate to All > Upgrade Center > Preview module.
2. Select the target version to be previewed.
3. Click Go or Refresh Preview to run the selected preview.
4. Click View preview details on the Previewing version card to view the following related lists.

   • **Predicted Skips to Review related list:** The Upgrade Preview process informs you about the customizations that are predicted to be skipped during an upgrade. The upgrade preview process the skip files that have been customized. Predicted Skips to Review lists all the skipped files that haven’t been reviewed yet.

   • **Predicted Skips Reviewed related list:** Predicted Skips Reviewed related list displays the records which have previously appeared on the Predicted Skips to Review related list and have been reviewed. When you select a skipped record to review and the Resolution Status has been set to a value other than Not Reviewed, the updated record moves to the Predicted Skips Reviewed related list.

   • **Previewed Changes related list:** Previewed Changes related list gives the total number of records that are predicted to change when the upgrade occurs. Total record changes also includes possible predicted skip files known as Predicted skipped records.

See Previewed changes for more details about the related lists.
<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>Predicted Disposition</td>

<td>• Predicted Update: The system is predicted to update this record.</td>
</tr>
<tr>
<td></td>
<td>• Reverted: This record was reverted to the base version, and won’t be skipped on the next upgrade.</td>
</tr>
<tr>
<td></td>
<td>• Predicted Skip: The system won’t change this record in order to preserve customizations.</td>
</tr>
<tr>
<td></td>
<td>• Predicted Skip (Manual Merge): The system won’t change this record because updating it requires manual intervention.</td>
</tr>
</tbody>
</table>

**Preview predicted changes**

Use the previewed changes table to view the list of total records that are predicted to change when the upgrade occurs.

**Preview skipped list prediction**

The Total record changes also includes records that are predicted to be skipped due to various reasons. The most common reason is due to customization. The reason an upgrade skips customizations is to avoid overwriting your customizations. Upgrade Preview attempts to predict which records will be skipped when the actual upgrade occurs. It predicts skips due to customizations, and some of the other more complex scenarios as well. It is possible to use Upgrade Preview to address these predicted customization skips before the upgrade occurs, which can prevent that skip from happening.

Click View preview details link on the Previewing version card. The Upgrade Preview form appears along with the following related lists details.

## Scheduling and monitoring an upgrade

Use the Upgrade Monitor module to schedule and monitor the status of an ongoing upgrade in your instance. You can also view the upgrade summary and the list of records causing conflicts in your instance once the upgrade is complete.
• Monitoring an upgrade: Monitor the progress of an ongoing upgrade in your instance
• Process the skipped records list: Resolve the differences between the upgraded and customized versions of a record by processing the skipped records list
• Resolve conflicts of a record: Resolve conflicts between your customized record and the changes associated with the upgrade

**Monitor an upgrade to an instance**

Monitor the progress of an ongoing upgrade in an instance with the Upgrade Monitor. When the upgrade is done, you can view a summary of the results on the Upgrade Summary Report.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to Upgrade Center > Upgrade Monitor.

   **Note:** If an upgrade is in progress, the user is automatically directed to Upgrade Center > Upgrade Monitor page.

2. Monitor the progress of the upgrade. When the system finishes the upgrade, it displays the Complete upgrade summary report.

**What to do next**

From the Upgrade Summary Report, resolve any conflicts that prevented the system from upgrading records.

**Upgrade Progress**

When an upgrade is underway, Upgrade Progress displays progress bars and other information to help monitor the process.
## Upgrade Progress details

### Skipped Records from upgrade to Paris Patch 1

When you upgrade to a newer release version, the upgrade can include new features and bug fixes. If customizations are detected during the upgrade, those files are skipped to avoid conflicts. After your upgrade is complete, review these skipped records to decide which version of the files you’d like to keep.

</tr>
</tbody>
</table>

**Note:** You can click **Skipped Record VTB** to view the resolution status of the current upgrade with skipped records using the visual task board (VTB) view. See **Skipped Records visual task board (VTB)** for more information.

**Node Upgrades**

The Node Upgrades section shows the status of the upgrade for each node in the instance. The color of the icon denotes the status, as illustrated by the legend (key) and to the right of the node icons. To see details about a node, position the cursor above the icon for that node. An arrow points to the node selected, and the information below the icons pertains to that node.

**Schema Changes to Clone-excluded Tables**

The Schema Changes to Clone-excluded Tables section shows a list of tables affected by the upgrade that were clone-excluded when you cloned the production instance to this instance. Because clone-excluded tables are empty, upgrading them takes less time than upgrading those same tables on the production instance. To estimate how much longer the production upgrade takes, note the size of the clone-excluded tables on the production instance.

Top 10 Plugins by Duration

The Top 10 Plugins by Duration helps you see the plugins that required the most time. Click **View all plugin duration** to see the **System Upgrade Metrics** list filtered by current sys upgrade history log and sorted by duration. See **View loaded files for a plugin** for more information.

### View loaded files for a plugin

Get a related list view of all the files loaded for a plugin by clicking **View all plugin duration**.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Upgrade Center > Upgrade Monitor**.
   When the system finishes the upgrade, it displays the Upgrade Summary Report.
2. Scroll down to **Top 10 Plugins by Duration**.
3. Click **View all plugin duration**.
   The System Upgrade Metrics list of all the plugins and their durations shows up.
4. Click one of the plugins from the list to open the System Upgrade Metrics form view of that plugin. The Plugin Files related list of all the loaded files for that plugin is displayed.

<table>
<thead>
<tr>
<th>Plugin Files</th>
<th>Search</th>
<th>Load duration</th>
<th>Search</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Image of plugin files list]</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note:** The total plugin load duration is not the sum of the load duration of all the loaded files for that plugin.

**Process the skipped records list**

Process the skipped records list to resolve the differences between the upgraded and customized versions of a record. If you have customized or altered a record affected by this upgrade, such as a business rule or script, the upgrade generates a skip log record.

**Before you begin**

Role required: admin

**About this task**

Review the changes you made to baseline records, such as business rules and scripts, that appear on the skipped records list and revert to the baseline version if appropriate. Post-upgrade, thoroughly test all changes you made to these records.

**Procedure**

1. Navigate to **All > Upgrade Center > Upgrade Monitor**.
   
   If the upgrade is still in progress, the system displays the Upgrade Progress screen. When the upgrade finishes, the system displays the Upgrade Summary Report.

2. After the system displays the Upgrade Summary Report, click the Review changes link in the Skipped box.
   
   The system displays the System Upgrades form.

4. Click the row for the first record you want to reconcile.
The system displays the **Upgrade details form** for that record.

5. Evaluate how you want to resolve the conflict for this record and take the appropriate action:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retain the customized record as is and do not update it</td>
<td>After reviewing the changes, set <strong>Resolution Status</strong> to <strong>Reviewed and Retained</strong>. The record moves from the Skipped Changes to Review to Skipped Changes Reviewed related list. See <a href="#">Review skipped records using related lists</a>.</td>
</tr>
</tbody>
</table>
| Retain the customization by merging changes from the updated object | **a.** Click **Resolve Conflicts** to navigate to the **Resolve Conflicts form**.  
**b.** Review the differences.  
**c.** To merge a field:  
  • Click the right-arrow button for the field.  
  • Click a text box to view and edit the detailed differences.  
  • When you have merged all appropriate fields, click **Merge**.  
After merging the customization changes:  
  • The **Disposition** changes from **Skipped** to **Merged**.  
  • The **Resolution Status** changes to **Reviewed and Merged**.  
  • The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list. |
| Discard the customization and update the record to match the base system for this upgrade | After reviewing the changes, click **Revert to Base System**.  
  • The **Disposition** changes from **Skipped** to **Reverted**.  
  • The **Resolution Status** changes to **Reviewed and Reverted**.  
  • The system creates a Customer Update record.  
  • The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list.  
**Note:** At any time after you revert a customization, you can click **Reapply Changes** to reapply the customization (undo the revert). |
<p>| Review the skip and perform no action on the object | After reviewing the changes, set <strong>Resolution Status</strong> to <strong>Reviewed</strong>. The record moves from |</p>
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Leave on the skipped list for a later decision, and note that you have not reviewed the record</td>
<td>From the Resolution list, choose <strong>Not Reviewed</strong> to defer the decision on how to handle this conflict. The record stays on the Skipped Changes to Review related list.</td>
</tr>
</tbody>
</table>

**Note:** The system tracks changes to records in an update set so you can apply these changes to another instance later. However, the system does not migrate the upgrade details records from one instance to the next. These records apply to a specific upgrade of a specific instance. If you want to preserve the Comments, Resolutions, or other information from the skipped list, export it from this instance.

6. In the **Comment** field, write the reasons for making your decision and other information you want to document.

7. Click **Update**.
   Post-upgrade, thoroughly test all changes you made to the records on the skipped record list.

**System Upgrade form**

When an upgrade is complete, the System Upgrades form displays key statistics about the upgrade and a related list of skipped records (the skipped list).

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Version of the instance before upgrading.</td>

</tbody>
</table>

### Resolve conflicts for an individual record

Resolve differences between your customized record and the changes associated with the upgrade.

#### Before you begin
Role required: admin

#### Procedure

1. From the Upgrade Details form for the record you are reconciling, click **Resolve Conflicts**.
   The system displays the Resolve Conflicts form, which highlights differences between the two versions of the record. The form displays information about the base system record on the left and the customized record on the right.

   **Note:** The system creates a new customer update record when you click **Resolve Conflicts**.

2. Compare the base system with the customized record for each field on this form. For non-script fields, edit the customized record on the right-hand side to include what you want from the base system and the customization.

3. If this record contains a script, check it for conflicts and resolve.
   a. Click inside the Script field.
      The system displays the Resolve Conflicts - Script form highlighting areas where the two versions of the script differ.
   b. Edit the right-hand side so that the script contains whichever content you want. To move a block of code from the left to right side, click the small arrows corresponding to that block in the middle column.
c. Click OK. The system returns to the Resolve Conflicts form.

4. To save your changes to the record, click Save Merge. The system sets the Resolution for this record to Reviewed and Merged.

Upgrade details form
From the Upgrade Details form, you can review an individual record affected by the upgrade and reconcile conflicts between the upgrade and customizations.

<table>

Resolve Conflicts form

The Resolve Conflicts form you compare to the base system version with the customized version of a record and reconcile the differences.

Fields

The fields this form displays depend on the type of record you are reconciling. The left column shows the records fields in the base system, including the proposed changes that are part of the upgrade. The right column shows the fields for your customized record.

Reviewing upgrade history

The Upgrade History module tracks every upgrade made to an instance. You can also view the complete report of an old upgrade or a recently completed upgrade version using this module.

- Upgrade history related lists: Use the related lists to resolve, track and review the skipped records in an upgrade
- Visual task board (VTB) view of skipped records: Use the VTB view to see the resolution status of any previous upgrade with skipped records

Review skipped records using related lists

Use different related lists to resolve, track and review the skipped records in an upgrade.

Before you begin

Role required: admin
Procedure

1. Navigate to All > Upgrade Center > Upgrade History. A list of upgrades is displayed.

2. Select an upgrade from the list. System Upgrades form is displayed.

3. Select any of the following related lists to review the skipped records.

   **Skipped Changes to Review related list**
   Resolve the skipped update records by tracking and reviewing them in the Skipped Changes to Review related list. To prevent your customizations from being overwritten during system upgrades, the upgrade process skips (does not apply the update to) objects that have been customized. See Resolve a skipped update and set a resolution status for more information.

   **Skipped Changes Reviewed related list**
   View the list of the reviewed skipped records in the Skipped Changes Reviewed related list. When you select a skipped record to review and set a Resolution Status to a value other than Not Reviewed, the update record moves from Skipped Changes to Review related list to the Skipped Changes Reviewed related list.

   **Copies to Review related list**
   Copies to Review lists all the records that need to be reviewed.

   **Copies Reviewed related list**
   Copies Reviewed lists all the records that have been reviewed.

   **Customization Unchanged related list**
   Customizations Unchanged lists all records that were skipped (due to a customization), but there have been no changes from the last upgrade. See Revert a customization for more information.

   **Changes Applied related list**
   Changes Applied lists all changes that were applied in this upgrade.

   **Claim Outcomes to Review related list**
   During system upgrades, the Claim Status tab displays outcomes to review and resolve.

   **Upgrade Details related list**
   Upgrade Details lists all Upgrade Details records for this upgrade.

   **Note:** The Copies to Review and Copies Reviewed related lists are Platform specific related lists.

Upgrade history related lists details
The following table gives the description of each field in all the related lists within the upgrade history module.

### Revert a customization

To prevent customizations from being overwritten by system upgrades, the upgrade process automatically skips changes to objects that have been customized. You may want to overwrite your customizations when a software upgrade contains a feature that you would like to implement.

**Before you begin**
- **Role required:** admin
About this task
To identify customized objects, the system adds a corresponding record in the Customer Updates [sys_update_xml] table. The table maintains the current version information for all objects that have been customized. The upgrade process skips changes to objects that have entries in the table. The upgrade process does not skip objects if only excluded fields have changed.

Procedure
1. Navigate to All > Upgrade Center > Upgrade History.
2. Select the desired software version.
3. Filter the Upgrade Details related list by Disposition is Skipped.
4. Optional: Add another filter condition for Changed is True to return only the objects that have changed since the last upgrade.
5. Select the update record to implement.
   The File differences field displays a side-by-side comparison of the customization and the default version. Deletions are highlighted in red, additions in green, and modifications in yellow.
6. Click Revert to base system to overwrite your customized object with the system default version.
   • The Disposition changes from Skipped to Reverted.
   • After you revert a customization, you have the option to click Reapply Changes to reapply your customizations (undo the revert).

Resolve a skipped update and set a resolution status
Review the reason for each skipped record to resolve each skipped update after an upgrade.

Before you begin
Role required: admin

About this task
You resolve an update by either retaining the customization or by merging or overwriting the customization with the base system update.

Note: Objects that are customized and that did not change in the base system since the last upgrade require no action on your part.

When an object is customized, the system adds a corresponding record to the Customer Updates [sys_update_xml] table and then maintains current version information for all customized objects. The upgrade process skips changes to objects that have a current version in the Customer Updates table. When you follow the procedure, you perform one of the following actions:

• Retain a customization with no changes
• Retain a customization by merging changes from the updated object
• Revert a customized object to the updated version (that is, overwrite the customization)
• Review the skip and perform no action on the object
**Procedure**

1. Navigate to All > Upgrade Center > Upgrade History.
2. Select the desired software version.
3. In the Skipped Changes to Review related list, select the update record to resolve. See Review skipped records using related lists.
4. Review the list of changes. For text fields, you can click in the field to open the Diff/Merge tool. Review the differences. Click a text box to view and edit the detailed differences.
5. Perform one of the following actions. You have the option to add a Comment to any record, for example, to explain the action to future reviewers.

### Skipped Changes to Review related list

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retain the customized record as is and do not update it.</td>
<td>After reviewing the changes, set Resolution Status to Reviewed and Retained. The record moves from the Skipped Changes to Review to Skipped Changes Reviewed related list.</td>
</tr>
</tbody>
</table>
| Retain the customization by merging changes from the updated object. | a. Click Resolve Conflicts to navigate to the Resolve Conflicts form.  
b. Review the differences.  
c. To merge a field:  
  • Click the right-arrow button for the field.  
  • Click a text box to view and edit the detailed differences.  
  • When you have merged all appropriate fields, click Merge. After merging the customization changes:  
    • The Resolution Status changes to Reviewed and Merged.  
    • The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list. |
| Discard the customization and update the record to match the base system for this upgrade. | After reviewing the changes, click Revert to Base System.  
  • Disposition changes from Skipped to Reverted.  
  • Resolution Status changes to Reviewed and Reverted.  
  • The system creates a Customer Update record.  
  • The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list. |
Field | Input Value
--- | ---
?! **Note:** At any time after you revert a customization, you can click **Reapply Changes** to reapply the customization.

Review the skip and perform no action on the object. | After reviewing the changes, set **Resolution Status** to **Reviewed**. The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list.

Leave on the skipped list for a later decision, and note that you have not reviewed the record. | From the **Resolution list**, choose **Not Reviewed** to defer the decision on how to handle this conflict. The record stays on the Skipped Changes to Review related list.

6. Click **Update**. Repeat the process to resolve each update record in the list.

**Results**

Only skipped updates with a **Resolution Status** of **Not Reviewed** or without a resolution set appear in the Skipped Changes to Review related list. Any action you take that changes the **Resolution Status** to a value other than **Not Reviewed** or **--None--** removes the skipped update from list and moves it to the Skipped Changes Reviewed related list.

**Skipped Records visual task board (VTB)**

View the resolution status of any previous upgrade with skipped records using the visual task board (VTB) view. An upgrade history record is created for each upgrade that is run.

To view the history report navigate to **Upgrade Center > Upgrade History**. You can then select an upgrade from the list to view the upgrade history details. Click the **Skipped Record VTB** related link to view and manage the skipped records over VTB.

?! **Note:** The **Skipped Record VTB** related link shows up only when there are skipped records for the version upgrade.

**Upgrade History VTB details**

<table>
<thead>
<tr>

The skipped records are prioritized based on the importance of the file types. The prioritization is done as follows:

- Priority 1 (highest priority): UI pages, UI macros, and more
- Priority 2: Business Rules, Security ACLs, and more
- Priority 3: Reports and more
Priority 4: Form Sections, Choice Sets, and more

Priority 5 (lowest priority): other

---

**Upgrade History Task form**

You can update information about a skipped record task using the Upgrade History Task form.

To make changes on a skipped record task, click a task number link on a task over VTB.

Update default labels in VTB view

Filter skipped records in the task board of the VTB with the implementation of color-coded labels. You can filter the skipped records by assigning a color to each of the products.

Before you begin

Role required: admin

Procedure

1. Navigate to All > Upgrade Center > Upgrade History.
2. Select an upgrade from the list.
   The System Upgrades form appears.
3. Click the Skipped Record VTB related link to view the resolution status of the skipped records over VTB.

   Note: The Skipped Record VTB related link shows up only when there are skipped records for the version upgrade.

   The VTB view of the resolution status of the skipped records shows up.
4. Click Labels to show the default labels.
   The default labels consist of Include codes, Does not include code and Others categories.
Note: The Include and Does not include codes categories indicate if there is any change in the code of the skipped records. All products fall under Other category of labels. The product labels are assigned with different colors. The tasks get assigned based on the label colors of the products.

5. Optional: If you want to add a label, click Add Label.
Enter the name of the label you want to create. You can also change the color of a label by clicking the color circle.
Note: The new labels and colors are saved only for the current visual task board and don't get rolled over to the next updated board. If you want the new label updates to show up in the next updated board, navigate to Upgrade Center > Administration > Properties > Upgrade Center VTB Labels. Set the colors as required and the updated colors start showing up from the next generated board.

What to do next
Click on a skipped record in the VTB to update the task. See Upgrade History Task form for more information.

View import history
View your import history by accessing the My Application Import History module.

Before you begin
Role required: admin

Procedure
1. Navigate to All > System Applications > My Application Import History. The list of import history records in your instance shows up.
2. Select one of the imports from the list for more information about that import. The form view of sys_upgrade_history record shows up.

Note: To learn more about importing from Source Control, see ServiceNow Studio. Once the importing is done, use the My Application Import History module to view the import history.

Quick access to plugins and history records
Reduce the navigating time by directly accessing plugins, application installation history records, and update set commits history records. The filters for the plugins and history records are automatically implemented in the plugins and history records views.

Before you begin
Role required: admin

About this task
Plugins and application installation history records
1. Navigate to System Definition > Plugin Installation History.
2. Select any of the plugins or history records to access them directly.

Update set commit history records
1. Navigate to System Update Sets > Update Sets to Commit.
2. Select any of the update sets to directly view the commit history of that update set.

Explore upgrade history log
Reduce processing time by extracting all upgrade related logs into a separate file named database-upgrade_<timestamp>.log. You can also zip the file and attach it to upgrade history.
Before you begin
Role required: admin

About this task
When the upgrade starts, the upgrade log messages are written to both the localhost_log file and the database-upgrade_<timestamp>.log file. When the upgrade is done, the database-upgrade_<timestamp>.log file is uploaded to the upgrade history table.

Procedure
1. Navigate to All > System Logs > Utilities.
   
   Note: You can implement this step to view the extracted database-upgrade_<timestamp>.log file only after the upgrade is done.

2. Click Node Log File Download. The database-upgrade_<timestamp>.log file appears in the list of log files.
   
   Note: The localhost_log file consists of all the logs. The database-upgrade_<timestamp>.log file consists of logs only related to the upgrade.

   Note: The database-upgrade_<timestamp>.log file appears only if the glide.db.upgrade.log.save_to_db.enabled property is set to True. By default, the glide.db.upgrade.log.save_to_db.enabled is set to True.

3. Go to Upgrade Center > Upgrade History. A list of upgrades shows up.

4. Click the required upgrade from the list. You can see database-upgrade_<timestamp>.log file is automatically attached to the upgrade.
   
   Note: The database-upgrade_<timestamp>.log file gets attached only if the glide.db.upgrade.log.save_to_db.enabled property is set to True. By default, the glide.db.upgrade.log.save_to_db.enabled is set to True.

5. Download the zipped database-upgrade_<timestamp>.log file.
   
   Note: The database-upgrade_<timestamp>.log file has been zipped to reduce the download time.

Administration
The Administration module contains properties for managing Upgrade Center.

Properties
On the properties form, you can set parameters that control how the system executes.

Upgrade Duration Estimation Properties

<table>
<thead>
<tr>
<th>Field / Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Queries upgrade duration estimate</td>
<td>A non-production instance queries the upgrade duration estimate. If this</td>
</tr>
<tr>
<td>glide.upgrade.preview.duration.instance.id</td>
<td>property is absent, the system uses all remote instance records to query</td>
</tr>
<tr>
<td></td>
<td>the upgrade duration estimate. You can also copy the sys_id of the remote</td>
</tr>
<tr>
<td></td>
<td>instance record you wish to query for upgrade duration estimate.</td>
</tr>
</tbody>
</table>
### Upgrade Duration Estimation Properties (continued)

<table>
<thead>
<tr>
<th>Field / Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The system uses the highest duration from the results.</td>
</tr>
</tbody>
</table>

### Upgrade Visual Task Board Properties

<table>
<thead>
<tr>
<th>Field / Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable an admin or user with admin role to own Upgrade VTB glide.upgrade_center.task_board.owner</td>
<td>Upgrade VTB owner must be an admin. If this property is absent, the system uses the first admin user from active admin users list. The active admin users list is sorted by username.</td>
</tr>
<tr>
<td>Enable admins or users with admin role to be members of Upgrade VTB glide.upgrade_center.task_board.members</td>
<td>Upgrade VTB members must be an admin. If this property is absent, the system adds all active admin users as members.</td>
</tr>
</tbody>
</table>

### Upgrade Center VTB Labels list

The Upgrade Center VTB Labels list under Administration module shows all the labels in the Upgrade Visual Task Board (VTB). You can also change the color of the existing labels.

If you want to change the color of an existing label, navigate to **Upgrade Center > Administration > Properties > Upgrade Center VTB Labels**

**Note:** If you update the color of an existing label, the change will not be reflected in the current version upgrade related board. The change will be seen only from the next version upgrade.
